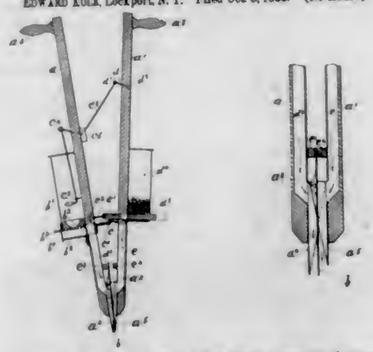
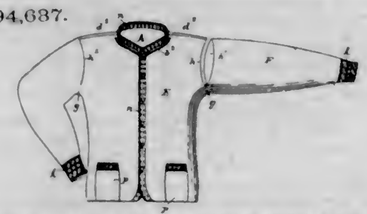
3. The combination, with the extensible fire-escape, of the guide-



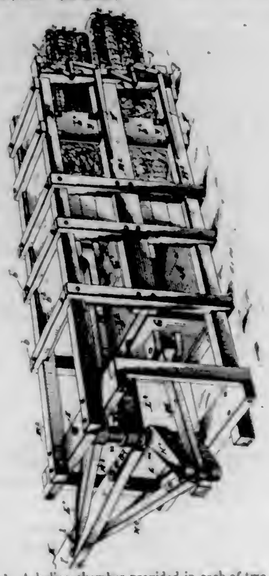
294,635.

ropes A', adapted to be adjusted and held by a windlass to correspond to the desired height of the scaffold, and the basket C', connected to the ropes A', and adapted to be raised or lowered by the cord D', substantially as shown and described.



4. The combination, with the supporting-frame B and the scaffold A, of the supplemental frame B', adapted to be lowered at one side to incline the scaffold, and the windlass-operated stay-cords E' and cam-supported props M', substantially as shown and described.

294,636. CORN-PLANTER AND FERTILIZER-DISTRIBUTER. EDWARD KOLB, Lockport, N. Y. Filed Oct. 3, 1883. (No model.)



Claim.—In a corn-planting and fertilizing machine, the parts *a a'*, provided with the usual handles, seed-planting and fertilizing receptacle, their operating mechanism, and lugs a^3 a^4, in combination with the pivoted central plate, *b*, and plates a^5 a^6, substantially as and for the purposes specified.

294,637. KNIT JACKET. OTTO KREISEL, Baltimore, Md. Filed Jan. 7, 1884. (No model.)

Claim.—A knit jacket having the sleeves attached to the body partly by a seam and partly by a continuous knit-fabric connection integral with both body and sleeve, as set forth.

294,638. DUPLEX BALING-PRESS. JOHN LA DOW, Albany, N. Y. Filed June 26, 1883. (No model.)

Claim.—1. A baling-chamber provided in each of two of its oppositely-located sides with a duplex opening and a division-piece located between the two openings comprising said duplex openings of the side and facing said baling-chamber.

2. The combination, with a baling-chamber having each of two of its oppositely-located sides made with duplex openings, of an adjustable division-piece provided with tie-band-supporting ledges.

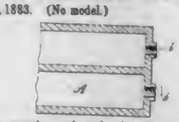
3. The combination, with a baling-chamber which has each of two of its oppositely-located sides made to consist of duplex openings, a rear-end-closing door provided with grooves for receiving tie-bands, and a follower or partition-piece or a platen provided with similar grooves, of division-piece *b'*, provided with tie-band-supporting ledges.

4. The combination, with a pressing-chamber, a platen, and a division-board or follower provided with grooves, of a baling-chamber which is provided with a rear-end-closing door provided with corresponding grooves, and a division-piece provided with tie-band-supporting cleats, which are located at each of two of its oppositely-located sides, and made to separate the duplex openings of said sides.

5. In a duplex baling-press, the combination and arrangement, with a pressing mechanism which is adapted to move two platens simultaneously, but in opposite directions and alternately, of two baling-chambers, which are arranged one above the other, each provided with oppositely-located duplex open sides and division-piece *b'*, provided with ledges *c*, made in their respective vertical sides.

6. In a baling-press, the combination, with platen-chamber A or A', having feed-openings *a a'* made in both vertical sides thereof, of the removable and interchangeable closing-board C, whereby either of the vertical sides of said chamber or chambers will be closed at will, while the opposite side will be open, substantially as and for the purpose set forth.

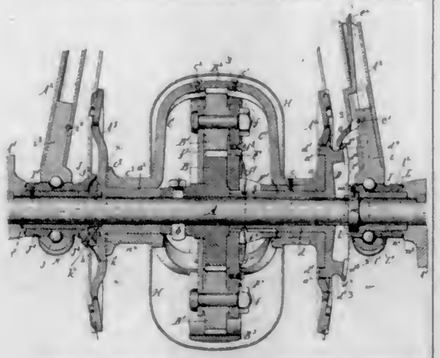
7. In a baling-press, the combination, with a baling-chamber and an end-closing board or door fitting in said chamber, and provided with tying-off grooves or recesses, of eccentric locking-bars E E, connected together by angular lever F, link *j*, and arm *k*, so that said bars will be moved simultaneously and in opposite directions for operations with said end-closing board or door, substantially as and for the purposes set forth.



8. In a baling-press, the combination, with platen G, (or G',) adapted to be moved in a reciprocating manner in a platen-chamber, of a toggle-lever having limbs of unequal length in which its long and short limbs will be each pivoted to the other, and also to bar H^3, coupled with a sweep-lever, with the thrusting end of the long limb pivoted to said platen, and the stationary end of the short limb pivoted to a vertical shaft, and a sweep-lever also pivoted to or from said vertical shaft, substantially as and for the purpose set forth.

9. In a duplex baling-press, the combination, with vertical shaft I, of sweep-lever K, having bars H^2 H^2 branching therefrom and pivoted each to a toggle-lever of a pair which are arranged one above the other and made with like unequal length of limbs H and H', in which the long limbs of each will have a hinged connection with a platen, and the short limbs of each will have a pivoted connection with said vertical shaft, and both limbs of each toggle-lever will be pivoted together, and also to one of said coupling-bars H^3, substantially as and for the purpose set forth.

10. In a baling-press operated by a sweep-lever, the combination, with said sweep-lever and the vertical shaft I, of coupling-bars H^3 H^3, having each a pivoted connection with a toggle-lever, connecting-bolt *l*, and coupling-plates *m m*, secured to the rear end of said sweep-lever in a detachable manner, whereby said sweep-lever may, at will of the operator, be made to have a rigid connection with its branch arms and with an arm of each of said toggle-levers and the vertical shaft, and be disconnected from said vertical shaft, and have a flexible connection with each said coupling-bars, and be swung against a side of the press-body, all substantially as and for the purpose set forth.



11. In a baling-press, the combination, with a sweep-lever and toggle-limbs, H H', of coupling-bars H^3 H^3, provided with a series of pinning-holes, *l' l'*, and pin or bolt *l*, whereby said toggle-limbs may be adjusted at different angles, as set forth.

294,639. THREADED CASTING. JOHN B. LARKIN, Pittsburg, Pa. Filed June 4, 1883. (No model.)

Claim.—A metal casting having in combination therewith a threaded sheet-metal thimble having its threads struck up or spun, embedded therein or thereon by pouring the casting metal around or into the said thimble, substantially as described.

294,640. BICYCLE. EMMIT G. LATTA, Friendship, N. Y., assignor of one-half to Adrian C. Latta, same place. Filed Apr. 17, 1883. (No model.)

Claim.—1. In an internally-geared driving-wheel, the combination of a sliding shifting-sleeve adapted to be held rigidly against rotary movement by being engaged with the fork or frame, and to be detached from the fork or frame at desire for changing the motion of the wheel, and a spring whereby the sleeve is held away from the fork or frame, substantially as set forth.

2. The combination, with the axle A, of a gear-wheel, B, a planet-wheel, B', attached to a supporting frame or arm, and a gear-wheel, B^2, secured to the driving-wheel of a sliding sleeve, whereby the planet-wheel support can be released or held rigidly at will, substantially as set forth.

3. The combination, with the axle, of the gear-wheel B, a planet-wheel, B', a gear-wheel, B^2, secured to the wheel, an arm, F, supporting the planet-wheel, and provided with teeth *g'*, and a sliding sleeve, *d*, provided with teeth *g*, substantially as set forth.

4. The combination, with the axle, gear-wheel B, planet-wheel B', and a driving-wheel provided with a gear-wheel, B^2, of an arm, F, supporting the planet-wheel, a spring, *f''*, and a sliding sleeve, *d*, substantially as set forth.

5. The combination, with the axle, of the gear-wheel B, planet-wheel B', gear-wheel B^2, secured to the driving-wheel, arm F, provided with hub F' and spring *f''*, and a sliding sleeve, *d*, provided with disk D, having devices for connecting it with the hub or fork at desire, substantially as set forth.

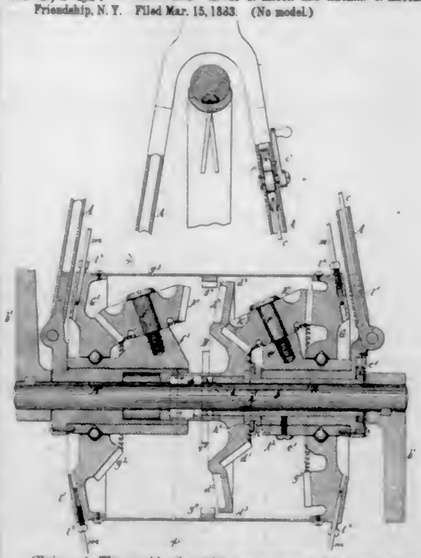
6. The combination, with the axle and driving-gear mounted thereon, of hub-disks A^3 A^4, arranged on opposite sides of the driving-gear, and the skeleton frame C C', whereby said hub-disks are connected, substantially as set forth.

7. The combination, with the axle, variable driving-gear, and fork or frame, of a sliding shifting sleeve, *d*, having a grooved disk, D, a lever, *e*, pivoted to the frame and engaging in the groove of the disk, and a shifting rod, e^2, bearing upon the lever *e*, substantially as set forth.

8. The combination, with a hollow fork, of a bent shifting rod arranged in the same, substantially as set forth.

9. In a bearing, the combination of a ball-bearing and an auxiliary parallel bearing, which is called into action when the ball becomes inoperative, substantially as set forth.

10. In a bearing, the combination of a ball-bearing and an auxiliary parallel bearing attached to the axle or other rotating part by a connection which is broken or released when the ball-bearing becomes inoperative, substantially as set forth.



11. The combination, with the bearing-box I and axle A, of the sleeve L, provided with a conical face, *l*, a cone-bearing, L', surrounding the sleeve L, and balls interposed between the cones *l* L' and the box I, substantially as set forth.

12. The combination, with the bearing-box I and axle A, provided with collar *m*, of the sleeve L, having a conical face, *l*, a fastening-screw, *m'*, a cone-bearing, L', and balls *l'*, substantially as set forth.

13. The combination, with a fork provided with a socket at its lower end, of a bearing-box provided with a shank seated in said socket and capable of turning therein, substantially as set forth.

14. The combination, with the bearing-box I, provided with shank *i*, of the fork A^2, provided with the lining *i'*, forming a socket, in which the shank *i* is seated, substantially as set forth.

294,641. VELOCIPEDE. EMMIT G. LATTA and ADRIAN C. LATTA, Friendship, N. Y. Filed Mar. 15, 1883. (No model.)

Claim.—1. The combination, with the crank-shaft *b* and hubs G G', of a connecting-drum, g^3, an internal-gear rim secured to said drum, and gear-wheels, whereby the shaft can be engaged at desire with said gear-rim, and whereby the direct motion of the crank-shaft, or a reduced or increased motion can be imparted to said gear-rim, substantially as set forth.

2. The combination, with the crank-shaft *b*, of the hubs G G', constructed, respectively, with bevel-gears g' g^2, bevel-wheels E and F, turning on fixed arbors, and a drum, g^3, secured to the hubs G G', and provided with an internal-gear rim, g^4, and an adjustable wheel, D, provided with bevel-gears d' d^2, and spur-gear d^3, adapted, respectively, to mesh with the wheels E, F, and g^3, substantially as set forth.

3. The combination, with the crank-shaft *b*, of hubs G G', provided with bevel-gears g' g^2, connecting-drum g^3, provided with the gear g^4, bevel-wheels E and F, shifting-wheel D, arranged between the bevel-wheels E and F, and means, substantially as described, whereby the wheel D can be adjusted to mesh with either of the gears E, F, and g^4, substantially as set forth.

4. The combination, with the crank-shaft *b*, of the bearing A', sleeve B, adapted to turn on the shaft and provided with spiral grooves A, collar H, engaging in the spiral grooves A, and shifting-wheel D, connected with the collar H, substantially as set forth.

5. The combination, with the crank-shaft *b* and gear-adjusting sleeve B, adapted to turn upon the crank-shaft, of the arms b^2, secured to said sleeve, wires *c*, and bell-crank lever C, whereby the sleeve can be turned and the gear mechanism be adjusted, substantially as set forth.

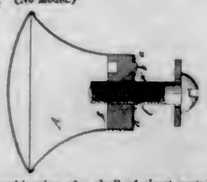
6. The combination, with a rim having an opening extending through it and the hub of a wheel, of a series of spokes constructed of a continuous piece of wire secured to the rim by extending along its outer side between two openings for the passage of the wire, substantially as set forth.

7. The combination, with the rim K and bent-wire spokes *m*, of the clamping-plates *k'*, interposed between the wire and the rim, substantially as set forth.

8. The combination, with the rim K, of a tire, N, and a clamping-plate, *k'*, secured to the rim and adapted to grasp the tire, substantially as set forth.

9. The combination, with the rim K and tire N, of clamping-plates *k'*, constructed with biting-edges adapted to be closed by an inward pressure against the clamping-plate, substantially as set forth.

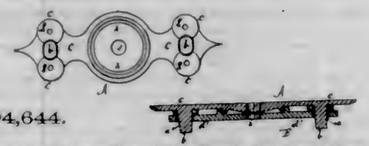
10. The combination, with a hub constructed in its face with radial recesses *l*, of the bent spokes *m*, and followers *l'*, seated in said recesses, and tightening-screws *l''*, working in the threaded walls of said recesses, substantially as set forth.



294,642. WRENCH. ORLANDO A. LEE, Mansfield, Ohio. Filed Jan. 10, 1884. (No model.)

Claim.—1. A wrench provided with a stationary jaw and a shank with inclined serrations *b' b'* and smooth sides, in combination with an adjustable jaw recessed for the reception of a thumb-piece, said thumb-piece having an oval-shaped opening, the sides of said opening being provided with serrations *b b*, and a spring-actuated sliding bolt bearing upon the thumb-piece, the parts being organized substantially as shown, and for the purpose set forth.

2. In a wrench having a stationary and sliding jaw, the shank B, screw-threaded on opposite sides, and provided with intermediate plain surfaces, and the thumb-piece D, located upon the shank and embraced by the sliding jaw, so that the thumb-piece will extend beyond the same on opposite sides, the parts being organized and combined substantially as shown, and for the purpose set forth.



294,643. KNOB OR HANDLE. CHARLES S. LEWIS, Waterbury, Conn. Filed July 2, 1883. (No model.)

Claim.—The combination of a shell of sheet metal forming part with the body of a knob or handle, of an internally-screw-threaded washer of thick strong metal fitted in the back part of such shell, and teats forced from the washer and extending through the shell, substantially as specified.

294,644. COUPLING-PLATE FOR WHIFFLETREES. DENNIS H. LUDDY, Monticello, Iowa. Filed Feb. 26, 1883. (No model.)

Claim.—The plate A, provided with the central draw-bolt aperture,

294,644.

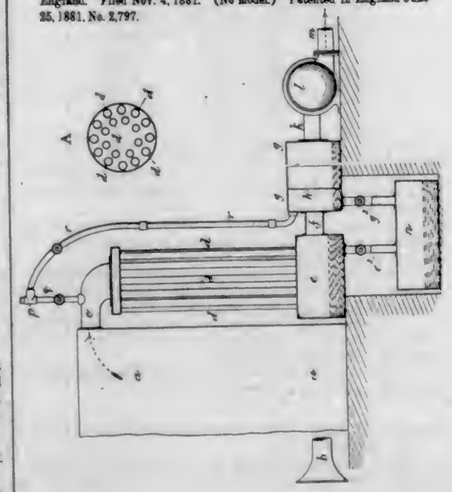
the extensions C, having the under bossed perforations, *g*, studs *b*, and annular flanges A, in combination with the under plate, B, having the branches *d* and *d'*, the former having perforations, and the latter elongated slots *a*, the central draw-bolt aperture, and the annular flange, all adapted to operate substantially as and for the purposes specified.

294,645. SADDLE FOR BICYCLES. FREEMAN LILLIBRIDGE, Cedar Rapids, Iowa. Filed Jan. 31, 1883. (No model.)

Claim.—1. A bicycle-saddle seat made in two longitudinal parts, each composed of but a single thickness of leather lying side by side, and suspended at the rear by and movable on the T-head of an upriving spring, substantially as described.

2. A bicycle-saddle seat made in two longitudinal parts, each composed of but a single thickness of leather lying side by side, and supported in front, so that the tension on one side will reciprocate with that of the other, substantially as described.

3. A separate upright post or support combined with the fore part of the backbone of a bicycle, and constituting the forward support of a flexible saddle-seat, while its rear end is supported by a spring.



4. A post or support for a flexible saddle, having a seat adapted to be secured to the forward part of the backbone, and having its upright curved forward to support the front part of the saddle-seat.

5. In combination with a flexible saddle-seat supported substantially as described, a spring which extends backward from the seat, when it makes a turn underneath itself and is attached to the backbone.

6. A flexible saddle-seat suspended at its forward end from a post attached to the fore part of the backbone, and suspended at its rear end from a spring which extends backward from the seat, where it makes a turn underneath itself, and is attached to the backbone.

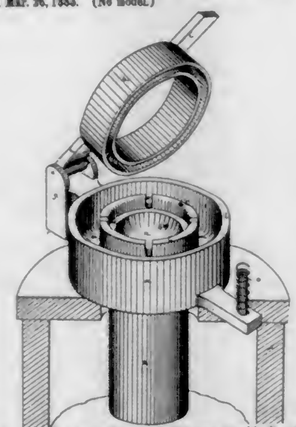
7. In combination with a flexible saddle-seat attached to its upper and free end of a spring, which extends backward therefrom, and makes a curve underneath itself, by means of which and the curve of the backbone an adjustment in height is afforded, substantially as and for the purpose set forth.

294,646. APPARATUS FOR GENERATING AND PURIFYING GASEOUS FUEL. SAMUEL LLOYD, Birmingham, County of Warwick, England. Filed Nov. 4, 1881. (No model.) Patented in England June 25, 1881, No. 2,797.

Claim.—1. The combination, with a gaseous-fuel generator comprising a stack and air-inlets, of a tubular surface condenser, a dry friction-scrubber, and steam-pipes for admitting steam into the condenser and scrubber for cleaning the same, substantially as described.

2. The combination of the gaseous-fuel generator provided with air-inlets, the condenser comprising the series of tubes, the scrubber comprising perforated plates inclosed in a casing, and the branched steam-pipe having a branch opening into the condenser, and a second branch opening into the scrubber, substantially as described.

3. In a steam-propelled vehicle—such as a steamboat, locomotive, or the like—the combination, with the boiler-furnace, of a gaseous-fuel generator comprising a stack and air-inlets, and purifying apparatus for condensing and separating the smoke-producing elements, interposed between the generator and boiler-furnace, substantially as described.



4. In a vehicle—such as a steamboat, locomotive, and the like—the combination, with a gaseous-fuel generator carried by said vehicle, of a condenser for purifying the gaseous fuel, and means for cooling the condenser by a current or circulation of the fluid, air, or water through which the vehicle moves, substantially as described.

294,647. ILLUMINATING-TILE. JACOB MARX, New York, N. Y. Filed Dec. 11, 1883. (Model.)

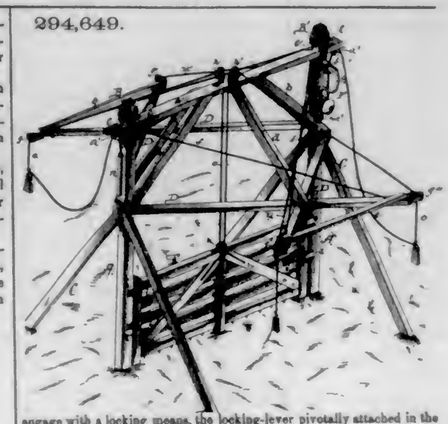
Claim.—A lens for illuminating-tile, provided with a pendant, which, upon one side, has an axially-diagonal face that is composed of two transversely-convex facets, substantially as and for the purpose specified.

294,648. SOLDERING-TOOL. GEORGE A. MARSH, Brunswick, Me. Filed Mar. 26, 1883. (No model.)

Claim.—1. In a device for soldering cans, a soldering-tool having a horizontal circular ledge on which the can may be revolved, a rim surrounding the ledge, by which the solder is applied to the can, and slots for the admission of the melted solder, in combination with a solder-receptacle surrounding the tool.

2. In a device for soldering cans, the combination of the receptacle *a* with recess *m*, and the tool consisting of the rim *c*, slots *s*, ledge *d*, and cup *n*, substantially as described.

3. In a device for soldering cans, the combination of the receptacle *a*, having the recess *m*, with the tool consisting of the rim *c*, slots *s*, ledge *d*, cup *n*, and air-passage *f*, substantially as described.



4. The combination of the receptacle *a*, having the recess *m*, the tool consisting of the rim *c*, slots *s*, ledge *d*, and cup *n*, with the piece *h* and hinged bar *i*, substantially as described.

5. The combination of the receptacle and tool, as described, with the bar *i*, piece *h*, and spring *o*, substantially as described.

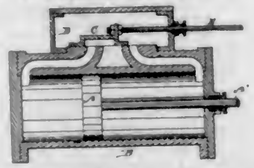
294,649. GATE. DAVID R. MATLOCK, Red Bluff, Cal. Filed Aug. 17, 1883. (No model.)

Claim.—1. In combination with the vertical sliding gate provided with guide-plates of unequal lengths, the longer of which is adapted to

294,649.

engage with a locking means, the locking-lever pivotally attached in the uprights of the gate-frame, substantially as described.

2. In combination with a vertical gate having extended guide-plates, the latch consisting of the lever *q* and latch-bar *s*, substantially as described.



3. In combination with a vertical sliding gate having extended guide-plate, the latch consisting of the lever *q* and latch-bar *s*, and signal lever and bell, substantially as described.

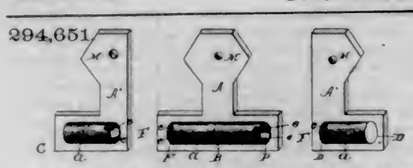
4. In combination with a vertical sliding gate having extended guide-plates, and carrying friction-wheels journaled therein, the latch consisting of the lever *q* and latch-bar *s*, substantially as described.

5. In combination with a vertical sliding gate having adjustable extending guide-plates carrying friction-wheels journaled thereon, the latch consisting of the lever *q* and latch-bar *s*, substantially as described.

6. In combination with the hand-cord *o*, a cord secured thereto and connected with the cord or weight to draw up the gate, substantially as and for the purposes set forth.

294,650. CUT-OFF-VALVE GEAR. MARSHALL J. MCCARTER, Norristown, Pa. Filed Aug. 3, 1883. (No model.)

Claim.—1. In a cut-off for steam-engines, the combination, with the disk J, mounted rigidly on the shaft, of an adjustable ring, Q, held centrally on the said disk, and connected with a cam-ring section, also held on the said disk, of the rocking frame or lever F, provided with the pin or roller T, which rocking frame or lever F is connected with the valve, substantially as herein shown and described, and for the purpose set forth.

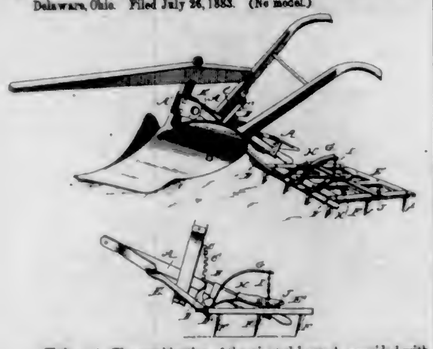


2. In a cut-off for steam-engines, the combination, with the disk J, mounted rigidly on the shaft, of a ring, Q, held centrally on the said disk, a cam-ring section, K, held on the said disk, the ring S, held on the disk, and provided with an arm, S', to which arm S' the ring K is fastened, the screw R, for connecting the ring Q with the arm S', the rocking frame or lever F, and the pin T, which frame or lever F is connected with the valve, substantially as herein shown and described, and for the purpose set forth.

3. In a cut-off for steam-engines, the combination, with the disk J, provided with the ridges O and L, of the ring Q, connected with the cam-ring section K, both resting on the disk J, the rocking frame or lever F, having a pin or roller, T, and a rod connecting the frame or lever F with the valve, substantially as herein shown and described, and for the purpose set forth.

4. In a cut-off for steam-engines, the combination, with the disk J, provided with the slots P and M, and the ridges O and L, of the ring Q and the cam-ring section K, which are connected and both resting on the disk, the rocking frame or lever F, having a roller or pin, T, and a lever or rod connecting the said frame or lever F with the valve, substantially as herein shown and described, and for the purpose set forth.

294,651. PAPER-FILE. LUTHER A. MCCORD, Clinton, S. C. Filed Aug 1, 1883. (No model.)

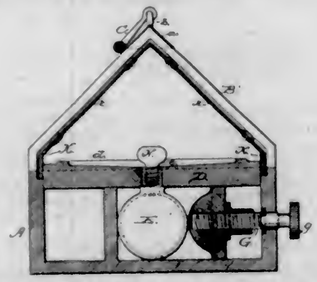


294,651

Claim.—1. In a paper-file, the combination, with a sectional bracket provided with tubular bearings, of a spring-roller having pins for holding paper, substantially as specified.

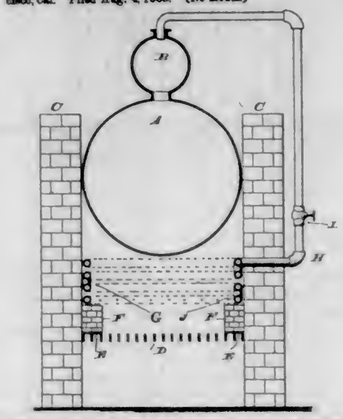
2. In a paper-file, the combination with the sectional bracket having tubular bearings provided with notches, of the roller having pins, and a wire for holding the paper, and the springs adapted to be inserted in the tubes, being provided with disk-heads to engage the ends of the roller, substantially as set forth.

294,652. HARROW ATTACHMENT. CHARLES ADDISON MCELROY, Delaware, Ohio. Filed July 26, 1883. (No model.)



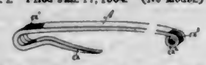
Claim.—1. The combination of the pivoted lever A, provided with a spring-catch, B, arm D, secured at right angles to the lever A, and provided with an arm, G, and spring-arms H H, harrow E', movably secured to the arm D, and provided with a chafing-plate, J, and chain I, as and for the purpose shown and set forth.

2. The combination of the arm D, provided with an arm, G, and spring-arms H H, harrow E', movably secured to the arm D, and provided with a chafing-plate, J, chain I, and means for connecting the arm D to a plow or cultivator, as and for the purpose shown and set forth.



3. The combination of a plow or cultivator provided with a plate, C, having a segmental rack, C', upon its outer edge, and having a keeper, A', secured to the plow-standard or one of the shovel-standards, lever A, pivoted at one end between the ends of the keeper A', and provided with a spring-catch, B, adapted to engage with the segmental rack C', arm D, secured at right angles to the lever A, and provided with an arm, G, and spring-arms H H, harrow E', movably secured to the arm D, and provided with a chafing-plate, J, and chain I, all constructed, combined, and arranged as and for the purpose shown and set forth.

294,653. ARTIFICIAL HORIZON. GEORGE W. MELVILLE, Philadelphia, Pa. Filed Jan. 29, 1884. (No model.)



Claim.—An artificial horizon consisting of a suitable box or receptacle, A, provided with a bag of mercury, a plate having a reservoir upon its upper surface, and a central opening communicating with said bag containing the mercury, a compression-screw and slide, glass frame K, and screw-plug H, all substantially as and for the purpose specified.

294,654. STEAM-BOILER FURNACE. ISAAC L. MERRELL, San Francisco, Cal. Filed Aug. 4, 1883. (No model.)

Claim.—In a steam-boiler furnace, the combination of the grate-bars D D, cast-iron plates E E, bench-walls F F, and perforated steam-coil G, substantially as shown and described.

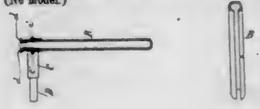
294,655. SPRING FOR BICYCLE-SADDLES. OLIVER M. MITCHELL, Providence, R. I. Filed Jan. 17, 1884. (No model.)

Claim.—1. The spring A, having the front bend and flattened end *a* and the eye a^2, as set forth.

2. The spring A, having the front bend and the flattened end *a* and the eye a^2, and provided with the slots a' a^3, as set forth.

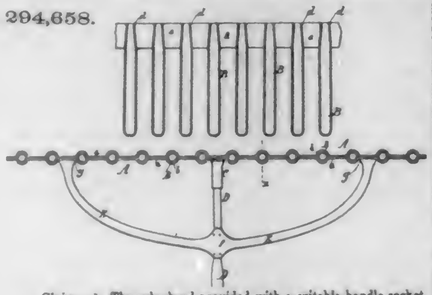
3. The ribs *b* b^2 and the strap b^3, formed upon the backbone of a bicycle, the rib *b* being formed with an eye, b', in combination with the spring A, and having the front bend and flattened end *a*, the eye a^2, and slots a' a^3, and the pin or bolt *c*, all arranged and operating as set forth.

294,656. GARTER. RANDOLPH MITCHELL, St. Louis, Mo. Filed June 18, 1883. (No model.)



Claim.—The elastic band A, one end of which is provided with a buckle and looped into ring D, the other end being provided with a hook adapted to catch into said ring, in combination with the short elastic strap E, one end of which is secured to ring D and the other having a clamping device attached to it, substantially as shown and described.

294,657. PRIMER. ROBT. F. MITCHELL, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Dec. 31, 1883. (No model.)



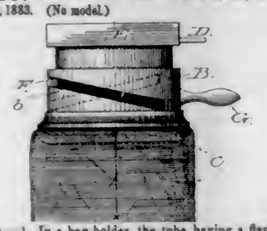
Claim.—The herein-described improvement in primers, consisting in the cup constructed at its closed end or bottom with a recess upon the outside to form a projecting portion, *b*, around said recess, the center projecting outward into said recess, but within the plane of said surrounding portion *b*, and upon the inside with a recess or depression at the center, to receive the fulminate, substantially as described.

294,658. RAKE. JOSEPH MOORE, Greeley, Colo. Filed Oct. 17, 1883. (No model.)

294,658.

Claim.—1. The rake-head provided with a suitable handle-socket, and formed of two wrought-metal strips, *a a*, with upwardly-tapered semicircular depressions *b b*, and riveted upon the top of rake-teeth, substantially as and for the purpose described.

2. The rake-teeth formed of tubular wrought metal brought to a taper at tops, rounded at points, and riveted upon the rake-head, substantially as and for the purpose described.



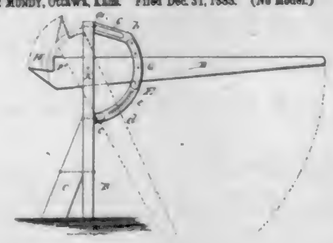
3. The bow-brace of the rake, formed of a piece of inverted-U metal bent or bowed, and flattened at its middle, and riveted to the handle, and also flattened at its ends and bent down and riveted to the head, substantially as described.

4. The combination of the rake-head A, formed of strips *a a b b*, rake-teeth B, and the U-metal bow-brace E, substantially as and for the purpose described.

5. A metallic rake with its head formed of two wrought-metal ribbed strips, *a a*, having upwardly-tapered semicircular depressions *b b* formed in them, and provided with a wrought-metal handle-socket, C, and with separated or single wrought-metal hollow teeth, B, confined between the strips by rivets, and kept from vertical movement by being riveted upon the top of the strips, substantially as described.

6. The combination of the wrought-metal flanged handle-socket C, the wrought-metal rake-head A, formed of ribbed strips *a a*, and the tubular rake-teeth B, substantially as described.

294,659. BAG-HOLDER. EDWD. H. MORESCOMB, Plover, Wis. Filed Nov. 9, 1883. (No model.)



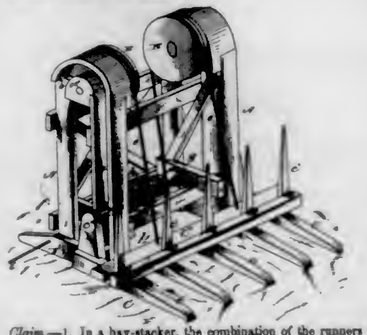
Claim.—1. In a bag-holder, the tube having a flange, C, inclined on its upper surface, and the lugs, in combination with the band provided with inclined slots, substantially as shown and described.

2. The combination of a tube provided with a flange, the top frame having a valve or shut-off, and the lugs F F, with the loosely-fitted band having the inclined slots, and adapted to slide upward and downward on the lugs, substantially as shown and described.

3. In a bag-holder, the tube A, provided with the frame E, valve D, the downwardly-inclined flange C, and lugs F F, in combination with the loosely-fitted band B, provided with the handle G, and inclined slots *b b*, adapted to slide upon the lugs, all substantially as shown and for the purpose described.

294,660. WAGON-JACK. WILLIAM K. MOTTRAM and JAMES ARCHIBALD MUNDY, Ottawa, Kans. Filed Dec. 31, 1883. (No model.)

Claim.—1. In a hay-stacker, the combination of the runners B B, the uprights A A, the grooves *a a'* in these uprights, terminating at stops *b*, the forked elevator, the rear extensions thereof, the pieces *c*, secured to these extensions, and provided with rollers guided in grooves *a a'*, and means for raising and lowering the said forked elevator, substantially as described.



2. In a hay-stacker, the combination of the uprights A A, the vertical grooves, and the semicircular grooves therein, terminating at stops *b*, the grooved pulleys E E, concentric with the semicircular grooves, and to the upper rounded ends of the uprights A A, the forked elevator, the guide-rollers *d'* thereof, and means whereby the elevator is raised and tilted, substantially as described.

294,661. PLASTIC COMPOUND FROM PYROXYLINE AND MICA. GEORGE M. MOWBRAY, North Adams, Mass. Filed Oct. 27, 1883. (No specimens.)

Claim.—1. The new composition of matter consisting of mica and soluble pyroxyline, substantially as described.

2. The new composition of matter consisting of mica, soluble pyroxyline, coloring-matters, and inert substances, to serve as a body thereto, substantially as described.

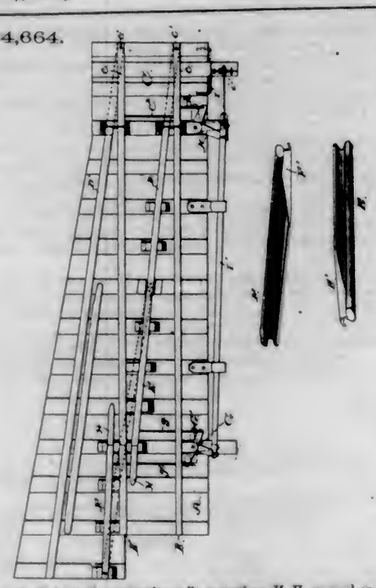
294,662. HAY-STACKER. ASHBEL A. NOYES, Steamboat Rock, Iowa. Filed Dec. 4, 1883. (No model.)

Claim.—1. In a hay-stacker, the combination of the runners B B, the uprights A A, the grooves *a a'* in these uprights, terminating at stops *b*, the forked elevator, the rear extensions thereof, the pieces *c*, secured to these extensions, and provided with rollers guided in grooves *a a'*, and means for raising and lowering the said forked elevator, substantially as described.

2. In a hay-stacker, the combination of the uprights A A, the vertical grooves, and the semicircular grooves therein, terminating at stops *b*, the grooved pulleys E E, concentric with the semicircular grooves, and to the upper rounded ends of the uprights A A, the forked elevator, the guide-rollers *d'* thereof, and means whereby the elevator is raised and tilted, substantially as described.

294,663. SCREW-DRIVER. WILLIAM L. PARMELEE, Ansonia, Conn. Filed Oct. 2, 1883. (No model.)

Claim.—1. A reversible bit provided about equidistant from its ends with a cylindrical boss having studs, in combination with a handle and ferrule having notches to receive the studs on the boss, as and for the purpose set forth.



2. A handle having a longitudinal bore from its smaller or ferrule end, an unbroken exterior, and a ferrule, in combination with a reversible bit having a cylindrical boss about equidistant from its ends, and means for interlocking it with the ferrule of the handle, as and for the purpose set forth.

294,664. RAILROAD-FROG. JOHN F. PENROD, Derry, Westmoreland County, Pa. Filed Sept. 15, 1883. (No model.)

Brief.—A railway-crossing in which the main rail is unbroken and the movable cross-over rails are protected by fixed sections of rails which register with them when they are not in use.

Claim.—In a railway-crossing, substantially as described and shown, the combination, with the unbroken main-line rail and the pivoted movable rails E F, of the protecting rails or sections H H, secured on the track in position to register with the movable ends of the rails E F when the latter are adjusted away from the fixed rail, substantially as described, and for the purposes set forth.

294,664.

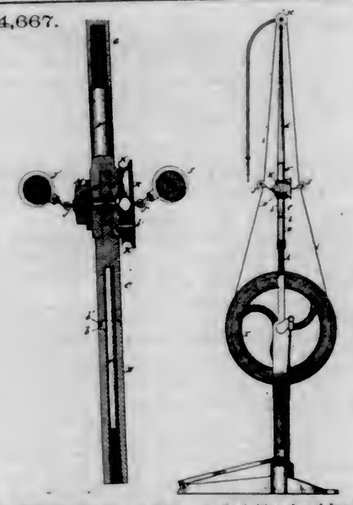
294,665. ROOFING COMPOSITION. JOHN F. PERRY, Chicago, Ill. Filed Apr. 4, 1883. (No specimens.)

Claim.—The within-described fire-proof roofing-paint, which consists, essentially, of soapstone, thirty-five per cent.; slate, twenty per cent., and crude oil ten per cent., mixed and treated substantially in the manner set forth.

294,666. COFFEE-URN. CHARLES H. PETERS, Cincinnati, Ohio. Filed Sept. 21, 1883. (No model.)

Claim.—1. In combination with a coffee-urn having a sealing-trough at its upper end, a cover fitting in said trough, and provided with one or more air-inlets below the water-level of the latter, each air-inlet being furnished with a pocket or equivalent receptacle communicating with the interior of the apparatus, for the purpose stated.

2. A coffee-urn having a sealing-trough, D, the outer wall of which, *a*, is lower than its inner wall or neck, C, for the purpose herein described.

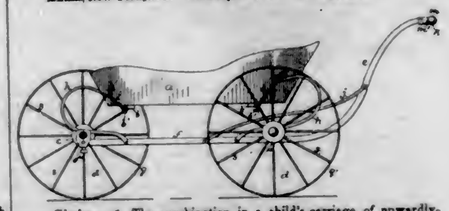


3. The combination of urn A, sealing-trough *a* B C D, cover E, rim F, tubes G, air-inlets *g*, pockets H, and openings *h*, as and for the purpose specified.

4. The combination of urn A, sealing-trough *a* B C D, cover E, rim F, tubes G, air-inlets *g*, pockets H, openings *h*, and deflecting-plate I, which plate is attached to said cover and enters the neck C, as herein described.

294,667. DENTAL ENGINE. ELIHU R. PETTIT, Philadelphia, Pa., assignor, by mesne assignments, to the S. S. White Dental Manufacturing Company, of Pennsylvania. Filed Oct. 30, 1878.

Claim.—1. The dental-engine upright or standard, hinged or jointed so as to be capable of being rocked or moved out of the perpendicular, in combination with a turning-connection below said joint or hinge, by which the standard may be turned or moved horizontally, substantially as described.



294,667.

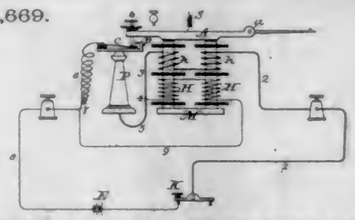
2. The dental-engine upright or standard, hinged or jointed so as to be capable of being rocked or moved out of the perpendicular, in combination with a turning-connection below said joint or hinge, by which the standard may be turned or moved horizontally, and a fastening device, O, to lock the standard when adjusted upon its turning-connection at the point desired, substantially as described.

3. The combination of the dental-engine upright or standard with the driving-pulley, the driven pulley at the upper end of said standard, the driving-belt, the hinge or joint in said standard, between the driving and driven pulleys, which permits the upper end of the standard to be moved out of the perpendicular, a turning-connection below the hinge or joint of the standard, and belt-guides at or about the hinge or joint of said standard, substantially as described, whereby the standard may be both moved out of the perpendicular and turned horizontally for proper adjustment without interfering with the operation of the engine.

294,668. CHILD'S CARRIAGE. JAMES POOLMAN and FRANK R. MARKS, New York, N. Y. Filed Apr. 26, 1883. (No model.)

Claim.—1. The combination, in a child's carriage, of upwardly-turned supporting-bars connected to the running-gear frame, and arranged on each end thereof, and a flexible chain depending from the upper end of said supports, with the body *a*, provided with the cross-bars *b b*, having a loop or hook end for engaging the opposite end of said chain, whereby the body is suspended elastically above the running-gear frame, substantially as set forth.

2. The standard or support *h*, provided with the hangers *o*, to receive the axle and reach-bar, substantially as shown and described.

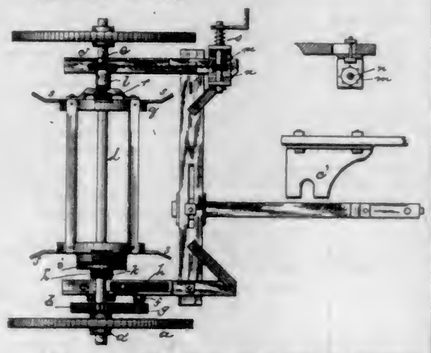


3. In the running-gear frame, the combination of the reach-bars *f*, axles *c*, and standards *h*, having the hanger-blocks *o*, to receive the ends of the said reach-bars and axles, as set forth.

4. The combination of the reach-bars *f*, axles *c*, and V-shaped brace-bars *g*, connecting the said reach-bars and the axles, substantially as and for the purpose set forth.

294,669. AUTOMATIC CUT-OUT FOR ELECTRO-MAGNETIC HELICES. FRANK L. POPE, Elizabeth, N. J. Filed June 22, 1883. (No model.)

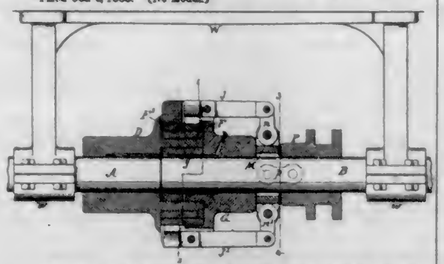
Claim.—1. The combination, substantially as hereinbefore set forth, of an electro-magnet provided with two independent assisting helices included in the same electric circuit, an armature movable toward the poles of said electro-magnet by virtue of the attractive force induced therein by one of said helices, a normally-closed shunt spanning the other or



294,669.

inactive helix, and mechanism, substantially such as described, for interrupting said shunt by such movement of the armature, thereby bringing the second helix into conjoint action with the first one as the armature approaches the poles of the electro-magnet.

2. The combination, substantially as hereinbefore set forth, of an electro-magnet provided with two independent assisting helices, one having a greater electric resistance than the other, and both being included in the same electric circuit, an armature movable toward the poles of said electro-magnet by virtue of the attractive force induced therein by the helix of lesser resistance alone, a normally-closed shunt spanning the helix of greater resistance alone, and mechanism, substantially as set forth, for interrupting said shunt by such movement of the armature, thereby bringing the helix of greater resistance into conjoint action with the helix of lesser resistance as the armature approaches the pole of the electro-magnet.



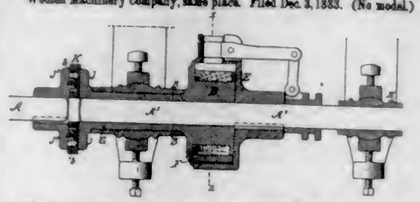
294,670. WIRE-REEL. HENRY C. PRATT, Canandaigua, N. Y. Filed Sept. 17, 1883. (No model.)

Claim.—1. In a reel for barbed wire for fences, the combination, with the threaded axle and pulley-nut thereon, of the spool, geared friction-plate, removable geared drive-wheel, and intermediate gearing, substantially as specified.

2. In a reel for barbed wire for fences, the combination, with the threaded axle carrying the reel and grooved pulley-nut, of the chain, pulley, and crank arranged upon the forward end of the frame for moving the reel into engagement with the operating mechanism at the opposite end of the frame and reel, substantially as specified.

294,671. FRICTION-CLUTCH. JOSIAH K. PROCTOR, Philadelphia, Pa., assignor to the James Smith Woolen Machinery Company, same place. Filed Oct. 4, 1883. (No model.)

Claim.—1. The combination of a shaft, wheel, or pulley having a hub or flange, two split clamping-rings adapted to said hub or flange and set opposite each other, a pair of levers whereby the rings may be clamped to the hub or flange, and a transversely-yielding sleeve for applying power to said levers, as set forth.



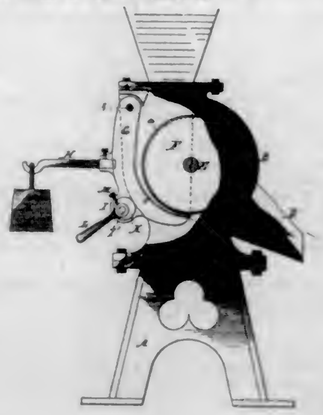
2. The combination of a series of operating-levers of a friction-clutch with a longitudinally-moving sleeve for operating said levers, the opening in said sleeve being larger than the shaft on which it slides, whereby a transverse yield of the sleeve is permitted, as set forth.

3. The combination of a shaft, wheel, or pulley having a hub or flange, a clutching-ring adapted thereto, a disk or driver, G, a fixed stud forming a connection between the disk and the front end of the ring, and a lever hung to the disk and bearing on the opposite end of the ring, as set forth.

4. The combination of the two shafts A and B and friction-clutch mechanism for connecting the same, with bearings *w* for said shafts, one or both of the latter having outside its bearing a yielding coupling, *x*, as set forth.

5. The combination of the shafts A B and the friction-clutch mechanism for connecting the same, the coupling or couplings *x*, and the single hanger W, having a bearing, *w*, for each shaft, as set forth.

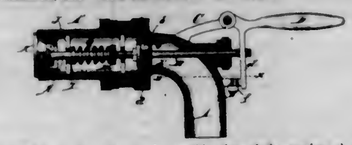
294,672. FRICTION-COUPLING FOR SHAFTS. JOSIAH K. PROCTOR and IRVING W. HOSKINS, Philadelphia, Pa., assignors to the James Smith Woolen Machinery Company, same place. Filed Dec. 2, 1883. (No model.)



Claim.—1. The combination, in a friction-coupling for shafts, of a bearing, B, a sleeve, G, adapted thereto and carrying one part of the clutch, the shaft A', carrying the other part of the clutch and having its end supported in the sleeve, the shaft A, and a coupling between said shaft and the sleeve G, as set forth.

2. The combination, in a friction-coupling for shafts, of a bearing, B, a sleeve, G, adapted thereto and carrying one part of the clutch, the shaft A', carrying the other part of the clutch and having its end supported in the sleeve, the shaft A, and a yielding coupling between said shaft and the sleeve G, as set forth.

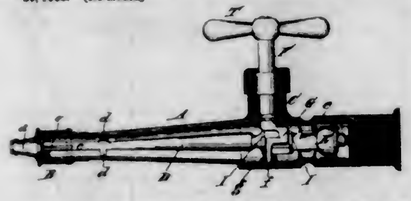
3. The combination of the bearing B, the sleeve G, adapted thereto and having the hub D, the shaft A', having a disk with friction-band F and clamping devices therefor, and having its ends supported in the sleeve, the shaft A, and a coupling between said shaft and the sleeve G, as specified.



4. The combination, in a friction-coupling for shafts, of the bearing B, a sleeve, G, adapted thereto, carrying one part of the clutch and having a disk, J, with projecting lugs *a*, a shaft, A', carrying the other part of the clutch and having its end supported in the sleeve, a shaft, A, having a disk, J', with lugs *a* at right angles to those of the disk J, and a disk, K, having radially-elongated openings for the reception of the lugs *a*, as set forth.

294,673. GRINDING-MILL. EZRA REDDY, Cleveland, Ohio, assignor of two-thirds to William R. Eynon and James W. Field, both of same place. Filed Nov. 23, 1883. (No model.)

Claim.—The herein-described grinding-mill, comprising the casing B, cylinder F, concave G, arm H, weight H', shaft I', provided with the eccentrics K and handle L, substantially as and for the purpose described.



294,674. WATER AND STEAM COCK OR FAUCET. JOS. RICHTER, Cincinnati, Ohio. Filed Feb. 15, 1883. (No model.)

Claim.—1. In a faucet, the combination of the sections A A', the valve-rod B, the ogee-valve *b*, seated on the section A, means for operating the said valve-rod and locking it in its adjusted position, the guides I, having the radial arms J, the valve-rod N, loosely passing through the guides, and having the valve K, seated on the section A', and the spring O, arranged between the guides, substantially as described.

2. The combination, with the two-part barrel A A', valve-rod B, stop E *f*, and lever D *d*, of the auxiliary valve K, its rod N, the guide I, having arms J, the spring O, and the nut *m*, all arranged and operating substantially as described.

294,675. HOSE-NOZZLE. JOS. RICHTER, Cincinnati, Ohio. Filed Sept. 20, 1883. (No model.)

Claim.—1. The combination of the barrel A, the nozzle B at the outer end thereof, having the orifice *a*, the piston D, having a stem, *c*, at one end, for entering the orifice in the nozzle at the outer end of the barrel to convert the solid stream of water into a spray, a cut-off valve at the other end of the piston, and means for shifting the piston longitudinally.

2. The combination, with the barrel A, its valve-seat *e*, and the nozzle B at the outer end of the barrel, having the orifice *a* for throwing a solid stream, of the piston D, having at one end the stem *c*, for entering the orifice of the nozzle at the outer end of the barrel to convert the solid stream into a spray, said piston having at its other end the cut-off valve E and the slot H, and a crank journaled in the barrel and extending through the slot, said crank having a stem, *f*, at its lower end, seated in a part of the barrel, substantially as described.

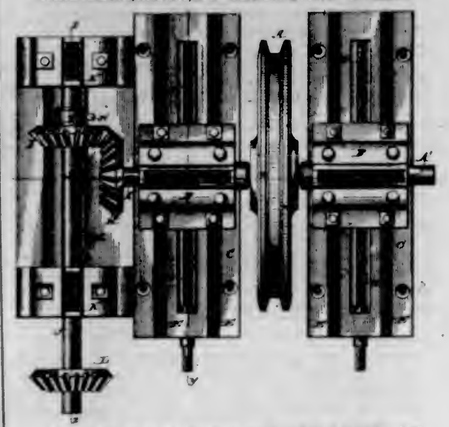
3. The combination, with the barrel A, having the valve-seat *e*, of the piston D, having guide-wings *d*, and provided at one end with the stem *c*, and at its other end with a cut-off valve, E, a slot, H, and guides K, and a crank journaled in the barrel and extending through the slot, said crank having a stem, *f*, at its lower end, seated in a ledge of the barrel, which ledge vertically supports the piston, substantially as described.

4. The combination, with the barrel A and the nozzle B, having the orifice *a* for throwing a solid stream, of the piston D, having at one end the stem for entering the orifice in the nozzle and converting the solid stream into a spray, a cut-off valve at the other end of the piston, and a crank for moving the latter, said piston having between its stem *c* and the crank the lateral guide-wings *d d*, to hold the said stem centrally in relation to the orifice of the nozzle, substantially as described.

294,676. PROCESS OF PRESERVING WOOD. WILLIAM W. ROBINSON, Ripon, assignor of one-half to George N. Lyman, Milwaukee, Wis. Filed Aug. 31, 1883. (No specimens.)

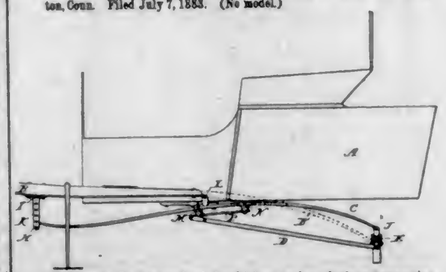
Claim.—The herein-described process of treating wood to render it fire and weather proof, consisting in subjecting it to a bath in a boiling solution composed of salt, quicklime, copperas, mineral paint, and sulphur mixed with water, subsequently drying the wood, and then coating it with a hot solution composed of mineral paint, as described, whiting, glue, and quicklime mixed with linseed-oil, substantially as specified.

294,677. COMPOSING-STICK. ROBERT STOWE ROBSON, Cambridgeport, assignor, by mesne assignments, to himself and John Loughrey, East Cambridge, Mass. Filed Feb. 3, 1883. (No model.)



Claim.—The type-receiver provided with the slotted standard and

294,677.



the nut and pointed clamp-screw, adapted thereto as described, in combination with the adjustable gage having the screw furnished with notches and extended from it through the standard and nut, and to operate therewith and with the clamp-screw as explained.

294,678. BELT-TIGHTENER. MARTIN LUTHER RUSSELL, Renfrew, Ontario, Canada, assignor of two-thirds to William Albaugh, Ovid, and Charles A. Keeler, Rochester, N. Y. Filed Dec. 20, 1883. (No model.)

Claim.—In a device for tightening cables and machine-belts of substantially the described construction, the combination of the pulley-wheel shaft A', having pulley-wheel A and bevel-pinion H, adjustable journal-boxes B B, having guide-blocks D D and downwardly-projecting piece F, provided with a screw-threaded aperture, F', blocks C C, having longitudinal grooves E E, adjusting-screws G G, with the shaft J, having a longitudinal groove or recess, M, and bevel-pinion I, having a key, N, to adapt it to be adjustably secured upon the grooved shaft J, all constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

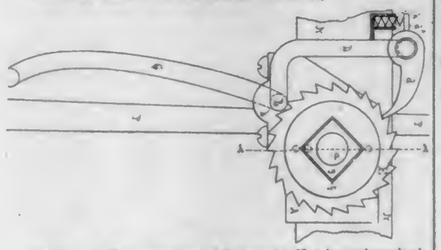
294,679. TWO-WHEELED VEHICLE. CYRUS W. SALADEE, Torrington, Conn. Filed July 7, 1883. (No model.)

Claim.—1. In a two-wheeled vehicle, a spring-platform supporting the body, and connected to the axle at the rear end, and to the shaft-frame at the forward end, the shaft-frame being connected to the platform, substantially as set forth.

2. The combination of the spring-platform, axle at the rear thereof, and a vertically-adjustable connection between the front end and shaft-frame, substantially as set forth.

3. The combination of the axle, spring-platform connected at the rear to said axle, and at the front to the shaft-frame, the shaft-frame being pivoted to the platform, and braces D, substantially as set forth.

4. The combination of the spring-platform, connected at its rear end to an axle, body supported by the platform, and shaft-frame pivoted to the platform at the rear, and attachments connecting the front end of the platform to the shaft-frame, substantially as set forth.

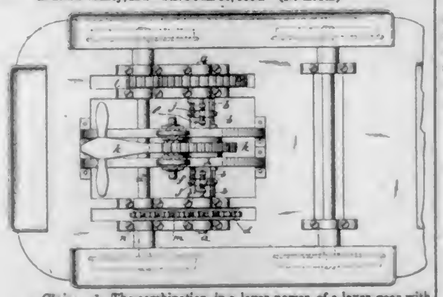


5. In a two-wheeled vehicle, semi-elliptic side springs having their rear ends secured to the axle, and the front ends to the shaft-frame, a body carried by the springs in advance of the axle, and the shaft-frame having the rear end pivotally connected to the springs, substantially as described

6. In a two-wheeled vehicle, semi-elliptic side springs extended from the axle to the shaft or pole frame, in combination with a spring or brace extended rearward to support the rear of the body, substantially as and for the purpose set forth.

7. In a two-wheeled vehicle, the combination, with the axle and a phaeton or drop front body, of semi-elliptic side springs, C, extended from the axle to the shaft or pole frame, a spring or brace, C', extended rearward, and arms S, connected to the drop-front of the body, substantially as set forth.

8. In a two-wheeled vehicle, the side springs, C, extended from the axle to the shaft or pole frame, cross-bar M, and diagonally-arranged axle-stays D, having their front ends pivotally connected to the center of the platform, and their rear ends, F, shackled to the axle at widely-separated points, substantially as and for the purpose set forth.

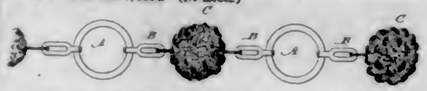


294,680. PICKER-STAFF CHECK FOR LOOMS. OREEN A. SAWYER and CHARLES S. FOSS, Lowell, Mass., assignors of three-fourths to Moses M. Lane, same place. Filed Mar. 30, 1882. (No model.)

Claim.—1. The combination of the loom-lay N and a ratchet-wheel, and friction-creating devices for retarding the rotation thereof, with a rock-shaft having an arm adapted for contact with the picker-staff, and an arm provided with a pawl which engages with the ratchet-wheel, substantially as described.

2. The combination of the loom-lay N and the ratchet-wheel E, frictional washers *e e*, and binding-nut *f* with the rock-shaft B, provided with the arms C and D, one of which is provided with a pawl engaging with the ratchet-wheel, and the other with an end portion adapted to extend across the path of the picker-staff, substantially as described.

294,681. MECHANICAL POWER. JOHN H. SCHAFFER, Blue River, Hancock County, Ind. Filed Jan. 10, 1884. (No model.)

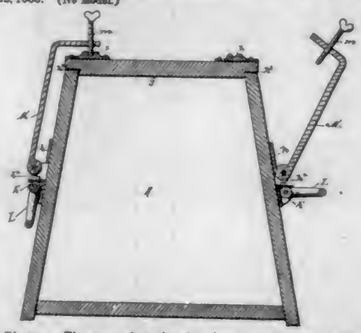


Claim.—1. The combination, in a lever-power, of a lever-gear with the separate and independent shafts *a a*, each having one or more fixed ratchet-wheels, *b*, and a gear on their outer ends, and a gear mounted loosely upon their contiguous ends, having side projecting arms, *f f*, and one or more spring-ratchets, *g g*, carried by said gear-arms in co-operating relation to the said ratchet-wheels, whereby the said shafts form separate and distinct drivers, substantially as described, for the purpose specified.

2. The combination, with the separate and distinct drive-shafts *a a*, each having two fixed ratchet-wheels, *b b*, with their teeth inclining in opposite directions, and a gear, *c d*, on their outer ends, of a gear, *e*, loosely mounted upon the contiguous ends of said shafts, having side projecting arms, *f f*, two connected ratchet-pins, *g g*, carried by said arms in co-operating relation to the said ratchet-wheels, a suitable adjustable spring-connection for each ratchet-pin, and a lever-gear operating with the said loose armed gear, substantially as described, for the purpose specified.

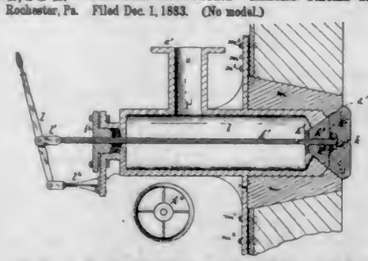
3. In combination, the following devices constituting a lever-power, viz: two separate and independent shafts, *a a*, each having two fixed ratchet-wheels, *b b*, their teeth inclining in opposite directions, a spur-gear, *c*, on the outer end of one shaft, and a sprocket-wheel, *d*, on the outer end of the other shaft, the gear *e*, loosely mounted upon the contiguous ends of said separate shafts, having side arms, *f f*, the spring-operated ratchet-pins *g g*, carried by said gear-arms, the hand-operating lever-gear, the power-transmitting shaft, the spur-pinion, the sprocket-wheel, and the chain, all constructed and arranged for operation substantially as herein set forth.

294,682. CHAIN FOR DRAPERIES. CHRISTIAN A. SCHMIDT, Hoboken, N. J. Filed Jan. 7, 1884. (No model.)



Claim.—1. As an improved article of manufacture, a chain on which balls or tufts of fibrous material are secured at intervals, substantially as herein shown and described.

2. The combination, with a chain, of a series of balls or tufts of fibrous material held on the chain, the said tufts or balls being suitably spaced, substantially as herein shown and described.



3. The combination, with the links B and the rings A, of the balls or tufts C, forming a chain with the said links and rings, substantially as herein shown and described.

294,683. COVER-FASTENING FOR CHURNS. ERNST HUGO SCHMIDT and HENRY FRIEDRICH CHRISTIAN BRAMMER, Davenport, Iowa. Filed June 22, 1883. (No model.)

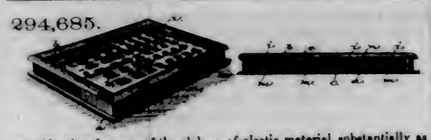
Claim.—The cover-fastening for churn-vessels, consisting of the plates A, secured to the sides of the vessel A, and provided with sockets A' and perforated ears A^2, the arms M, carrying set-screws *m*, pivoted in said ears, and the cover D, having the bearings *i*, to engage said set-screws, to secure said cover to the churn, as shown and described.

294,684. BESSEMER CONVERTER. HERMANN SCHULER-BERGE, Rochester, Pa. Filed Dec. 1, 1883. (No model.)

Claim.—1. A Bessemer converter provided with wind-box and tuyeres, in combination with internal stoppers for stopping and regulating the size of the tuyere-openings, and means for operating such internal stoppers, so as to seat or unseat them at will during the operation of the converter, substantially as and for the purposes described.

2. In a Bessemer converter, the combination of removable tuyeres or tuyere-sections with internal stoppers operated through the tuyeres, and means for operating such stoppers, substantially as and for the purposes described.

294,685. SHOW-CASE FOR JEWELS. CHARLES WM. SCHUMANN, New York, N. Y. Filed June 22, 1883. (Model.)



Brief.—The slab may be of other elastic material than rubber, as felt or papier-mache; or it may be made of rigid material, with enlarged perforations, provided with spiral springs to act on each jewel.

Claim.—1. In a show-case for jewels, the combination, with the removable glazed cover, of the slab, *c*, of elastic material, substantially as described.

2. In a show-case for jewels, the combination, with the removable glazed cover, of the slab, *c*, of elastic material, provided with means for holding the jewels in their proper positions, substantially as described.

3. In a show-case for jewels, the combination, with the removable glazed cover, of means by which each jewel is independently pressed against said cover, so that jewels of different sizes may be placed in the same case and all held securely in position, substantially as described.

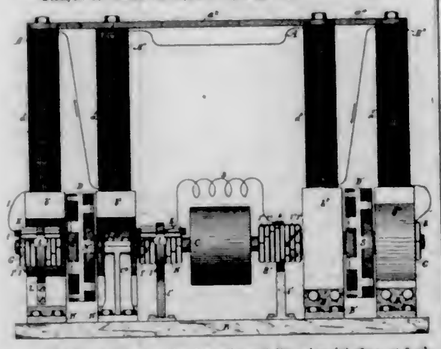
294,685.

294,686. GARMENT ATTACHMENT. CHAS. D. SPENCE, Brooklyn, N. Y., assignor to Smith, Gray & Co., same place. Filed Dec. 14, 1883. (No model.)

Claim.—1. A supplementary band for the waist of pantaloons, consisting of a main strip, A, having opening *x x*, and provided with elastics D, arranged obliquely, as set forth, substantially as described.

2. The combination of a waistband for pantaloons, having button-holes or analogous fastening devices, with a series of elastic bands arranged in opposite oblique positions in couples, substantially as described.

3. A supplementary waistband for pantaloons, consisting of the following elements: a main strip, *a*, an under parallel strip, *a'*, opening *x x*, elastic strips D, fastened at their upper and lower ends to the band A in oblique positions, said elastics being connected at their apexes, as and for the purpose intended, substantially as described.



4. In a supplementary waistband for pantaloons, having elastics D, arranged diagonally, as shown, in couples, and meeting at their apexes, in combination with stay-piece B on the lower portion, *a'*, of the band, as and for the purpose intended, substantially as described.

5. The combination, with a pair of pantaloons, of a supplementary waistband provided with button-holes or the like, and having fastened thereto a series of elastics, D, arranged in couples of V's at the rear center of said band, whereby said pantaloons, when fastened, will yield to tension and strain from any angle, as and for the purpose set forth, substantially as described.

294,687. MEDICAL COMPOUND. GEO. SHERRY, Wheeling, W. Va. Filed Aug. 24, 1883. (No specimens.)

Claim.—The herein-described compound, consisting of pulverized sulphur, pulverized charcoal, refined sugar, lemon-rind, and sulphate of quinia, in the proportions specified.

294,688. DYNAMO-ELECTRIC MACHINE. ROBERT J. SHERRY, New York, N. Y. Filed Nov. 17, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a central armature plate or disk of soft iron, and an annulus of soft iron carried thereby, by suitable projections, and situated in a plane parallel to the plane of said central plate.

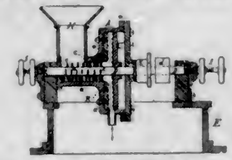
2. The combination, substantially as hereinbefore set forth, of a central armature disk or plate of soft iron, two annuli of soft iron—one on either side of said disk—and means of attaching said annuli to the face of said disk, substantially as described.

3. The combination, substantially as hereinbefore set forth, of the central armature-disk, upon each face thereof an annulus of soft iron, means of attachment, substantially as described, and coils of conductors surrounding each annulus, except at the points of attachment.

4. The combination, substantially as hereinbefore set forth, of a central shaft, a disk of soft iron carried thereby, situated in a transverse plane thereto, an annulus of soft iron carried upon the face of said disk, shouldered lugs projecting from said disk, lugs projecting from said annulus for fitting said shouldered lugs, and bolts for securing them in place.

5. The combination, substantially as hereinbefore set forth, of a central disk of soft iron, two series of bobbins—one on either side thereof—the bobbins of one series being placed in intermediate angular positions to those of the other series, and said bobbins lying lengthwise in a plane parallel to the plane of said disk, substantially as described.

6. The combination, substantially as hereinbefore set forth, of two field-magnets having their respective parts parallel the one to the other, two semicircular fields arranged in the same axial line, produced by said magnets in the manner described, and facing in opposite directions.



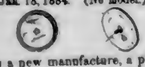
7. The combination, substantially as hereinbefore set forth, of two independent magnetic fields arranged in the same axial line, one produced by two semicircular pole-pieces of similar polarity, and the other by the remaining pole-pieces of the electro-magnets producing said first-mentioned field.

8. The combination, substantially as hereinbefore set forth, of two fields, one produced by two semicircular pole-pieces of similar polarity, and the other produced by the remaining pole-pieces of the electro-magnets producing said field first mentioned, a single shaft traversing both fields, and two armatures mounted on said shaft and having equal and diametrically-opposite sections respectively situated in said fields at the same time.

9. The combination, substantially as hereinbefore set forth, of two magnetic fields respectively created by the pole-pieces having similar polarity, of two independent electro-magnets, two armatures having diametrically-opposite sections of coils respectively traversing said fields simultaneously, and the four commutators described for collecting the currents generated in said armatures.

10. The combination, substantially as hereinbefore set forth, of two fields created and disposed in the manner described, two armatures revolving in said fields, a single shaft upon which said armatures are mounted, and a central pulley by which said shaft is impelled.

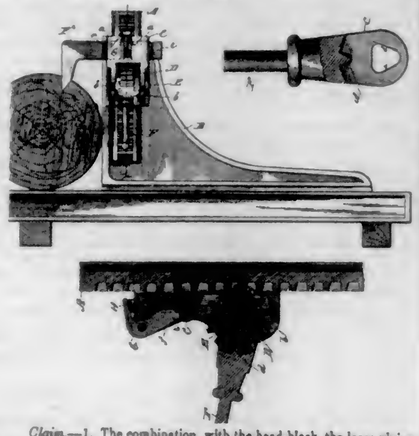
294,689. MACHINE FOR GRINDING PAPER-PULP. JOHN B. SHEPLER, Toledo, Ohio. Filed Apr. 16, 1883. (No model.)



Claim.—1. In a machine for reducing paper-pulp, the combination of the bed plate or frame E, hopper H, cylinder *e*, having fingers *c'*, back plate, *a*, hoop A, having flange *a'*, plate *i*, and grinding-plate B, secured to the back plate, in combination with the shaft D, mounted in the bed-plate, and provided at each end with adjusting-screws *f*, a grinding-plate, C, mounted on the shaft, pulley *d*, stuffing-box *s*, and fingers *c*, as set forth.

2. In a machine for reducing paper-pulp, the combination of the bed plate or frame, hopper H, cylinder *e*, back plate, *a*, provided with the grinding-plate B, secured thereto, the front plate, *i*, and hoop A, with the shaft D, mounted in the bed-plate, and having adjusting-screws *f*, a grinding-plate, C, mounted on the shaft, and means for operating the same, as set forth.

294,690. FINISHER-PLATE FOR PLUG-TOBACCO PRESSES. ALBERT SICHEL, New York, N. Y. Filed Jan. 8, 1884. (No model.)



Claim.—A finisher-plate for use in the manufacture of plug-tobacco, composed of sheet or plate iron or other stiff metal, having one or both of its faces covered with a plate of sheet-tin united therewith, as and for the purposes hereinbefore set forth.

294,691. TAG FOR PLUG-TOBACCO, &c. ALBERT SICHEL, New York, N. Y. Filed Jan. 18, 1884. (No model.)

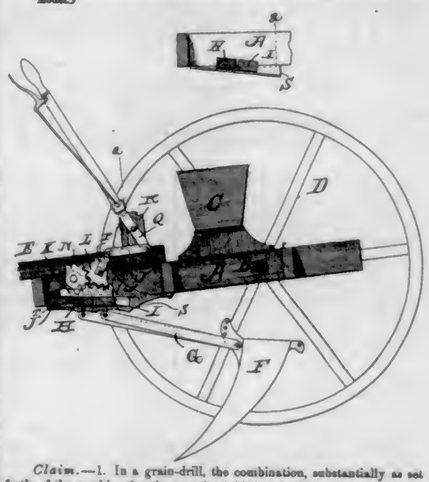
Claim.—As a new manufacture, a pressed sheet-foil or soft-metal tag provided with one or more attaching projections, substantially as shown and described.

294,692. SAW-MILL DOG. WILLIAM H. SNYDER, Waynesborough, Pa. Filed Jan. 10, 1884. (No model.)

Claim.—1. The combination, with the head-block, the loose pinion, the axial bolt securing the latter to the head-block, and the rack-bar, of the handle-lever having branched ends *c c*, with elongated openings in them, with independent bearings *e e'*, and a tooth, *d*, as and for the purpose described.

2. The head-block C, having a hole through it for the dog, and another hole in its face communicating with the hole for the dog, and provided with ears *f f*, rising from the edges of the hole in the face, in combination with the right-angular latch G, pivoted to the ears *f f*, and having one end extending through the hole in the face to engage with the dog, and its other end lapping over the top of the head-block, and a spring, H, located between the top of the head-block and the upper arm of the latch, as and for the purpose described.

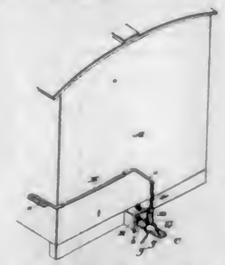
294,693. HAY-LOADING MACHINE. MARTIN M. SORNBORGER, Millville, Cal. Filed Apr. 11, 1881. (No model.)



Claim.—1. The combination of a pair of horizontal and upwardly-inclined track-beams, a pair of horizontal and upwardly-inclined track-beams placed above the former, a pair of upwardly-inclined switch-sections leading from the latter track-beams to a track above them, a pair of horizontal and upwardly-inclined track-beams placed above the second pair, and constructed with a pair of hinged track-sections near their upper ends, resting upon the upper ends of the inclined switch-sections of the track below, a carriage having rollers at its sides traveling in the lowest track, a rake hinged to the rear end of the carriage, and having rollers at the end of its head traveling upon the middle and the upper tracks, and means for elevating it, as and for the purpose shown and set forth.

2. The combination of a triple track, horizontal at its lower end and upwardly inclined at its other end, upwardly-inclined switch-sections leading from near the end of the middle track to the upper track, hinged track-sections forming parts of the upper track, as described, a traveling rake consisting of a carriage having rollers traveling upon the lowest track, and a rake having rollers upon the ends of its head traveling upon the middle and upper tracks, and hinged to the carriage, and an inclined slat floor hinged under the tracks at the point below the switch-sections, as and for the purpose shown and set forth.

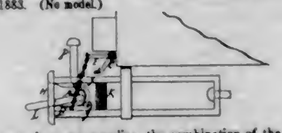
3. A hay-loader consisting of a frame mounted upon wheels, a triple track consisting of a lower horizontal portion and an upper inclined portion, upwardly-inclined switch-sections and hinged switch-rails leading from the middle to the uppermost track-beams, as described, a slat floor hinged under the tracks below the switch-sections, a carriage having rollers traveling upon the lowest track, a rake hinged to its rear end, and provided with rollers upon the ends of its head traveling upon the middle and upper tracks, a windlass having a drum of a larger diameter upon its middle, and journaled at the forward end of the frame, pulleys journaled at the upper ends of the inclined tracks, ropes attached to the forward end of the carriage, passing over the pulleys and winding upon the ends of the windlass, and a rope winding upon the drum of the windlass in the opposite direction to the ropes upon its ends, and having means at its end to be attached to draft-power, all constructed and arranged to operate as and for the purpose shown and set forth.



294,694. SEEDING-MACHINE. HARRISON D. SPANGLER, Rushville, Ind., assignor to Norris & Brother, same place. Filed Nov. 16, 1883. (No model.)

Claim.—1. In a grain-drill, the combination, substantially as set forth, of the machine-framing, a pair of shifting draft-bars, hoes and drag-bars attached to the draft-bars, in the manner specified, means for shifting the draft-bars, and angularly-arranged guides for the draft-bars, as specified.

2. In a grain-drill, the combination, substantially as set forth, of the machine-framing, a pair of shifting draft-bars having drag-bars and hoes attached, a hand-lever, guides for the draft-bars, a pair of racks, as set forth, secured to each draft-bar, pinions engaging each other in pairs and engaging the racks, and a shaft uniting the pairs of pinions.

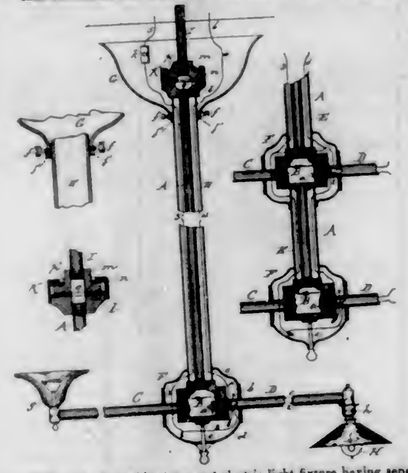


294,695. CAR-COUPLING. ALFRED D. STANSBURY, Colliers, W. Va. Filed Dec. 5, 1883. (No model.)

Claim.—1. As a means for raising a coupling-link to position for entry into an approaching draw-head, a forked clamp adapted to engage with the sides of a link, in combination with means, substantially as described, whereby said clamp may be moved vertically by a person stationed at one side of the car, substantially as specified.

2. In combination with a car, A, provided with a draw-head, B, the rod E, journaled upon said car, and provided with the handle *e* and arm *e'*, the chain F, and the clamp G, having within its forks the notches *g'*, for engagement with the sides of a link, C, substantially as and for the purpose shown.

294,696. CAR-COUPLING. ALONZO C. STEVENS, Elmira, N. Y. Filed Mar. 15, 1883. (No model.)



Claim.—1. In a car-coupling, the combination of the upper and lower draw-head plates, *g*, and buffer-plate H, with a removable U-shaped block, K, having connected therein a U-shaped dog, A, for holding and tripping the coupling-pin, also an L-shaped lifting-lever, B, all as and for the purpose set forth.

2. The U-shaped dog A, pivoted at the rear near the bottom and working automatically in a slot in the U-shaped block K.

3. The L-shaped lifting-lever B, pivoted to the side near the rear end of the U-shaped block K by the same bolt that pivots the U-shaped dog A, and the other end of which lies inside of buffer-plate H, and its connection with the rolling rod C, which is attached to the end of the car, substantially as and for the purpose set forth in the foregoing specification.

294,697. COMBINED GAS AND ELECTRIC-LIGHT FIXTURE. LUTHER STERRINGER, New York, N. Y. Filed June 14, 1882. (No model.)

Claim.—1. A combined gas and electric-light fixture having separate arms for the electric lamps, and provided with wires passing to such arms, concealed by the ornamental covering of the gas-pipe, and with wires extending through the electric-lamp arms and connected with the main wires within the said ornamental covering, whereby the wiring is wholly concealed, substantially as set forth.

2. In a combined gas and electric-light fixture, the combination of separate arms for the gas-burners and electric lamps with the central supporting gas-pipe stem or arm, the ornamental sleeve covering such central stem or arm, the conducting-wires passing to the electric-lamp arms within such ornamental sleeve, and wires passing through such electric-lamp arms and connected with the main wires within the ornamental covering of the fixture, substantially as set forth.

3. In a combined gas and electric-light fixture, the combination, with a central supporting gas-pipe stem or arm and one or more gas-distributing bodies, of separate arms for gas-burners and electric lamps, supported by such distributing body or bodies, the arms for electric lamps being closed against the admission of gas thereto, substantially as set forth.

4. In a combined gas and electric-light fixture, the combination, with a central supporting gas-pipe stem or arm and one or more gas-distributing bodies, of separate arms for gas-burners and electric lamps, supported by such distributing body or bodies, the arms for electric lamps being closed against the admission of gas thereto, and conductors entering or running out of the electric-lamp arms through side openings in such arms outside of such body or bodies, substantially as set forth.

5. In a combined gas and electric-light fixture, the combination, with a central supporting gas-pipe stem or arm and one or more gas-distributing bodies, of separate arms for gas-burners and electric lamps, supported by such distributing body or bodies, the arms for electric lamps being closed against the admission of gas thereto, side openings in such electric-lamp arms outside of the gas-distributing body or bodies, but within the ornamental covering of such body or bodies, conductors inclosed within said electric-lamp arms and passing outwardly through such side openings, and main or stem conductors connected with such arm-conductors and concealed within the ornamental covering of the fixture, substantially as set forth.

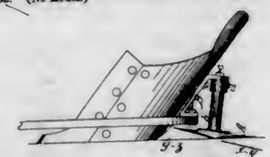
6. In a combined gas and electric-light fixture made as a single structure, the combination of a central pipe for supplying the gas, surrounded by an ornamental covering, with wires for supplying the electric current, located in the space between the pipe and ornamental covering, and concealed by said ornamental covering, substantially as set forth.

7. In a combined gas and electric-light fixture made as a single structure, the combination of a central pipe for supplying the gas, surrounded by an ornamental covering, a canopy or shell at the top or inner end of such ornamental covering, and wires supplying the electric current, located in the space between the pipe and ornamental covering, and entering such space within the canopy or shell, substantially as set forth.

8. In a combined gas and electric-light fixture made as a single structure, the combination of a central pipe for supplying the gas, surrounded by an ornamental covering-sleeve, a canopy or shell adjustably secured upon the upper or inner end of said covering-sleeve, and wires for supplying the electric current, located in the space between the pipe and ornamental covering-sleeve, and entering such covering-sleeve within the canopy or shell, substantially as set forth.

9. In a combined gas and electric-light fixture made as a single structure, the combination of a central pipe for supplying the gas, surrounded by an ornamental covering-sleeve, an insulating-joint introduced in said pipe above the ornamental covering-sleeve, and wires for supplying the electric current, entering said covering-sleeve below said insulating-joint, substantially as set forth.

10. The insulating-joint constructed in the form of a gas-union and having insulating-washers, the opposing parts of such union being locked against turning upon each other, substantially as and for the purpose set forth.



294,698. DIE FOR FORMING PULLEY-CENTERS. NORMAN C. STILES, Middletown, Conn., assignor to the Indianapolis Machine and Bolt Works, Indianapolis, Ind. Filed June 23, 1883. (No model.)

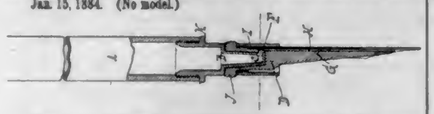
Claim.—1. The herein-described dies for forming wrought-metal pulley-centers, consisting of the two parts A B, each having a series of projections, *a*, alternating with recesses *b* around its edge, leaving a circular space within them corresponding substantially to the diameter of the center to be produced, the projections *a* on the one corresponding to the recesses *b* on the other part, and whereby the ears on the edge of the center or disk may be turned alternately to the right and left of the plane of the disk, substantially as described.

2. The herein-described dies for forming wrought-metal pulley-centers, consisting of the two parts A B, each having a series of projections, *a*, alternating with recesses *b* around its edge, leaving a circular space within them corresponding substantially to the diameter of the center to be produced, the projections *a* on the one corresponding to the recesses *b* on the other part, and whereby the ears on the edge of the center or disk may be turned alternately to the right and left of the plane of the disk, the circular space within the said projections concentrically corrugated, substantially as described.

294,699. PLOW. GARLAND B. ST. JOHN, Jackson, Mich. Filed Dec. 1, 1883. (No model.)

Claim.—1. In a disk-landside plow, the combination of the plow beam or standard with the bracket B, axle *a*, hub *b*, and disk A, secured by bolt *c*, substantially as described.

2. The combination, with a plow, of a frog, C, made separate from the standard or beam and bolted to it, and also to the mold-board and share, said frog consisting of a vertical portion, a horizontal portion, and a curved or concave portion, substantially as and for the purposes described.

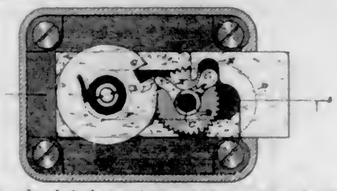


3. The combination, with the mold-board and beam or standard, of

the angular bracket B, secured at one end to the standard, at the other end to the axle-arm of a hub, bearing a convex turning-landside disk, A, and also secured to the mold-board, substantially as described.

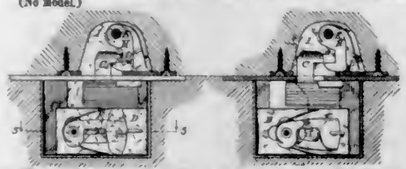
4. The combination, with the mold-board and beam or standard, of the angular bracket secured at one end to the standard and at or near the other end to the mold-board, of a hub bearing a convex turning-landside disk, said disk being set with its front part leading inward, and sustained by the said bracket, substantially as described.

5. The combination, with the plow-standard and mold-board, of the rotating-landside disk A, the bracket B, the flanged and recessed hub *b*, the axle having a sand-band, and the bolt *c*, substantially as described.



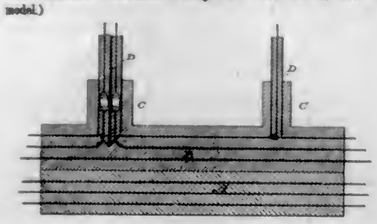
294,700. FOUNTAIN-PEN. HENRY STOCKMANN, Brooklyn, N.Y. Filed Jan. 15, 1884. (No model.)

Claim.—1. A fountain-pen embodying in its structure the tubular handle, forming an ink-reservoir, the tapering nipple on the lower end of the handle, having a lateral discharge-orifice, the rotating valve on the nipple, having an orifice to register with the nipple-orifice, and the sleeve on the valve, forming a pen-holder, substantially as and for the purpose described.



2. A fountain-pen embodying in its structure the tubular handle, forming an ink-reservoir, the tapering nipple on the lower end of the handle, having a lateral discharge-orifice, the rotating valve on the nipple, having an orifice adapted to register with the nipple-orifice, and a shank provided with a channel for conveying the ink from the valve-orifice to the nib of the pen, and the sleeve on the valve, forming a pen-holder, substantially as and for the purpose described.

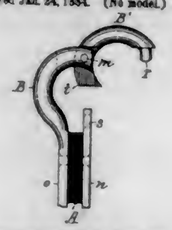
294,701. PERMUTATION-LOCK. EMORY STOCKWELL, Stamford, Conn., assignor to the Yale & Towne Manufacturing Company, same place. Filed Dec. 1, 1882. (Model.)



Claim.—In a lock, the combination of a balanced fence, its arbor, a moving bearing between them, and means for moving the bearing on the arbor, substantially as set forth.

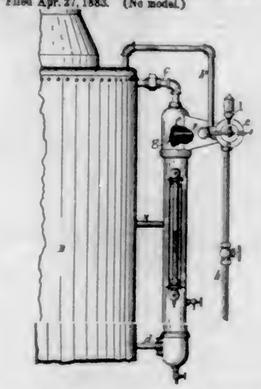
294,702. LOCK. WARREN H. TAYLOR, Stamford, Conn., assignor to the Yale & Towne Manufacturing Company, same place. Filed Oct. 6, 1883. (No model.)

Claim.—In combination with a lock having a movable bolt and a bolt-locking mechanism, a concealed spring-catch inaccessible to a key or other instrument, substantially as set forth.



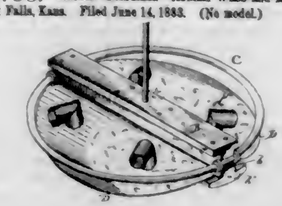
294,708. UNDERGROUND CONDUIT FOR ELECTRIC CONDUCTORS. EDMOND VERSTRAETE, Chicago, Ill. Filed Oct. 23, 1883. (No model.)

Claim.—1. An underground conduit for electrical conductors, consisting of the section B, carrying the main conductors, and provided with projections C, forming a water-tight insulating-joint for branch wires, the whole being composed of the herein-described plastic material, adapted to be placed in position while hot, and to be self-sustaining thereafter, substantially as described.



2. A branch for electrical conduits, consisting of the rubber tube D, inclosing the branch wires and covering their junction with the main conductors, and provided with a filling of the herein-described plastic material, and also having a portion of the same built up around the exterior of the junction of said tube and conduit, as set forth.

294,704. TUG-CLIP. STEPHEN A. WALL, Newark, N.J. Filed May 12, 1883. Renewed Jan. 24, 1884. (No model.)



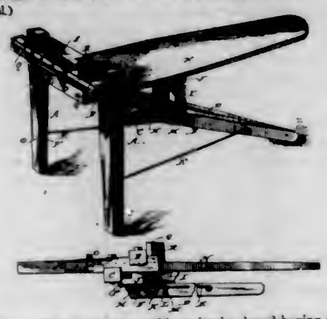
Claim.—The combination, with the hame-tag A, of the strap *o*, having the hook B, with pivoted part B' jointed thereto, and provided with the dowel *r*, as described, and the strap *n*, provided with hole *s*, the whole arranged and operated substantially as and for the purpose set forth.

294,705. FEED-WATER REGULATOR. DAVID C. WALTER, Toledo, Ohio. Filed Apr. 27, 1883. (No model.)

Claim.—In a boiler-feeder substantially as described and shown, the combination of the boiler, the float-chamber arranged alongside of and connected with the boiler by steam and water pipes, the float, the valve-chamber connected by suitable pipes with pumping-engine and supported on and opening into the float-chamber, the steam-pipe connecting the boiler and the valve-chamber, and the rotary valve connected with the float and provided with ports adapted to register with the pumping-engine pipes, and connected with and rotated by the float, said valve being provided on its inner end with plate a^2, serving as a partition between the valve and float chamber, whereby the steam is passed direct from the boiler to the pumping-engine, substantially as described, and for the purposes specified.

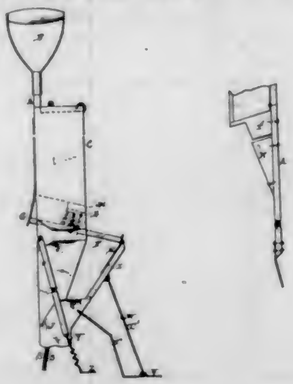
294,706. CHURN-DASHER. ROBERT WEBB and MILTON G. BRIDGES, Elk Falls, Kans. Filed June 14, 1883. (No model.)

Claim.—In a reciprocating churn-dasher, the cross-bar B, with a downwardly-projecting portion, *b*, and the rim C, secured to the cross-bar within grooves, and provided with wires *c c*, to which are hinged side wings, D D, which are perforated and provided with exit-pipes having outwardly-projecting ends, the parts being combined and organized substantially as shown, and for the purpose set forth.



294,707. TAG OR LABEL FOR MAIL-BAGS. GEO. W. WENTWORTH, Boonville, N.Y. Filed Dec. 29, 1883. (No model.)

Claim.—1. A destination tag or label for mail-bags, provided with a longitudinal sinuous open slot, its inner end provided with an enlarged opening, substantially as and for the purposes set forth.

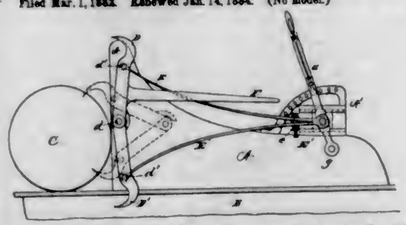


2. A destination tag or label for mail-bags, having a longitudinal sinuous slot contracted between its ends and terminating in an enlarged opening, in which the cord may rest.

294,708. IRONING-BOARD. JOHN C. WEST, Clarksville, Mo., assignor of one-half to Jefferson D. Smith, same place. Filed Oct. 13, 1883. (No model.)

Claim.—The combination, with an ironing-board having a transverse cleat at one end projecting above its upper surface, of two upright legs connected at their upper ends by cross-pieces, one upon each side of the legs and one a distance above the other corresponding to the thickness of the board, as described, and means for supporting the outer portion of the board, and for bracing the legs, as and for the purpose shown and set forth.

294,709. HAND CORN-PLANTER. FRANK A. WHITBROOK, Port Jervis, N.Y. Filed Mar. 29, 1883. (No model.)



Claim.—1. In a hand corn-planter, the combination of the seed-slide and the spring for returning it to place with the two blocks I' N, which are secured to the side of the piece A, and between which the slide moves, substantially as shown.

2. The combination, in a hand-planter, of the pivoted lever I, ground-plate U, rods T T', levers X, cranks Y, and covering device, substantially as described.

3. In a hand corn-planter, the combination of the operating-lever I, a ground-plate connected thereto, and the covering device Z, which is moved by means of a crank, substantially as set forth.

294,710. SAW-MILL DOG. WILLIAM M. WILKIN, East Saginaw, Mich. Filed Mar. 1, 1882. Renewed Jan. 14, 1884. (No model.)

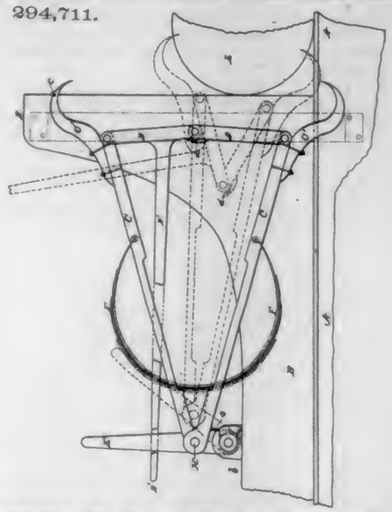
Claim.—1. In a saw-mill dogging apparatus, the combination, substantially as shown, of the following elements: two dogs adapted to grasp the log or cant from opposite directions, which are independent of the knee, and are pivoted together by their shanks, and are also pivoted near their bits to bars which are pivoted to a support upon the knee back of the standard.

2. In a saw-mill dogging apparatus, the combination, substantially as shown, of the following elements: two dogs adapted to grasp the log or cant in opposite directions, which are pivoted together by their shanks, and are also pivoted near their bits to spring-bars which are pivoted to a support upon the knee back of the standard.

3. The combination, with the knee or jack of a saw-mill head-block, of a dogging apparatus which has its attachment to said jack upon a laterally-movable support back of the standard, and is yoked at its forward end loosely within a frame formed by or upon said standard, and is provided with means, substantially as shown, whereby the attendant can move the same laterally upon the jack and extend the bits of the dogs more or less beyond the face of the standard, for the purposes mentioned.

4. In a saw-mill dogging apparatus, the combination, substantially as shown, of the following elements: two dogs adapted to grasp the log or cant in opposite directions, which are pivoted together at their shanks, and are also pivoted near their bits to bars which are pivoted upon a sliding pivot on the knee back of the standard, which sliding pivot is provided with means whereby the attendant can move the same to and fro at pleasure, whereby the said dogging apparatus can be adjusted by the attendant so as to cause the dogs to act at a greater or less distance from the face of the knee, and also whereby the attendant can grapple a log or cant not snug against the knee and draw it back against the face of the knee.

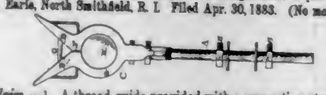
5. In a saw-mill dogging apparatus, the combination, substantially as shown, of the following elements: a spring-bar pivotally connected with the knee back of the standard, and extending to near the face of the knee, and there connected with a dog which is pivoted thereto near its bit, and is operated upon by a toggle-lever.



6. In a saw-mill dogging apparatus wherein the dog-bits are pivoted on the ends of spring-bars which are pivotally connected with the knee back of the standard, and are moved from contact with the log or cant by a toggle-lever, the combination, with said toggles, of a stop for limiting the movement of the same at the joint toward the face of the head-block standard, substantially as and for the purposes set forth.

294,711. SAW-MILL DOG. WILLIAM M. WILKIN, Erie, Pa. Filed Mar. 21, 1882. Renewed Jan. 14, 1884. (No model.)

Claim.—1. In the dogging apparatus of a saw-mill head-block, which consists of dog-bits actuated by spring-bars, substantially as shown, to drive them into the log or cant, which spring-bars are provided with other proper mechanism for withdrawing the bits from the log or cant, the said dog-bits formed upon or firmly attached to the outer extremities of said spring-bars, for the purposes mentioned.



2. In the dogging apparatus of a saw-mill head-block wherein the dog-bits are actuated to enter the log or cant by spring-bars which are attached back of the face of the knee to or connected with a lever, E, by which the said dog-bits can be moved more or less beyond the face of the knee, the combination therewith of a spring operating upon said lever to

294,711.

automatically hold back said dog-bits until the power of said spring is overcome by power applied to said lever E, and a stop near said dog-bits for preventing the said dog-bits from being drawn back wholly within the face of the knee by the said spring operating upon said lever, for the purposes mentioned.

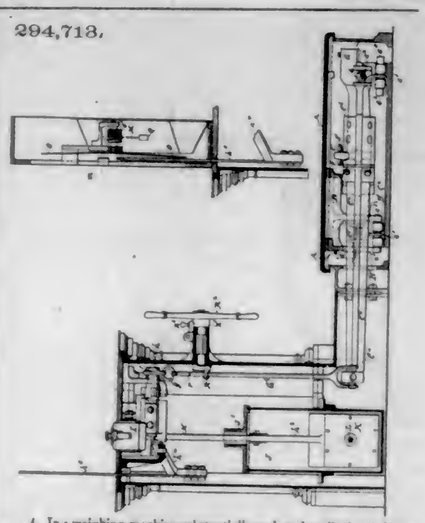
294,712. THREAD-GUIDE FOR SPOOLING-MACHINES. EDEN B. WILLIAMS, Forestdale, assignor by mesne assignments, of part to Daniel D. Earle, North Smithfield, R. I. Filed Apr. 30, 1883. (No model.)

Claim.—1. A thread-guide provided with a supporting-stem having a joint therein, with an opening through said guide in which the thread will sink, with the device for partially filling the opening, around which device the thread will pass, and the support for the device, substantially as described.

2. The combination of a thread-guide pronged at its upper end and provided with a vertical slot, and an opening, G, the opening being provided with beveled edges, with a device which is adjustable in relation to the opening, and a support for the device, the opening and the device being shaped as described, whereby the thread will automatically sink down, after catching between the prongs, through the slot and upon either side of the device, substantially as set forth.

3. The combination of a suitable support for the frame, the frame having an opening provided with beveled edges made through it, with a device having a screw-threaded stem arranged within said opening, the stem L for supporting the stem connected to the device, and the support for the stem L, the stem L being provided with means for vertical adjustment, whereby a double adjustment may be given to the device, substantially as shown.

4. The combination of the frame having a circular opening provided with beveled edges made through it, with a device having a screw-threaded stem arranged within said opening, and a second stem for supporting the first, the second stem being capable of vertical adjustment, whereby a double adjustment may be given to the device, substantially as shown.



294,713. WEIGHING-MACHINE. EDGEN WOLNER, Liverpool, County of Lancaster, England. Filed Aug. 13, 1883. (No model.) Patented in England Feb. 22, 1883, No. 977, and in Belgium Sept. 17, 1883, No. 62,515.

Claim.—1. In a weighing-machine, the combination of the series of stirrup-links c', supporting the weight of a series of saddle-links, c, carrying the same, the knife-edges c^2, load-arms C^3, and lever-beams C^2 C^3, linked together, by which means the load is well and evenly distributed.

2. The lever-beams C^2 C^3, with hanger-shaped ends provided with knife-edges G, upon which they are supported on their central axis of gravity, whereby a swinging or rocking motion in stable equilibrium is produced.

3. The combination of the lever-beams C^2 C^3, having their respective arms C C', one under and the other above said beams, respectively, and carrying knife-edges F F, with the adjustable link E.

294,713.

4. In a weighing-machine substantially such as described and shown, the combination of a lever-beam, C^2, provided with a circular rim, C^6, and lever-arm C^4, having a flange curved to fit said rim and secured thereto, substantially as and for the purpose explained.

5. In a weighing-machine substantially such as described and shown, the lever consisting of the major lever-beam C^2, having circular rim provided with slots, and lever-arm C^4, provided with a circular flange fitting the rim of beam C^2, and secured thereto by bolts passing through the flange and the slots of the rim, whereby the lever-arm C^4 is adapted to be adjusted to any angle relatively to beam C^2

6. In a weighing-machine substantially such as described, the combination of lever-beam C^2, provided with rim C^6, and the reversible lever-arm C^4, applied thereto, substantially as and for the purpose explained.

7. In a weighing-machine substantially such as described, the combination of transfer-lever C^4 with the loose muff C^5, fitted upon the end of said lever and provided with a set-screw, and an arm, C^{11}, provided with suspension knife-edges and adjustably secured to said muff, whereby the knife-edges may be brought into the exact position required to make connection with the rod which connects with the indicating devices.

8. In a weighing-machine substantially such as described and shown, the combination of transfer-lever C^4 and rod G', the loose muff C^5, having a rim, and a short arm adjustably bolted to said rim and provided with suspension knife-edges, whereby said knife-edges are adapted to be set at any required angle with the lever.

9. In a weighing-machine, the combination of a swinging indicator, a cylinder, and a piston fitting loosely within the cylinder, said cylinder and piston being secured one to the frame of the machine and the other to the swinging indicator, substantially as and for the purpose set forth.

10. The combination, in a weighing-machine, of the counterpoise-arm A^2 with the box K, the loosely-fitting piston L', and the chamber of liquid, J, substantially as and for the purposes described.

11. In a weighing-machine, substantially as described, the combination, with a movable arm, A^2, thereof, of cylinder K, carried by said arm, and stationary piston L', of smaller diameter than the interior of the cylinder, substantially as described and shown, whereby the movements of said arm are guided, the parts are cushioned against jar and concussion, and violent oscillations of the indicator are prevented.

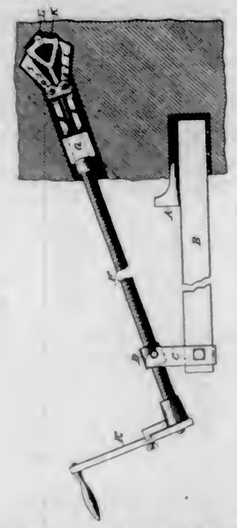
12. The combination of the counterpoise-cylinder oscillating on lever-arm A^2, the curved piston-rod L, and the piston L', fitting loosely in the counterpoise-cylinder, but rigidly attached to the piston-rod L, with the cistern of liquid, J, substantially as described.

13. The relieving apparatus consisting of the hand-wheel R^2, shaft R', and crank and crank-pin R, capable of engaging into hook r as the hand-wheel is actuated, whereby the hook r is raised and brought forward till the hook r hooks into shackle g g', where it is left, when the crank-pin, continuing its forward revolution, falls again, and the reverse action takes place when the crank is turned the reverse way.

14. The combination of the suspension-rod G', having two hooks—one the terminal or suspension hook and the other the relieving-hook—with a device for lifting the rod G' out of position by lifting hook r, and a stop, R^3, for holding said device in any position.

15. The lever carrying on its respective arms a balance-weight and scale for showing tare, a set of indicator-scales, the pull of a system of levers from the platform, and, lastly, a weight hanging at a steep inclination below the axis of the lever.

16. The combination, with a lever carrying the pull of a system of levers, of the weighing-scale on one arm, a weight on a nearly-vertical arm, a series of scales attached to an arm, and the finger-wheel O, worked by gear from said lever, and so geared that each of the fingers of the wheel shall indicate in succession, on the moving scales, the smaller increments of weight, while a stationary pointer, A^7, shall indicate the large weights, substantially as set forth.



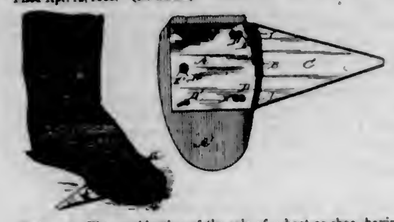
17. The combination of lever A^4, weighted chain M, and finger-wheel O with the series of scales A^8 and stationary pointer A^7, substantially as and for the purposes described.

18. In a weighing-machine, the combination, with an arm, A^4, oscillating (with differences of weights to be weighed) beside a stationary frame, the one (arm or frame) carrying a pointer and the other a scale for that pointer, of a conductor of motion—such as chain M—giving motion to the axle of a wheel revolving alongside of the lever, so as to greatly multiply the motion of the wheel relatively to the lever, by which means, with a pointer or series of pointers on one and a series of scales or a scale on the other, the minor weights can be read off through the movement of the wheel in reference to the lever, and the major weights by the movement of the lever in reference to the stationary frame.

19. In a weighing-machine substantially such as described, the combination, with a lever-beam, C^2, of a transfer-arm adjustably secured thereto, whereby it is adapted to be set at different angles to suit different sizes and forms of weighing-machines.

20. In a weighing-machine, the combination of a diagonal lever, C^4, fitted with circular flange, and connecting the levers supporting the table or platform A to the indicating apparatus, with a circular flange, C^6, fixed to the center of the beam C^2, to which flange the flange of lever C is attached by a bolting device, by which means the length of the arm C^4 and distance between C^2 and the indicating apparatus can be indefinitely increased without altering the amount of leverage and weighing of the machine or the patterns of the various levers.

294,714. EXPANDING REAMER. CHRISTOPHER WREN, Plymouth, Pa. Filed Nov. 16, 1883. (No model.)



Claim.—1. The combination, in an expanding reamer for use in coal, cutting with a rotary motion, of the crank E, threaded box or nut D, and screw F, having a coupling, G, with a carrier-arm, H, cutters I, springs J, head K, and jam-head L, all substantially as shown and described.

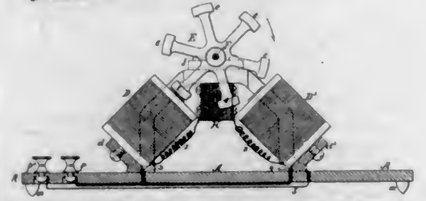
2. A carrier-arm, H, having a tongue, m, lugs n, and an irregular-shaped longitudinal slot, p, through it, substantially as shown and described, and for the purpose set forth.

3. In an expanding coal-reamer operating with a rotary motion and continuous feed by means of a screw, the application of a jam-head, L, to the purpose of attaining a reflex action for the purpose of expanding the cutters, substantially as described and set forth.

4. The combination of the threaded box D, screw F, and crank E, operating in such a manner that the feed is continuous when the reamer is revolved, for the purposes set forth, substantially as shown and described.

294,715. CORN-HARVESTER. GUSTAF ERICK ALENDER, Athol, Dak. Filed Apr. 12, 1883. (No model.)

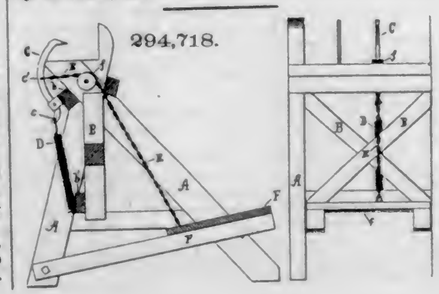
Claim.—1. The combination of the sole of a boot or shoe, having two studs near its outer edge and one near its inner edge, under the ball of the foot, and a rectangular plate having an upturned portion, a laterally-projecting cutter-blade, two slots near its outer edge, having enlarged inner portions, and a perforation near the inner edge, as and for the purpose shown and set forth.



2. The combination of the sole of a boot or shoe, having two studs near its outer edge and a stud near its inner edge, under the ball of the foot, a plate provided with four slots, one in each corner, having enlarged inner ends, a perforation near its inner edge, and having an upturned portion terminating in a laterally-extending cutter-blade, and provided with slots, one at each end, having their lower ends enlarged, and an adjustable strap having bifurcated ends provided with headed studs, as and for the purpose shown and set forth.

294,716. WIRE-STRETCHER. WILBOURN DAVIS AMES, Fairfield, Iowa. Filed Oct. 31, 1883. (No model.)

Claim.—The wire-stretcher having a transverse slot and oblique grooves in its flanges, terminating in eyes f', and shouldered at f^2, adapted to receive a locking-pin, substantially as described.

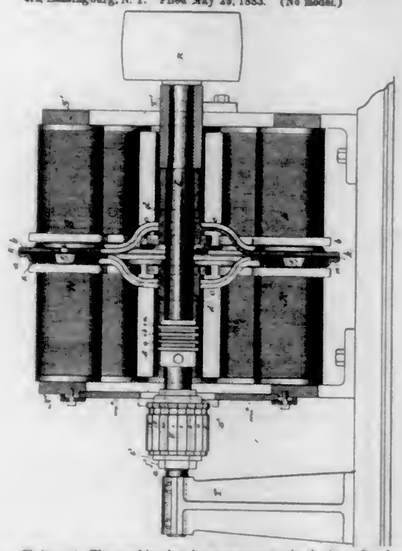


294,717. ELECTRIC MOTOR. MURRAY BAGON, Philadelphia, Pa., assignor to the Novelty Electric Company, same place. Filed Dec. 10, 1883. (No model.)

Claim.—1. The herein-described frame for electric motors, consisting of the arched side pieces with connecting cross-pieces at their ends, having inclined lugs, as and for the purpose set forth.

2. The combination of the frame, consisting of the arched side pieces, connecting cross-pieces, and inclined lugs, with an armature mounted in bearings on the side pieces, and electro-magnets secured to said inclined lugs, substantially as described.

294,718.



294,718. SAW-BUCK. BENJAMIN ROBERT BAKER, Northfield, Minn. Filed Sept. 6, 1883. (No model.)

Claim.—1. In combination with a saw-buck frame provided with the cross-pieces *b* and *b'*, the clamp C, pivoted to the cross-piece *b*, and provided with the spring D, secured to the cross-piece *b'*, the chain E, fixed to the clamp-arm and bearing on the pulley *f*, and an actuating-lever, substantially as described.

2. In combination with a saw-buck frame provided with the cross-pieces *b* and *b'*, the clamp C, pivoted to the upper cross-piece, *b*, and provided with the spring D, having its lower end secured to the lower cross-piece, *b'*, the chain E, fixed to the clamp-arm and bearing on a pulley, *f*, and the foot-lever F, fulcrumed to the standards, substantially as described.

294,719. DYNAMO-ELECTRIC MACHINE. CLINTON M. HALL, Troy, assignor of two-thirds to John McKenzie, West Troy, and Joseph A. Powers, Lansingburg, N. Y. Filed May 29, 1883. (No model.)

Claim.—1. The combination, in an armature-wheel, of two flat rings or disks with conical or tapered openings, ranges of coils or helices introduced into the openings, and screws or rivets for clamping the rings together and holding the helices into the disks, substantially as set forth.

2. The combination, in an armature-wheel, of two flat rings or disks having conical or tapered openings, and two separate ranges of coils introduced into the openings in such disks, substantially as set forth.

3. The combination, in an armature-wheel, of two flat rings or disks having openings, helices or coils within such openings, and a layer of insulating material between the respective disks and their coils, substantially as set forth.

4. The combination, with the helices, of an armature wheel or ring of metal recessed to receive the coils or helices, and having separations in the metal between the alternate helices at 4, for the purposes and substantially as set forth.

5. The combination, with the armature-wheel, of helices or coils wound with an exterior conical form to fit into the similarly-shaped openings in the armature-wheel, substantially as set forth.

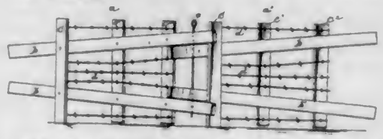
6. The combination, with the commutator-plates and intervening insulating material, forming a cylinder, of collectors or rubbers, each composed of a range of plates with concave ends fitting the surface of the commutator-cylinder, boxes for holding such plates, and springs to press upon the rubbers, substantially as set forth.

7. The combination, with the rubbers, of the boxes l^2 for holding the same, the springs p^2, the covers n^2 for the boxes, and the screws for adjusting the springs, substantially as set forth.

8. The combination, with the ranges of armature-coils each having free ends, of the rings $+a$ $+b$ $-c$ $-d$, the commutator-plates and collectors, and the circuit-connections, arranged substantially as set forth.

9. The combination, with the circular range of field-magnet poles, separate ranges of induction elements in the armature, and the commutator-plates and collectors, of the branched connections between the free ends of the armature elements and their respective commutator-plates, arranged substantially as and for the purposes set forth.

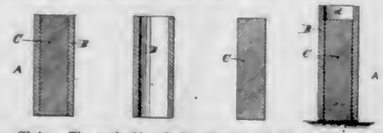
294,720. LUBRICATOR. JEAN BESSETT, Houston, Tex., assignor of one-half to Tobias Buffinger, same place. Filed Jan. 3, 1884. (No model.)



Claim.—1. The combination, with an oil-reservoir having a shank provided with a perforated top, of the rotating nut fitted over the shank, and having a cup-shaped top and a perforated wall, substantially as described.

2. The combination, with a reservoir having a screw-threaded shank provided with a perforated top wall, of the screw-nut on the shank, having a cup-shaped top and a perforated wall, substantially as described.

3. The combination of a reservoir having a screw-threaded shank provided with a top wall having a central orifice and a side perforation, the screw-nut having the rim or flange, and a wall provided with a central orifice and a side perforation, and the valve-stem passing through the said central orifice, substantially as described.



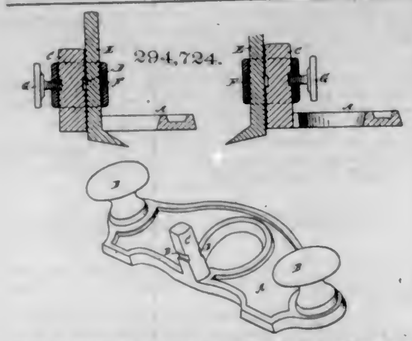
4. The combination of a reservoir having a screw-threaded shank provided with a perforated top wall, the screw-nut fitted on the shank, and having a perforated top wall, and the packing-disk arranged between the two walls, substantially as described.

294,721. FENCE. IRVIN M. BROWN, Covington, Ind. Filed Jan. 23, 1883. (No model.)

Claim.—In a portable fence, the panels *a a'*, consisting of the vertical slats *c*, fixed to one side of the bars, and the vertical slats *c'* and *c²*, fixed to the other side of the bars, the horizontally-arranged converging bars *b b'*, and the vertical connecting-bars *e*, the ends of the bars *b b'* being extended beyond the end uprights of each panel to such a distance that when the panels are united and the bar *e* passed through a hole in the bars at the point of intersection the extended ends shall rest against the adjacent uprights, substantially as and for the purpose set forth.

294,722. INGOT FOR GOLD-PLATED WIRE. LEVI L. BURDON, Providence, R. I. Filed Sept. 12, 1883. (No model.)

Claim.—The method herein described of making metallic compound ingots, which consists, first, in inserting the suitably-prepared metallic core within the seamless tube, the latter extending beyond the end of said core to form a space or chamber; secondly, placing solder within said chamber, then introducing the whole into a suitably heated furnace, thereby fusing said solder, thus uniting or welding the core and tube together; and, lastly, withdrawing the ingot from the furnace, after which it is adapted to be drawn or reduced to the required size, substantially as and for the purpose set forth.



294,723. HOP-TRAINING DEVICE. CLARK T. BUSH, Maryland, N. Y. Filed Sept. 6, 1883. (No model.)

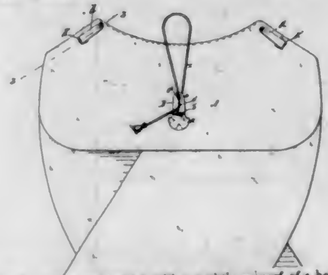
Claim.—In combination with the standard or ground-post and the upper or smaller sticks, the cap or ring D, formed with a central quarterfoil opening, the space between the points adapted to receive the ground-stick, and the segments thereof adapted to receive the upper or smaller sticks and admit of their free ends being spread apart, substantially as and for the purposes set forth.

294,724. ROUTER-PLANE. HENRY P. COPE, Detroit, Mich., assignor of one-half to John H. Bissell, same place. Filed Jan. 12, 1884. (No model.)

Claim.—1. A router-plane having a support secured to its stock between one edge thereof and an opening therethrough, combined with

means for connecting the plane-iron to either the inner or the outer portion of said support, to bring the cutting-edge of the plane-iron within or without the stock, substantially as described.

2. A router-plane having a post secured to its stock between one edge thereof and an opening therethrough, and a clamp adapted to secure the plane-iron to either the inner or outer side of said post, substantially as shown and described.



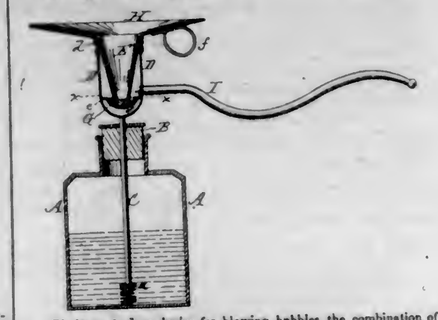
3. A router-plane having a post, C, secured to its stock, and having grooves D on its inner and outer sides, respectively, combined with the plane-iron E, the clamp F, and the set-screw G, passing through the clamp and entering one of the grooves, for holding the plane-iron on either the inner or the outer side of the post, to bring the cutting-edge of said iron within or without the stock, substantially as described.

294,725. MAKING ROLLED METALLIC FOIL. HENRY S. CROOKE and LEWIS CROOKE, New York, N. Y. Filed Oct. 29, 1883. (Specimens.)

Claim.—1. The improvement in the art of making metallic foil, which consists in the following operations, performed in the order named, viz: first, rolling the metal or alloy to or nearly to the required thickness for the foil; second, embossing the foil; and, third, rerolling, substantially as described.

2. The improvement in the art of making metallic foil, which consists in the following operations, performed in the order named, viz: first, embossing the foil to remove the wrinkles and impart a roughened appearance to its surfaces; and, second, rerolling the same to crush down the protuberances constituting the embossing, substantially as described.

294,726. NECKTIE. WILLIAM C. CROSS, Boston, Mass. Filed Dec. 26 1883. (No model.)



Claim.—The combination, with a necktie or scarf, of a holding-clip having an offset, *b*, with eye *b'* therein, and a tongue, *c*, with a wedge-shaped or tapering slit or slot therein, communicating with the eye *b'*, and a cord secured at one end to the tie, with its free end passing through the eye *b'*, as and for the purposes hereinbefore set forth.

294,727. COMPOSITION FOR CLEANING AND RENOVATING FABRICS. THOMAS EWING, Philadelphia, Pa., assignor to C. Frederick Clarke and Gustavus M. Spencer, both of same place. Filed Dec. 10, 1883. (No specimens.)

Claim.—1. The within-described compound for cleansing and renovating the colors of fabrics, the same consisting of aniline solution, alkali, and ammonia, compounded substantially in the manner and proportions herein set forth.

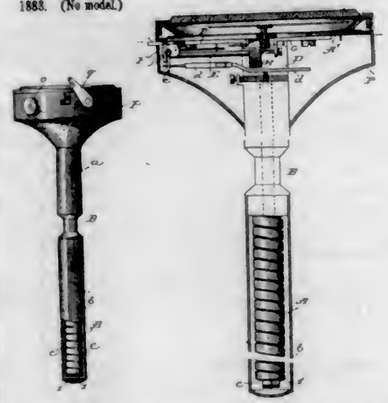
2. The mode herein described of cleansing and restoring the colors of fabrics, said mode consisting in applying to the fabric a composition of aniline solution, alkali, and ammonia, and then sponging the fabric, substantially as specified.

294,728. BUBBLE-BLOWER. WILLIAM S. FICKETT, Rochester, N. Y. Filed Aug. 11, 1883. (No model.)

Claim.—1. In a device for blowing bubbles, the combination of the chamber for holding the liquid, the cone resting in the chamber and reaching nearly to its bottom, the wide disk at the top of the chamber, and the stem opening into the chamber above the liquid for blowing air to produce the bubble, as set forth.

2. In a device for blowing bubbles, the combination of the exterior holding-chamber, the perforated cup in the bottom of the chamber, the cone resting in the chamber and its bottom passing below the top of the cup, the flaring disk at the top of the chamber, and the stem opening into the chamber above the cup, as set forth.

3. The combination of the exterior chamber, the perforated cup in the bottom of the chamber, the cone passing through the chamber, its lower end resting below the top of the cup, the flaring disk at the top of the chamber, the stem opening into the chamber above the cup, and the tube attached to the chamber and passing down into the bottle or other supply-reservoir, as set forth.



4. In a device for blowing bubbles, the combination of the stopper resting in the mouth of the bottle, the tube attached to the stopper and passing down into the bottle, and an attachment at the top of the tube for blowing and forming the bubble, as set forth.

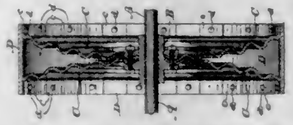
5. In a device for blowing bubbles, the combination of a stopper resting in the mouth of the bottle, a tube attached to the stopper and passing down into the bottle, and a spring at the bottom of the tube for producing the reaction of the parts, as specified.

6. In a device for blowing bubbles, the disk at the top of the attachment, forming a wide base for the bubble, and provided with sloping sides for discharging surplus liquid, as set forth.

7. In a device for blowing bubbles, the combination, with the chamber for receiving and holding the liquid that forms the bubble, of a disk at the top of the chamber, which is removable, and is provided with a handle, whereby it may be removed from the chamber with the bubble adhering, as set forth.

294,729. CLINICAL METALLIC THERMOMETER. WM. B. POWLE, Newton, assignor to Robert M. Morse, Jr., Boston, Mass. Filed Nov. 15, 1883. (No model.)

Claim.—1. A clinical thermometer consisting of a dial-plate having suitable index-finger, a stem attached to the rear of the dial-plate, a bimetallic spiral coil within said stem, and fixed thereto at its lower end,



an arm connected to its upper end, and mechanism connected to the spindle of the index-finger, adapted to be struck and pushed by the said arm, whereby the said finger is advanced as the temperature of the coil rises, substantially as described.

2. In combination, the hollow stem and coil having a staff fixed to the upper end of said coil, an arm on upper end of said staff, a rocking shaft having an arm within the sweep of the staff-arm, a crown-wheel on the inner end of the rocking shaft, and a pinion on the spindle of the index-finger, all substantially as described.

3. In combination with the rock-shaft of the thermometer, having an arm, *a*, the jointed arm of the coil-staff, as and for the purpose set forth.

4. In a clinical thermometer, an index-finger and a laminated coil, with intermediate mechanism connecting it to the finger, whereby the movement of the coil pushes the finger over the dial, and a brake mechanism, the parts being combined and operating as described.

294,730. WHEEL OR PULLEY. HARMON H. FULTON, Indianapolis, Ind., assignor to the Indianapolis Machine and Bolt Works, same place. Filed Jan. 14, 1884. (No model.)

Claim.—1. A wheel or pulley composed of a hub, a rim, and a web, said web being composed of two corrugated sheet-metal disks formed dished or hollowing, substantially as described, and for the purpose specified.

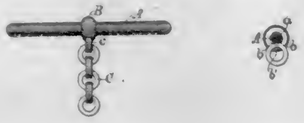
2. The combination, with the hub and rim of a wheel or pulley, of a web consisting of two corrugated disks, C C, brought together in the center, where they are joined to the hub, and spread outwardly at the outer edge, where they are joined to the rim at or near its edges, substantially as set forth.

294,731. MANUFACTURE OF EMBOSSED FABRICS. CLAUDE GARNIER, Lyons, and PAUL DEPOULLY, Paris, France. Filed Nov. 3, 1883. (No specimens.) Patented in France May 30, 1883, No. 155,776.

Claim.—1. In the manufacture of embossed fabrics, first treating the fabric with a preparatory dressing which is softened by heat, next passing it between heated embossing-rollers, and finally passing it through a fixing or completing solution, substantially as herein described.

2. In the manufacture of embossed fabrics, the preparatory treatment of the fabric with an alkaline solution, for the purpose of shrinking it before embossing, substantially as herein described.

3. In the manufacture of embossed fabrics, the interposition between the engraved metallic embossing-cylinder and the fabric to be embossed of a blanket of cotton cloth which has been treated with an alkaline solution, substantially as herein described.



294,732. THERMOMETER. HENRY GUTE, New York, N. Y. Filed Jan. 26, 1884. (No model.)

Claim.—1. The combination, in a thermometer-frame, of the vertical portion A, having integral therewith the disks *d* and *a*, the latter being provided with the flange *c*, and the casing B, adapted to rest on the said flange *c* and be revolved at will, substantially as described.

2. The combination, in a thermometer-frame, of the vertical portion A, having integral therewith the disks *d* and *a*, the latter being provided with the flange *c*, the casing B, adapted to rest on the said flange *c* and be revolved at will, and the cap C, provided with screw-threads for securing it in place on the disk *a*, adapted to secure the casing against vertical movement, substantially as described.

294,733. WATCH-CHAIN ATTACHMENT. HENRY M. HERRING, North Attleborough, Mass., assignor to Oscar M. Draper, same place. Filed Dec 17, 1883. (No model.)

Claim.—1. The combination, with a cross-bar having a circumferential groove, of a sleeve, and a link or ring secured to said sleeve and engaging with said groove, for the purposes set forth.

2. The combination, with the bar A, having the groove *a*, of the sleeve B, having the apertures *b b*, and the link of ring *c*, passing through said apertures and entering at its periphery the said groove, substantially as and for the purposes described.

294,734. ORNAMENTAL-CHAIN LINK. HENRY M. HERRING, North Attleborough, Mass., assignor of one-half to OSCAR M. DRAPER, same place. Filed Jan. 17, 1884. (No model.)

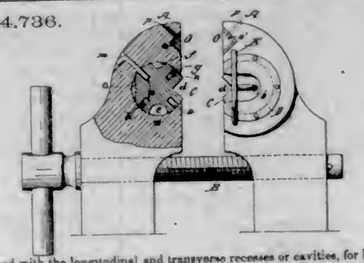
Claim.—1. An ornamental-chain link consisting of an open loop and separate fillings secured to the sides of said loop by a concealed wire fastening.

2. In an improved ornamental-chain link, the combination, with an open link and its connecting-rings, of fillings arranged to fit the sides of said link and formed with obliquely-cut ends adapted to rest against the sides of said rings, and a wire fastening for said fillings.

3. The combination, with the loop A and its rings *a*, of the tubular fillings B, having the oblique ends *b*, and the wire fastening C, all constructed and arranged substantially as described.

4. The combination, with the loop A and its rings *a*, of the fillings B, having oblique ends *b* and slots *b'*, and the fastening C, all constructed and arranged substantially as described.

294,735. GRINDING-MILL. DANIEL HESS, Atlanta, Ga. Filed Apr. 20, 1883. (No model.)



Claim.—The feed-box F, the stationary burr G, and conical crushing-shell H', in combination with the driving-shaft B, the conical burr H, collar I', grinding-disk I, provided with the tapering supporting-shell J, and set-screw *i'*, as set forth.

294,736. VISE. HENRY A. HYLE, Redwood, N. Y. Filed Dec. 14, 1883. (Model.)

Claim.—1. The jaws A, recessed, as shown at *a*, in such manner as to remove a portion of the faces of the jaws, in combination with the cylinders C, placed in the said recesses, the cylinders being formed with cavities of various shapes and adapted to be turned in the jaws, substantially as and for the purposes described.

2. The combination, with the recessed jaws A, of the cylinders C,

294,736.

formed with the longitudinal and transverse recesses or cavities, for holding objects in horizontal and vertical positions, substantially as described.

3. The cylinders C, formed with cavities or recesses and with the flat portions *c*, substantially as and for the purposes described.

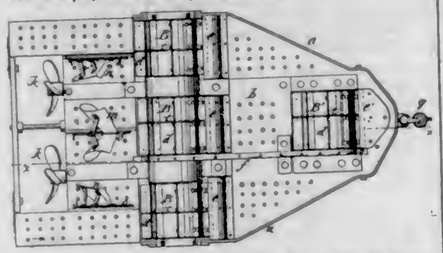
4. The cylinders C, placed in recesses made in the jaws, and formed with the narrow slots for holding flat or edged objects, as set forth.

5. The cylinders C, placed in recesses made in the jaws, and formed with shallow and short recesses *i j*, for holding pointed objects, as set forth.

6. The combination, with recessed jaws A and cylinders C, placed in the jaws, of the plates D, for holding the cylinders in place, and for preventing the entrance of dust, &c., substantially as described.

7. The cylinders C, formed with cavities and placed in recesses *a*, and provided with the handles *b*, for revolving the cylinders, substantially as described.

8. The combination, with the cylinders C, placed in the recesses *a*, of the key-pins *m*, arranged for holding the cylinders, substantially as set forth.



9. The jaws A, having recesses *a* formed in them, for receiving the cylinders C, in combination with the removable staples E, for strengthening the jaws and for preventing them from spreading, substantially as described.

10. The cylinders C, adapted to be placed and revolved in the recesses *a* of the jaws A, and formed with angular cavities or recesses for holding angular objects, as set forth.

11. The cylinders C, adapted to be placed and revolved in the recesses *a*, made in the jaws A, and formed with the concaved recesses for holding round objects, substantially as set forth.

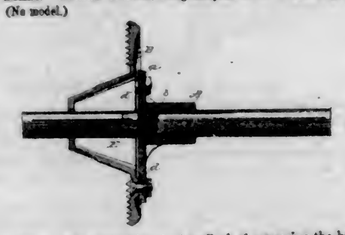
294,737. APPARATUS FOR LOOSENING UP AND REMOVING SAND-BARS, &c., IN RIVERS AND HARBORS. LARENOW ALEXANDER JOHNSON and NELS EMANUEL JOHNSEN, Portland, Oreg. Filed July 21, 1883. (No model.)

Brief.—A frame tapered at the front, covered with perforated plates, and having a headed cross-shaft with end protecting-plates carries air-tight drums with longitudinal cutting-flanges connected by a peripheral flange. A double and two single plows secured to cutting-plates deliver to propeller-shaped dispelling-wheels.

Claim.—1. The apparatus for loosening up and removing obstructions from rivers and harbors, consisting of a frame-work having a pointed or rounded forward end, and provided with drums having radial blades, and with plows, substantially as shown and described.

2. The combination, with the frame *a*, provided with covering-plates *b*, of the drums B B', provided with the radial blades *d*, substantially as shown and described.

3. The combination, with the revolving drums B, of the plows *m n*, substantially as and for the purpose specified.



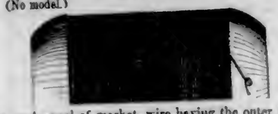
4. The combination, with the supporting-frame, of the revolving drums B, the plows *m n*, and the propeller-wheels *k*, substantially as and for the purpose specified.

5. The combination, with the plows *m n*, arranged substantially as described, of the blades or bars *o*, substantially as and for the purpose specified.

6. The cross-shaft *c*, provided with heads at its ends, and the covering-plates *i*, combined with the side plates or frames, *a'*, of the apparatus, substantially in the manner and for the purpose specified.

7. The combination, with a series of revolving and air-tight drums provided with radial blades, each extending continuously the length of its drum, and provided with a central supporting-flange, of a suitable supporting-frame and shaft provided with end heads, to prevent the frame from spreading laterally, substantially as shown and described, to form an apparatus adapted for being dragged on the bottoms of rivers or harbors, for the purpose of removing obstructions, as specified.

294,738. METHOD OF ATTACHING THE GRINDING-PLATES OF MILLS. WILLIAM J. LANE, Poughkeepsie, N. Y. Filed Aug. 21, 1883. (No model.)



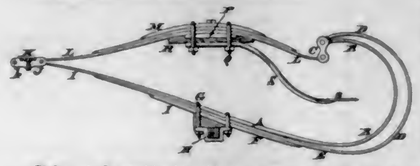
Claim.—The method herein described of preparing the burr of an iron mill for attachment to its spindle, consisting in taking a separate soft-metal hub provided with a flange for connecting it with the burr, in securing the hub to the face-plate of a lathe and boring it in that position, in grinding the back of the burr in a lathe, and, finally, in attaching the hub-flange to the ground back of the burr, all substantially as described.

294,739. FEED MECHANISM. NICHOLOS P. LEFE and JOSEPH W. LEFE, Fremont, Ohio. Filed Jan. 12, 1884. (No model.)

Claim.—In a feed mechanism, the combination, with the feeder-shaft having the ratchet, of the oppositely-acting dogs or pawls, each provided with a tooth and an arm at its angle, and pivoted between and at the outer ends of levers having their bearings on the feeder-shaft on the sides of the ratchet-wheel, substantially as described, and for the purpose set forth.

294,740. SPOOLED MARKET-WIRE. ARTHUR B. MALIN, Cleveland, Ohio, assignor of one-half to George W. Malin, same place. Filed June 12, 1883. (No model.)

Claim.—A spool of market-wire having the outer layer of wire covered or coated with shellac or other suitable substances to protect the wire of the outer layer and prevent the ingress of air or dampness to the inner layers, substantially as set forth.



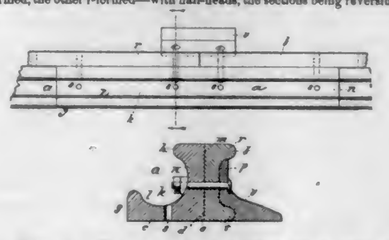
294,741.

294,741. SHIRT. EMILIE S. MOORE, New York, N. Y. Filed Oct. 27, 1883. (No model.)

Claim.—The hereinbefore-described shirt-front, consisting of the outer and inner sections, A C, and the intervening section B, combined and united together substantially as hereinbefore set forth

294,742. RUNNING-GEAR FOR VEHICLES. CHAUNCEY M. MURCH, Cincinnati, Ohio. Filed Dec. 3, 1883. (No model.)

Claim.—1. In combination with the lower spring, A B, having its forward extension, I, elevated and connected to the splinter-bar K, the upper spring, L, whose front or longer portion is attached to said extension I, while its rear or shorter portion is loosely coupled by a shackle, C, to the upwardly-curved termination B of the aforesaid lower spring, A, as herein described.

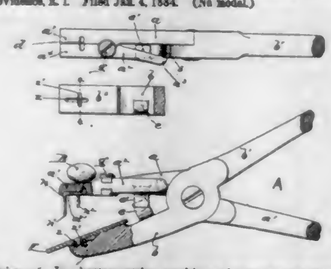


2. In combination with the composite spring A B D E I, the semi-elliptic spring L, coupled thereto in the manner described, and supporting a fifth-wheel frame, as set forth.

3. The combination, in a running-gear, of the X-shaped frame Z, terminating with curved portions P P', made of angle-iron, said frame being pierced at its center to receive the king-bolt O, and having the lower ring, N, of the fifth-wheel secured thereto, for the purpose described.

4. The combination, in a running-gear, of springs A B D E I L, shackle C, frame Z P P', fifth-wheel N T, and king-bolt O, for the purpose described.

294,743. REVERSIBLE SECTIONAL LAP-JOINT RAILWAY-RAIL. HAMSFORD D. NORRELL, Richmond, Va. Filed Aug. 24, 1883. (No model.)

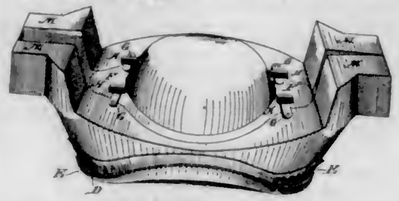


Brief.—A railway-joint consisting of two rail-sections—one L-formed, the other I-formed—with half-heads, the sections being reversible.

Claim.—1. The L-form railway-rail section having plane faces meeting at right angles to each other, and half-heads arranged, respectively, in vertical and horizontal position, substantially as specified.

2. A lap-joint railway-rail composed of the reversible L-shaped sections *a*, the reversible I-form section *b*, the coupling-plates *v*, and coupling-bolts, substantially as specified.

294,744. BUTTON-SETTING INSTRUMENT. GEORGE W. PRENTICE, Providence, R. I. Filed Jan. 4, 1884. (No model.)



Claim.—1. In a button-setting machine or instrument provided with means for retaining a button and fastener in position, the prong-deflecting device herein described, consisting of the dies *z z'*, the latter having a concave form, and arranged at right angles with and crossing the die *z*, said dies being formed in a jaw or member of said instrument, substantially as shown, and for the purpose set forth.

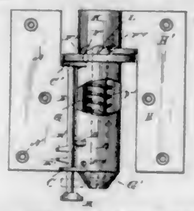
2. The button-setting instrument A, herein described, consisting of the jaws *a b*, the former being provided with the pivoted supplemental lever or jaw a^2, and the jaw *b* being provided with the clinching-dies *z z'* and cam projection *c*, the whole combined and arranged substantially as shown, and for the purposes set forth.

3. In a two-jaw button-setting instrument provided with clinching-dies and wedge *c*, and further provided with means for retaining a button and pronged fastener in position, the combination therewith of a supplemental lever adapted to be pivoted to the button-holding jaw, and having a wedge or cam, *c'*, adapted to engage with the wedge *c* of its fellow jaw, substantially as shown, and for the purpose described.

294,745. DEVICE FOR FLANGING HAT-BODIES. MARTIN H. RYDER, Stamford, assignor to Alden Selmans, South Norwalk, Conn. Filed Nov. 15, 1883. (No model.)

Claim.—1. A device for flanging hat-brims, having an inner removable portion, through which the crown of the hat extends, and with the sides adapted to close or contract, substantially as set forth.

2. A device for flanging hat-brims, consisting of a block or frame constructed and flanged as described, and adapted to receive a removable inner portion, through which the crown of the hat extends, substantially as described.



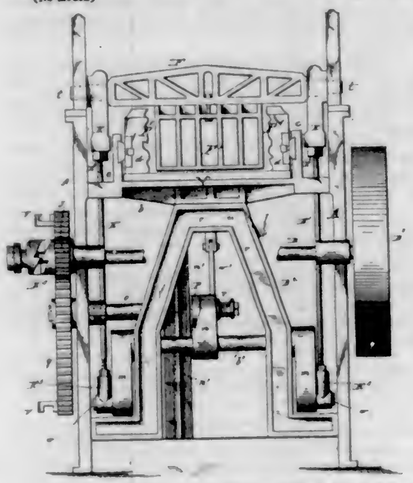
3. A hat-flanging device composed of three sections—a central removable section, through which the crown of the hat extends, and the side sections flanged and constructed as described and adapted to close or contract, substantially as set forth.

4. In a device for flanging hats, the sides and ends of the frame inclined and formed as described, whereby the hat may be firmly held and the retaining-cord prevented from slipping upward, substantially as set forth.

5. The inner removable section adapted to receive the crown of the hat within the same, in combination with the sides of the frame adapted to contract, and clamping devices attached to said frame, whereby said inner section may be forced and held in the required position, substantially as and for the purpose set forth.

6. In a hat-flanging machine, the sides of the frame and the flanged portion thereof, constructed as described, and with their line of junction adapted to correspond with the desired curve of the inner portion of the hat-flange, substantially as set forth.

294,746. LOCK-HINGE. THOMAS P. STRAUP and LOUIS MORGENSTERN, Easton, Pa.; said Morgenstern assignor to said Straup. Filed Oct. 12, 1883. (Model.)



Claim.—1. In a hinge, a cylinder having open ends, said cylinder being provided with a wing, and a disk provided on its upper side with a socket-plug and clutching-teeth, in combination with a socket-clutching cup and a wing formed integral therewith, a rod fixed to the under side of said disk, and a spring having one end secured to the disk and the other end secured to the cylinder, substantially as described, and for the purpose set forth.

2. In a hinge, a cylinder having a wing projecting therefrom, said cylinder being provided with guide-lips and a locking-lug on the cylinder, a locking-rod provided with lugs adapted to engage the said locking-lug, as specified, a disk provided with slots around its outer edge, and having on its upper side a socket-plug and clutching-teeth, and a rod on its under side provided with a spiral spring wound thereon, the lower end of the spring being connected to the cylinder and the upper end thereof fixed to the disk, in combination with a wing and a socket-clutching cup, substantially as described, and for the purpose set forth.

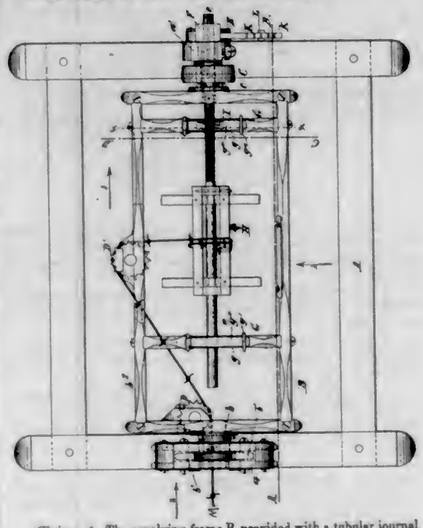
3. In a hinge, a cylinder having a wing connected thereto, said cylinder having lug D and lips C C', provided with openings at the intersection of said wing and cylinder, a locking-rod, E, provided with lugs E', a disk provided with a recess for the reception of the upper end of the cylinder, said disk having slots around its outer edge, and provided on its upper side with a socket-plug, F^2, and clutching-teeth, and a rod on its under side provided with a spiral spring wound thereon, the upper end of the spring being fixed to the disk and the lower end thereof secured to the cylinder, in combination with a wing and a socket-clutching cup formed integral, substantially as described, and for the purposes set forth.

4. In a hinge, a cylinder having a wing fixed thereto, said cylinder having lug D and lips C C', provided with openings at the intersection of said wing and cylinder, a locking-rod, E, provided with lugs E', a disk provided with a recess for the reception of the upper end of the cylinder, said disk having slots around its outer edge, and provided on its upper side with a socket-plug, F^2, and clutching-teeth, and a rod on its under side provided with a spiral spring wound thereon, the upper end of the spring being fixed to the disk and the lower end thereof secured to the cylinder, in combination with a wing and a socket-clutching cup and a lip, J, having opening J' at the intersection of said cup and wing, substantially as described, and for the purposes set forth.

294,747. PRESS. JAS. N. WRIGHT, Quincy, Ill. Filed June 5, 1883. (No model.)

Claim.—1. In a pressing-machine, the combination of the main frame, the auxiliary angular bracing-frame, and the table of the press, all constructed and adapted to operate substantially in the manner and for the purposes described.

2. The combination, in a press, of the brace B^2, adapted to support the table V at the middle thereof, the guides *e e*, rigid on the table, the adjustable draws *d*, for holding and adjusting the back plate of the mold, and the cross-head or bridge, all constructed and adapted to operate substantially in the manner and for the purposes described.



3. In a press of the character described, the combination of the vertically-movable cross-head guided in the main frame, with the loops, the adjustable pitman-rods, and the crank on the shaft *b'*, substantially as and for the purposes described.

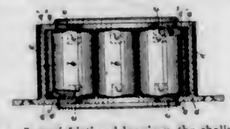
4. In a press, the combination of the shaft *b'*, the angular bearing-brace therefor, the three cranks thereon, the shaft located at the back of the press-frame, and provided with a pulley, the clutch K^2, the device *r*, the crank P, the brace fastened to the angular brace, the shaft *o*, and the gear *q*, having an automatic throw-off catch, and the catch *u*, attached to the starting-lever, all constructed and adapted to operate substantially in the manner and for the purposes described.

5. The combination, in a press, of the starting-lever, the catches *v u*, the spur-wheel *q*, and the clutch and its pinion on the belt-drum shaft B, substantially as described.

6. The combination, in a press of the character described, of a main supporting-frame, an intermediate angular frame, a press-table supported thereon, and a vertically-movable cross-head guided thereby, all constructed and adapted to operate substantially in the manner and for the purposes specified.

294,748. WIRE-TWISTING MACHINE. JAMES AYERS and ALEXANDER C. DECKER, Bushnell, Ill., assignors to Washburn & Moen Manufacturing Company, Worcester, Mass. Filed June 14, 1879.

Claim.—1. The revolving frame B, provided with a tubular journal *b*, at one end, and hollow journal *c* and band-pulley C at the other, and rag-wheels D D', relatively arranged as described, in combination with the sectional longitudinally-movable reel-shaft *e*, about which the reel rotates, and actuating mechanism, substantially as and for the purposes set forth.



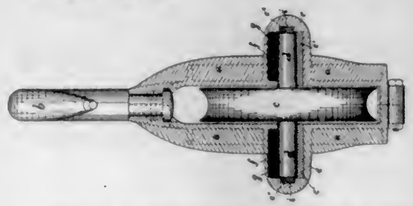
2. The combination, with frame B and sectional shaft *e*, of removable bearing-pieces *g*, substantially as and for the purposes set forth.

3. The combination, with the revolving frame, sectional reel-shaft and reel, of the cross-pieces having bearings for the removable portion of said shaft, which supports the reel and the removable bearing-blocks, substantially as described.

4. The combination, with the revolving frame, the threaded reel-shaft, the cross-pieces, the means for controlling the rotation of the reel-shaft, and the switch engaging in the thread of said shaft, of the removable bearing-blocks arranged on the opposite side of the shaft from said switch, substantially as described.

REISSUES.

10,455. ANTI-FRICTION BEARING. THOMAS R. FERRALL, Boston, Mass. Filed Jan. 28, 1884. Original No. 252,872, dated Jan. 31, 1882.



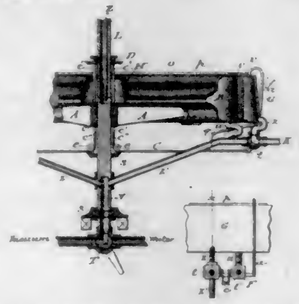
Claim.—1. In anti-frictional bearings, the shells *a a'' a' a'''* and the rollers *b b*, in combination with the regulators *c c* and their radial intermediate projections *c'' c'' c''*, adapted to serve as stops for the said regulators against the inside of the flanges *a'' a'''*, as herein shown and described.

2. In anti-frictional bearings, the shells *a a'' a' a'''*, the rollers *b b*, with their cylindrical recesses *b' b'*, the regulators *c c*, with cylindrical projections *c' c'* and radial intermediate projections, *c'' c''*, as and for the purpose set forth.

3. The herein-described method of making anti-frictional bearings, consisting in casting the shells *a' a'* with solid ends *a'' a'''*, inserting therein the rollers and regulators, then casting around the abutting shells *a a'* the metal ring *e*, and finally boring out or removing the central parts of the ends *a'' a'''*, for the insertion and reception of the shaft *d*, as and for the purpose set forth.

4. In anti-frictional bearings, the independent washer or regulator *c*, having inwardly-projecting cylindrical pegs *c' c'*, to separate the rollers, and radial projections *c'' c''*, to hold the washer in its proper position within the shell of the bearing, substantially as set forth.

10,456. SELF-LUBRICATING BEARING. THOMAS R. FERRALL, Boston, assignor to Herbert Loud, Everett, Mass. Filed Feb. 4, 1884. Original No. 272,369, dated Feb. 27, 1883.



Claim.—1. The herein-described self-lubricating bearing, consisting of the metal shell or case *a*, chamber *f*, adapted to contain the lubricant *g*, and having end recess, *a''*, with its cushion or material *i*, as and for the purpose set forth.

2. In combination with the shell *a* and the chamber *f*, adapted to contain the lubricant *g*, the semicircular bushing *a'*, as and for the purpose set forth.

3. In a pulley-block having wood or metal side pieces, *a a*, as shown, the bearings *e e*, projecting outside of the side pieces, *a a*, as and for the purpose set forth.

4. In a pulley-block, the sheave *c*, secured to spindle *d*, and made to revolve with the latter, in combination with the wood or metal side pieces, *a a*, and outwardly-projecting bearings *e e*, projecting beyond said side pieces, *a a*, as and for the purpose set forth.

10,457. CENTRIFUGAL FILTERING OR STRAINING APPARATUS. S. MORRIS LILLIE, Philadelphia, Pa. Filed Jan. 23, 1884. Original No. 252,733, dated Jan. 24, 1882.

Claim.—1. In a centrifugal machine, an annular basket, B, consisting of an annular hollow shell supported on the axial tube by suitable radial supports, and whose outer wall consists of a sieve or straining medium, in combination with a central hopper having radial tubes or passages leading into the annular basket and making liquid and air tight junctions with the shell of the same, the hopper and radial passages affording means for introducing a liquid or semi-liquid into the basket while the machine is in motion, substantially as specified.

2. The combination, in a centrifugal machine, of a basket to hold the material to be drained or filtered, a chamber or chambers surrounding the basket and revolving with it, into which the drained or filtered liquid flows from the basket and discharging-pipes through which the liquid may flow from the chamber or chambers while the machine is in motion, substantially as specified.

3. The combination, in a centrifugal machine, of two concentric chambers formed in the annular body of the machine by an annular straining-partition, and tubes leading from the outer chamber and communicating, through the axle and bearing for the same, with one or more conduits, substantially as specified.

4. A centrifugal machine having an annular basket to hold the material to be drained or filtered, a chamber or chambers surrounding the basket and revolving with it, into which the filtered or strained liquid flows from the basket, in combination with any suitable vacuum apparatus communicating, through the bearing and axle of the machine, with the chamber or chambers surrounding the basket of the same, substantially as specified.

5. In a centrifugal machine, the combination, with the chamber surrounding and revolving with the basket, of discharge-pipes curved so that the liquid will, while the machine is revolving, form air-traps and prevent any flow of air through the said pipes while the machine is in motion, substantially as specified.

6. The combination of a centrifugal machine having a basket arranged to be tightly closed toward the axle, a suitable vacuum-inducing apparatus, and an axial communication between the vacuum-inducing apparatus and the basket of the machine, substantially as specified.

7. In a centrifugal machine, the combination of an annular basket for holding the material to be drained or filtered, axial passages through the bearings and axle, and radiating tubes connecting the axial passages with the annular basket, substantially as specified.

8. The combination, in a centrifugal machine, of a central hopper communicating with the basket of the machine by suitable passages, and a sleeve-cap, D, on the axle, by which the mouth of the hopper may be closed, substantially as specified.

9. The combination, in a centrifugal machine, of an annular basket, for holding the material to be subjected to centrifugal force, and arranged to be tightly closed toward the axle, a central hopper communicating with the annular basket through suitable passages, a sleeve-cap on the axle of the machine, by which the mouth of the central hopper may be closed, and an axial passage through the axle and bearing of the same, communicating with the annular basket, substantially as specified.

10. The combination, in a centrifugal machine, of two concentric chambers formed in the body of the machine by an annular straining-partition, and two series of discharge-spouts of one or more spouts each, one series for each of the two chambers, substantially as described.

11. The combination, in a centrifugal machine, of the outer annular chamber, G, inner annular chamber, B, and intervening straining medium, and discharging-spouts furnished with suitable faucets for the outer chamber, or for the inner chamber, or for both chambers, substantially as specified.

12. The combination, in a centrifugal machine, of two annular chambers and intervening straining medium, discharge-spouts for the outer chamber, faucets or valves for the said spouts, and means for operating the faucets or valves while the machine is revolving, substantially as specified.

13. The combination, in a centrifugal machine, with the annular basket for holding the material to be strained, of a discharging spout or spouts, faucets or valves for the same, and means for operating the faucets or valves while the machine is revolving, substantially as specified.

14. The combination, in a centrifugal machine, of two concentric chambers and intervening straining medium, a series of discharge-spouts—one or more—each having a suitable faucet or valve for the outer chamber, the same for the inner chamber, and mechanism for operating the cocks or valves of the two series of spouts while the machine is revolving, substantially as specified.

15. The combination, in a centrifugal machine, of two concentric chambers, intervening straining-wall, and means for introducing a liquid into the outer chamber while the machine is in motion.

16. The combination, in a centrifugal machine, of two concentric chambers, a filtering-wall separating the two, and means for causing a flow of liquid at will through the filtering-wall in either direction—i. e., from either chamber into the other—substantially as specified.

17. In a centrifugal machine having its body divided into two concentric compartments by an annular filtering-wall, the combination, with the outer of the two compartments, of the draining-spout *s*, nozzle K, pipe *s'*, connecting with an axial tube, N, and the cock *t*, for putting the draining-spout *s* in communication with either the nozzle K or pipe *s'*, substantially as described.

18. In a centrifugal machine having its basket for holding the material to be strained or filtered surrounded by a chamber, G, the combination, with the chamber, of pipes *a*, opening into the chamber through the top and communicating with a passage through the axle and bearing of the machine, and discharging ports or spouts for the chamber at the bottom of the same, substantially as specified.

19. In a centrifugal machine having its basket for holding the material to be strained or filtered encircled by a chamber, G, the combination, with the chamber, of means for introducing a liquid into it at the top while the machine is revolving, and ports or means for the escape of the liquid from the bottom of the chamber, substantially as specified.

20. In a centrifugal machine, the combination, with the basket for holding the material to be strained, of means or mechanism for drawing off liquid or semi-fluid matters from the basket while the machine is revolving independently of the permeable straining-wall or periphery of the basket, substantially as specified.

21. The within-described process of removing the matter collected in the basket B of a centrifugal machine, consisting in washing the same from the basket through suitable discharging-spouts, as *u*, by means of a current of liquid caused to flow through the filtering-wall into the basket and out of it through the said spouts, substantially as specified.

22. The within-described process of cleansing the filtering medium of a centrifugal machine, consisting in causing a flow of cleansing-liquid through the said filtering medium in a direction contrary to that of the filtration, through the agency of the centrifugal force developed by the revolution of the machine, substantially as specified.

N. PETERS, Photo-Lithographer, Washington, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

THE LAKE SHORE AND MICHIGAN SOUTHERN RAILWAY COMPANY, APPELLANT, *v.* THE NATIONAL CAR BRAKE SHOE COMPANY.

Decided January 28, 1884.

1. BING'S PATENT—SHOES FOR CAR-BRAKES—CONSTRUED AND LIMITED.

In this case it was held that on the record herein claim 2 of Letters Patent No. 40,156, granted to James Bing, October 6, 1863, for an improved shoe for car-brakes—namely, "The combination of shoe A, sole B, clevis D, and bolt G, the whole being constructed and arranged substantially as specified"—does not embody any lateral rocking motion in the shoe as an element of the combination.

2. SAME—INFRINGEMENT—COMBINATIONS—MECHANICAL CHANGES.

On such a construction, there was on the record herein patentable novelty in said claim, and a structure having the same four parts in combination, with merely formal, and not substantial, mechanical differences, infringes said claim.

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

Mr. Geo. Payson for the appellant.

Mr. E. Banning and *Mr. Thos. A. Banning* for the appellees.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity brought by the National Car Brake Shoe Company, a corporation, against the Lake Shore and Michigan Southern Railway Company, in the Circuit Court of the United States for the Northern District of Illinois, for the infringement of Letters Patent No. 40,156, granted to James Bing, as inventor, October 6, 1863, for seventeen years, for an improved shoe for car-brakes. The bill was filed June 7, 1880, less than four months before the expiration of the patent. The answer, which was filed October 4, 1880, two days before the patent expired, denies infringement, and alleges that the thing patented had been in public use or on sale, with the consent and allowance of Bing, for more than two years prior to his application for the patent, and that the invention had been abandoned by him to the public. There is no defense of want of novelty or patentability set up in the answer. The replication was filed on the same day with the answer. No proofs were taken, but five days after the filing of the replication and three days after the patent expired the parties entered into the following written stipulation:

It is hereby stipulated by and between the parties to the above-entitled suit, for the purposes of said suit and no other, as follows, to wit:

1. That the patent sued on, No. 40,156, issued to James Bing, October 6, 1863, may be considered as formally offered in evidence, and that complainant is the exclusive owner thereof.

2. That the small brass model offered by complainant, and marked "Complainant's Exhibit, Bing's Brake-Shoe," is a correct representation of the invention described in said patent, except that defendant claims that said model has not enough rocking motion.

3. That the small wooden model offered by defendant, and marked "Defendant's Exhibit A," is also a correct representation of the said invention, except that complainant claims that said model has too much rocking motion.

4. That defendant has used two different kinds of brake-shoes, both of which are claimed by complainant to be infringements of the second claim of said patent, but as to both of which infringement is denied by defendant.

5. That the first of said brake-shoes is constructed in all respects like that described in said patent, except that the two parts—viz., the shoe and the sole—are fitted on each other so snugly as to have no rocking motion.

6. That the second of said shoes is correctly represented by the small wooden model marked "Defendant's Exhibit B," and that it also has no rocking motion.

7. That brake-shoes having a detachable sole attached to the shoe by bolts passing through the shoe and sole at right angles to the face of the sole, one at the top and one at the bottom, and secured by nuts screwed onto the inner ends of said bolts, so that the sole could be taken off upon the removal of said bolts, had been known and used in the United States for some years prior to the said invention of said Bing, and that the small wooden model marked "Defendant's Exhibit C" is a correct representation of said brake-shoes.

8. That said shoe last mentioned was suspended from the truck by a hanger or clevis attached to a bolt passing through a hole at the top of said shoe, as shown in said model.

9. That neither of said brake-shoes used by defendant has the lateral rocking motion described in said patent or infringes the first claim of said patent.

10. That, if the court be of the opinion that said lateral rocking motion forms no part of the second claim of said patent, then the first of said defendant's brake-shoes above mentioned is admitted to be an infringement of said claim, and the decision as to that shoe shall be in favor of complainant, provided the court shall also be of the opinion that there is on that construction any patentable novelty in said claim. But if the court be of the opinion that said lateral rocking motion does form a part of said second claim, or that there is no patentable novelty in said claim, if so construed as to exclude said rocking motion, then, in either of these cases, the decision shall be in favor of defendant as to said first shoe.

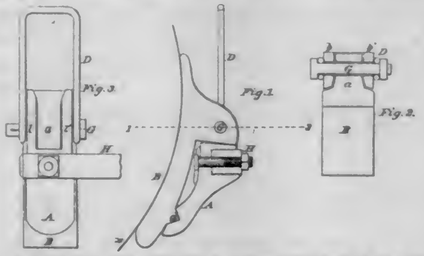
11. That, if the court shall be of the opinion that said lateral rocking motion forms no part of the second claim, and that defendant's second brake-shoe—viz., that the defendant's Exhibit B is in its mechanical construction substantially the same as the combination described in said claim—then the decision as to that shoe also shall be in favor of complainant, provided the court shall also be of opinion that there is any patentable novelty in said claim when so construed. But, if the court shall be of opinion either that said lateral rocking motion does form a part of said second claim, or that the mechanical construction of said shoe-brake is not substantially the same as that shown in said claim, or that there is no patentable novelty in said claim if so construed as to exclude said rocking motion, then, in either of said cases, the decision as to that shoe shall be in favor of defendant.

12. That, in case the court finds the issues in favor of the complainant, both parties waive a reference to the master, and agree that complainant's damages may be assessed at the sum of $200.

13. That all the evidence in this case is comprised in this stipulation, the models therein referred to, and the said letters patent.

On that stipulation and the models referred to in it and the patent the case was heard in the circuit court. That court filed a written opinion on the 26th of October following, (9 Bissell, 503,) upon which a decree was entered on the same day as of the preceding 9th of October, declaring the patent to be good and valid in law so far as regards the second claim thereof and to be owned by the plaintiff; that the defendant had infringed the patent by using the invention secured by the second claim, and that the plaintiff recover $200 damages in accordance with the stipulation, the same

to be in full satisfaction of all claims of the plaintiff against the defendant on account of the defendant's infringement of the patent. The defendant has appealed.



The specification of the patent is in these words:

My invention relates to the construction of shoes or rubbers for car-wheels, and consists, first, in constructing the shoe of two parts, in the peculiar manner described hereafter, so that the part in contact with the wheel can accommodate itself to the same; secondly, in the peculiar combination, described hereafter, of the two parts of the shoe, the clevis by which the shoe is suspended to the truck, and the bolt which secures the clevis to the shoe, and the two parts of the shoe to each other.

In order to enable others skilled in this class of mechanism to make and apply my invention, I will now proceed to describe its construction and operation.

On reference to the accompanying drawings, which form a part of this specification, Figure 1 is a vertical section of my improved shoe for railway-car brakes; Fig. 2, a sectional plan on the line 1, 2, Fig. 1; and Fig. 3, a front view of the shoe.

Similar letters refer to similar parts throughout the several views.

A is the shoe, and B the sole, the latter being formed to fit the periphery of the car-wheel, (part of which is shown by the line *x*,) and having a lug, *a*, which fits between the lugs *b b'* on the shoe.

D is a clevis, the upper end of which is suspended to the truck of the railway-car, the lower end being arranged to embrace the lugs *b* and *b'* of the shoe, a bolt, G, passing through the lower end of the clevis, through the lugs *b* and *b'* of the shoe, and through the lug *a* of the shoe B.

It will be observed on reference to Fig. 2 that the lug *a* is made tapering, and that the bolt G fits loosely in the said lug, as well as in the lugs *b* and *b'*, so that the sole is self-adjustable laterally, for a purpose described hereafter.

A projection, *d*, on the sole B fits into a socket in the shoe in such a manner that the sole can vibrate laterally in the said socket, while the projection serves to maintain the shoe and sole in their proper relative positions.

H is the usual brake-beam, one end of which fits into a recess in, and is secured to, the shoe A, the other end of the beam being secured to a similar shoe on the opposite side of the car-truck.

The peripheries of car-wheels are always beveled or inclined, so that it becomes necessary to make the soles of the ordinary shoes or rubbers of a corresponding bevel, one shoe at one end of the beam being beveled in one direction, and the other shoe at the opposite end of the beam being beveled in a contrary direction. Even when the usual shoes are properly fitted to the beveled peripheries of the wheels, the lateral movement of the axles as the wheels traverse curves of the track is such that the ordinary shoes cannot fit accurately at all times.

Another evil attending the use of ordinary shoes or rubbers is that, as the lateral movement of the axles takes place, an undue strain is imparted to the brake-beam. These difficulties are avoided by my invention, inasmuch as the sole B is permitted to have a lateral rocking motion on the shoe, and can at once accommodate itself to the bevel of the wheel, or to any variation caused in that bevel by the lateral movement of the axle.

Another improvement in my invention is the peculiarly simple arrangement of the clevis which supports the shoe, the bolt G serving the purpose of connecting the clevis to the shoe and the latter to the sole.

The claims of the patent are as follows:

1. The shoe A and sole B, both being constructed and adapted to each other substantially as described, so that the sole can have a lateral rocking movement on the shoe, for the purposes specified.
2. The combination of shoe A, sole B, clevis D, and bolt G, the whole being constructed and arranged substantially as specified.

It is stipulated that neither of the two brake-shoes of the defendant infringes the first claim of the patent, for the reason assigned in the stipulation, that neither of them has the lateral rocking motion described in the patent, although it is stipulated as to one of them that it is constructed in all respects like that described in the patent, except that the shoe and the sole are fitted to each other so snugly as to have no rocking motion.

1. The first question presented for decision on the stipulation is as to whether the lateral rocking motion forms a part of the second claim of the patent. The circuit court held that the second claim did not embody as an essential element the lateral rocking motion, and that such element need not be found in a car-brake shoe in order to make it an infringement of the second claim. The view urged on the part of the defendant is, that the combination of the shoe, the sole, the clevis, and the bolt cannot, as a whole, be "constructed and arranged substantially as specified," if the whole is not so constructed and arranged as to admit of the lateral rocking motion, and that there is no suggestion in the specification of any construction or arrangement in which the sole has not a lateral rocking motion on the shoe. We think that the circuit court was correct in its construction of the second claim on the record before it. The first part of the invention is stated in the specification to be the peculiar manner of constructing the shoe proper and the sole in two parts in such way that the sole can accommodate itself to the wheel by reason of its having a lateral rocking motion on the shoe proper. That is the subject-matter of the first claim. The second part of the invention, or, as the specification says, the second improvement in the invention, is stated to consist in the peculiar combination of the shoe proper, the sole, the clevis, and the bolt, the clevis suspending the shoe and its sole to the truck, and the bolt securing the clevis to the shoe proper and that to the sole. The combination of the mode of suspending by the clevis with the mode of securing by the bolt is the same whether the sole has a lateral rocking motion or not. That combination as a whole is constructed and arranged substantially as specified, even where there is no lateral rocking motion to the sole. The words "substantially as specified" mean "substantially as specified in regard to the combination which is the subject of the claim." The adaptation of the shoe proper and the sole to each other in such way as to produce or allow of the lateral rocking motion was the subject of the first claim. The combination formed by the peculiar arrangement of the clevis and the bolt in reference to the shoe proper and the sole is a combination which has no effect to produce or prevent the lateral rocking motion; and the stipulation states that this combination can be used constructed exactly as described in the patent when the shoe proper and the sole are so snugly fitted together that the sole has no rocking motion. In consonance with this view, the specification and the claims maintain a distinction between the arrangement for the rocking motion and the manner of combining together the shoe proper, the sole, the clevis, and the bolt. The stipulation declares that when the combination of the second claim is made there may be a lateral rocking motion in the sole, or there may not, for it states that the exact structure of the patent may be copied and yet the fitting of the sole to the shoe proper may be so snug that there may be no lateral rocking motion in the sole, and so no infringement of the first claim. Hence, a loose fitting of the same parts in the same structure would produce a lateral rocking motion and an infringement of the first claim. There is no suggestion that the combination of the second claim was not new; and, there being nothing shown in the state of the art which requires any such construction of the second claim as that contended for by the defendant, and it being fairly susceptible of the opposite con-

struction, and the latter being one which is commensurate with the real invention embraced in the second claim, and one which prevents the real substance of that invention from being bodily appropriated by an infringer, it is proper to give the claim such a construction.

2. The next question raised by the stipulation is as to whether there is any patentable novelty in the second claim on such a construction. No question of novelty is raised in the answer, and nothing is introduced in evidence on that subject, or on the state of the art, except what is found in paragraphs 7 and 8 of the stipulation. The opinion of the circuit court, which is set forth in the record, speaks of "the various patents that have been put in evidence," but none such are before us, and the brief of the appellee states that the model marked "Defendant's Exhibit C," (mentioned in paragraph 7 of the stipulation,) "has been selected, as the nearest approach to the patented invention, from a large number used in the court below." This would indicate that the full case presented to the court below is not presented here. As, however, the parties to this suit have stipulated as to what the record is so far as anything in the controversy between them in this suit is concerned, and the stipulation states that it is a stipulation for the purposes of this suit and no other, and the clerk of the circuit court certifies the transcript to be "a true, correct, and complete transcript of the record of all the proceedings" had in the circuit court in this suit, "as appears from the files and records of" the court remaining in his custody and control, what is furnished to us must be accepted as sufficient for the purposes of this suit, leaving our decision in the case to stand, in its bearing in respect to other suits on the same patent, with only that weight which is due to it in view of the manner in which the case is presented in the record.

The brake-shoe described in paragraphs 7 and 8 of the stipulation, and shown in defendant's Exhibit C, it is very clear does not contain what is covered by the second claim of the patent as we have defined it or destroy its patentable novelty. Bing accomplishes by one bolt what required three bolts in the prior structure. His whole structure can be taken off from the clevis by removing the one bolt, while in the prior structure it required the removal of two bolts to take off the sole from the shoe proper and the removal of a third bolt to take off the shoe proper from the clevis.

3. On the foregoing views, it is admitted by paragraph 10 of the stipulation that the first of defendant's brake-shoes infringes the second claim, and there must be a decision as to that shoe in favor of the plaintiff.

4. The only remaining question is as to whether the defendant's other brake-shoe, Exhibit B, is in its mechanical construction substantially the same as the combination described or shown in the second claim. In the Bing shoe-brake the clevis is a three-sided structure, the two lower ends of which embrace the two lugs of the shoe proper, and the bolt passes through the lower end of one arm of the clevis, then through one of the lugs on the shoe proper, then through the lugs on the sole, then through the other lug on the shoe proper, and then through the lower end of the other arm of the clevis, and the sole cannot be removed without first removing the bolt, because the lug on the sole fits in between the lugs on the shoe proper. In the defendant's structure there is no bolt-hole through the lug on the sole, but there is a curved depression made in its top, in which the curved lower end of the clevis rests. The clevis does not have two arms, the lower ends of which embrace the lugs of the shoe proper, and the bolt goes through one of those lugs, then through a hole in the lower end of the clevis, (the clevis being a vertical piece, without arms, and not three-sided,) and then through the other one of those lugs, but the bolt does not go through the lug on the sole. That lug is kept in place by the pressure on it of the curved lower end of the clevis, which cannot move out of position, because the bolt goes through it and holds it. The bolt alone, without the clevis, will not confine the lug on the sole. The lug on the sole cannot be removed until the bolt is removed and the clevis is detached. The shoe proper, the sole, and the clevis are combined by the single bolt, which secures together the clevis, the shoe proper, and the sole. The bolt and the clevis perform the same office in the two structures, and the mechanical differences are merely formal and not substantial. The combination consists of the same four parts, differing only in form.

The decree of the circuit court is affirmed.

Supreme Court of the United States.

THE ILLINOIS CENTRAL RAILROAD COMPANY, APPELLANT, *v.* LAURA B. TURRILL, ADMINISTRATRIX OF SAMUEL H. TURRILL, DECEASED. THE MICHIGAN SOUTHERN AND NORTHERN INDIANA RAILROAD COMPANY, APPELLANT, *v.* LAURA B. TURRILL, ADMINISTRATRIX OF SAMUEL H. TURRILL, DECEASED.

Decided January 28, 1884.

1. PROFITS.

In view of the former decision of this Court in these cases, (reported under the name of the Cawood patent, 94 U. S., 695,) nothing was left open for further inquiry but the amounts of the former recoveries for the use of the non-infringing machines, and the true way of determining this clearly was to find out what part of the profits for which the original decrees were rendered had been made by the use of the non-infringing machines.

2. PROFITS—WHEN INTEREST IS ALLOWABLE.

As a general rule, a patentee is not entitled to interest on profits made by an infringer, because profits are regarded in the light of unliquidated damages; but where a case was sent back to ascertain how much should be deducted from decrees for errors in the accounting as then stated, it seems not at all inequitable to allow interest on the corrected amounts from the date of the master's report. The cases are entirely different in this particular from what they would have been if the original decrees had been reversed for error in the principles of the accounting. The decrees in the present cases may be considered as affirmed in part and reversed in part, the new reference being had only to find out the exact extent of the reversals.

3. PRACTICE IN THE COURTS—DEATH OF PATENTEE AFTER APPEAL DOES NOT ABATE THE SUIT.

The death of the patentee since the appeals were taken does not prevent the suits from being further prosecuted in the name of the legal representatives.

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

Mr. Geo. Payson for the railroad companies.

Mr. Chauncey Smith and *Mr. L. L. Bond* for the administratrix.

Mr. Chief Justice WAITE delivered the opinion of the Court.

The effect of the judgments in these cases when here on the former appeals, as reported under the name of

the "Cawood patent," (94 U. S., 695,) was to affirm the decrees then appealed from so far as they charged these appellants, respectively, with the profits made from the use of the infringing machines, known as the "Illinois Central," the "Etheridge," and the "Whitcomb," and to reverse as to the profits made by the use of the "Bayonet Vise," the "Michigan Southern," and the "Beebee & Smith," which were adjudged to be non-infringing machines. The total amount of profits arising from the use of all the machines, infringing and non-infringing, was settled, and the judgment of the court was that the profits had properly been estimated by comparing the cost of mending on the machines with the cost of mending on a common anvil. This was found to be about thirty-six cents per foot mended in favor of the machines. (Page 709.) Nothing was left open for further inquiry but the amounts of the former recoveries for the use of the non-infringing machines. It was quite right therefore for the circuit court, when the cases went back, to direct the master to ascertain from the old evidence, if possible, and, if not, from new, how much should be deducted from the old decrees on account of the erroneous recoveries. The true way of determining this clearly was to find out what part of the profits for which the original decrees were rendered had been made by the use of the non-infringing machines. This the master attempted to do, and in the case of the Illinois Central Company there is no doubt in our minds that the conclusion he reached was entirely correct. In fact, we do not understand that this is disputed. It is argued that a sufficient allowance was not made in the accounting for cut rails, but that question was settled by the original decree, and could not be re-examined on this reference. The inquiry now is limited to the amount of mending done by the use of the non-infringing machines and its comparative cost.

In the case of the Michigan Southern and Northern Indiana Company the evidence is not as satisfactory as in that of the Illinois Central. The shop-books in which the accounts for repairing rails were kept, if kept at all, were not produced, and had probably been destroyed, as of no value before the accounting took place. In their absence it is difficult to determine with accuracy what the facts were, but upon full consideration we are satisfied the circuit court did not in its decree underestimate the amount of deduction to be made in favor of this company.

In making up the decree interest was added from the date of the master's report on the balances found due after the ascertained deductions had been made, and this is assigned for error. As a general rule a patentee is not entitled to interest on profits made by an infringer. The reason is that profits are regarded in the light of unliquidated damages, (*Parks* v. *Booth*, 102 U. S., 106,) but in many of the cases it is said that circumstances may arise in which it would be proper to add interest. (*Mowry* v. *Whitney*, 14 Wall., 653; *Littlefield* v. *Perry*, 21 Wall., 230.) Here, as has been seen, in effect the original decrees rendered in July, 1874, were affirmed in 1876 to the extent of the present recoveries. The cases were only sent back to ascertain how much should be deducted from those decrees for errors in the accounts as then stated. If the decrees had been entered originally for the present amounts, the patentee would have been entitled to interest from 1874. That was settled in *Railroad Company* v. *Turrill*, (101 U. S., 836,) which was one of the cases affirmed in whole at the former hearing in this Court. Under these circumstances it seems to us not all inequitable to allow interest on the corrected amounts from the date of the master's report in 1879. The cases are entirely different in this particular from what they would have been if the original decrees had been reversed for error in the principles of the accounting. Those decrees may very properly be considered as affirmed in part and reversed in part, the new reference being had only to find out the exact extent of the reversals.

Since the present appeals were taken the patentee has died, and the appellants now suggest that the causes of action do not survive, and the suits cannot be further prosecuted in the name of the legal representatives of the decedent. As to this, it is sufficient to say that what was called by Chief Justice Marshall in *Gordon* v. *Ogden* (3 Pet., 35) "the silent practice of the Court" has always been the other way. It is every-day practice to revive such suits, and the books are full of cases in which this has been silently done, no one apparently entertaining a doubt of its propriety.

The decree in each of the cases is affirmed.

Mr. Justice Blatchford did not sit in these cases and took no part in their decision.

The Official Gazette.

The OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of March 11, 1884.

DESIGNS.

14,865.—LANTERN.—*Francis Billingham*, Brooklyn, assignor to *The E. P. Gleason Manufacturing Company*, New York, N. Y. Application filed February 9, 1884. Term of patent 14 years.

14,866.—WATCH-CASE.—*Jean François Boyer*, Boston, Mass., assignor to *The Boston Watch Case Company*, same place. Application filed February 16, 1883. Term of patent 7 years.

14,867.—CARPET.—*Walter J. Gadsby*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed February 12, 1884. Term of patent 3½ years.

14,868 to 14,873, inclusive.—CARPET.—*Otto Heinigke*, New Utrecht, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Applications filed January 28, 1884. Term of patents 3½ years.

14,874 to 14,881, inclusive.—CARPET.—*Winthrop L. Jacobs*, East Orange, N. J., assignor to *The Hartford Carpet Company*, Hartford, Conn. Applications filed January 28, 1884. Term of patents 3½ years.

14,882.—CARPET.—*Arthur L. Halliday* and *William McCallum*, Yonkers, N. Y., assignors to *The Bigelow Carpet Company*, Clinton, Mass. Application filed February 8, 1884. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

10,986.—PREPARATION FOR DISGUISING THE BITTERNESS OF QUININE, &c.—*Academic Pharmaceutic Company*, New York, N. Y. Application filed December 27, 1883.

"The name 'QUINEPTUS.'"

10,987.—PLUG-TOBACCO.—*Charles L. Adams*, Lynchburg, Va. Application filed January 30, 1884.
"The words 'ARKANSAS TRAVELER.'"

10,988.—SMOKING AND CHEWING TOBACCO, CIGARS, AND CIGARETTES. *James G. Butler & Co.*, St. Louis, Mo. Application filed February 2, 1884.
"The arbitrary representation or device of a heart."

10,989.—COGNAC BRANDY.—*J. Denis, Henry Mounié & Co.*, Cognac, France. Application filed December 16, 1882.
"The letters and words 'J. DENIS, HENRY MOUNIÉ & CO.,' the signature in fac-simile of our firm, the whole being connected with the representation of a grape-leaf."

10,990.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed February 2, 1884.
"The words 'HOOK & LADDER' and a pictorial representation of a hook and ladder, which may be used either separately or in connection with each other."

10,991.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed February 2, 1884.
"The words 'BOAR HEAD' and a pictorial representation of a boar's head, which may be used either separately or in connection with each other."

10,992.—SMOKING-TOBACCO.—*B. Leidersdorf & Co.*, Milwaukee, Wis. Application filed February 13, 1884.
"The word-symbol 'RED CLOVER.'"

10,993.—CERTAIN EMBOSSED METAL ARTICLES.—*A. Massé & Anglade*, Paris, France. Application filed July 2, 1883.
"The representation of a bee and the letters 'A. M. & CIE.'"

10,994.—LIVER-PELLETS.—*Henry E. Peters*, Allentown, Pa. Application filed November 30, 1883.
"The representation of a dandelion-plant in bloom."

10,995.—MELISSA-WATER.—*Henry Renouard & Co.*, Paris, France. Application filed November 2, 1883.
"The fac-simile signature 'BOYER.'"

10,996.—MELISSA-WATER.—*Henry Renouard & Co.*, Paris, France. Application filed November 2, 1883.
"The words 'EAU DES CARMES.'"

10,997.—CERTAIN PROPRIETARY MEDICINES.—*United States Medicine Co.*, New York, N. Y. Application filed January 5, 1884.
"Within one or more circular lines is the figure of an eagle with raised wings, and which is represented as standing upon a shield and holding with one foot a number of arrows, and with the other foot a branch bearing leaves and fruit. Beyond the head of the eagle are seen the upper parts of a number of flags, and above and behind the eagle are a number of stars. Around the circular line or lines are printed the words 'THE LEAVES OF THE TREE WERE FOR THE HEALING OF THE NATIONS.'"

10,998.—PLUG, TWIST, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Alexander Cameron & Co.*, Richmond, Va. Application filed February 15, 1884.
"The words 'THE PATHFINDER.'"

10,999.—PLUG, TWIST, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Alexander Cameron & Co.*, Richmond, Va. Application filed February 15, 1884.
"The words 'QUEEN OF THE SEAS.'"

11,000.—PLUG, TWIST, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Alexander Cameron & Co.*, Richmond, Va. Application filed February 15, 1884.
"The words 'THE FLOWER OF ALL NATIONS.'"

11,001.—PLUG, TWIST, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Alexander Cameron & Co.*, Richmond, Va. Application filed February 15, 1884.
"The word 'VENUS.'"

11,002.—PLUG, TWIST, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Alexander Cameron & Co.*, Richmond, Va. Application filed February 15, 1884.
"The words 'ST. ANDREW'S.'"

11,003.—PLUG, TWIST, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Alexander Cameron & Co.*, Richmond, Va. Application filed February 15, 1884.
"The words 'ELSIE'S HARVEST.'"

11,004.—PLUG, TWIST, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Alexander Cameron & Co.*, Richmond, Va. Application filed February 15, 1884.
"The words 'ALL THE RAGE.'"

11,005.—PLUG, TWIST, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Alexander Cameron & Co.*, Richmond, Va. Application filed February 20, 1884.
"The words 'SPIRIT OF THE TIMES.'"

11,006.—GUNPOWDER.—*Curtis's & Harvey*, London, England. Application filed February 9, 1884.
"The symbol, representation, or word 'DIAMOND.'"

11,007.—CRACKERS, BISCUITS, WAFERS, AND CAKES.—*F. A. Kennedy Company*, Chicago, Ill. Application filed February 18, 1884.
"The representation of a phenix in the act of rising from the flames."

11,008.—CIGARS.—*C. C. Saums*, Baltimore, Md. Application filed January 21, 1884.
"The word 'MINERVA.'"

11,009.—BANJOS, BANJO CASES AND STRINGS, AND OTHER TRIMMINGS. *John F. Stratton*, Brooklyn, N. Y. Application filed February 15, 1884.
"A representation of the music-staff, the treble clef, and the notes F B C."

LABELS.

3,967.—Title: "CHAPPELEAR'S BRONCHINI" (FOR A MEDICINE.)—*William M. Chappelear & Sons*, Zanesville, Ohio. Application filed February 12, 1884.

3,968.—Title: "THE LEADER" (FOR CIGARS.)—*Hermann Dunker*, Milwaukee, Wis. Application filed February 13, 1884.

3,969.—Title: "CLARK'S EXTRACT OF JAMAICA GINGER, CONCENTRATED."—*Dort & Chandler*, Keene, N. H. Application filed February 14, 1884.

3,970.—Title: "MURRAY'S SPECIFIC."—*Carlos H. Elmore* and *William M. Whitelaw*, Kansas City, Mo. Application filed February 15, 1884.

3,971.—Title: "FLINT'S SAPONACEOUS TOOTH POWDER THE PEERLESS DENTIFRICE."—*J. T. Flint & Co.*, Derby Line, Vt. Application filed February 16, 1884.

3,972.—Title: "DR. VON BIEBER'S SURE CURE FOR MALARIA."—*John B. Henion*, Rochester, N. Y. Application filed February 19, 1884.

3,973.—Title: "HIGGINS CROWN LAUNDRY SOAP."—*Walter Higgins*, Brooklyn, N. Y. Application filed February 14, 1884.

3,974.—Title: "WESTERN DELIGHT," (FOR FLOUR.)—*Huber & Wack Milling & Live Stock Co.*, St. Louis, Mo. Application filed February 19, 1884.

3,975.—Title: "RED CROSS ENGINE OIL."—*Isted & Halsted*, Milwaukee, Wis. Application filed February 15, 1884.

3,976.—Title: "RED CROSS CYLINDER OIL."—*Isted & Halsted*, Milwaukee, Wis. Application filed February 15, 1884.

3,977.—Title: "THE WHITE ELEPHANT" (FOR CIGARS.)—*Mensing & Stecher*, Rochester, N. Y. Application filed February 12, 1884.

3,978.—Title: "VICTORIA PILLS."—*A. C. Meyer & Co.*, Baltimore, Md. Application filed February 14, 1884.

3,979.—Title: "CAUTION." (FOR A MEDICAL COMPOUND.)—*A. C. Meyer & Co.*, Baltimore, Md. Application filed February 14, 1884.

3,980.—Title: "DAY'S HORSE AND CATTLE POWDER."—*A. C. Meyer & Co.*, Baltimore, Md. Application filed February 14, 1884.

3,981.—Title: "I. A. POTTER'S NEW AMERICAN STRENGTHENING PLASTER."—*Ira A. Potter*, Watertown, N. Y. Application filed February 18, 1884.

3,982.—Title: "RHOREE'S BREAD RAISING."—*Provident Chemical Works*, St. Louis, Mo. Application filed February 4, 1884.

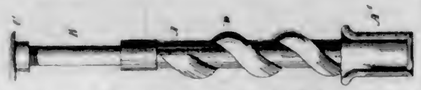
3,983.—Title: "THYMOLINE CHILDREN & ADULTS HEALTH PROTECTOR."—*Gustav Schwarzwald*, New York, N. Y. Application filed February 7, 1884.

3,984.—Title: "SOLID GOLD" (FOR CHEESE.)—*John Thallon*, New York, N. Y. Application filed February 19, 1884.

3,985.—Title: "SOLID SILVER" (FOR CHEESE.)—*John Thallon*, New York, N. Y. Application filed February 19, 1884.

3,986.—Title: "FINEST SELECTED DAIRY" (FOR BUTTER.)—*John Thallon*, New York, N. Y. Application filed February 19, 1884.

3,987.—Title: "FRENCH COOK BAKING POWDER."—*John McO. Thornburgh*, St. Louis, Mo. Application filed February 18, 1884.

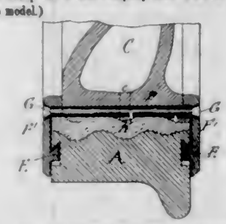


3,988.—Title: "TWENTY-FOUR O'CLOCK" (FOR CIGAR-BOXES.)—*H. Westcott, Son & Co.*, Binghamton, N. Y. Application filed February 14, 1884.

3,989.—Title: "PÂTE ROUGE METALLIQUE" (FOR A PASTE FOR POLISHING METALS.)—*W. H. Winslow & Co.*, Boston, Mass. Application filed February 14, 1884.

PATENTS

GRANTED MAR. 11, 1884.



294,749. CASE FOR OPERATING STOP-COCKS FOR WATER AND GAS PIPES. EVERETT L. ABBOTT, South Bend, Ind. Filed Sept. 4, 1882. (No model.)

Claim.—1. The lower section, A, formed with the exterior spiral swell, D, having in its interior the spiral groove *b*, in combination with the interior section, B, having the pin *c*, substantially as shown and described.

2. The rod *a*, having the twist *d* for keeping it in a central position, in combination with the section B, substantially as described.

294,750. CAR-WHEEL. ANSON ATWOOD, Dunellen, N. J., assignor to the Atwood Hemp Car Wheel Company, New York, N. Y. Filed Oct. 23, 1883. (No model.)

Claim.—1. The combination of an elastic packing, K, with the tire A and rim D, having corresponding corrugations or roughenings upon their adjacent faces so shaped as to lock the tire against both lateral and rotary slip on the wheel, substantially as described.

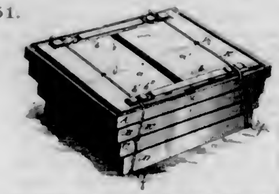
2. The combination of the rim D, tire A, and elastic packing, with their circumferential corrugations, with the loosely-engaging tongue and groove upon the tire, and flange or ring, and with suitable means for preventing rotary slip, substantially as described.

3. The combination of the tire A, rim D, packing K, flange F or ring or rings F', loose tongue-and-groove lock E, and bolts G, having no metallic contact with tire or rim, substantially as described.

4. The combination of the tire A, rim D, packing K, flange F or ring F', lock E, and bolts G, passing through grooves in the rim, with the lip *g*, substantially as described.

5. The combination of the tire A, rim D, packing K, rings or flange F F', lock E, bolts G, and keys H, substantially as described.

6. The compound of fiber and vaseline for packing railway-car wheels, substantially as described.



7. A car-wheel having the separate tire and a body cast in one piece, consisting of the hub and rim, with the intermediate double-arched portion, having sand-holes from the inner arch through the hub and from the outer arch through the rim, and with unperforated sides, substantially as described.

8. In a wheel having a tire, A, capable of yielding radially to thrust or jar, the combination of the body, tire, and a loose tongue-and-groove lock, E, connecting the tire to the body, substantially as and for the purpose described.

294,751. KNOCKDOWN CRATE. WILSON M. BAKER, Urbana, Ohio. Filed Jan. 8, 1884. (Model.)

Claim.—1. A crate consisting of a series of trays gradually diminishing in size, whereby a nest can be made by setting one into another, the trays set apart and above each other, a sectional cover for the upper tray, and means for holding the trays in position, substantially as and for the purpose set forth.

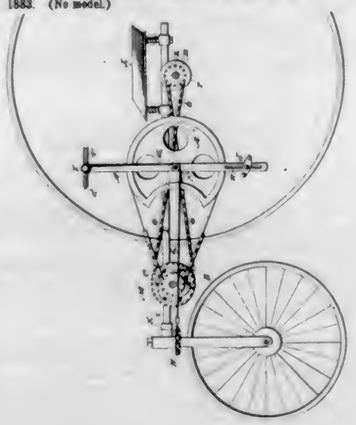
294,751.

2. A crate consisting of a series of trays of unequal length and width, each tray having means for supporting it upon and apart from the next lower tray when set up, whereby an air-space is left between the trays, and a holding device, substantially as set forth.

3. In a crate, the combination, with a series of trays of unequal length and width, of two swinging bails secured to the under side of the bottom tray, and means for fastening the bails near the ends when the crate is set up, and near the middle when it is knocked down, substantially as set forth.

4. In a crate, the combination, with the trays, the fastening device, and the covers *a a'*, of the holding-bars *b*, having notches *b'*, as set forth.

5. A crate consisting of trays of unequal length and width, each tray except the top one being covered by the one above it, and means for effecting an air-space between adjacent trays, and the top covers, *a a'*, of dimensions to fit into the lower tray when the crate is knocked down, as set forth.



6. A cover for a crate, consisting of the pieces *a a'*, of dimensions to fit into one of the trays, and provided with cleats which prevent the cover from slipping and afford space for ventilation, substantially as and for the purpose set forth.

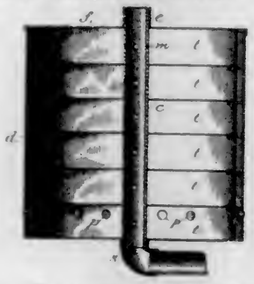
294,752. COMPOSITE OIL FOR LUBRICATING, &c. GEORGE W. BARKER, Brooklyn, N. Y. Filed July 31, 1883. (No specimens.)

Brief.—Improvement on Letters Patent No. 255,096, dated March 21, 1882.

Claim.—The herein-described composite oil, composed of castor-oil and corn-oil in nearly equal proportions.

294,753. TRICYCLE. ALBERT BOWN, Streator, Ill. Filed Aug. 15, 1883. (No model.)

Claim.—1. In a tricycle, the combination, with a disk mounted on a frame, of an oscillating lever adapted to move said disk, a pinion connected to the disk by means of chains or belts, or both, and a wheel or wheels C, connected to a suitable wheel or wheels on the rear axle by one or more endless chains, substantially as described.

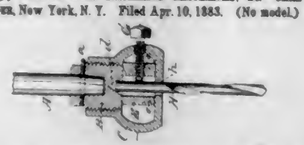


2. In a tricycle, the combination, with a disk mounted on a frame, of an oscillating lever secured thereto, a pinion connected with the disk by a belt, chain, or both, and a clutch or clutches connected with pinions secured to the rear axle, substantially as set forth.

3. In a tricycle, the combination, with a disk loosely secured to a frame, the latter resting in the rear axle, of an oscillating lever secured thereto, a pinion secured to a shaft and connected with the disk, and clutches, also mounted on said shaft and connected by chains or equivalents to pinions secured to the rear axle, the latter provided with a differential gear, substantially as set forth.

4. In a tricycle, the combination, with a frame, the rear end resting on the rear axle, of a disk secured to a cross-piece journaled in bearings secured to the frame, a lever, also secured to said cross-piece, said lever provided with adjustable pedals, a pinion secured to a shaft and connected with the disk by a belt and chain, and clutches mounted on said shaft and connected by chains or equivalents with pinions secured to the rear axle, substantially as set forth.

5. In a tricycle, the combination, with an oscillating lever provided on its upper end with handles, and also near its center with rollers or pulleys, of a wheel or disk secured to the lever and provided with pulleys, and a rope and chain or equivalent secured to the handles and passing partly around the wheels and pulleys and around a pinion connected to the fork of the steering-wheel, substantially as set forth.



294,754. BOILER-WATER PURIFIER. GEO. MICHAEL BRAUNINGER, Janesville, Wis. Filed Apr. 30, 1883. (No model.)

Claim.—1. The combination, in a boiler-water purifier, of a series of pans forming chambers, and a central column or shaft, *c*, pierced with holes *m m*, communicating with each chamber, all arranged to operate in the manner and for the purpose herein described.

2. The combination of the inclosing-case *d*, the series of pans *a a*, provided with the partition *n* and holes *k k*, and central tubular shaft, *c*, provided with cap *e* and the holes *m m* in each succeeding chamber, said partition *n* being adapted to cause the water to flow over the entire surface of the pans while flowing from one to the other, all substantially as and for the purpose specified.

294,755. CHUCK FOR DRILLING-MACHINES, &c. CARL ADAM REINGER, New York, N. Y. Filed Apr. 10, 1883. (No model.)

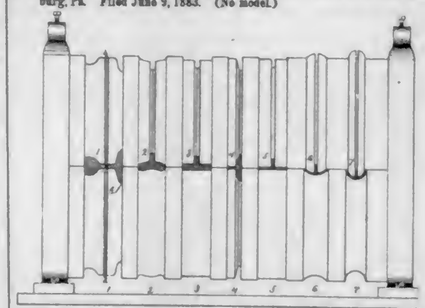
Claim.—1. In a chuck, the combination of a threaded piece, B, with a nut, C, ring-piece E, and set-screw G, for securing the drill in place, substantially as before set forth.

2. The combination of the threaded piece B, having a tapering hole, *d*, the nut C, having projections *s s*, the ring-piece E, set-screw G, pin *a*, and the nose or stop *c*, for controlling the movement of the threaded piece B, substantially as shown and described.

294,756. LEAD AND CRAYON HOLDER. CHARLES W. BROWN, Philadelphia, Pa. Filed May 2, 1883. (No model.)

Claim.—1. A lead or crayon holder consisting of a casing, as A, provided with a piece of elastic material, as *g*, so arranged that by reason of its elasticity it will hold the lead or crayon in any position to which it may be moved, and means by which said lead or crayon can be

294,756.

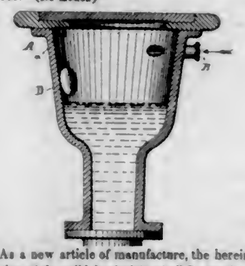


moved against the resistance of said elastic material, substantially as described.

2. A lead or crayon holder consisting of a casing, as A, provided with a piece of elastic material, as *g*, so arranged that by reason of its elasticity it will hold the lead or crayon in any position to which it may be moved, one or more guide-blocks, as *l m*, and means by which said lead or crayon can be moved against the resistance of said elastic material, substantially as described.

3. A lead or crayon holder consisting of a casing, as A, provided with a piece of elastic material, as *g*, having a central opening and conically-recessed ends, and so arranged that by reason of its elasticity it will hold the lead or crayon in any position to which it may be moved, and means by which said lead or crayon can be moved against the resistance of said elastic material, substantially as described.

4. A lead or crayon holder consisting of a casing, as A, provided with a piece of elastic material, as *g*, so arranged that by reason of its elasticity it will hold the lead or crayon in any position to which it may be moved, one or more guide blocks or pieces, as *l m*, all of said pieces having central openings and conically-recessed ends, and means by which said lead or crayon can be moved against the resistance of said elastic material, substantially as described.

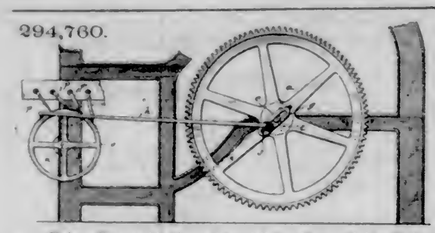


294,757. MANUFACTURE OF T-PLATES. HENRY G. BROWN, Pittsburg, Pa. Filed June 9, 1883. (No model.)

Claim.—1. The improvement in the art of making T-plates or T-bars herein described, consisting in severing a rail in the web, and by suitable rolls, which support the section of the web and slightly reduce it flatwise, rolling the head or tread down to a flat plate, substantially as described.

2. In rolls for rolling T-plates or T-bars from rails, the combination of the upper and lower rolls having the passes 2, 3, 4, and 5, substantially as and for the purposes set forth.

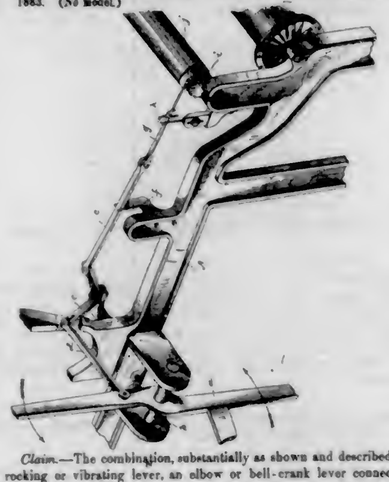
294,758. DISINFECTANT. CHAS. A. CATLIN, Providence, R. I. Filed June 18, 1883. (No model.)



Claim.—As a new article of manufacture, the herein-described disinfector, consisting of the solid deodorizing-ball D, provided with a length of cord or other suspending means secured to said ball, and adapted to be attached to the lid of a water-closet, substantially as set forth.

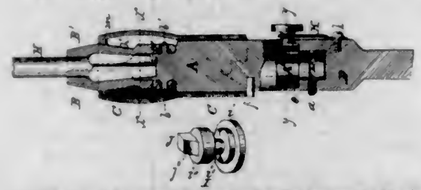
294,759. DISINFECTANT. CHAS. A. CATLIN, Providence, R. I. Filed July 30, 1883. (Specimens.)

Claim.—A solid disinfecting compound composed of chloride of zinc and boracic acid molded or formed into masses of any desired shape, for the purposes specified.



294,760. REGULATING SPEED OF DRIVEN SHAFTS. JOSEPH W. CHENEY, Palmer, Mass., assignor of one-half to Roscius C. Newell, same place. Filed Sept. 12, 1883. (No model.)

294,760.

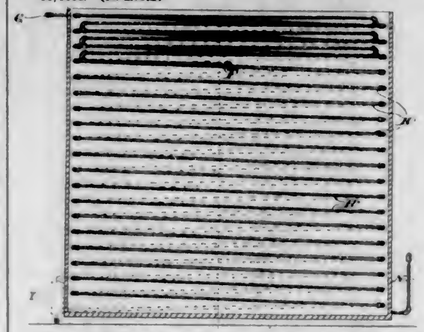


Claim.—The combination, substantially as shown and described, of a main rotary shaft and a driven shaft with an elbow secured to the driving-shaft, a pawl adjustable therein to vary its throw, a ratchet on the driven shaft, engaged by the pawl to impart an intermittent or step-by-step motion to said driven shaft, and means to hold said driven shaft at the points to which it is pulled by the pawl, as set forth.

294,761. CONVERTING MOTION. JOSEPH W. CHENEY, Palmer, Mass., assignor of one-half to Roscius C. Newell, same place. Filed Sept. 12, 1883. (No model.)

Claim.—The combination, substantially as shown and described, of a rocking or vibrating lever, an elbow or bell-crank lever connected therewith by one arm, a rod connected to the other arm of said elbow-lever, a pawl, bearings for said rod and pawl, and a ratchet-shaft engaged by said pawl, as and for the purpose specified.

294,762. RATCHET BIT-BRACE. WILLIAM R. CLARKSON, Buffalo, N. Y. Filed Oct. 5, 1883. (No model.)

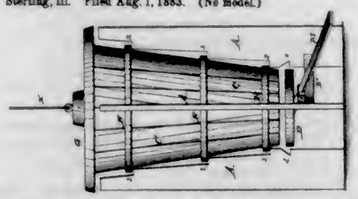


Claim.—1. In ratchet bit-braces and similar implements, the combination, with the socket A, having the shank A', provided with longitudinal grooves *e*, of the button I, having the milled head *i*, neck *i'*, and a projection, J, having one face, *j*, inclined to and the opposite face parallel with the axial line of said button, said button being journaled upon a blade-spring, K, by the neck *i'*, and the whole constructed and combined substantially in the manner as and for the object stated.

2. In bit-braces and similar implements, the combination, with the socket part A, having a fixed abutment, *f*, of a nut, C, having in its internal surface an inclined portion, *g*, formed in said nut in the process of casting, as described, said nut being constructed to operate in conjunction with the socket portion A, having in its upper end the central angular depression, G, and two longitudinal side grooves fitted with jaws B B', stuck upon projecting pins *b b'*, substantially as and for the object stated.

3. In ratchet bit-braces, a dog for the ratchet-wheel, consisting of an annular head, *i*, neck *i'*, collar *i''*, and the angular projection J, having one of its faces inclined to and its opposite face parallel with the axial line of said dog, said dog being constructed to revolve with its neck *i'* in an aperture of the blade-spring K, substantially as and for the purpose specified.

294,763. CONDENSER FOR AMMONIA ICE-MAKING APPARATUS. MAHLON S. CONLY, Indianapolis, Ind., assignor of two-thirds to Thomas H. Butler and Orange R. Weaver, both of same place. Filed Aug. 10, 1883. (No model.)

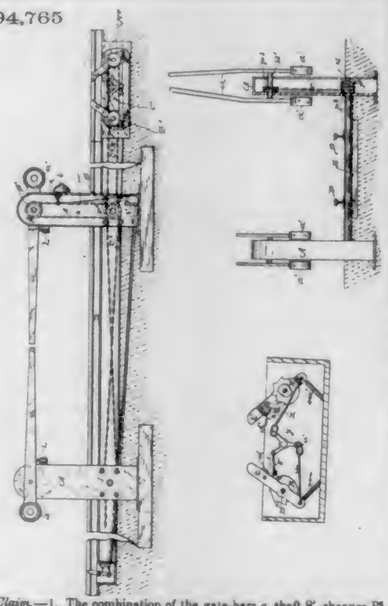


Claim.—1. In an ice-making apparatus, a condenser a portion of the coils of which convey the gas received from the retort upwardly from the receiving-point to the top of said condenser, and the remaining portion of which convey the gas downwardly to the liquid-gas reservoir, substantially as described, and for the purposes specified.

2. A condenser for an ice-making apparatus, the coils of which are arranged in two divisions, one of which carries the gas upward to the top of the condenser through water of a temperature low enough to condense whatever aqueous vapors it may contain before reaching said top, and thus cause the products of said vapors to run back into the retort, and the other division of which conveys the gas downward through water of a constantly-decreasing temperature, whereby it is gradually condensed until it becomes liquid gas and flows out into the liquid-gas reservoir, substantially as set forth.

3. The combination, in a gas-condenser, of an outside casing, a gas-inlet pipe, a series of ascending pipes, with which said gas-inlet communicates, a series of descending pipes, with which the ascending pipes communicate, a liquid-gas reservoir, with which the descending pipes communicate, a cold-water inflow-pipe entering at or near the bottom of the casing, and a water-overflow pipe passing out at or near the top of the casing, substantially as described, and for the purposes specified.

294,764. MACHINE FOR TRUSSING TUBS. MATHEW CORCORAN, Sterling, Ill. Filed Aug. 1, 1883. (No model.)

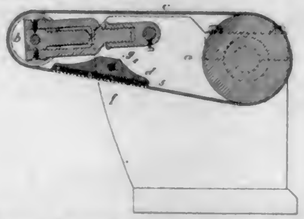


Claim.—1. The combination of the standards A, provided on their inner faces with recesses 1, the truss-hoops B, fitted to rest in said recesses, the bottom D within said standards, the lever E, and fulcrum F, substantially as shown, and for the purpose described.

2. The combination of the standards A, provided with recesses 1 and 2 on the inner faces thereof, the truss-hoops B, fitted to rest in such recesses 1, the removable bottom I, fitted to rest in such recesses 2, the weight G, arranged to be suspended over and dropped upon the upper ends of the staves C within such hoops, and the rope H, substantially as shown, and for the purpose specified.

294,765. RAILROAD-CROSSING GATE. JOSEPH OTT, Joliet, Ill. Filed July 20, 1883. (No model.)

Brief.—A railroad-gate worked by levers operated upon by the tread of the car-wheels. The levers carry ratchets, and are returned to their normal position by springs. Through sheaves, chains, and Y-shaped piece connected to the levers the successive wheels of the train lower or raise the gate-bars gradually.

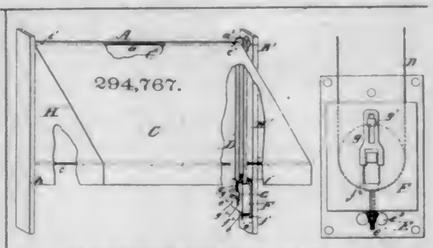


294,765

Claim.—1. The combination of the gate-bars *a*, shaft S', sheaves P^a P^b P^c, chains *c c' c'*, posts A, levers *t t'*, links *z v w*, Y-shaped piece *y*, springs *m m'*, ratchets R R', pawls *x x*, rock-shafts S^a R', and sheaves P P', all arranged to operate substantially as and for the purpose set forth.

2. The combination of the levers *t t'*, pawls *x x*, ratchets R R', links *z v w*, coil-springs *m m'*, sheaves P P', Y-shaped piece *y*, and chains *c' c²*, by means of which successive wheels of the approaching train lower the gate-bars *a a*, or elevate them, gradually, in the manner and for the purpose set forth.

294,766. ABRADING-MACHINE. FREDERICK W. COY, Boston, Mass. Filed Dec. 1, 1883. (No model.)



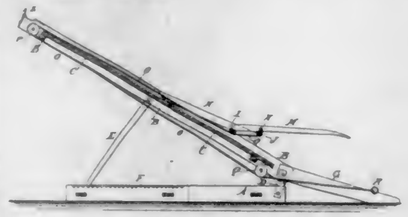
Claim.—1. The combination, with a belt having an abrasive surface, supporting-pulleys therefor, and an intermediate rigid support, of a surface of yielding material arranged between said rigid support and the belt, substantially as described.

2. The combination of a belt having an abrasive surface, supporting-pulleys therefor, an intermediate support of rigid material approximating the form of the article to be abraded, yielding material arranged, as described, between the rigid support and belt to support a portion of the belt, a fixed standard or holder, and means for detachably securing the intermediate support to said holder, whereby differently-formed supports are adapted to be used interchangeably, as set forth.

3. The combination of a belt having an abrasive surface, supporting-pulleys therefor, and an intermediate fixed support of rigid material, and an interposed surface of yielding material, arranged as described, to support a portion of the belt between the pulleys, substantially as described.

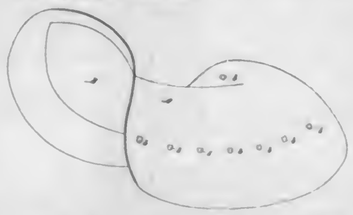
294,767. AWNING. HUGH B. COYLE, Philadelphia, Pa. Filed June 28, 1883. (No model.)

Claim.—1. In an awning-frame, the combination, with box F, of bracket E, having screw *a'* and nut *a²*, and supporting the pulley *e*, substantially as shown and described.



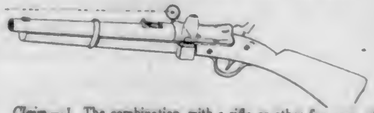
294,767.

2. In an awning-frame, the combination, with box F, having slot *f'*, of pulley *e*, bracket E, screw *a'*, and nut *a²*, said pulley having a shaft, *e²*, which projects through said slot, substantially as shown and described.



3. In an awning-frame, the combination, with pulley e, having squared or angular shaft *e²*, of lock or fastening G, for engaging with said shaft to prevent said pulley from turning, substantially as shown and described.

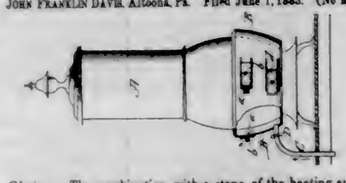
294,768. HAY-STACKER. ALBERT COOLEY, Osceola, Iowa. Filed Sept. 21, 1883. (No model.)



Claim.—In a hay-stacker, the combination, with the frames A B, connected together, and one having hooks or recesses S at its upper end, and a bottom board, C, of the rake H I J K, having rearwardly-projecting teeth, and the ropes O O, connected to the cross-bar J of the rake, in the rear of the cross-bar I thereof, the lower outer ends of the teeth of the rake resting upon the board C, and the ropes acting upon the under side of the rake-head, as shown and described, and for the purpose set forth.

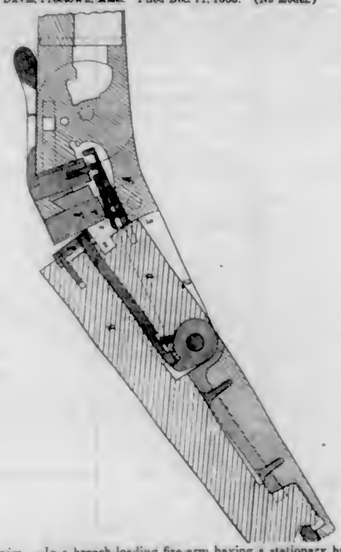
294,769. HORSE-COLLAR PAD. DEXTER CURTIS, Madison, Wis. Filed Aug. 29, 1883. (No model.)

Claim.—The herein-described leather metal-lined collar-pad, consisting of a curved body of leather or like flexible material, and a narrow metal bearing-plate applied to the under side of the arch, and secured thereto by integral edge prongs or lugs, substantially as described.



294,770. SIGHTING ATTACHMENT FOR FIRE-ARMS. HARRY C. CUSHING, New London, Conn. Filed June 11, 1883. (No model.)

Claim.—1. The combination, with a rifle or other fire-arm, of the clamp-sleeve *d*, the arm *e*, pivoted to the sleeve, the tubular socket *f*, secured to the mirror-frame, and the mirror having the non-reflecting spot *h*, all substantially as described, and for the purpose set forth.



2. In combination, a rifle or other fire-arm, an adjustable reflector attached thereto, and a lamp also attached to the rifle, all substantially as described.

294,771. HEATING AND VENTILATING DRUM FOR STOVES. JOHN FRANKLIN DAVIS, Altoona, Pa. Filed June 1, 1883. (No model.)

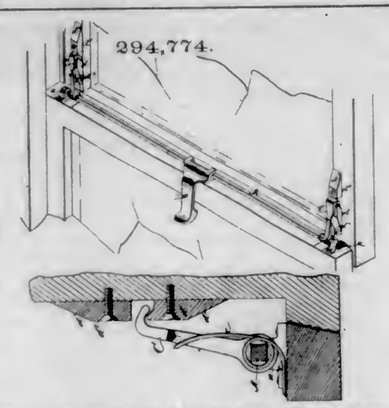
Claim.—The combination, with a stove, of the heating and ventilating drum or jacket B, surrounding the fire-pot, and having side openings, *a a* and *c c*, controlled by slides *b b* and *d d*, and the external cold-air pipe, C, having a valve, D, all constructed and arranged as and for the purpose described.

294,772. BARREL-LOCK FOR BREAKDOWN GUNS. NATHAN RUSSELL DAVIS, Freetown, Mass. Filed Dec. 11, 1883. (No model.)

Claim.—In a breech-loading fire-arm having a stationary breech and a barrel or barrels pivoted or hinged, so as to be movable relatively to such breech, in manner as set forth, the combination of the notched latch G and its actuating-spring *b*, secured or attached to the bolt E, so as to be movable lengthwise thereby, with the breech A, the barrel or barrels B, the notched locking projection D, and the stationary latching-catch *d*, such catch being extended from the breech, and all being arranged in manner to operate substantially as set forth.

294,773. VENTILATING-DAMPER. JOHN P. DORR, Neenah, Wis. Filed June 25, 1883. (No model.)

Claim.—1. As a damper for stoves, ventilators, &c., a counterbalanced plate adapted to be hung in or over the ventilating or draft opening, in combination with means, substantially as described, for regulating and gaging its action, as set forth.

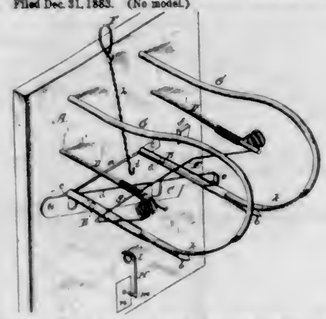


2. The damper consisting of a plate formed with two leaves bent to form an inverted V, and to be hung in or over the ventilating-opening, as set forth.

3. The combination, with plate C, having a slot in one side, of the spirally-flanged bolt D, adapted to act upon the edges of said slot, as set forth.

294,774. SASH-FASTENER. FREDERICK EBERLEIN, Chicago, Ill. Filed Jan. 12, 1884. (No model.)

Claim.—1. In a window-fastener, a rod journaled on the lower sash, having a handle in its center, and a spring-actuated hooked arm at each end, in combination with a series of beveled stops arranged in



294,774.

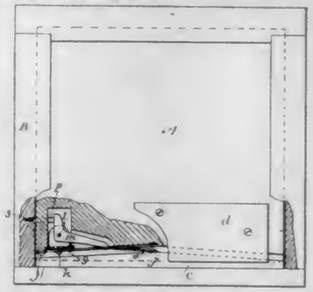
pairs upon the upper sash, one of which is formed with an under-beveled end, substantially as and for the purpose set forth.

2. The handle B, having stop *b*, rod or journal A, castings *a a*, hooked arm C, and spring *c* upon the lower sash, in combination with the stops *d d'*, beveled upon one end, and one of them under-beveled, substantially as shown, and for the purpose set forth.

294,775. TEMPORARY BINDER. WILLIAM ERWIN ELAM, Americus, Ga. Filed Dec. 31, 1883. (No model.)

Claim.—1. In a temporary binder, the combination, with the receiving-standards thereof, of a pivoted and slotted plate and a stop or latch for holding the plate engaged with the standards, substantially as and for the purpose set forth.

2. A temporary binder for letters or other papers, consisting of a suitable base, having removably secured thereto a receiving standard or standards, and an upright or uprights terminating in spring ends normally impinging against said standard or standards, and a suitable guard for holding said papers compactly upon the standards, substantially as and for the purpose specified.



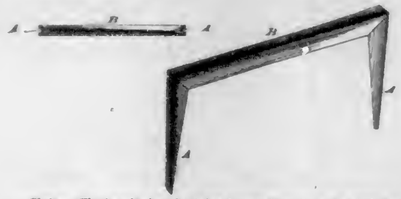
3. The base of a temporary binder for letters or other similar papers, provided with a transverse slot, having secured therein and to the base suitable receiving-standards, in combination with confining-uprights, also secured to the base, and terminating in springs normally impinging against the upper extremities of the standards, an adjustable guard, and means, substantially as described, for holding this guard out of contact with said standards, for the purpose set forth.

4. A temporary binder consisting of a slotted base, having connected thereto hollow grooved receiving-standards provided with sharpened extensions, and suitable confining-uprights having their free ends terminating in springs engaging with the extensions of the standards, in combination with a guard normally abutting against said standards and adjustable upon posts secured to the base, and a device forming a means for holding the guard out of contact with the standards, and a hanger for the binder, substantially as shown and described.

5. A temporary binder for letters or other papers, consisting of a base provided with projecting stubs, in combination with hollow receiving-standards, constructed to fit over and upon said stubs, and provided with right-angular projections fitting in a mortise in the base, a pivoted plate or plates for holding the standards upon said base, confining-uprights terminating in spring ends impinging against the standards, and an adjustable guard for retaining the papers in place, all arranged and operating substantially as and for the purpose specified.

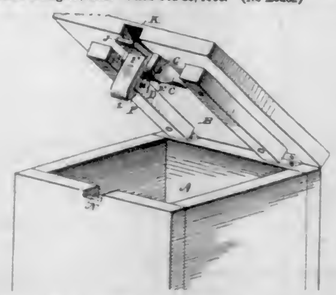
294,776. WEATHER-STRIP. JEREMIAH R. FOGG, Salisbury, Mass. Filed Jan. 17, 1884. (No model.)

Brief.—A weather-strip consisting of a bar or guard-strip, spring, and operating-lever arm. The bar or guard-raising spring is interposed between the bar and operating-lever arm.



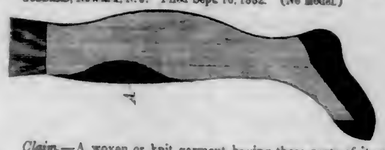
Claim.—1. As an improvement in weather-strips, the combination of the vertically-moving bar *c*, arm-spring *e*, suitably fulcrumed upon the door at one end, and at the other end attached to said bar, near the lineal center thereof, a pivotal lever arranged to act upon said spring between its fulcrum and its connection with said bar, and a stop arranged to actuate said lever and through said spring depress the bar, substantially as specified.

2. In combination with bar *c*, spring *e*, and a pivotal lever arranged to act upon said spring, and thereby depress said bar, an adjustable stop arranged to engage said lever and actuate the same to the required extent at the closing of the door, substantially as specified.



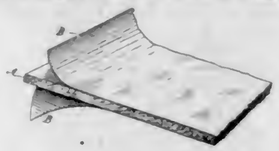
3. The combination of spring *e*, a pivotal lever arranged to act thereon, and the lever and spring-holder formed with a recessed base, *g*, to receive the spring, perforated ears *k*, to receive and pivotally support the lever, and holes *i i*, arranged adjacent to the spring-recess, whereby the heads of the securing-screws *h* engage and sustain said spring, substantially as specified.

294,777. WOOD-WORKER'S DOG. JOHN FORBES, San Francisco, Cal. Filed Jan. 3, 1884. (No model.)



Claim.—The herein-described dog for wood-workers, consisting of a body and two depending arms constructed at right angles to the body, and provided with inwardly-beveled or V-shaped edges, and adapted to be driven into the wood, so as to be flush with the surfaces thereof, in the manner and for the purpose as set forth and specified.

294,778. BOX-FASTENER. SAMUEL D. FORD and FRANCIS M. SPENCER, South Abington, Mass. Filed Oct. 23, 1883. (No model.)



Claim.—The combination of a box having a recess in the inside of its front, a bail secured horizontally over the said recess and having beveled upper edge, a cover hinged to the said box and having a wedge-shaped or triangular recess in its under side at its front edge, registering with the recess in the front of the box, a leaf secured to the under side of the cover and having a recess at its front end, and a latch pivoted in the said recess and comprising a body, a downwardly-extending hooked catch, and a forwardly-projecting finger-piece registering with the triangular recess in the cover and extending flush with the front edge of the latter, as set forth.

294,779. ARTICLE OF KNITTED OR WOVEN WEAR. WILLIAM GODDARD, Newark, N. J. Filed Sept. 16, 1882. (No model.)

Claim.—A woven or knit garment having those parts of it which are subjected to the greatest wear and tear re-enforced or rendered durable by a strengthening solution, other parts being left untreated, substantially in the manner and for the purposes described.

294,780. COVERING FOR STEAM-BOILERS, &c. GEORGE CLEVELAND HEKES, Chicago, Ill. Filed July 16, 1883. (No model.)

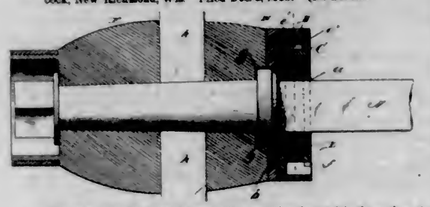
Claim.—1. The combination, with the heat-radiating surface, of a protective covering therefor, the same consisting of a layer of asbestus or the like faced with tin-foil, substantially as described.

2. The protective covering for heat-radiating surfaces, the same consisting of a layer of asbestus or the like having its face coated with tin-foil, substantially as described.

3. The protective covering for heat-radiating surfaces, the same consisting of a layer of asbestus or the like having both of its faces coated with tin-foil, substantially as described.

294,781. DIVIDED SCREW-NUT. GEORGE S. HELTS, Batavia, N. Y. Filed Dec. 31, 1883. (No model.)

Claim.—1. In combination with a screw, B, and cup or holder A, made to encircle the screw, said cup or holder having inclined or diverging walls or bearings, a divided nut, C, for the screw, fitted to said bearings of the holder, with automatic means to force the parts of the nut asunder as they are moved toward the wider or more open part of the bearings of the holder, substantially as and for the purpose set forth.



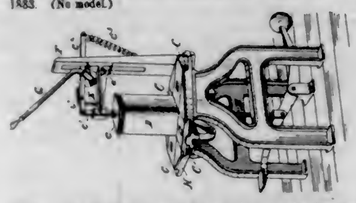
2. In combination with a screw, B, and holder A, fitted to encircle the screw, said holder having diverging walls or bearings, a divided nut, C, for the screw, fitted to said bearings or walls of the holder, with means to automatically guide the parts of the divided nut as they are moved longitudinally along the bearings of the holder, substantially as shown and described.

3. The combination of a screw, B, cup or holder A, encircling said screw, and having diverging bearings or walls, divided nut C for the screw, fitted to the bearings or walls of the holder, and stops *g*, to limit the longitudinal movements of the nut along the bearings of the holder, substantially as set forth.

4. The combination of a screw, B, cup or holder A, encircling said screw, and provided with diverging bearings, a divided nut, C, for the screw, fitted to the diverging walls or bearings of the holder, and guides for the parts of the nut serving to keep said parts of the nut evenly opposed to each other during their longitudinal and lateral movements, substantially as described.

5. In combination with the body D and screw B of a clamp, a divided nut, C, substantially as described, for the screw, fitted to the head of the clamp, so as to move longitudinally along the same, and means to force the parts of the nut asunder as the latter is moved thus longitudinally, substantially as set forth.

294,782. SAND-BAND FOR VEHICLE-WHEELS. JAMES W. HITCHCOCK, New Richmond, Wis. Filed Dec. 8, 1883. (No model.)

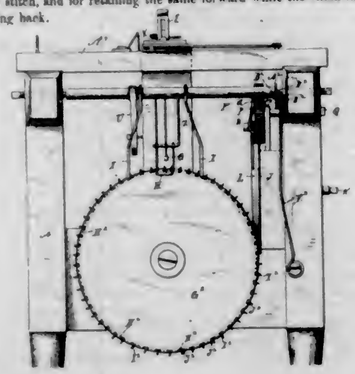


Claim.—1. In a sand-band, the combination, with the axle, of a rubber ring or band, a metallic collar fitting over and compressing the same, and a protecting-cover, as set forth.

2. In a sand-band, the combination, with the axle, of a rubber ring or band, a metallic collar fitting around the same and formed with a dust-chamber, and a protecting-cover, as set forth.

3. In a sand-band, the combination, with the axle, of a rubber ring or band, a metallic collar fitting around the same and formed with a dust-chamber, an opening communicating with said dust-chamber, and a protecting-cover, as set forth.

4. In a sand-band, the combination, with the axle, of a rubber ring or band, a metallic collar fitting around the same, and having annular flanges extending outward and forming a dust-chamber, an opening communicating with said chamber, and a protecting-cover, as set forth.



294,783. CAN-MACHINE. JAMES HOGG, Chicago, Ill. Filed Mar. 14 1883. (No model.)

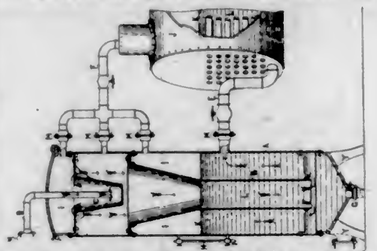
Claim.—In combination with the forming or crimping mechanism of a can-machine, the independently-operating presser mechanism composed of the bar *c'*, provided with a foot or plate, *c*, bracket E, having cam-surface *g'*, lever e^2, pivoted to said bracket, and lever G, pivoted to lever e^2, all arranged and operating substantially as and for the purpose described.

294,784. KNITTING-MACHINE. WILLIAM H. H. HOLLIS, Tyrone, Pa., assignor, by mesne assignments, to Robert S. Seeds, same place. Filed Sept. 14, 1883. (Model.)

Brief.—The stitch-presser is hook-shaped, and has but one end secured to the rock-shaft, while its loop or U-shaped portion embraces or straddles the needles, as heretofore. By this means the stitch-presser is given a lateral elastic motion, so that it will not bear too hard upon or strain the needle as it moves along the same during the rotation of the needle-carrier. A right-angular guard wire or arm projects across the free end of the presser. A lock is provided at one end of the rock-shaft for the purpose of holding the presser back while the stitch-lifter is catching a stitch, and for retaining the same forward while the stitch-lifter is moving back.

Claim.—1. The rock-shaft having the approximately hook-shaped spring stitch-pressing loop secured by but one end to the shaft, means for operating this shaft, and the right-angular guard wire or arm projecting across the free end of the presser, substantially as set forth.

2. The combination of the main rock-shaft having the projecting arm, means for operating the rock-shaft, the reciprocating stitch-lifter pivoted to said arm, the pitman having the elongated bearing-slot, and pivotally connected to the arm, the auxiliary rock-shaft provided with the cam-plate formed with the double-beveled notch in its edge, and carrying the stitch-presser, fabric-pressers, and thread-carrier, the needle-carrier having the projecting needles, means for operating the needle-carrier, and a fixed spring having a bent end engaging the notches to hold the rock-shaft stationary while the main rock-shaft and its arm and stitch-lifter move the limit of the elongated pivotal bearing-slot of the pitman, substantially as set forth.

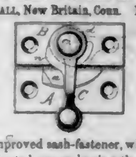


3. The combination of the frame, the needle-carrier having the projecting needles, and the rear plate or disk formed with a notched periphery, the main gear-wheel having the lateral-curved flange engaging the notches, the pinion meshing with this gear, the main rock-shaft having the two arms, the pitmen extending, respectively, from the two arms of this rock-shaft to the pinion and to an arm on the front rock-shaft, the front rock-shaft carrying the stitch and fabric pressers, and the stitch-lifter pivoted to the main arm on the main rock-shaft, substantially as and for the purpose set forth.

294,785. DOOR-SPRING. WILLIAM W. JACKSON, Chicago, Ill. Filed July 23, 1883. (No model.)

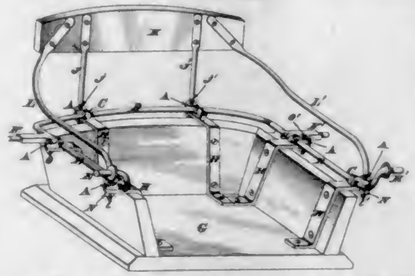
Claim.—The combination of the door having therein a mortise, C, extending entirely through it from one of its vertical edges to the other, the said door being provided on its hinged edge with the slotted plate I, located at one end of the said mortise, the hook F, projecting through the slot in the said plate, and connected by means of a cord or wire, G, to a sliding head, E', having a beveled outer end projecting from the free edge of the door, and arranged in the said mortise, the spring H, arranged between the said plate and the plate I, the fixed screw or pin D, adapted and arranged to receive or engage the hook F, the V-plate I', and the door-frame, substantially as and for the purposes specified.

294,786. FEED-WATER HEATING AND PURIFYING APPARATUS. N. A. T. JONES, Plymouth, Mass. Filed Nov. 23, 1883. (No model.)



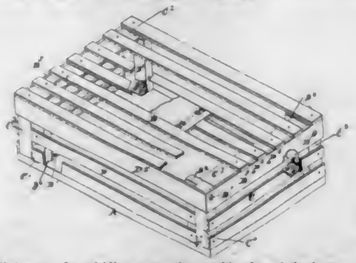
Claim.—1. In a water heating and purifying apparatus, the combination of the base O, the water-chambers R R, the blow-off pipes R' R'', the exhaust-passages V V, with condense-chambers and drip-pipes V' V'' in the bottom, and tube-sheet and base cast all in one piece, the shell N, the exhaust-steam chamber N', the group of bent water-pipes P, each pipe connected in its center by a union-joint, one end of which communicates with the inflow water-chamber and its other end with the outflow water-chamber, forming a direct water communication from one water-chamber to the other through the group of small water-pipes P, substantially as shown and described.

2. In a water heating and purifying apparatus, the combination of the reservoir A, the removable water-guide B, the deep removable overflow-pail C, the inflow-pipe D, the outflow-pipe E, the live-steam pipe or pipes F, the blow-off pipe G, all provided with suitable valves, and glass water-gage H, substantially as shown and described.



3. In a water heating and purifying apparatus, the combination of the base O, the water-chambers R R, the blow-off pipes R' R'', the exhaust-passages V V, with condense-chambers and drip-pipes V' V'' in the bottom, and the tube-sheet and base cast all in one piece, the shell N, and the exhaust-steam chamber N', the group of bent water-pipes P, each pipe connected in its center by a union-joint, one end of which communicates with the inflow water-chamber and its other end with the outflow water-chamber, forming a direct water communication from one water-chamber to the other, through the group of small water-pipes P, the reservoir A, the removable water-guide B, the deep removable overflow-pail C, the inflow-pipe D, the outflow-pipe E, the live-steam pipe or pipes F, the blow-off pipe G, all provided with suitable valves, and glass water-gage H, substantially as shown and described.

294,787. FASTENER FOR THE MEETING-RAILS OF SASHES. ELEAZER KEMPSHALL, New Britain, Conn. Filed Sept. 18, 1882. (Model.)



Claim.—The improved sash-fastener, which consists of the respective plates and the pivoted sweep having the cam or enlargement upon its hub, the edge of which cam stands obliquely across the meeting line of the sash-rails when the sweep stands at a right angle thereto, substantially as described, and for the purpose specified.

294,788. SHIFTING-RAIL FOR VEHICLES. JACOB KNAPP, Cincinnati, Ohio. Filed Dec. 24, 1883. (No model.)

Claim.—In combination with the ordinary seat-irons H, perforated at I, the nuts A, provided with inwardly-projecting hooks C, that grasp the rail D, said nuts being traversed by the lower ends of back-braces J J' and arm-rests L L', which braces and rests are retained in place by screwing upon them the customary nuts N, as herein described.

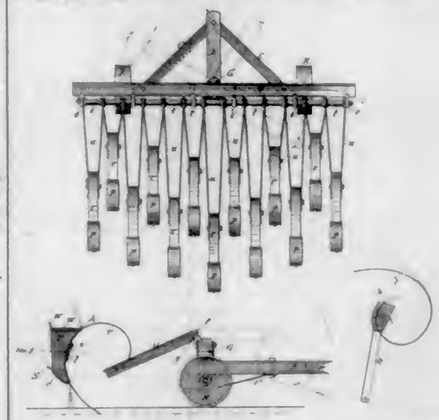
294,789. FOLDING CRATE. LOUIS KRIECKHAUS and CHARLES KRIECKHAUS, St. Louis, Mo. Filed Jan. 3, 1884. (Model.)

Claim.—1. In a folding crate, the combination of the bottom, the sides, the ends, and the top, the sides and the ends having end posts hinged to the bottom, to fold down with their sides and ends, and to rest on the bottom of the crate, and the top having side and end pieces to surround the sides and ends of the crate, whether the sides and ends of the crate are in vertical or horizontal position, as set forth.

2. In a folding crate, the combination of the bottom, the sides, the ends, and the top, the sides and ends having end posts formed with pin-holes and hinged to the bottom, to fold down with their sides and ends, and to rest on the bottom of the crate, and the top having side and end pieces to surround the sides and ends of the crate, whether the sides and ends of the crate are in vertical or horizontal position, the end pieces of the top having pin-holes in line with the pin-holes in the end posts when the latter are in vertical position, and pin-holes in line with the pin-holes of the end posts of the sides of the crate when the said sides and ends of the crate are folded down, as set forth.

3. In a folding crate, the top having side and end pieces and boards on its under side, inside of the end pieces and between the side pieces, in combination with a bottom and sides and ends having end posts and hinged to fold down inwardly, the said boards to occupy either a position between the upper ends of the end posts on opposite sides, or when the crate is folded occupying positions on the outside of the ends of the crate, as set forth.

294,790. PAINT-CAN. WILLIAM KUHEN, Cincinnati, Ohio. Filed Jan. 21, 1884. (No model.)



Claim.—1. A paint can or vessel composed of a pair of dished shells united at their margins, and provided with a suitable outlet, one of said shells being relatively more compressible than the other, for the purpose herein described.

2. A paint can or vessel consisting of a pair of dished shells of approximately elliptical form united at their margins, and provided with a suitable outlet, one of said shells being relatively more compressible than the other, for the purpose described.

294,791. SPRING-TOOTH CULTIVATOR AND DRILL. CHARLES LA DOW, Albany, N. Y. Filed Mar. 30, 1882. (No model.)

Brief.—Independently-hinged drag-bars with sectional tooth-sockets, between which are adjustably clamped, edgewise, flat curved spring-teeth, said sockets acting as weights and runners to regulate the depth of cut, the heavier weights being on the short bars. Seed-box with regulating-slide adjustably attached to the spring-tooth, the vibrations of which discharge the seed. Drag-bars with attached spring-tooth and seed-box reversible on frame.

Claim.—1. In a cultivator, the combination of a draft-frame, rising-and-falling drag-bars attached thereto, sectional tooth-sockets on the ends of the drag-bars, and teeth clamped between the sections of said sockets, and capable of being angularly adjusted relatively to the drag-bars, the sockets on the drag-bars acting as shoes or runners to regulate the cut of the teeth.

2. The combination of the parallel bars n n, hinged to the draft-frame at their forward ends and adapted to be drawn toward each other at their rear ends, a tooth-socket placed between the ends of the bars, a curved tooth, substantially such as described, and capable of angular adjustment in the socket, and a clamping-bolt, which draws the ends of the bars together and clamps the tooth in its socket.

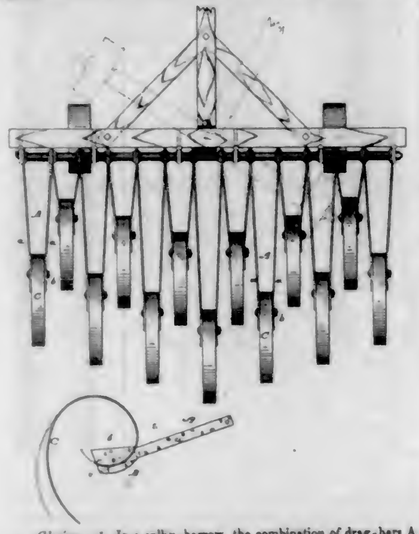
3. In a cultivator, the combination of a draft-frame, alternate long and short drag-bars attached to said draft-frame, teeth on the draft-bars, and weights, also constituting tooth-sockets on the draft-bars, adapted to enforce the cut of the teeth in proportion to the length of the drag-bars.

4. In a cultivator, the combination of a vibratory spring-tooth with a grain carrying and distributing box carried on the tooth, substantially as and for the purpose described.

5. The combination of a grain carrying and distributing box and a vibratory spring-tooth, the vibrations of which set upon the grain in the box to regulate its discharge.

6. In a cultivator, the combination of a vibratory spring-tooth with a grain carrying and distributing box carried on the tooth, and with mechanism for regulating the discharge of the grain.

7. In a cultivator, the combination of the draft-frame, teeth hinged thereto and adapted to be reversed on the frame, grain-boxes mounted on the teeth, and mechanism for preventing the escape of the grain when the teeth are reversed, substantially as described.



8. The combination of a vibratory spring-tooth and a seed-box adjustably mounted thereon, substantially as and for the purpose described.

9. In a cultivator, a draft-frame, a spring-tooth attached thereto and capable of being set at different angles relatively to said draft-frame, in combination with a seed-box adjustably mounted on the tooth, substantially as and for the purpose described.

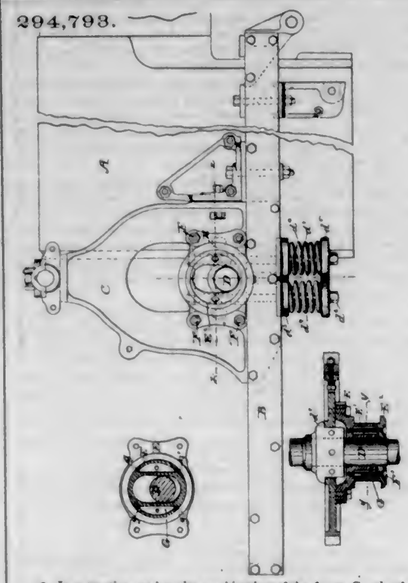
10. In a cultivator, the combination of a draft-frame, drag-bars attached thereto and adapted to conform to the inequalities of the surface, spring-teeth on the drag-bars, seed-boxes adapted to conform to the movement of the drag-bars, and mechanism for gaging the penetration of the teeth, substantially as described.

294,792. HARROW OR CULTIVATOR. CHARLES LA DOW, Albany, N. Y. Filed Mar. 1, 1883. (No model.)

Brief.—Independently-hinged drag-bars carrying shoes or runners, with spring-teeth adjustably attached. The shoes gage the depth of penetration.

Claim.—1. In a sulky-harrow, the combination of drag-bars A, hinged at their forward ends and provided with shoes B at their rear ends to slide on the ground, with teeth adjustably secured to said shoes, so that said teeth may project more or less below the shoes into the ground, as shown and described.

2. The combination of the independent drag-bar A and curved tooth C with the shoe B, slotted to permit the tooth to slide therein for the purpose of setting it more or less deep in the ground below the shoe, substantially as described.



3. The combination of an independently-acting drag-bar, and a spring-tooth curved above its attachment to the bar, substantially as described, and capable of being angularly adjusted relatively to the bar, and adapted to be held as adjusted by means of clamping devices applied to the edges of the tooth.

294,793. TRACTION-ENGINE BEARING. FRANK F. LANDIS, Waynesborough, Pa. Filed Dec. 9, 1882. (No model.)

Claim.—1. In a traction-engine, an axle-bearing block provided with an inner and an outer bearing-surface, the former adapted to the rotation of the axle, and the latter adapted to its vertical oscillation, in combination with the sill B, formed of two parallel bars, suspension-rods between said bars, and springs under said sills, substantially as and for the purpose described.

2. The combination of the axle D, blocks *d* and *d'*, suspension-rods d^2, sills B, caps d^2 d^3, and springs between said caps, substantially as and for the purpose described

294,793.

3. In a traction-engine, the combination of the frame C and axle D with bridge E, having the journal E' and oil-pockets therein, substantially as and for the purpose described.

4. The combination, with the side frame, of the bridge-piece E, secured thereto, and having the journal E', with pockets G G, provided with the ducts *g g'*, and the removable flange E^2, substantially as and for the purpose described.

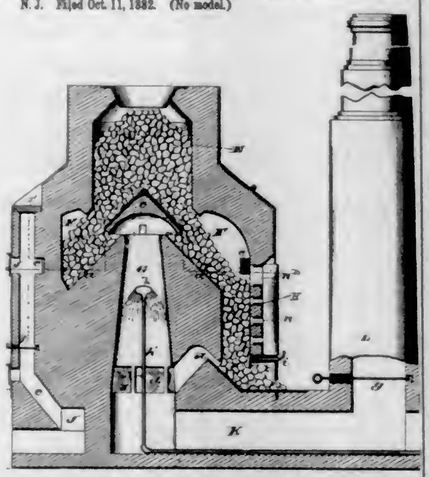
5. In a traction-engine, the combination of the axle D, caps d^2 d^3, springs d^4, rods d^2, and bearings *d d'*, with the slotted bridge E, having the annular journal E', substantially as and for the purpose described.

294,794. TRACTION-ENGINE. FRANK F. LANDIS, Waynesborough, Pa. Filed Mar. 21, 1883. (No model.)

Claim.—1. In a traction-engine, the combination of a boiler and a boiler-supporting frame yieldingly suspended from a traction-axle, with a yielding thrust and draft bar connecting the frame and axle-bearings, substantially as and for the purpose described.

2. In a traction-engine, the combination of a traction-axle, a frame-work yieldingly suspended therefrom, and a thrust and draft bar secured to the traction-axle bearings and passing through a bracket located upon the frame-work in front of and in line with the bearings, and provided with cushioning-springs located in front and in rear of said bracket, substantially as and for the purpose described.

3. In a traction-engine, the combination of the sills of a boiler-supporting frame, and a traction-axle located above the sills and provided with a bearing connected by suspension-rods to springs located below the sills, and having an inner flange adapted to bear against the housings, with a thrust and draft bar, comprising an inner and an outer plate, arranged to embrace a portion of the housings, and connected to cushioning-springs arranged in line with the traction-axle bearing, substantially as and for the purpose described.



4. A traction-axle bearing-box bored vertically for the reception of suspension-rods, and bored transversely for connection with a horizontal thrust and draft bar or bars, and provided with flanges, in combination with thrust and draft bars, substantially as shown and described.

5. The combination of the bearing-box D, bearing C, strap D′, suspension-rods E, plate F, provided with flanges, sills B, springs G, and plate H under said sills, substantially as and for the purpose described.

6. The combination of the sills B, brackets K and B², the housing, and boiler, with a horizontal thrust and draft bar composed of plates, substantially as shown and described.

7. The combination, with the axle-bearing D, suspension-rods E, and springs G, of the springs M M′, located upon horizontal bars, and arranged to be compressed by the forward and backward movement of the axle, substantially as and for the purpose described.

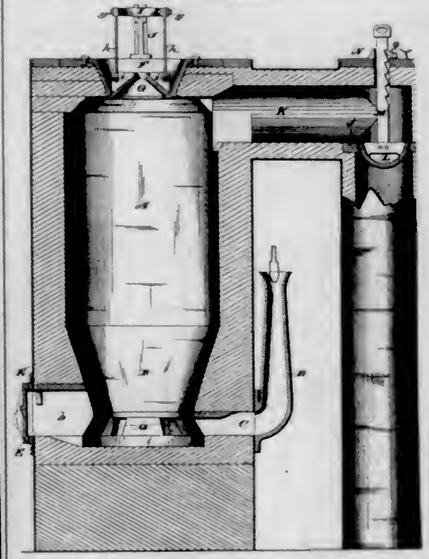
294,795. ORE-ROASTING FURNACE. NELSON M. LANGDON, Chester, N. J. Filed Oct. 11, 1882. (No model.)

Claim.—1. In an ore-roasting furnace, a reverberatory heating or combustion chamber having an inclined or sloping bottom and a central downtake provided with a cap arranged above and over the entrance to said downtake, substantially as set forth.

2. In an ore-roasting furnace, a reverberatory heating or combustion chamber provided with a bottom having a slope or inclination of about the angle of repose of the ore to be roasted, in combination with a supply-chamber located above said heating-chamber and extending downwardly a sufficient distance to prevent the ore from filling the reverberatory space of the heating-chamber, substantially as set forth.

3. The combination, with a reverberatory heating-chamber having an inclined bottom whose slope or inclination is about that of the angle of repose of the ore to be roasted, of a supply-chamber extending downward sufficiently to prevent the ore from filling the reverberatory space of the heating-chamber, and a series of ore-chambers arranged to receive the ore by gravity from said heating-chamber, substantially as set forth.

4. In an ore-roasting furnace, the combination, with a series of ore-chambers, of a central downtake connected with said ore-chambers by passages adapted to convey gases, but so constructed as to prevent the admission of ore to said downtake, substantially as set forth.

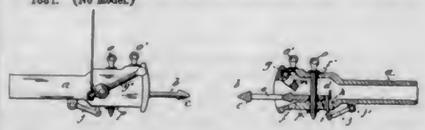


5. In an ore-roasting furnace, the combination, with a series of ore-chambers and an exit-flue, of a central downtake connected near its lower end to said ore-chambers by angular passages, as and for the purpose set forth.

6. In an ore-roasting furnace, the combination, with ore-chambers, a central downtake, and flues connecting the downtake with the lower portions of said ore-chambers, of steam-conduits located in the outer walls of the ore-chambers for admitting steam in direct contact with the ore, and a rose or sprinkler arranged within the downtake, substantially as set forth.

7. In an ore-roasting furnace, the combination, with the central downtake having a gas-passage near its lower end connecting with an ore-chamber, of a rose or sprinkler for water arranged within the downtake, substantially as set forth.

8. The combination, with the heating-chamber, of gas-flues and air-pipes arranged in the wall of the furnace, said gas-flues connecting at their lower ends with a distributing-flue, and both said flues and pipes being provided with suitable valves or dampers, substantially as set forth.



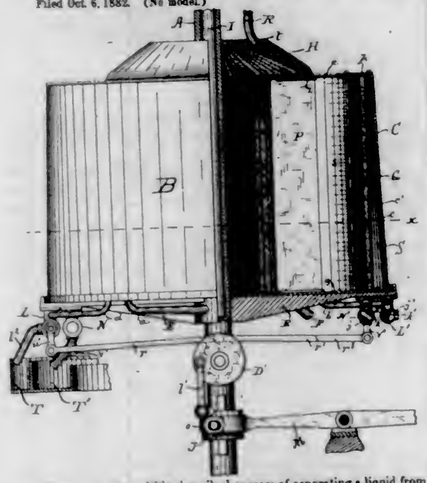
294,796. GAS-PRODUCING FURNACE. NELSON M. LANGDON, Chester, N. J. Filed May 23, 1883. (No model.)

Claim.—1. The combination, with a chamber encircling the bosh, door-passages located on diametrically-opposite sides of the bosh and communicating at their outer ends with said encircling chamber and at their inner ends with the combustion-chamber, and tuyeres located between said door-passages and on opposite sides of the bosh, of the steam-jet-blast injector for introducing steam and air into the annular chamber around the bosh and from thence through the door-passages and tuyeres to the combustion-chamber, substantially as set forth.

2. The combination, with a gas-producing furnace provided with a chamber encircling the bosh, of the tuyeres *a a*, constructed to diminish in width from their outer to their inner ends, the door-passages *b b*, located on diametrically-opposite sides of the bosh, and the steam-jet-blast injectors D, substantially as set forth.

294,797. CAR-COUPLING. GEORGE W. LARAWAY, Hartford, Conn., assignor of one-fourth to Fred C. Rockwell, same place. Filed Dec. 17, 1881. (No model.)

Claim.—1. In a car-coupler, a link wedge-shaped at one end, provided with projections about midway of its length, with the hook at the other end, and having perforations for the passage of coupling-pins, all substantially as described, and for the purpose set forth.



2. In a car-coupler, the draw-head *a*, having the vertical perforations *f* and *f′* in the central line of the draw-head, in combination with the pawl *g*, the pin *o*, and the link *l*, all substantially as described.

3. In a car-coupler, in combination, the draw-head *a*, having the vertical central perforations, *f* and *f′*, the pawl *g*, with vertical perforation, the link *b*, the pin *o*, and lever *g′* and connected mechanism for operating the pawl, all substantially as described.

4. In a car-coupler, the combination of draw-head *a*, having perforations *f f″ h*, pawl *g*, pawl-lever *g′*, link *b*, connecting-rod *i*, crank *j*, rod *k*, and lever *k′*, all substantially as described, and for the purpose set forth.

5. In an automatic car-coupler, the combination of draw-head *a*, link *b*, pin *o*, secured in the draw-head by spring-pin *p*, pawl *g*, and lever *g′*, and mechanism for operating the lever from the sides or top of the car, all substantially as described, and for the purpose set forth.

294,798. PROCESS OF AND APPARATUS FOR SEPARATING RAW SUGAR LIQUOR FROM THE SCUM AND MECHANICAL IMPURITIES CONTAINED THEREIN. S. MORRIS LILLIE, Philadelphia, Pa. Filed Oct. 6, 1882. (No model.)

Claim.—1. The within-described process of separating a liquid from its mechanical impurities specifically lighter and specifically heavier than itself, consisting in subjecting the impure liquid to the action of centrifugal force in a rapidly-revolving drum, and in drawing off from the revolving drum by itself the liquid separated from its mechanical impurities by the centrifugal force, substantially as specified.

2. The within-described process of separating a liquid from its mechanical impurities specifically lighter and specifically heavier than itself, consisting in running the impure liquid continuously into a suitable rapidly-revolving drum, and in drawing off, respectively, from the concentric layers of the specifically lighter impurities, and the comparatively clear liquid formed in the drum by the centrifugal force, the said lighter impurities and the clear liquid as fast as the separation progresses, substantially as specified.

3. The combination, with the drum of a centrifugal machine, of two series of discharging-spouts, one series draining the drum near the axle, and the other near its circumference, means for introducing a liquid continuously into the drum between the two series of spouts, while the machine is in motion, and means for introducing a liquid continuously into the drum, while in motion, between the circumference of the same and the outer series of draining-spouts, substantially as specified.

4. The combination, with the drum of a centrifugal machine, of one or more discharging-spouts, draining the drum through ports near the axle, means for introducing a liquid into the drum, while in motion, between the ports of the discharging-spouts and the circumference, and means for introducing a liquid continuously into the drum, while in motion, still nearer to or at the circumference of the drum, substantially as specified.

5. The combination, with the drum of a centrifugal machine, of two series of discharging-spouts attached to the drum and revolving with it, one series draining the drum at points near the circumference, and the other series draining it at points near the axle, means for introducing the liquid to be treated into the drum, while revolving, between the two series of spouts or the openings of the same into the drum, and apparatus for regulating, while the machine is in motion, the flow of material from the outer or from both series of spouts independently of the flow of the liquid into the drum, substantially as specified.

6. The combination, in the drum of a centrifugal machine, of the annular wall C, permeable to liquids, surrounding annular chamber S, inner chamber, O, a series of discharging-spouts, F, for the said inner chamber, opening into it near the axle, means for introducing a liquid continuously into the inner chamber between the openings of the discharging-spouts into the same, and the annular permeable wall C, and means for introducing a liquid continuously into the chamber S while the machine is in motion, substantially as specified.

7. The combination, in the drum of a centrifugal machine, of an annular wall, C, permeable to liquids, surrounding annular chamber S, inner chamber, O, two series of discharging-spouts for the said inner chamber, one series draining the chamber at points near the axle, as at F, and the other series draining it at points near the annular permeable wall C, as at N, means for introducing a liquid continuously into the drum at a distance from the axle between the two series of discharging-spouts while the machine is in motion, and means for introducing a liquid continuously into the annular chamber S while the machine is in motion, substantially as specified.

8. The combination, with the drum of a centrifugal machine, of an annular wall, C, permeable to liquids, and dividing the interior of the drum into two chambers, the outer annular chamber, S, and the inner chamber, O, two series of discharging-spouts for the inner chamber, one series draining it at points near the axle, and the other draining it at points near the permeable wall C, means for introducing a liquid continuously into the outer chamber, S, while the machine is in motion, and apparatus for regulating the flow of material from one or from both series of spouts, substantially as specified.

9. The combination, in the drum of a centrifugal machine, of the annular filtering-wall C, outer chamber, S, inner chamber, O, spouts F, for draining the inner chamber, spouts for draining the outer chamber, S, means for introducing a liquid continuously into the inner chamber, O, between the spouts F and the filtering-wall, and apparatus for regulating, while the machine is in motion, the flow of material through the draining-spouts of the outer chamber, substantially as specified.

10. The combination, in the drum of a centrifugal machine, of an annular filtering-wall, spouts for draining the drum at points located within the annular filtering-wall and near the axle, means for introducing a liquid continuously into the drum between the said spouts and filtering-wall, and means for regulating the flow of the liquid through the filtering-wall, substantially as specified.

11. The combination, in the drum of a centrifugal machine, of the filtering-wall C, inner chamber, O, and discharging-spouts F, for draining the same from points near the axle, outer chamber, S, and discharging-spouts L for the same, and annular hopper H, delivering into the drum between the spouts F and filtering-wall C, substantially as specified.

12. The combination, in a centrifugal machine, and with the drum of the same, of the annular filtering-wall C, inner chamber, O, and discharge-cocks F and N for the same, outer chamber, S, and discharge-cocks L, axial conduit I, communicating with the chamber S through the radiating tubes *a*, and annular hopper H, communicating with the inner chamber, O, between the discharge-cocks F and the filtering-wall C, substantially as specified.

13. In the drum of a centrifugal machine, the combination, with an annular chamber, S, encircling the annular filtering-wall of the drum, of the discharging cocks or valves L and the radiating tubes *a*, independent of the cocks or valves L, communicating with an axial conduit, substantially as specified.

14. The within-described mechanism for operating the valves or cocks in the discharging-spouts of the drum of a centrifugal machine, consisting of the pivoted lever M, collar J, links *l*, and disks D, or their equivalents, and the rods *r*, connecting the disks with the operating-levers of the cocks or valves, the combination operating substantially as specified.

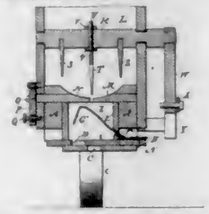
15. In a centrifugal machine, a system of mechanism for operating the cocks or valves of the discharging-spouts of the drum—the said mechanism forming a part of the machine and revolving with it—arranged, as regards the mass and disposition of the elements of the system, so that the effects of the centrifugal force due to the revolution of the machine on the various elements will neutralize each other, in combination with means for operating the system while the machine is revolving, substantially as specified.

16. The within-described process of separating from a raw sugar liquor its mechanical or suspended impurities, consisting in first defecating the raw liquor with blood or its equivalent, and in then freeing the liquor of the resulting coagulum and the specifically heavier mechanical impurities by subjecting it to the action of centrifugal force in a suitable rapidly-revolving drum, and drawing off from the revolving drum by itself the clear or comparatively clear liquor, separated from the scum and from the other mechanical impurities, substantially as specified.

294,799. MAIL-BAG CORD FASTENER AND LABEL HOLDER COMBINED. HUGH EUGENE LUNDY and CHARLES LEO LUNDY, Cincinnati, Ohio. Filed Dec. 26, 1883. (No model.)

Claim.—1. The label-holder consisting of a base-plate, the plate 7, cut out in the middle and at one end, and the outer or retaining plate, 8,

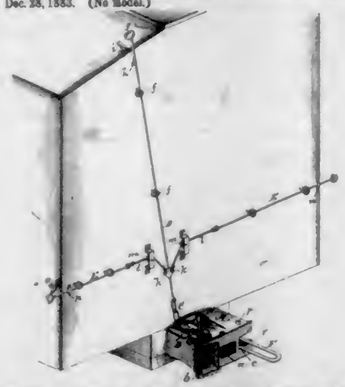
294,799.



out out in the middle only, in combination with a rivet placed through said base-plate, and having its head projecting into the label-receptacle for the purpose of binding the label in place, and the said plates being secured together, as by means of rivets.

2. The combination, with an oblong box-frame for incasing and supporting the cord-fastener mechanism, of a label-holder consisting of the said box side, a C-shaped plate, 7, a retaining-plate, 8, provided with an opening in its middle, and a rivet passing through the middle of the first or base plate, and provided with a projecting head, 10, for binding and securing the label in place between the side branches of the piece 7 and the base-plate and retaining-plate 8.

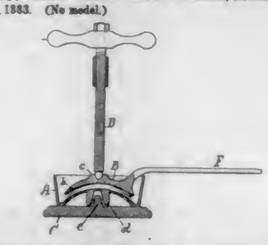
3. The combination of the spring-supporting and label-binding rivet-pin 2 with the spring 5 6, and with the mechanism incasing and supporting box-frame, and with the base-plate and the plates 7 and 8, forming the label-receptacle, all having the construction, relation, and functions set forth.



294,800. SEED-PLANTER. ANDREW JACKSON MADRA, Fort Smith, Ark. Filed Oct. 19, 1883. (No model.)

Claim.—1. The combination of the seed-box, the seed-slide having a hinged arm extending inwardly through a slot in the side of the seed-box and provided at its inner end with a downturned scraper, and suitable mechanism for reciprocating the seed-slide, as set forth.

2. The combination of the hopper, the rock-shaft having the stirrers, the seed-box arranged under the hopper and having the transversely movable seed-slide, equipped with a scraper-arm extending inwardly through a slot in the side of the said seed-box, a spring secured to the side of the frame and having its rear end connected pivotally with the outer end of the seed-slide, which is thereby forced in an inward direction, and the transporting-wheel provided on one side with cams engaging and operating the said spring, as set forth.

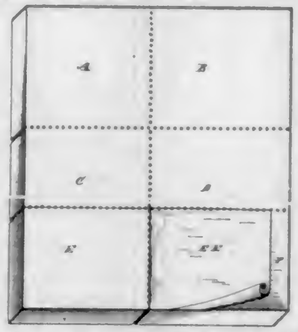


294,801. CAR-COUPLING. AMOS F. MOREY, Winfield, Kans. Filed Dec. 28, 1883. (No model.)

Claim.—1. A draw-head for car-couplings, provided with a central link-opening and two side or outer link-openings, one of which is provided with a weighted dog or latch, and the opposite outer link-opening having, in addition thereto, a lateral opening or slot to allow the link to be thrown back at right angles to the draw-head, and a boss for holding the link in said angular position, substantially as and for the purpose set forth.

2. The combination, with a suitable draw-head provided with a weighted dog or latch, of a rod connected thereto by suitable links, and extending up to the top or roof of the car, and similar rods connected to said upright rod by chains or ropes passing over pulleys and extending horizontally beyond the sides of the car, said rods passing through guides or eyebolts, and provided with projections adapted to engage with pivoted hooks or catches upon the sides and top of the car, substantially as and for the purpose specified.

294,802. HAND-PRESS. HENRY F. OSBORNE, Newark, N. J. Filed July 31, 1883. (No model.)



Claim.—1. The combination, with the receiver and presser, of means, substantially as described, for pressing them together, substantially as and for the purpose set forth.

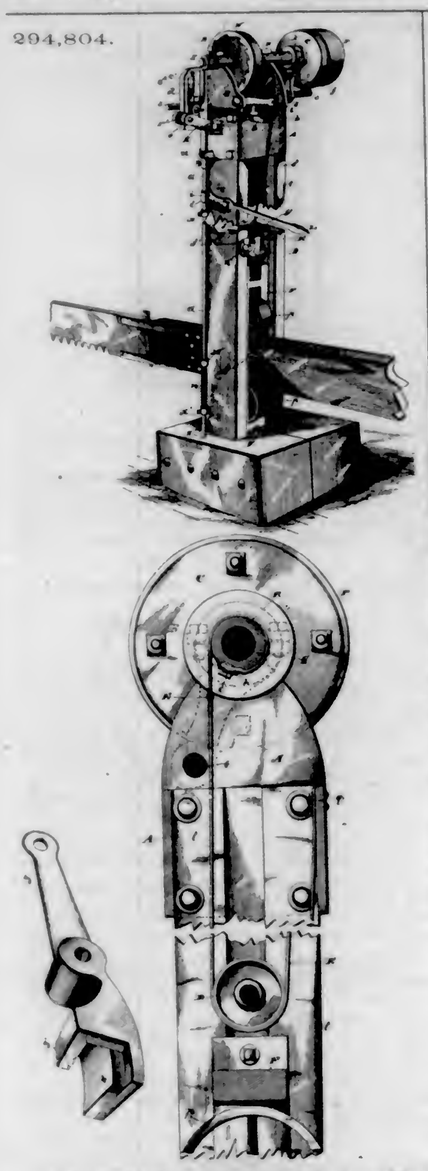
2. The combination of a receiver having corrugations *a*, a presser having corrugations *b*, and provided with handle F, and means, substantially as described, for pressing them together, as and for the purpose set forth.

3. The combination, with the frame C, provided with screw D, of the removable receiver A, provided with means to hold it from turning in the frame, and a removable presser, B, provided with a handle for oscillating it, substantially as shown and described.

294,803. PERFORATED PAPER TABLET. WILLIAM O'SHEA, Lincoln, Nebr. Filed Mar. 3, 1883. (Model.)

Claim.—As an improved article of manufacture, a tablet divided into blocks or sheets of different sizes by lines of perforations, substantially as and for the purpose set forth.

294,804. DRAG-SAW ELEVATOR. WILLIS J. PERKINS, Grand Rapids, Mich. Filed Dec. 14, 1883. (No model.)



Claim.—1. The combination, with a saw and a shear-frame, of a shaft, a friction-clutch mounted on said shaft, a band or belt connecting the shear-frame, and mechanism connected to the clutch and automatically operated by the shear-frame, whereby the upward movement of the latter can be discontinued, substantially as set forth.

2. The combination, with a shear-frame and saw, of a shaft, a loose pulley thereon, a sliding clutch, a belt connecting the saw-frame to the shaft, and intermediate mechanism for automatically engaging and disengaging the pulley and shaft.

3. The combination, with a saw and shear-frame, of a shaft, a loose pulley thereon, a sliding clutch, intermediate mechanism, whereby the movements of the shear-frame automatically control the movements of the shaft, and a suitable brake mechanism, all of the above parts combined as described.

4. In a drag-saw elevator, the combination, with the upright guides, of a head-frame provided with a shaft carrying a ratchet-wheel, a combined dog and brake adapted to engage said ratchet-wheel, and devices connecting the shear-frame and said shaft, whereby said shear-frame may be raised and lowered, substantially as set forth.

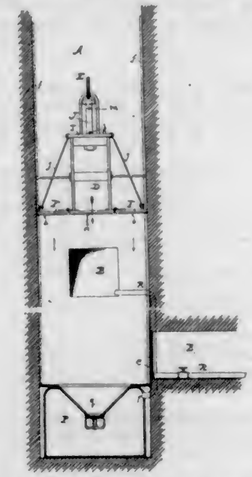
294,804.

5. In a drag-saw elevator, the combination, with a saw and shear-frame, of a shaft, a band or belt connecting the shear-frame and shaft, a friction-clutch, a loose pulley, and a longitudinally-sliding shaft for moving the clutch into and out of contact with the pulley, substantially as set forth.

6. In a drag-saw elevator, the combination, with a shear-frame and saw, of a shaft to which the shear-frame is connected, a loose pulley on said shaft, a friction-clutch, a longitudinally-sliding rod for moving the friction-clutch, and mechanism connected to the shear-frame for moving the sliding rod, substantially as set forth.

7. The combination, with a saw and shear-frame, of a shaft to which the shear-frame is connected by a belt, a loose pulley mounted on said shaft, a clutch for engaging said pulley, a ratchet-wheel rigidly secured to the shaft, a dog for engaging the ratchet-wheel, a hook connected to the outer end of the dog by a cord, and adapted to be hooked over a pin on the machine-frame, and a pin or equivalent device on the shear-frame for releasing the hook, all of the above parts adapted to operate as described.

8. In a drag-saw elevator, the combination, with a shaft provided with a friction-clutch, a pulley, and a combined brake and ratchet-wheel, of a frame supporting said shaft and provided with a combined dog and friction-brake adapted to engage said combined brake and ratchet-wheel, a sliding rod provided with cams adapted to engage a sliding shaft and thereby operate said friction-clutch, and a shear-frame connected with first-named shaft and adapted to be operated by the rotation of said shaft, substantially as set forth.



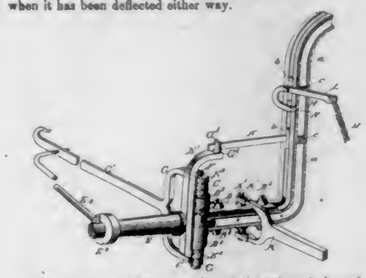
9. The combination, with a saw and shear-frame, of a shaft, a belt or other device connecting the shear-frame to the shaft, a loose pulley mounted on the shaft, a clutch for engaging the pulley, a longitudinally-sliding shaft for moving the clutch, and provided with an anti-friction roller, and a longitudinally-movable rod provided with double cams at its upper end, between which the roller on the longitudinally-movable shaft rests, substantially as set forth.

10. In a drag-saw elevator, the combination, with a revolving shaft, a sliding clutch, and loose pulley mounted on said shaft, a longitudinally-sliding shaft, one end of which is connected to the clutch, and a longitudinally-sliding rod for moving the sliding shaft, the said rod being provided with adjustable collars, of a saw and shear-frame, the latter connected to the revolving shaft by a suitable band or belt, and provided with an arm adapted to come in contact with the collars on the longitudinally-sliding rod and move the said rod alternately up and down, substantially as set forth.

11. In a drag-saw elevator, the combination, with the shaft, loose pulley, friction-clutch, longitudinally-sliding shaft, longitudinally-sliding rod connected with said sliding shaft, as described, adjustable collars secured to the rod, and a spiral spring encircling a portion of the rod and resting on the lower collar, of a saw and shear-frame, the latter connected to the shaft by a suitable belt, and provided with an arm adapted to come in contact with the upper adjustable collar on the sliding rod and the spring seated on the lower collar and move the said rod, substantially as set forth.

12. In a drag-saw elevator, the combination, with a shaft, a loose pulley mounted thereon, a longitudinally-sliding shaft, a clutch, a longitudinally-sliding rod, the upper end of which is connected to the sliding shaft, a sleeve adjustably secured to the sliding rod, and a lever, one end of which is connected to the sleeve, of a saw, a shear-frame, and a belt connecting the shear-frame to the shaft, substantially as set forth.

294,805. MEANS FOR VENTILATING MINING SHAFTS AND TUNNELS. WM. PHILLIPS, Coos Bay, Oreg. Filed Oct. 18, 1882. (No model.)



Claim.—1. A cage for mining-shafts, provided with hinged sections F on its sides, and means, substantially as described, whereby said sections may be raised on the outside, to leave open spaces between the cage and shaft-walls, as set forth.

2. The combination, with the cage D and hinged sections F F on its sides, of the standard J, secured to the cage, cross-head I, capable of being moved thereon, and connecting rods or parts *j*, substantially as set forth.

294,806. CULTIVATOR. CHARLES W. POST, Springfield, Ill. Filed Sept. 14, 1883. (No model.)

Brief.—A spring to return the spindle and wheel to the line of draft when it has been deflected either way.

Claim.—1. A cultivator-arch and the axle end thereof, composed of continuous parallel bars separated by intermediate blocks, said bars and blocks being secured together by bolts, substantially as described.

2. The combination, with the beams and with the arch of a cultivator, of blocks rigidly secured to the axle ends of the arch, and forming bearings for said beams, substantially as described.

3. The combination of the beams and arch of a cultivator with a block secured to the axle end of said arch, and forming a connection of the beams thereto, said block having one or more distinct bearings providing for a lateral adjustment of said beams, substantially as described.

4. In a cultivator, the combination, with the beams, of perforated bearing-blocks having one or more projecting conical seats or bosses, providing for a tilting movement of the beams, substantially as described.

5. The beam provided with a forked end, having slots in the ends of its fork, in combination with the block rigidly secured at one end of the arch, and bolts passing through said blocks and slots, substantially as described.

6. The combination, with the metal block formed with an upper and lower set of bosses, and rigidly secured at an end of the arch, of the beam having a forked and slotted end embracing an upper and lower boss, and a bolt passing through the block and its bosses, and also passing through the slots in the end of the beam, whereby the latter shall be capable of a vertical tilt or play, substantially as described.

7. The combination of the arch and an axle pivotally jointed thereto, with a flexible connection for exerting a force tending to maintain said arch and axle in alignment with each other, substantially as described.

8. The combination of the arch and an axle pivotally jointed thereto, with a spring connecting said arch and axle, substantially as described.

9. The combination of the arch and an axle pivotally jointed thereto, with a spring rigidly attached at one end to the arch, and at its other end having a shifting bearing in its attachment with the axle, substantially as described.

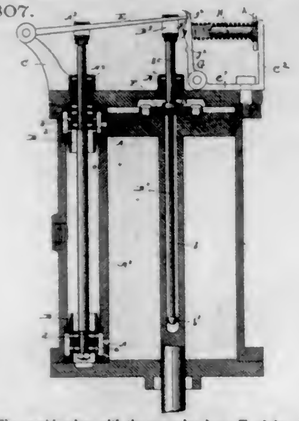
10. The arch, in combination with an axle pivotally jointed thereto, and provided with a rigid arm having a slotted bearing, and extending above the pivot of the axle, and a spring, one end of which is rigidly secured, and the other end working in said bearing, substantially as described.

11. The arch and the rigid bearing-block, in combination with the axle, and means, substantially as described, pivotally connecting and providing for a vertical adjustment of the axle with the arch, as and for the purposes set forth.

12. The arch and the rigid bearing-block, in combination with the sleeve seated and vertically adjusted in said block, and a pivot embraced by said sleeve and forming a connection between the arch and the axle, substantially as described.

13. The combination, with the draft-rod, the axle, the socket B', and pivot-bolt connecting said rod and axle, of a brace-rod rigidly connecting the block, rod, and axle, substantially as described.

14. The combination of the arch, the axle, the draft-rod, a pivot connecting said elements with each other on a concentric axis, and a flexible connection between the arch and axle, all substantially as described.

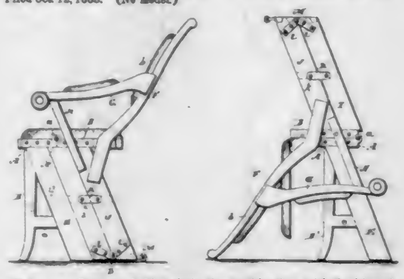


15. The combination, with the arch and the beams, of a bent hang-up arm, pivoted to the arch and provided with a right-angular bend, substantially as described.

294,807. OPERATING VALVES OF STEAM-CYLINDERS. EVAN L. REESE, Newark, Cal. Filed Sept. 16, 1882. Renewed Dec. 5, 1883. (No model.)

Claim.—1. The combination, with the valves A and rod A', of the lever E, reversing-stem B', and yielding arm G, having cam-surfaces *g*, substantially as described.

2. The combination, with the valve-operating lever E, of the reversing-stem B', having the stops *b'* *b²*, and the yielding cam-plated arm G, as set forth.

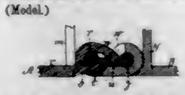


294,807.

3. The combination, with the reversing-lever E, of the yielding arm G, having the inclines, substantially as set forth.

4. In a valve mechanism actuated from the movements of the piston-rod of the working-cylinder, the reversing-stem B', working in a slot or bore, *b*, in the piston-rod, and having the stops *b'* *b²*, in combination with the striking-plate F on the piston-head, reversing-lever E, and spring pressure-arm G, provided with the inclines, substantially as herein specified.

294,808. STEP-LADDER CHAIR. FREDERICK REDDEL, York, Pa. Filed Oct. 12, 1883. (No model.)

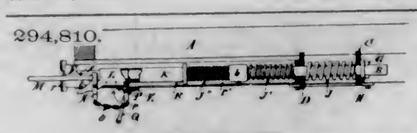


Claim.—1. In a step-ladder chair, the combination, with the hinged seat A B, of the legs B' and brace E, secured to the section A, the section J, rigidly secured to the section B, the section I, pivotally secured to the section J, and hooks for securing the parts in open and closed adjustment.

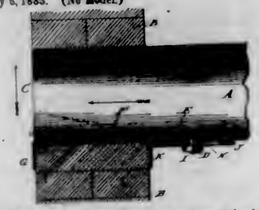
2. As a new article of manufacture, a step-ladder chair consisting, essentially, of the hinged seat A B, back F, hinged cushion C, the legs B, and sections E I J, substantially as set forth.

3. In a step-ladder chair, the combination, with the sections A B, hinged together, and the hinged cushion C, of supports rigidly secured to the section A, and supports rigidly secured to the section B, all of the above parts being combined as described.

294,809. DOUBLE HINGE. CHAS. C. RICHMOND, Boston, Mass. Filed Nov. 8, 1883. (Model.)



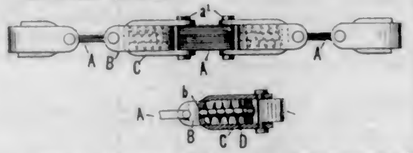
Claim.—A check for the connecting-link of a double hinge, consisting of a portion of the inner edge of one of its leaves so bent as to form a depression, *s*, a rounded surface, *t*, and a flat surface, *u*, constructed and arranged to operate substantially as described.



294,810. CAR-COUPLING. EDWARD J. ROBERTS, Ashland, Ky., assignor of one-fourth to William W. Culbertson, same place. Filed Sept. 6, 1883. (No model.)

Claim.—In a railway-car coupling, the combination of draw-bar B, having the integral jaw F and the sliding jaw L, the independently-sliding draw-head R, the springs J J' J'', and the releasing-lever N, and operating crank-shaft P, substantially as and for the purpose set forth.

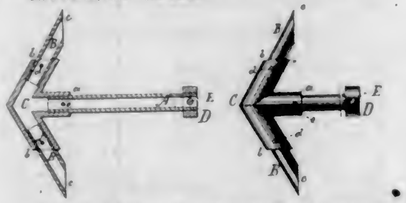
294,810.



294,811. STOVE-PIPE THIMBLE. LUTHER RUSSELL, Evart, Mich. Filed July 5, 1883. (No model.)

Claim.—The combination, with a stove-pipe, of the locking or fastening device consisting of the plate E, hinged latch F G, screw D, slotted plate J K, washer H, and nut I, constructed and combined to operate substantially in the manner and for the purpose herein shown and set forth.

294,812. CHAIN. STEPHEN RYDER, North Attleborough, Mass. Filed Nov. 17, 1883. (No model.)

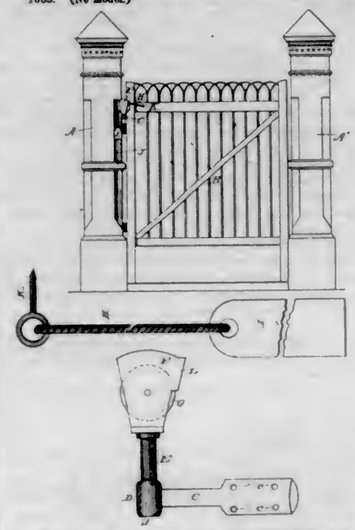


Claim.—1. An extensible link having two similar frame parts, B C, and proper attachments thereto, with a supporting-rod, *b*, and coiled spring D, as described.

2. In combination with two elastic links, each having the frame parts B C and coiled spring D, the intermediate solid-bar link, A, uniting the two elastic links together, as shown.

3. The chain described, consisting of the solid-bar links with extensions *a'* *a'*, the frame part B, with rod *b*, the frame part C, with opening *c*, and the spring D, combined and arranged as described, for the purpose set forth.

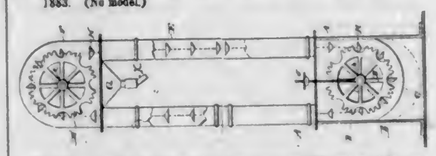
294,813. ANCHOR. HERMAN M. SCHNEEKLE, Rockaway Beach, N. Y. Filed Oct. 15, 1883. (No model.)



Claim.—1. An anchor having for its essential elements the pipe or tubular flukes B, the socket-head C, constructed with sockets *a* *b* *b*, the stem A, and a cross-bar, E, connected to said stem, the stem and pipe or tubular flukes being fitted to the socket of the head C, all substantially as and for the purpose herein set forth.

2. The combination of the socket-head C, having the internally-threaded sockets *a* and *b* *b*, the hollow flukes B, composed of pipe or tubing, and externally threaded at their inner ends for insertion into the sockets *b* *b*, the stem A, composed of pipe of suitable diameter and strength, externally threaded at its inner end for insertion into the socket *a*, the head D, and a cross-bar, E, secured upon the outer end of the said stem, all substantially as and for the purpose herein set forth.

3. The combination of a hollow socket-head, C, having the internally-threaded sockets *a* *b* *b*, flukes B B, formed of pipe, and externally threaded at their inner ends for insertion in the sockets *b*, the pins or devices *d*, arranged to prevent the axial turning of the hollow flukes B, the stem A, formed of pipe threaded at its inner end for insertion in the socket *a*, and at its outer end to receive the head D, the said internally-threaded head D, and the cross-bar E, all substantially as and for the purpose herein set forth.



4. The combination of the wings or veins F with the hollow flukes B, the socket-head C, having the sockets *a* and *b*, the stem A, and cross-bar E, all substantially as and for the purpose herein set forth.

294,814. GATE. FRANK X. SCHULLIAN, Quincy, Ill. Filed Sept. 21, 1883. (No model.)

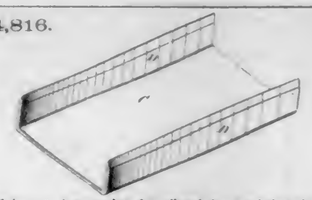
Claim.—As an improvement in gate-closing devices, the combination of the pulley-frame F, formed with lugs L, and carrying a pulley, and provided with a pin or extension projecting downwardly therefrom, a horizontal bar, C, arranged at right angles to the pulley-frame and secured to the gate-post, a socket or tube, D, formed at one end of the bar, and in which the pin or extension is swiveled, and a rope or chain passing through the pulley-frame, and having one end secured to the gate, while the other end is provided with a weight sliding in a recess of the post, as set forth.

294,815. ELEVATOR. FRED J. SCHUPP, Marshall, Mo. Filed Oct. 17, 1883. (No model.)

Claim.—1. In an elevator, the combination, with two upright metallic spouts, a cap secured to the upper ends of said spouts, and a hopper provided with a discharge-pipe, of suitable chain-supporting wheels and chain and buckets, substantially as set forth.

2. In an elevator, the combination, with a suitable base and sprocket-wheel, a suitable cap provided with a similar wheel, and a hopper communicating with the cap and provided with a discharge-pipe, of two parallel tubular spouts connecting the base and cap, and a chain and buckets secured to the chain, the parts being arranged as described.

3. The combination, with a base, cap, hopper, and sprocket-wheels, one of the latter being adjustable, of the parallel tubular spouts connecting the cap and base and the chain and buckets, all of the above parts being arranged substantially as described.



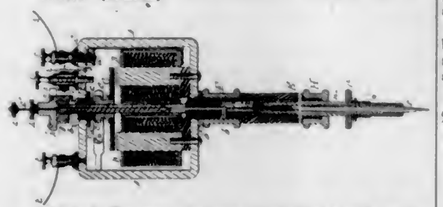
4. In an elevator, the combination, with a chain and buckets, of the sprocket-wheels, each provided with recesses situated equidistant apart, and teeth between the said recesses for engaging the chain, substantially as set forth.

5. An elevator-bucket consisting, essentially, of a saucer-shaped receptacle, an eyebolt, a sleeve, and a socketed hook, all of the above parts combined as described.

294,816. WEAR-PLATE FOR RAILROAD-TIES. DAVID SERVIS, Bennett, assignor to the Servis Railroad Tie Plate Company, New York, N. Y. Filed Feb. 18, 1882. Renewed Nov. 14, 1882. (No model.)

Brief.—A wear-plate provided with flanges having sharpened edges is adapted to be driven into the sleeper under the rail.

294,816.



Claim.—1. A wear-plate for railroad-ties, consisting of a body having projecting flanges at its side edges, said flanges being sharpened to adapt them to be forced into the tie, substantially as described, and for the purpose set forth.

2. The combination, with a railroad-rail and supporting cross-tie, of a wear-plate consisting of a body having projecting flanges at its side edges, said plate being interposed between the rail and tie, with its flanges entered into the tie longitudinally or parallel with the grain or fibers of the wood composing the tie, substantially as described.

3. In a wear-plate for railroad-ties, the combination, with the side edges of the plate C, of flanges D, having sharpened edges, substantially as herein shown and described, whereby the said plate will be strengthened to sustain a downward pressure, and may be readily forced into the tie lengthwise of the grain of the wood, as set forth.

294,817. RETOUCHING-MACHINE. CHARLES H. SHAFFER, Rockford, Ill., assignor of one-half to Jones, Woodruff & Co., same place. Filed Aug. 11, 1883. (No model.)

Claim.—1. The combination, with the tubular shaft, with an armature mounted thereon and capable of a rotary movement, of a center shaft supported in the axial center of the tubular shaft and capable of an endwise reciprocating movement therein, substantially as and for the purpose set forth.

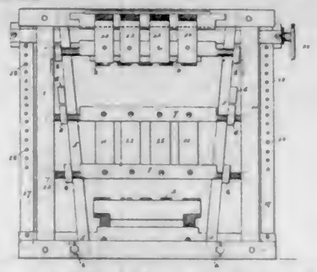
2. The combination, with the tubular shaft, with an armature mounted thereon and capable of a rotary movement, and with the center shaft supported in its axial center, of a clutching mechanism to connect the center shaft with the tubular shaft, or disconnect it therefrom, substantially as and for the purpose set forth.

3. The combination, with the center shaft supported in the axial center of the tubular shaft and capable of a rotary motion therewith, of a spring within the tubular shaft, and a cam to engage an anti-friction wheel to impart an endwise reciprocating movement to the shaft in its rotary movement, substantially as and for the purpose set forth.

4. The combination, with the spring within the tubular shaft, and a cam mounted upon the central shaft, of an anti-friction wheel having an adjustable support to vary the throw of the shaft in its endwise reciprocating movements, substantially as and for the purpose set forth.

5. The combination, with the anti-friction wheel having an adjustable support, of a spring within the adjustable tubular support, substantially as and for the purpose set forth.

6. The combination, with the adjustable tubular support of the anti-friction wheel, having its base grooved, of a guide-bar to engage the groove in the base of the support, substantially as and for the purpose set forth.



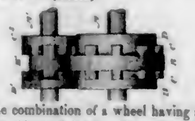
7. The combination, with the cam mounted upon the center shaft and clutch-head, of a pivoted lever-latch capable of radial position, substantially as and for the purpose set forth.

8. The combination, with the cam and with the clutching-latch pivoted therein, of a spring to hold the latch in its clutching or radial positions, substantially as and for the purpose set forth.

9. The combination, with the cam mounted upon the center shaft and disengaged from the clutching-head, of an anti-friction wheel supported in the clutch-head to impart an endwise reciprocating movement to the center shaft, substantially as and for the purpose set forth.

10. The combination, with the center shaft and with the hand-piece, of a pencil-receiving tube having its projecting end provided with a pencil-holder, said tube suitably connected with the center shaft and supported in the axial center of the hand-piece, and capable of a rotary and reciprocating movement therein, substantially as and for the purpose set forth.

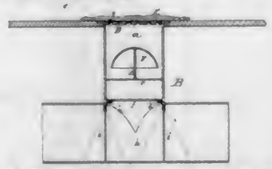
294,818. BALING-PRESS. NOAH W. SPEERS, Sr., Memphis, Tenn., assignor of one-half to William A. Smith, same place. Filed July 2, 1883. (No model.)



Claim.—1. In a baling-press having a two-part press-box, the hinged sides having projecting beams adapted to surround and retain the elongated braces of the front and back battens, substantially as specified.

2. The combination, with the fixed front and rear battens of a press-box, of the hinged sides and upper door or doors, said sides having bearings adapted to engage and lock the hinged doors when pressed to place, substantially as specified.

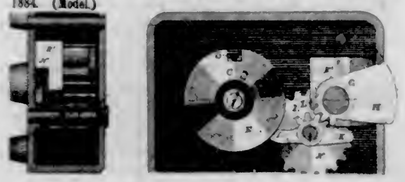
3. The combination, with hinged front and back battens having elongated braces, of hinged sides having brackets for engaging said elongated braces, and suitable cam-blocks for holding them in closed position, substantially as set forth.



4. In a baling-press, the combination, with the follower or presser-block, of the draw bars or rods having one or more series of holes, the transverse driving-shaft, and sprocket-wheels thereon, arranged and adapted to operate substantially as specified.

294,819. COMBINED FRICTION AND COG GEAR. NOAH W. SPEERS, Sr., Memphis, Tenn., assignor of one-half to Wm. A. Smith, same place. Filed July 30, 1883. (Model.)

Claim.—The combination of a wheel having a smooth bearing-surface in the center of its periphery, with teeth projecting from each side thereof, said bearing-surface and teeth being formed in relievo out of the body of the wheel, and a second wheel having complementary portions, as described.

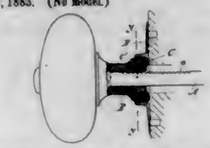


294,820. VENTILATION. MARSHALL B. STAFFORD, New York, N. Y. Filed Nov. 2, 1882. (No model.)

Claim.—1. In a ventilating apparatus applied to the bottom of a car, the vertical flue provided with means for deadening the sound, in combination with the horizontal flue, substantially as set forth.

2. In a ventilating apparatus applied to the bottom of a car, the vertical flue and the horizontal flue, the former being supplied with a sound-deadening device, and the latter with swinging valves, the whole being arranged substantially as and for the purposes set forth.

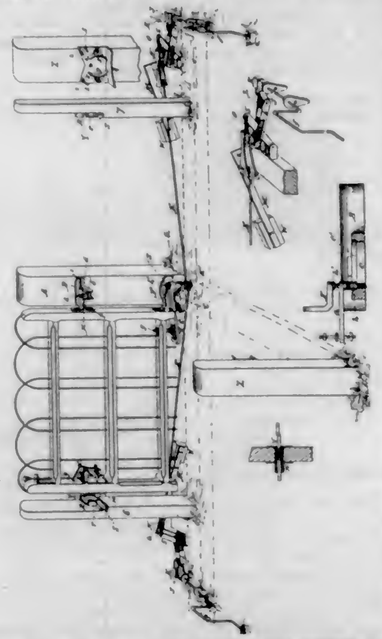
294,821. SAFE-LOCK. EMORY STOCKWELL, Stamford, Conn., assignor to the Yale & Towne Manufacturing Company, same place. Filed Jan. 2, 1884. (Model.)



Claim.—1. In a lock, the combination of a rotary fence-bearing, a rotary fence, and a rotary bolt, operating together, substantially as set forth.

2. A lock-case provided with raised block R′, having a ledge, S, with a bolt-pivot aperture, and a recess beneath, substantially as set forth.

3. In a lock, the combination of rotary tumblers and cam, a rotary fence and bolt connected operatively together, a rotary fence-bearing, and means for rotating the bearing when the lock is operated, substantially as set forth.



4. In a dial-lock, the combination of a rotary fence-bearing, a spindle for operating the tumblers, and mechanism connecting or gearing the two together, so that whenever the spindle is rotated the fence-bearing must also rotate, substantially as described.

294,822. KNOB ATTACHMENT. OSCAR STODDARD, Detroit, Mich. Filed Aug. 27, 1883. (No model.)

Claim.—The rose D, having the internal recess, *d*, in its socket, in combination with the neck B, having the recess *b*, and the transverse slot *c*, arranged to receive the gate C *c*′, whereby it may be adjustably engaged with the transversely-slotted spindle A, substantially as described.

294,828. GATE. WILLIAM P. TEETER and CHARLES E. TEETER, Trotwood, Ohio. Filed July 26, 1883. (No model.)

Claim.—1. In a swinging gate, the hinge device composed of the arm D, having horizontal slots *s* in the post-plate, and a toothed upper surface, the plate *d*, toothed on its lower surface, and provided with a fixed collar and pintle, *b b*′, and the arm H, provided at one end with a circular opening somewhat larger than the pintle, and at the other with a right-angled plate having vertical slots *s*′, combined with the post A and the gate, as set forth.

2. An angle-plate adapted to be fastened to the hinge-post, and having an angular slot, *c*, provided with an endless track, *c*′, in combination with the extension F of the lower gate-hinge and the gravity-latch, the extension having a loose collar or wheel, *h*, adapted to play in said endless track, as set forth.

3. A gravity-latch formed of a lever journaled about the extension of the lower gate-hinge, and pivotally attached to the under bar of the gate by a bolt having a fixed head below the latch, said bolt being adjustable by a screw-thread and nut above, as set forth.

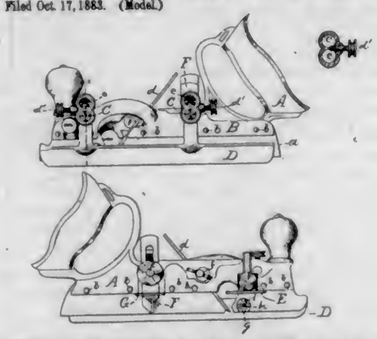
4. In combination with a swinging gate, the trip device composed of the adjustable pull-rod, stirrup, detachable link, lever-bar journaled to the studs of the ground-beam, double-slotted bar, lever, and trip, as set forth.

5. In combination with a swinging gate, the trip device composed of the adjustable pull-rod E, stirrup N, detachable link O, lever-bar 5, journaled to the ground-beam, double-slotted bar *i*, levers J K, hook L, weighted arm M, and the wheel-iron *f*, as set forth.

6. The double-latch stop composed of the guide or rest plate Q, the double-moving lips P P, projecting stop-pins 1 1, and the confining-studs 2 2, combined with the post Z and the gate, as set forth.

7. The combination of the latch composed of the vertical handle y, elbow-lever X, and fastening-bolt V, the latter partly enveloped by a spiral actuating-spring and shoulder-plate, *n*, with the double-latch stop composed of the guide and rest plate Q, moving lips P P, stop-pins 1 1, and confining-studs 2 2, as set forth.

8. The combination of the latch composed of the vertical handle y, elbow-lever X, and fastening-bolt V, the latter partly surrounded by the spiral actuating-spring and shoulder-plate *n*, with the single-latch stop composed of the incline S and the U-shaped supporting and confining recess, as set forth.



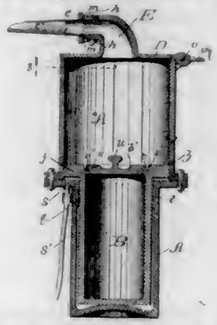
294,824. WHIP-SOCKET. JUDSON L. THOMSON, Syracuse, N. Y. Filed July 3, 1883. (No model.)

Claim.—1. The combination, with a whip-socket, of an elastic tube arranged with its axis concentric with the interior of the whip-socket, and secured in position by an expansible ring inserted in the tube, and pressing a portion thereof into its seat in the whip-socket, substantially as specified.

2. The combination, with a whip-socket, of an elastic tube having transverse excisions in one side, and secured at its opposite side to the interior of the whip-socket by an expansible ring or band pressing the tube into its seat in the whip-socket, substantially as described and shown.

294,825. BENCH-PLANE. JUSTUS A. TRAUT, New Britain, Conn. Filed Oct. 17, 1883. (Model.)

Claim.—1. The combination of the gage-rods C C of a bench-plane, the gage or fence D, having two sets of sockets—one above the other—and suitable means for fastening said gage upon said rods, substantially as described, and for the purpose specified.



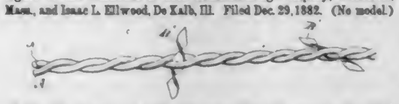
2. The combination of gage-rods C C, a suitable gage or fence having double sockets for the reception of said rods, and a set-screw arranged intermediately between the sockets and adapted to clamp the rods when placed in either one of the sockets, substantially as described, and for the purpose specified.

3. The combination of the stock and the rotatory cutting-spur adapted to project below the edge of the stock, or to be carried up above said edge by turning it upon its axis, substantially as described, and for the purpose specified.

4. The combination of the stock, the rotatory spur pivoted thereto, and a suitable stop for limiting the rotation of said spur during the forward movement of the stock, substantially as described, and for the purpose specified.

5. The combination of the stock, the spur-disk having radial arms, the adjusting-screw, by means of which said disk is secured to the stock, and a suitable stop for preventing said spur-disk from rotating on said screw, substantially as described, and for the purpose specified.

294,826. HYDRAULIC SAUSAGE-STUFFING MACHINE. FREDERICK W. TUERK, Jr., Chicago, Ill. Filed June 27, 1883. (No model.)



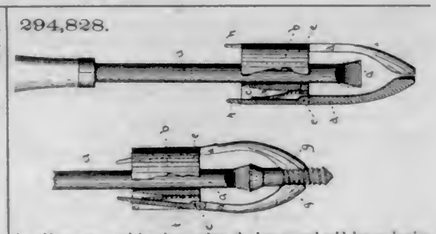
Claim.—1. A sausage-stuffing machine comprising, in combination, a hollow cylinder or shell made narrowest toward its lower end, a second cylinder of dimensions smaller than the first named, to fit within the narrower portion of the latter, and provided with a piston-head of dimensions to fit within the upper portion of the outer cylinder to serve as a piston, means for admitting water under pressure into the cylinder below the piston and discharging it therefrom at will, and a tube at the top of the device to form an outlet for the sausage-meat, substantially as described.

2. In a stuffing-machine, the combination of the shell A, having an outlet, *s*, hollow cylinder B within the same, and provided with a cover, *v*, and knob *u*, and cover D, hinged at one side to the shell A, and provided with an outlet-tube, E, and detachably secured at the other side to the shell A by means of swinging eyebolts *k* and nuts *i*, as and for the purpose set forth.

3. In a stuffing-machine, the shell A, having its lower portion narrower than its upper, and provided with means for admitting water under pressure into its lower end, and for discharging the same, and provided also with an outlet-tube at its upper end for the discharge of the sausage-meat, and with a shoulder, *y'*, having an opening, *s*, in combination with the piston comprising the cylinder B within the lower portion of the shell and flange *z*, fitting within the upper portion, the said cylindrical part B being somewhat higher than the interior of the narrower portion of the shell within which it fits, whereby when it rests upon the bottom of the same a space intervenes between the shoulder *y'* and the piston-head, substantially as described, and for the purpose set forth.

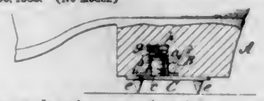
4. In a stuffing-machine, the combination of the following elements, viz: the shell A, provided with an outlet, *s*, and having its upper and lower portions of unequal size, as shown, and provided with an internally-convex bottom, piston B, provided with a lateral flange, *z*, fitting within the upper portion of the shell A, and with the cover *b'* and handle *u*, three-way valve C, operating within the tube *q*, which is connected with a water-supply, and provided with an outlet-pipe *p'*, cover D, hinged to one side of the said shell and detachably secured thereon by means of swinging eyebolts having their bearings upon the shell A, and provided with an outlet-tube, E, bent to form an elbow and made tapering toward its mouth, and spout *e'*, secured thereon by means of a collar, *v*, all being arranged to operate substantially as described.

294,827. BARBED WIRE. ANDREW J. UPHAM, Sycamore, Ill., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Dec. 29, 1882. (No model.)



Claim.—A spirally-twisted sheet-metal barb, in combination with two main fence-strands cabled together and holding the spiral barb between its twists, substantially as set forth.

294,828. SCREW-DRIVER. ALFRED D. WALLEN, Mendham, N. J. Filed Mar. 31, 1883. (No model.)

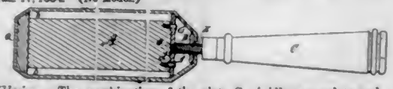


Claim.—As an improved article of manufacture, the screw-driver combining therein the driving portion *a*, having the broadened portion *a'*, the annular casing *b*, formed of one piece of metal, and provided with the central opening, and peripheral grooves *c*, the springs *f*, secured

294,828.

in said grooves, and bearing against the levers, and said levers having converging and recessed jaws, and adapted to allow the screw-shank to be thrust into said recess, all substantially as herein set forth and shown.

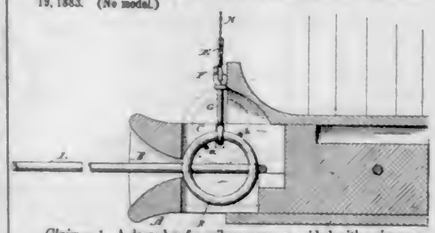
294,829. ICE-CREEPER. FRANK M. WEST, Mohawk, N. Y. Filed July 30, 1883. (No model.)



Claim.—1. In an ice-creeper, the spring-actuated plug *f*, placed in the sleeve *b*, for closing the sleeve when the spur-plate is removed, substantially as described.

2. In an ice-creeper, the combination, with the plate B, having sleeve *b*, of the plug *f*, spring *g*, and cap-plate A, arranged to operate substantially as and for the purposes set forth.

3. In an ice-creeper, the sleeve *b*, formed with the shoulder *i*, in combination with the spring-actuated plug *f*, formed with the flange *i'*, substantially as and for the purposes set forth.



4. The plate B, formed with the screw-threaded sleeve *b*, and fitted in the recess *a*, made in the heel A, in combination with the detachable plate C, formed with the spurs *e*, and with the screw-threaded stud *c*, substantially as and for the purposes set forth.

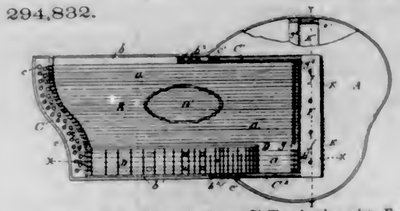
294,830. RAZOR-STROP. JOHN H. WHITE, North East, Md. Filed Jan. 17, 1884. (No model.)

Claim.—The combination of the plate G, rigidly secured to and projecting beyond the body A, nut-plate D, and handle C, provided with the shouldered screw-shank E, substantially as and for the purpose herein specified.

294,831. CAR-COUPLING. JOSIAH WHITE, Toledo, Ill. Filed Sept. 19, 1883. (No model.)

Claim.—1. A draw-bar for railway-cars, provided with a ring serving as a coupling-bolt, as described.

2. The combination, with a draw-head for railway-cars, of a ring serving as a coupling-pin, and means for holding it in its normal position behind the link-opening, substantially as described.



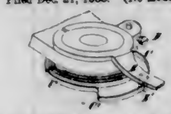
3. The combination, with a draw-bar having a slot, of a coupling-ring supported therein, and means for raising the ring to uncouple the cars, as described.

4. The combination, with the self-coupling draw-head provided with a ring, as described, of means for securing the ring in a coupled condition, as set forth.

5. The self-acting car-coupler, consisting of a slotted draw-head, a ring secured therein and serving as a coupling-pin, means for locking it in its coupling position, and means for uncoupling it without danger of injury to the operator, substantially as described.

294,832. CITHERN. FRANK F. WEHARD, St. Louis, Mo. Filed Aug. 10, 1883. (No model.)

294,832.

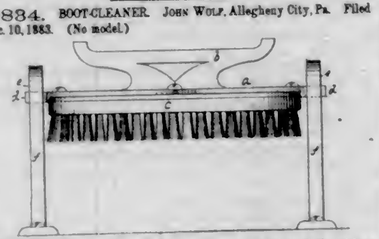


Claim.—1. In a cithern, the braces C' C² and string-plate E, in combination with the neck B and shell A, as herein shown and described, and for the purpose set forth.

2. In a cithern, the braces C' C² and string-plate E, in combination with the brace E', screws *e*, and shell A, as and for the purpose set forth.

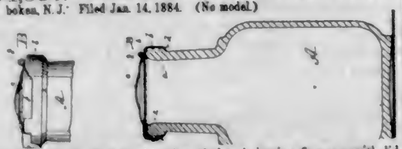
3. The combination of the braces C' C², string-plate E, brace E', cover F, strings *a*, and body or shell A, all constructed and arranged as shown and described, and for the purpose set forth.

4. The screw H, having flattened end and straight edge *h*, in combination with the guide-plate *g*, to form an adjustable bridge, as herein shown and described, and for the purpose set forth.



294,833. HAIR-SPRING FOR WATCHES. CHARLES AUG. WILMS, St. Louis, Mo. Filed Dec. 21, 1883. (No model.)

Claim.—1. A hair-spring for watches, &c., having a kink or bend formed in the side of the outer coil, substantially as and for the purpose set forth.

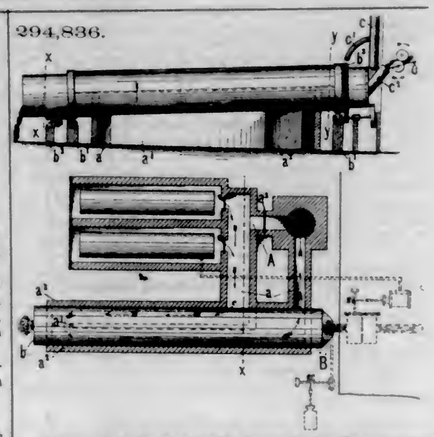


2. A hair-spring for watches, &c., having a kink or bend formed in the side of its outer coil back of the point of attachment of the regulator, substantially as and for the purpose set forth.

294,834. BOOT-CLEANER. JOHN WOLF, Allegheny City, Pa. Filed Dec. 10, 1883. (No model.)

Claim.—A new and improved foot-scraper consisting of the oblong metallic plate *a*, having on one side thereof a scraper, *b*, and on the other side a brush, *c*, and at each end a rectangular pintle or trunnion, *d*, broader or thicker in one direction than the other, in combination with the supporting-frame *f*, having the key-hole-shaped slots *s e*, as shown and set forth.

294,835. CAP FOR MUSTARD-BOTTLES. FERDINAND WOLFF, Hoboken, N. J. Filed Jan. 14, 1884. (No model.)



Claim.—1. The combination of ring *b*, having flange *e*, with lid *c*, having flange *f*, the hinges *e f* being turned up to form hinge *g*, substantially as specified.

2. The combination of ring *b*, having flanges *d e*, with lid *c*, having the tapering flange *f*, and with the hinge *g*, placed on top of and set back from periphery of ring *b*, substantially as specified.

3. The combination of flanged ring *b* with flanged cap *c*, hinged thereto by hinge *g*, formed on top of ring *b*, and with knobs *h i*, punched out of the flanges of the ring and cap to form a lock, substantially as specified.

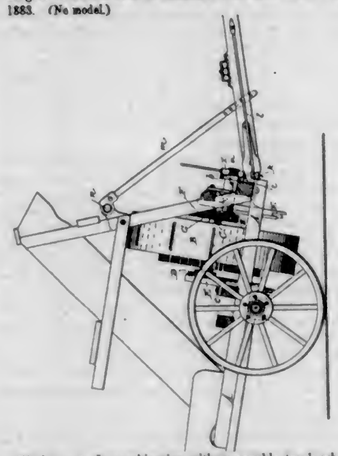
294,836. BAGASSE-DRIER. RICHARD H. YALE, New Orleans, La. Filed May 21, 1883. (No model.)

294,836.

Claim.—1. In the art of treating bagasse for fuel, the combination of the following elements: a cylinder the metal surface of which is directly exposed to fire heat, means, substantially as described, for causing a positive air-current to pass directly through the cylinder, and means, substantially as described, for agitating the contents of the cylinder.

2. In combination with an auxiliary flue, *a*, located away from the furnace and main flue, and adapted to take the waste heat from the furnace, a drier, B, located in the auxiliary flue, and having the products of combustion from the furnace directly applied to its external surface, as and for the purpose described.

3. In combination with the drier B, the auxiliary flue *a*, having the walls a^2 a^3 and partition *a'*, the flues being located below the drier, as set forth.



4. In combination with a drier adapted to revolve at varying speeds, an air-flue, *c*, having the exhaust-pipe *c'* leading into the same.

5. The combination of the following elements: a grinding-mill, a revolving drier adapted to receive bagasse directly from the mill, an auxiliary motor for actuating the drier independently of the mill, and means, substantially as described, for regulating the heat-supply delivered to the drier, substantially as set forth.

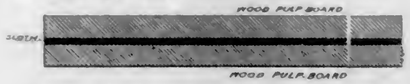
6. The inclined drier B, having a capacity for revolution as described, in combination with the fixed head C, having the air-flue *c* and the chute c^3, as described.

7. The drier B, having the head C, with flue *c*, chute c^3, and door c^3, adapted to tightly close the cylinder when the chute is removed, as described.

294,837. HARVESTING-MACHINE. CALVIN YOUNG, Auburn, N. Y., assignor of one-half to D. M. Osborne & Co., of New York. Filed July 7, 1883. (No model.)

Claim.—1. In combination with removable truck-wheels, a harvester-frame, a main wheel therefor, and intermediate mechanism, sub-

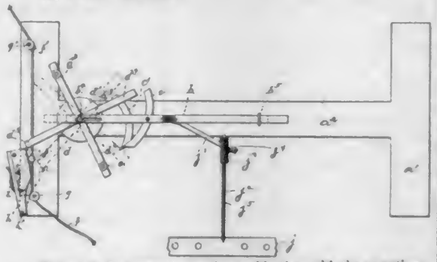
stantially as described, forming a permanent connection between the wheel and frame, and acting to raise either in respect to the other, and locking devices whereby said mechanism may be caused to sustain the frame upon the wheel, or to suspend the wheel within the frame, at will.



2. In combination with the main frame and rack-plates, the main wheel, the axle provided with the pinions and chain-wheel, the endless chain, the actuating-wheel therefor, and the two alternately-acting automatic pawls, adapted to lock said actuating-wheel against rotation in opposite directions.

3. In combination with removable truck-wheels, substantially as described, the harvester-frame, the main wheel, the main axle, the rack-plates and pinions connecting the axle with the frame, the endless chain and chain-wheels to actuate and hold the axle, and means, substantially as described, for locking the chain against motion in each direction.

4. In combination with removable truck-wheels, the harvester-frame provided with rack-plates to receive the axle, the main wheel, the axle provided with the pinions and chain-wheel, the endless chain, the chain-wheel on the frame, and the two alternately-acting pawls, whereby the parts may be locked against motion in opposite directions alternately.



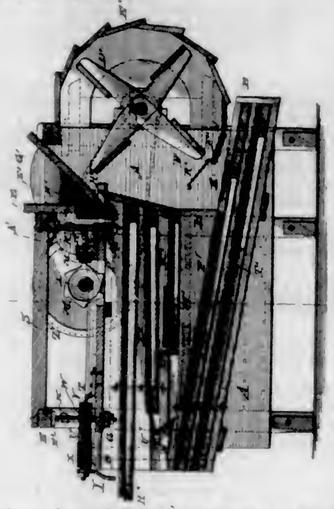
294,838. PANEL. ROBERT A. ADAMS, Grand Rapids, Mich. Filed July 2, 1883. (No model.)

Brief.—Panel-lumber is constructed of sheets of wood-pulp board cemented to interposed cloth.

Claim.—The combination, in a panel, of sheets of wood board or wood pulp with the sheet of cloth inserted, as described, and all cemented with any suitable elastic glue or cement, substantially as described.

294,839. CHECK-ROW CORN-PLANTER. CHARLES M. BABCOCK, Galesburg, Ill., assignor of one-half to John C. Stewart, same place. Filed May 9, 1883. (No model.)

Claim.—1. In a corn-planter, the combination, with the operating-wheel having slots d^4 cut in the ends of its bars d^3, and means whereby said wheel is connected with the dropping mechanism, and the knotted rope *f*, of the latch-bar A, pivoted at its rear end, a suitable supporting-spring, and the plate A^4, mounted on the latch and arranged to enter the notches d^4 in the arms d^3, said latch-bar being provided, near its forward end, with the notch A^3, arranged to receive and hold the wheel-arms, and constructed in rear of said notch with the cam or inclined face A^2, arranged in position to be engaged by the rope knots or buttons, whereby the latch is pushed back and the wheel released, all substantially as and for the purposes specified.



2. The combination, substantially as described, of the operating-wheel provided with pins or rollers secured on respectively the upper and lower sides of its alternate arms, and the reciprocating bar provided with cams secured on said bar, and arranged vertically on opposite and diametrically on the same side of the wheel, said cams being inclined in opposite directions in the plane of the wheel, and formed with bearing-surfaces on respectively their forward and rear edges, said bearing-surfaces being alternately engaged by the pins or rollers on the wheel-arms, substantially as specified, and for the purposes set forth.

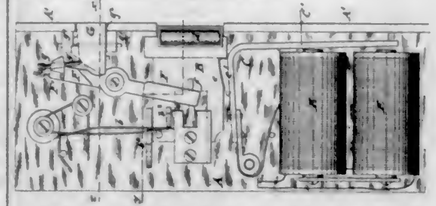
3. The combination, in a corn-planter, of the wheel having its arms provided with pins or rollers *a a'*, and slotted in their outer ends, the pivoted latch-bar A, supported by spring *i*, and constructed with notch A^3 and inclined face A^2, the plate A^4, mounted on said latch and arranged to enter the notches in the wheel-arms, the bifurcated bar *b*, provided on its arms b' b^2 with cams *c c'*, inclined in opposite directions, and provided on respectively their forward and rear edges with bearing-surfaces arranged to be engaged by the pins or rollers *a a'*, the dropping-slide *j*, arranged parallel with the bar *b*, pivoted rod j^2, secured at its rear end to the dropping-slide, and connected at its opposite end with the bar *b* by means of pitman j^3, and adjustable sleeve j^5, and the rope *f*, all arranged and operating substantially as specified, and for the purposes stated.

294,840. LUBRICATING COMPOUND. BUEL F. BARTLETT, Dunkirk, N. Y. Filed Jan. 14, 1884. (No specimens.)

Claim.—A lubricating compound consisting of graphite, dairy-salt, flour of sulphur, and gypsum, mixed together in substantially the proportions set forth.

294,841. FLAXSEED-CLEANER. GEO. BEAL, Gilman, Iowa. Filed Nov. 10, 1883. (No model.)

Claim.—1. In a seed-cleaner, the combination of a vibrating shoe having a longitudinal top bar, a bracket secured upon the latter near its front end, a rawhide bearing-strip in the said bracket, a horizontal adjusting-screw, R, and a cam-wheel bearing against the said strip, substantially as set forth.



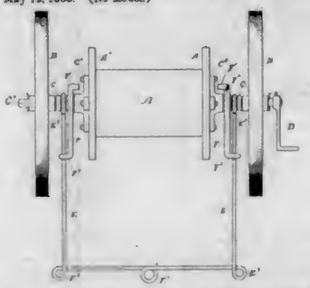
2. The combination of the vibrating shoe, mechanism for operating and for regulating the throw of the same, a bracket mounted upon the said shoe, a screw-threaded arm extending through a cross-bar of the frame, plastic cushions arranged upon the said arm on each side of the frame-bar, and a tightening-nut, as substantially set forth.

3. The combination, with the shoe carrying the screens, the suspending links, and prop-sticks, of the seat provided with an adjustable bearing of rawhide, a rotating cam-wheel adapted to strike said bearing to move the shoe in one direction, and the bracket, and the springs adapted to move the shoe in the opposite direction, substantially as specified.

4. The combination, with the shoe hung and propped as described, of adjustable devices for moving it in one direction, and the bracket T, springs X and W, and jam-nut V, forming adjustable devices for moving the shoe in the opposite direction, substantially as specified.

294,842. ELECTRIC DOOR-PULL. CHAS. BEILE, Brooklyn, assignor to Beile & Sulzer, New York, N. Y. Filed Aug. 2, 1883. (Model.)

Brief.—The slide which secures the door-bolt is set through a pivoted wedge-shaped piece which is swung in the act of closing the door, so as to operate a lever which forces the slide forward against the pressure of one section of its double returning-spring, said slide being held forward by a spring-catch which is released by a magnet. Upon the withdrawal of the spring-catch both sections of the spring act to move back the slide, thereby releasing the door-bolt.



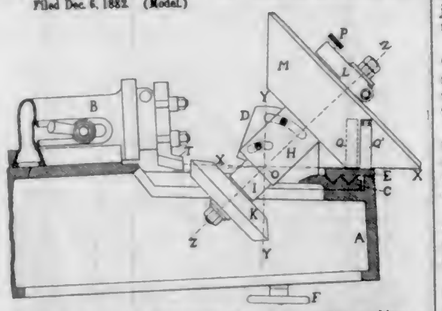
Claim.—1. The combination, with a recessed covering-plate, of a spring-actuated slide-piece, a pivoted and spring-actuated latch adapted to engage the slide-piece, means to release the latch from the slide-piece, a fulcrumed lever engaging the slide-piece and having at its upper end a guided and spring-pressed slide-pin, and a pivoted and spring-cushioned wedge-piece acting upon the slide-pin and its lever, substantially as and for the purpose set forth.

2. The combination of a recessed covering-plate, A, a spring-actuated slide-piece, B, a pivoted and spring-actuated latch, C, having an extension, C', said latch being adapted to engage the slide-piece, an electro-magnet, E, arranged close to the extension C', a fulcrumed lever, F, having an arm, F', at its upper end, a spring-pressed slide-pin, *g*, guided in said arm, and a pivoted and spring-cushioned wedge-piece, G, substantially as and for the purpose set forth.

3. In a door-pull, the combination, with a covering-plate, A, having a beveled catch, *b'*, a slide-piece, B, having a beveled releasing-catch, b^2, a double spring, *b*, applied to said slide-piece, a latch, C, adapted to engage the slide-piece, means to release the latch from the slide-piece, a fulcrumed lever, F, a spring-pressed slide-pin, *g*, at the upper end of said lever, and a pivoted and spring-cushioned wedge-piece, G, substantially as set forth.

294,843. WIRE-CARRIER. GEORGE W. BELFORD, Princeville Ill. Filed May 19, 1883. (No model.)

Claim.—1. As a wire-carrier, a spool, A A', in combination with the axles C C, each having squared end C^2 and arms C^4, whereby the same are bolted to the ends of said spool, suitable wheels, B B, and tongue E, having loop E'.



2. The spool A A', axles C C, each having squared end C^2, annular grooves C^3, and arms C^4, whereby the said axles C C are bolted to the ends of said spool, in combination with wheels B B, crank-arm D, tongue E, and dog F, having set-screw, substantially as set forth.

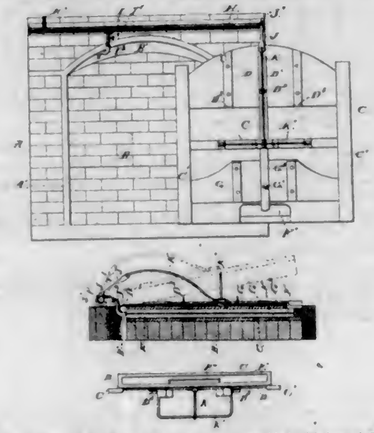
3. Spool A A', axle C, and crank-arm D, in combination with wheels B, tongue E, and dog F, having set-screw F', substantially as and for the purpose specified.

4. Spool A A', axles C C, having squared ends C^2, shoulders C^3, and arms C^4, in combination with crank-arm D, wheels B B, tongue E, and dog F, having ear F', as set forth.

5. The spool A A', axles C C, having squared ends C^2, grooves C^3, shoulders C^3, and arms C^4, in combination with a crank, D, wheels B B, tongue E, having loops E^2 E^2 E', and eyes E^2 E^2, and the dogs F, having ears F', looped end F^2, and set-screw F^4.

294,844. BEVEL-GEAR CUTTER. HUGO BILGRAM, Philadelphia, Pa. Filed Dec. 6, 1882. (Model.)

Claim.—1. As an improvement in bevel-gear-cutting machines, a straight-edged, truncated, V-shaped tool adapted to cut with its straight sides the curved working-faces of the teeth of the bevel-wheel through evolution, substantially as described.



2. In bevel-gear-cutting machines, the arbor I, carrying the blank K, the bearing H of said arbor being secured in an inclined position to the plate C, which is made to revolve on its geometrical axis Y Y, and by its revolution transmits to the center line of the arbor I a motion tracing a conical surface, substantially as described.

3. In bevel-gear-cutting machines, the former-cone M, fitted to the inclined arbor I, in combination with the bands Q and Q', whereby said cone describes a rolling motion when said arbor makes the aforesaid conical movement, substantially as described.

4. In bevel-gear-cutting machines, the combination, with the index-plate N, lever L, and pin P, of the former-cone M and the arbor I, whereby said former-cone can be coupled to the arbor I in various positions in order that the rolling motion of the cone may be transmitted to said arbor.

5. In bevel-gear-cutting machines, the combination of the reciprocating tool T and its holder B with the rotating plate C, inclined bearing H, arbor I, former-cone M, with bands Q and Q', index-plate N, lever L, and pin P, substantially as and for the purpose described.

294,845. COKE-OVEN DOOR. WALTER A. BLYTHE and JAMES HENDERSON, Dunbar, Pa. Filed Dec. 18, 1883. (No model.)

Claim.—1. The door for coke-ovens, provided with lateral flanges, and provided on its upper edge with a vertically-adjustable valve, substantially as set forth.

2. In a coke-oven having its doorway walled nearly to its upper end, the door herein described, fitted to said doorway and having its upper end constructed to fit flush with the upper end of the doorway-wall, and provided with an air chamber or passage having an inlet at its outer lower edge and an air-exit at its upper side, a valve adjustable over the air-inlet, and slide-valve adjustable vertically from the upper side of the door, all arranged and operating substantially as and for the purposes set forth.

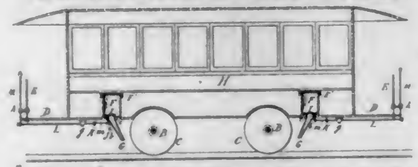
3. The combination of the oven, the horizontal water-pipe arranged above the doorway and connected with a water-supply, the door provided with a water-jacket, the connecting-pipe depending from the water-pipe and arranged to deliver water into the water-jacket, and the hanger-bar journaled at one end on the water-pipe, and having its other end connected with the door, substantially as set forth.

4. In a coke-oven having the usual draft-opening in the upper end of its doorway, the door having its upper end arranged approximately flush with the upper end of the doorway-wall, and provided with a slide-valve adjustable or movable above said door and in a plane parallel thereto, substantially as and for the purposes set forth.

5. In a coke-oven, the combination, with the door and the supporting-bar secured and arranged above the doorway and extended to one side thereof, of the hanger-bar having one end bent around or otherwise suitably journaled on and movable along the supporting-bar, and its other end connected with and supporting the door, substantially as set forth.

6. A coke-oven door provided with a water-jacket and an air flue or passage, said air flue or passage being projected into said jacket and subject on three of its sides to the heating action of the water in said jacket, substantially as and for the purposes set forth.

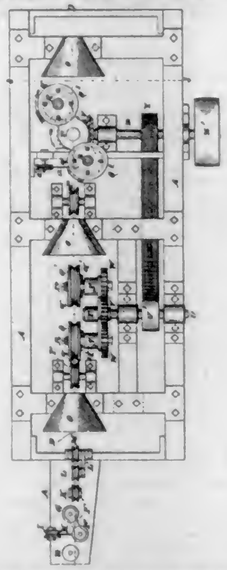
7. The herein-described coke-oven door, provided with a horizontal bail or handle, K', and the bar K, having its lower end secured to the door in line with bail K', and its other end carried upward and bent outward away from the door, combined with the supporting-bar H, arranged above the door and extended to one side, as described, and the hanger J, having one end swiveled to the upper end of bar K, and its other end journaled on and movable along the bar H, all arranged and operating substantially as and for the purposes set forth.



8. The combination, with the door having a water-jacket on its in-

ner side and the water-pipe arranged above the doorway, and provided with a depending pipe, I, of the pipe I^2, coupled to and rotatable on pipe I and bent into the approximately Z shape, substantially as and for the purposes specified.

9. A coke-oven door having a water-jacket on its inner side, and an air flue or passage arranged in front of and next the water-jacket, and provided with means at its upper and lower sides whereby to regulate the draft, substantially as and for the purposes set forth.



10. The hereinbefore-described coke-oven door, composed of the door proper having lateral flanges C', and constructed with water-jacket E, and the air-flue F, projected up through said water-jacket and subjected to the heating action thereof, means for controlling the admission of air to the flue F, and the valve K, movable above the door and in a plane parallel therewith, substantially as specified.

294,846. STREET-CAR SAND-BOX. MORRIS BOOKMAN and CHARLES F. BINGHAM, East New York, N. Y. Filed Mar. 5, 1883. (No model.)

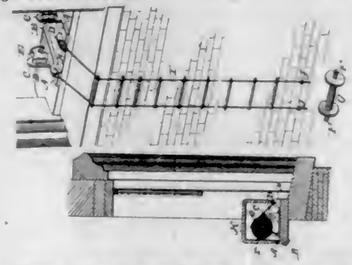
Claim.—In combination with a street-car having a hole, *c*, in the floor, a device for discharging sand in front of the wheels, constructed as herein shown and described, and consisting of the sand-box F, having cover F', bottom aperture, *a*, and nipple *b*, the flanged discharge-pipe G, valve I, rod *f*, bar K, rod L, hand-staff M, and pin A, all arranged and adapted to operate as set forth.

294,847. MACHINE FOR CLEANING WIRE. THOMAS H. BURRIDGE, St. Louis, Mo., assignor of two-thirds to William L. Reynolds and John W. Govier, same place. Filed June 16, 1883. (No model.)

Claim.—1. The combination, in a wire-cleaning machine, of two emery-wheels supported on an oscillatory frame or head, T, with weight *a* or equivalent device holding the wheels to the wire.

2. The combination of emery-wheels Q Q', supported on shafts E, and oscillatory head T, the central shaft, U, carrying wheel V, and the wheels W on shafts R, substantially as and for the purpose set forth.

3. In a wire-cleaning machine, the combination of two emery-wheels, Q Q', mounted on an oscillatory frame, to work on the top and bottom of the wire, and two emery-wheels, Q^2 Q^2, mounted on an oscillatory frame, to work on the sides of the wire, as set forth.



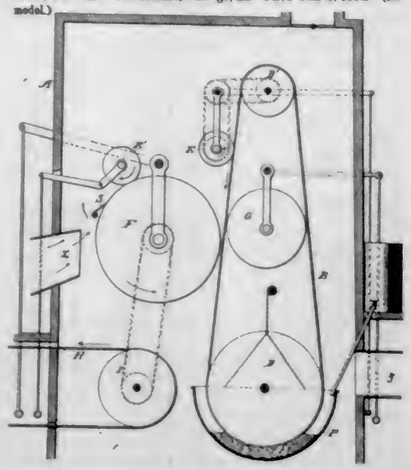
4. The combination, in a wire cleaning or polishing machine, of emery-wheels Q Q', mounted on oscillating head T, and straightening-wheels E F G K L M, arranged substantially as and for the purpose set forth.

5. In a wire-cleaning machine, the combination of a set of horizontal straightening-wheels, a set of vertical straightening-wheels, a pair of emery-wheels rotating in a vertical plane, a pair of emery-wheels rotating in a horizontal plane, and guides O between the straightening and emery wheels, as set forth.

6. An emery-wheel having studs q^4, in combination with shaft R, having cross-bar r^3, and ball-and-socket connection between the wheel and shaft, as set forth.

294,848. FIRE-ESCAPE. ROBT. ALFRED BUSH, Brockville, Ontario, Canada. Filed May 3, 1883. (No model.)

Brief.—The hooked rails to which the upper ends of the ladder are secured are provided with side flanges for hand-holes. The reel is secured to the ladder by staples which are loosely connected to the reel, so that when the ladder is unwound the reel drops therefrom, preventing a shock to the ladder.

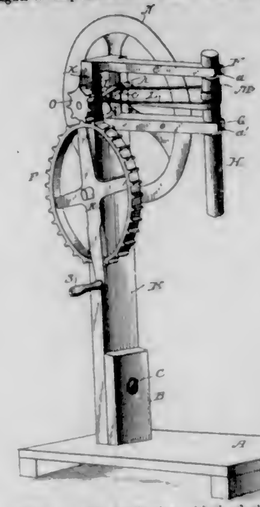


Claim.—1. In a fire-escape, the herein-described base-rails, adapted to be secured to a window-sill, and having hooks at their rear ends clamping the edge of the sill, side flanges provided with hand-holes, and perforated lugs at their front ends, in combination with a flexible escape-ladder secured to the said lugs, as set forth.

2. The combination, with a flexible fire-escape ladder, of a reel secured to the lower ends of the sides of said ladder by means of staples loosely connected to the said reel, so that the said reel shall become detached by its own weight when the ladder is unrolled, substantially as set forth.

3. As an improvement in fire-escapes, the combination of a pair of rails adapted to be secured to a window-sill, and having side flanges provided with hand-holes, and having recesses in their upper edges, forming bearings for a reel, a flexible ladder attached to the front ends of said rails, and a reel attached to the lower ends of the sides of the said ladder by means of staples detachable from the said reel by the weight of the latter, the ladder being wound, from the bottom up, upon the reel, and the latter supported by its trunnions in the bearings in the upper edges of the flanges of the rails, substantially as set forth.

294,849. METHOD OF AND APPARATUS FOR DESICCATING EGGS, &c. LYDIA J. CADWELL, Chicago, Ill. Filed Jan. 3, 1884. (No model.)



Claim.—1. The within-described improvement in treating eggs and other liquid or semi-liquid substances, which consists in forming the same into a thin film and exposing it to heat while being crushed, agitated, and desiccated, then transferring this worked material to form another film, and again similarly treating it to more thoroughly desiccate it, and finally thoroughly drying the same, as set forth.

2. In an apparatus for treating eggs and other like substances, two carriers and working appliances, and openings arranged to convey heated gases from the furnace first to the carrier on which the material is last worked, and then to the first carrier, substantially as specified.

3. The combination, in a desiccating apparatus, of two or more carriers and two or more disintegrators, and means for bringing the first carrier, after the material is sufficiently worked, in contact with and transferring it to the second, substantially as specified.

4. The combination, with the carrier B, of a disintegrating-roll, and means for revolving the latter positively in the same direction as the carrier.

294,850. MECHANICAL MOTOR. DAVID C. CAMP, Athens, Ga., assignor to Camp Brothers, same place. Filed Feb. 18, 1884. (No model.)

Claim.—1. The combination, with the double-crank shaft I, of the straps L and pulley M, as and for the purpose set forth.

2. The combination, with the upright E, having recess K and arms *e e'*, of the double-crank shaft I, strap L, and shaft H, having pulley M, as and for the purpose set forth.

3. The combination, with the standard B and bolt C, of the upright E, having slot D, recess K, and arms *e e'*, and double-crank shaft I, strap L, and vertical shaft H, having pulley M.

4. The upright E, having gear-wheel P, handle S, recess K, and arms *e e'*, in combination with double-crank shaft I, having fly-wheel N and pinion O, and the straps L and shaft H, as set forth.

294,851. TIP FOR ELECTRIC CONDUCTORS. WILLIAM A. CHILDS, Englewood, N. J., and FRANK SHAW, New York, N. Y. Filed Oct. 25, 1883. (No model.)

Claim.—1. A conducting-tip for electric conductors, made in two portions, as described, one of which constitutes the tip proper and is adapted for insertion into and removal from a binding-post, switch-socket, or such like connecting device, while the other portion is jointed to the first and receives and firmly holds the conductor.

2. A conducting-tip for electric conductors, made in two portions, as described, one of which constitutes the terminal and is adapted for insertion into and removal from a binding-post, switch-socket, or such like connecting device, while the other portion is jointed to the first and receives and firmly holds the conductor, in combination with a supplemental spring-actuated connector secured to one portion and adapted to bear on a suitable contact-surface upon the other part.

3. The combination of the tip B, adapted for insertion into a binding-post, socket, or such like connector of the conductor-holder connected by a joint with said tip, and a swivel for permitting the tip to be turned without turning the conductor, or vice versa.

4. The combination of the ferrule holding the conductor, the piece *b*, jointed to said ferrule, and the tip swiveled on the piece *b*.

5. The combination of the metallic ferrule or sleeve C for the conductor, the tip B, and a connecting-joint, as and for the purpose described.

6. The combination, with the longitudinally-perforated joint-piece *b*, of the contact-pin *c*, spring *f*, and the socketed tip B, secured to the joint-piece.

7. The combination of the longitudinally-perforated joint-piece *b*, the socketed tip B, swiveled on said joint-piece, and the contact-pin *c* and its spring, as and for the purpose described.

8. The combination, with a flexible conductor, of a terminal ferrule or holder and a jointed tip-piece adapted for insertion into a binding-post or socket, as and for the purpose described.

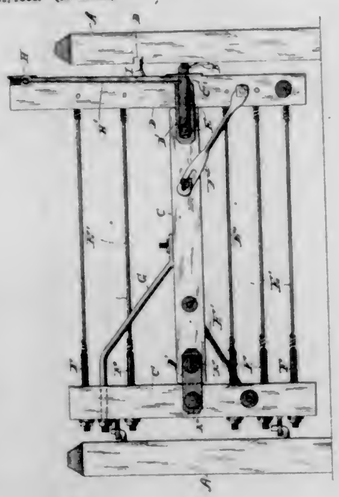
9. The combination of the joint-piece *b*, having the circumferential groove, the tip-piece B, and the pin *g*, as and for the purpose described.

10. The combination of the socketed tip B, the contact pin and spring in the socket, and the joint-piece *b*, having longitudinal perforation and circumferential groove, and the curved surface *d* upon the other portion of the joint, as and for the purpose described.

11. As a new article of manufacture, a tip for flexible conducting-cords, consisting of the ferrule C, to which the conductor is connected, and the tip B, adapted for insertion into a binding-post or switch-plug socket, and connected with the ferrule by a joint, as and for the purpose described.

12. As a new article of manufacture, the ferrule C and the tip B, adapted for insertion in a binding-post or socket, and having swivel-connection with the ferrule, as and for the purpose described.

13. The combination of the flexible conductor A, ferrule C, and jointed tip B, as and for the purpose described.

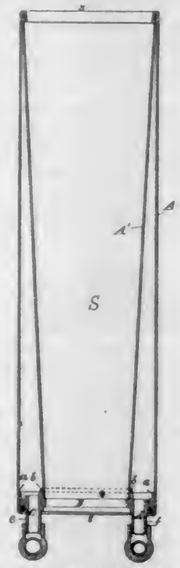


294,852. VEHICLE-BODY. HARLAN P. COLBY, Charlotte, Mich., assignor of one-half to F. L. Elma, same place. Filed Apr. 9, 1883. (No model.)

Claim.—1. In wagon-bodies, the combination of a sill having a groove and a bead forming a continuation of one of the walls of the groove, with a panel without beads near its bottom, and resting upon the bottom of the groove, substantially as described.

2. In a wagon-body, the combination of a sill having a groove and a bead forming a continuation of the wall of the groove, panel resting in said groove, a top rail resting upon the panel, an outer angle-iron having ribs resting in groove in said panel, an inner angle-iron having a rabbet for the top rail, and bolts for clamping the whole together, substantially as described.

294,853. GATE. DENNIS COLLINS, New Hampton, Iowa. Filed Sept. 21, 1883. (No model.)



Claim.—1. In a swinging gate, the combination, with the horizontal beam having rounded ends, and the hinge and latch uprights or battens flexibly secured thereto by means of plates and bolts, of the oblique adjusting-brace secured to the horizontal beam, passing through the hinge-batten, and provided with a tightening-nut, substantially as described.

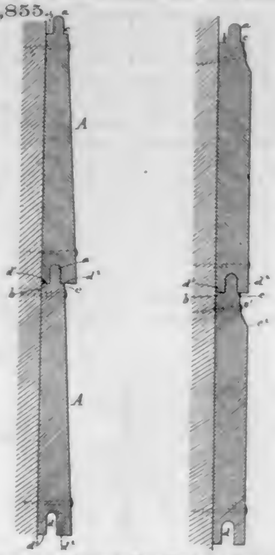
2. In a swinging gate, the combination, with the horizontal beam having rounded ends, and the hinge and latch battens flexibly secured thereto by plates and bolts, of the rods secured to the latch-batten and to the eyebolts, the latter passing through the hinge-batten and the oblique brace secured to the horizontal beam and passing through the hinge-batten, substantially as described.

3. A gate consisting of a horizontal beam, the hinge and latch battens flexibly secured thereto by plates and bolts, the rods and eyebolts connecting the battens together, the oblique slotted braces, and the oblique adjusting-brace secured to the horizontal beam and passing through a slot in the hinge batten, substantially as described.

294,854. STEAM-RADIATOR. CHESTER COMSTOCK, New Canaan, Conn. Filed May 3, 1883. (No model.)

Claim.—1. A radiator composed of one or a number of sections, each section consisting of an outer cylinder, A, and inner cylinder, A', united at one end by overlapping and soldering or in other suitable manner, in combination with the annular connecting-ring B, having flanges *a b*, whereby the lower ends of the cylinders A A' are held apart, thereby forming a steam-space between the cylinders, the sides of which are convergent, and having openings *c d*, for the admission of steam and escape of water, substantially as herein shown and described, for the purpose set forth.

2. In a radiator constructed as described, the coupling-ring B, having flanges *a b*, openings *c d*, and a stem, C, provided with branching arms E E', having passages for steam and water, substantially as herein shown and described.



3. The combination of the cylinders A A', annular connecting-ring B, having flanges *a b*, openings *c d*, and a stem, C, provided with branching arms E E', having passages for steam and water, the passage in arm E being in line with the opening *c*, and the passage in arm E' in line with opening *d*, the whole being fitted to and supported upon a base, D substantially as and for the purpose set forth.

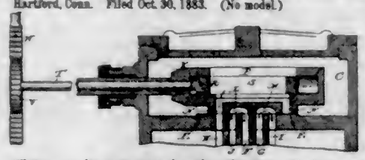
294,855. SIDING AND CEILING FOR BUILDINGS. GEORGE W. CRAWFORD, Davenport Centre, N. Y. Filed Dec. 17, 1883. (No model.)

Brief.—Consists of a board formed with a tongue projection on its upper edge and shoulders projecting at right angles, the inner shoulder having greater bearing-surface than the outer, said board having a groove on its lower edge, with projecting shoulders at right angles to said groove, thicker on their outer than on their inner face.

Claim.—In a siding or ceiling for buildings, a strip or board formed with a tongue projection on its upper edge, and an outer and inner shoulder projecting at right angles from the base of said tongue, the inner shoulder being wider and of greater bearing-surface than the outer, said strip having a groove on its lower edge with projecting shoulders at right angles to the groove, said shoulders being thicker on their outer face than on their inner face, substantially as and for the purpose set forth.

294,855.

294,856. INKING-PAD. CHAS. W. CRUSINGER, St. Louis, Mo. Filed June 30, 1883. (No model.)



Claim.—1. In a pad, the combination of a body having a base and elastic walls forming recesses, and a porous cover to rest on the body and tops of the walls, the walls forming a firm support, as set forth.

2. A pad cast of elastic material, the said material forming an ink-chamber and supports in said chamber, as set forth.

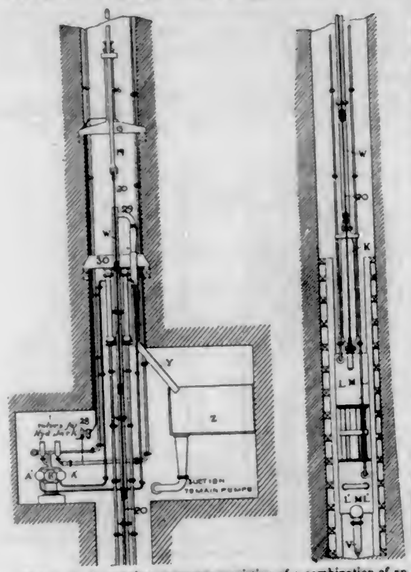
3. The combination of elastic body, feed-mouth to receive a stopper, an ink-chamber with elastic supports being formed in the body, and a porous cover, as set forth.

294,857. CUT-OFF VALVE. ISAAC B. DAVIS and WILBUR L. SHEPARD Hartford, Conn. Filed Oct. 30, 1883. (No model.)

Claim.—1. In a compound engine, the two cylinders, each with two steam-ports, the exhaust-port, the slide-valve constructed, as described, with a steam-passage through the same from front to back, and the oscillating cut-off valve mounted lengthwise within the slide-valve, substantially as described.

2. The combination, with the slide-valve having the tubular stem or spindle and the steam-passage through its body, of the oscillating cut-off valve mounted lengthwise therein, with its spindle extended centrally through the tubular spindle.

3. In combination with the high and low pressure cylinders and the five ports opening into the steam-chest, as described, the slide-valve provided with the ports L, M, N, N', and P, and the longitudinal oscillating cut-off valve R, as described and shown.



4. In combination with a slide-valve having a longitudinal slit or passage for the admission of live steam through the same from the outside, substantially as described, the oscillating valve R, mounted lengthwise therein, with a corresponding longitudinal port or slit, said oscillating valve being fixed against end motion.

294,858. PAPER WRAPPER. DUNDAS DIXE, New York, N. Y. Filed Aug. 20, 1883. (No model.)

Claim.—The described package-wrapper, provided at one end with the notches or cuts *d*, thereby forming the tongues *f*, and the edges of the border *a* being cut away at *a' a'*, as described, whereby the said wrapper is capable of being applied to a package, as specified.

294,859. APPARATUS FOR DRAINING MINES. GEO. W. DICKIE, San Francisco, Cal., assignor to the Risdon Iron and Locomotive Works, same place. Filed Dec. 23, 1882. (No model.)

Claim.—1. A pumping apparatus consisting of a combination of an actuating-engine moved by water-pressure, and having valves and valve-operating mechanism to effect a reciprocating motion therein, and a pump to which said motion is directly transmitted through pipes filled with water, as and for the purpose described.

2. In a pumping apparatus having a vertically-acting pump, the combination, with the said pump, of an actuating-engine moved by water-pressure, having separate cylinders and plungers to generate the pressure to supply each end of said pump, and in which separate cylinders different pressures may be produced to act alternately through leading pipes to effect the up-and-down stroke of the pump, substantially as and for the purpose described.

3. An actuating-engine consisting of a combination of a set of rams alternately moving backward and forward within their respective cylinders through the action of water-pressure controlled by suitable valves and valve-operating mechanism, and a second set of similar rams connected with the first set by a cross-head, which, operating in their respective cylinders, generate a power, which is transmitted through leading pipes filled with water for the purpose, substantially as herein described.

4. The pump consisting of the differential plunger, with the discharge and suction valves, all operating within suitable cylinders, in combination with side rams operated within their respective cylinders by water-pressure applied thereto, and transmitting their motion to said differential plunger by being connected therewith, substantially as herein described.

5. In combination with a pump used for sinking purposes in a mine, a hydraulic lifting-jack consisting of a ram operating in a cylinder, which ram in raising carries up with it suspensory rods, to which the pump is attached, substantially as and for the purpose herein described.

6. In combination with a pump used for sinking purposes in a mine, and a hydraulic lifting-jack operating to raise and lower the same, the suspensory rods herein described, consisting of the side straps, 19, having the slotted holes therein, with cross-key 18, rods 20, having shoulders 22, swinging rods 23, hanging from girder 15, and cross-bars 25, arranged and operated substantially as described, and for the purpose set forth.

7. As a means of raising and lowering a hydraulic sinking-pump in a mine, the combination of a lifting-jack permanently located in the shaft above said pump, and from which it is suitably suspended, and telescopic joints for the pressure-supply pipes and discharge-column, substantially as herein described.

8. In combination with a hydraulic pump operated by an actuating-engine having coincident duration of stroke, a safety device, substantially as herein described, consisting of valves, which are opened by suitable mechanism to give free communication between each end of said pump to the effect of equalizing the pressure therein to arrest further motion upon completion of the stroke.

9. In combination with a hydraulic pump, the specific combination of parts constituting the above safety device, consisting of the flat bar 12, with wedges 14 14' thereon, bell-cranks 8 8', suitably supported, twin valves 3 3' in their respective cylinders 1 1', and connecting-pipes arranged and operated substantially as herein described.

10. The air-chamber, Fig. 16, consisting of a combination, with the vertical discharge-pipe of the pump, of the envelope surrounding the same and the bowl into which the end of the discharge-pipe dips, substantially as and for the purpose described.

11. The triple valves shown in Fig. 17, consisting of a combination of the valves 33 and 34, opening and closing passages between the cylinder of the lifting-jack and the pressure and balance column, respectively, the valve 35, opening and closing a passage from the telescopic pipes, Figs. 11 and 12, to the open air, and the operating-lever 36, substantially as and for the purpose described.

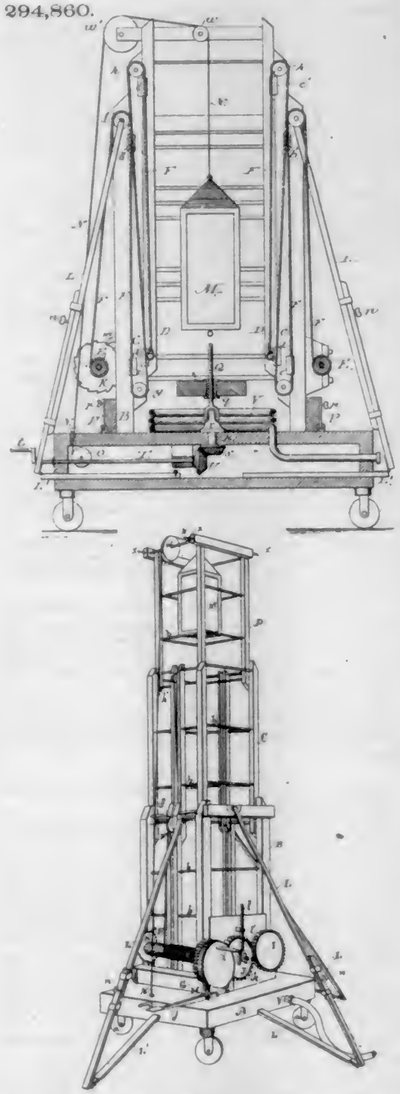
12. In combination with a sinking-pump for mines, having sliding frame in which it is periodically lifted and lowered, the telescoping leading and discharge pipes and the actuating-engine, substantially as herein described.

294,860. FIRE-ESCAPE. ELAM DYE, San Francisco, Cal. Filed Apr. 2, 1883. (No model.)

Brief.—The ropes by which the sections are extended are wound upon drums provided with gear-wheels at one end. A central gear-wheel feathered on its shaft meshes with the rope-drum gears, and may be thrown out of gear with either or both, providing for extending both sides of the sections evenly. The hoist-rope drum is placed within the hollow base of the truck. The lower section is secured to the truck by links and set-screws, and by a central pivoted screw, which passes through a stationary nut in the lower section, by which the adjustment of the inclination of the structure is permitted and adjusted.

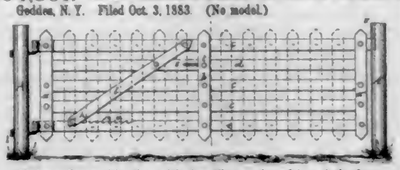
Claim.—1. The telescoping frame-sections B C D and their operating-ropes F, in combination with the winding-drums E E', one on each side, the gears G I on said drums, and the intermediate gear, J, feathered on its shaft, and the lever *l*, with its clutch *l'*, for throwing said gear out of engagement with gears G I, substantially as and for the purpose herein described.

2. The hollow base A and the telescoping frame-sections B C D, in combination with the cage M, smaller than the interior of said sections, the rope N, pulleys *w w'*, and winding-drum O, in said hollow base, substantially as and for the purpose herein described.



3. The hollow base A and frame-section B, in combination with the extensible braces L and strips L', hinged to their lower ends and sliding in the hollow base A, substantially as herein described.

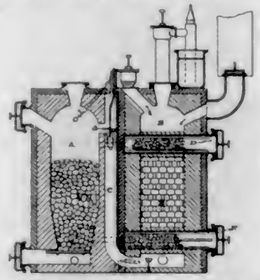
4. The base A, telescoping frame-sections B C D, and the corner-links P, with set-screws *p*, securing section B to base A, in combination with the means for inclining said section, consisting of the pivoted screw Q, nut *q*, and means for rotating said screw, substantially as herein described.



5. The hollow base A, telescoping frame-sections B C D, and the corner-links P, with set-screws *p*, securing section B to base A, in combination with the means for inclining said sections, consisting of the pivoted screw Q and nut *q*, the bearing *r*, shafts R T, pinions S U, and crank *t*, all arranged and operating substantially as herein described.

6. The hollow base A and telescoping frame-sections B C D, in combination with the hose V, lying on the base A, and having its end extending into it and through its side, substantially as herein described.

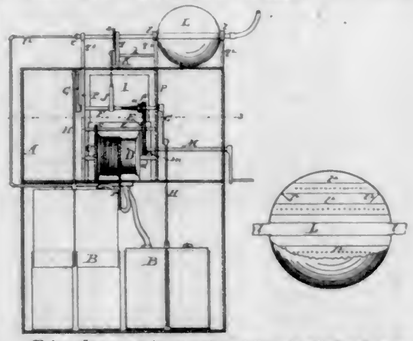
294,860.



294,861. GATE. BENJAMIN N. EASTMAN and CHARLES F. FINKBEINER, Geddes, N. Y. Filed Oct. 3, 1883. (No model.)

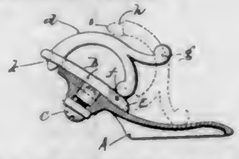
Claim.—In combination with the stiles *a*, *a'*, and *b*, and the bars *c c*, pivoted on said stiles, the lever *d*, pivoted on the central stile, the bar *e*, provided with notches *n n*, and the brace *l*, hinged on the top bar and connected with the lever *d*, and having its lower end adapted to engage with the notches *n n*, substantially as described and shown.

294,862. HYDROCARBON-GAS GENERATOR. JOSEPH FLANNERY, Philadelphia, Pa. Filed Mar. 20, 1883. (No model.)



Claim.—1. In a gas-generator, the combination of the generator-chamber A, a pipe which introduces oil into the chamber, and the steam-jet pipe projecting into the gas-outlet passage, whereby the jet of steam may be introduced into the chamber at the point at which the gas makes its escape, the steam being made to form an envelope for the oil and the gas resulting therefrom, substantially as described.

2. In a gas-generator, the combination of the generating-chamber A, the chamber B, and a connecting-passage, C, with the steam-jet nozzle or injector O, placed below the opening in the generator-chamber, and which serves to exhaust the gas from the generator-chamber and drive it into the chamber B, substantially as shown.



3. In a gas-furnace, the combination of the generating-chamber A, into which the oil is passed at any suitable point above the fire, the steam-pipe provided with the jet-nozzle *a* O, the passage C, and the chamber B, the jet O being made to exhaust the gas from the chamber A against jet *a*, which is passed into the chamber A at the point from which the gas escapes, whereby the gas and steam are intimately commingled, substantially as specified.

294,863. CARBURETOR. ADOLF GAIRING and HENRY LEHMANN, Cleveland, Ohio. Filed Oct. 19, 1883. (No model.)

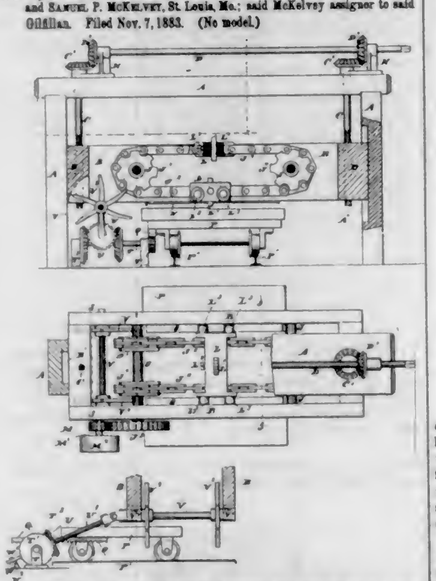
Claim.—In a gas-carburetor substantially as described, and in combination with the segment K, link *k*, eccentric J, and the pinion *s*, the globular vessel L, having hollow journals *l*, perforated shelves *l'*, and inwardly-extending deflectors or wings *l²*, all combined and arranged to operate substantially as and for the purpose set forth.

294,864. CHECK OR WATER HOOK. THOMAS GARREN, Providence, R. I. Filed Nov. 22, 1883. (No model.)

Claim.—1. In an improved check or water hook, the hinged hook or part *d*, provided with spheroidal end *i* and groove *h*, in combination with the base or bar *a*, provided with aperture *k*, substantially as and for the purposes hereinbefore set forth.

2. As an improved article of manufacture in check or water hooks, the hook or part *d*, provided with spheroidal end *i*, groove *h*, and projection *g*, hinged to the base or bar *a*, and said spheroidal end *i*, with groove *h*, being adapted to engage aperture *k* in said base or bar *a* to form a snap-catch, substantially as shown and described.

294,865. CARTRIDGE DECAPPER, RECAPPER, AND RELOADER. FALCONER GIFFARD, Burlington, Iowa, assignor of three-fourths to Wm Penrose and Solomon McNeill, both of same place. Filed July 30, 1883. (Model.)

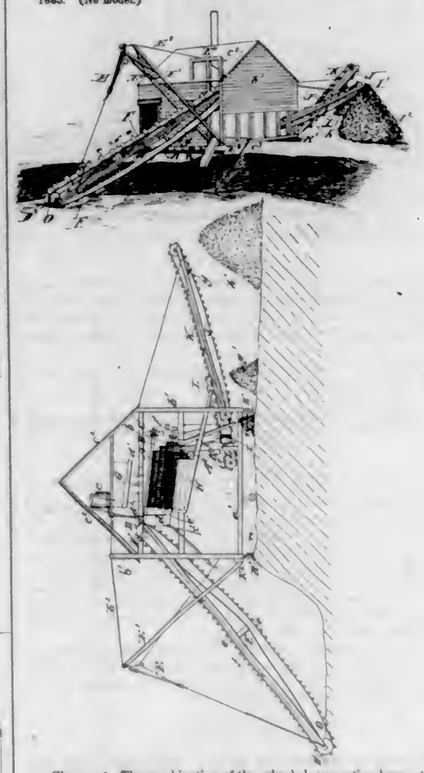


Claim.—1. The combination, in a cartridge implement, of the cartridge-chambers F G, their support A, and handles B and C, hinged thereto, the handle B having recessed chamber wherein is supported a fixed capping-anvil surrounded by a spring-actuated washer, which normally projects beyond said pin, forming a recess for the support of the primer, and the handle C provided with means for forcing the cartridge against the capping-anvil, all substantially as described.

2. The combination of the handle B, having cap-escape perforation *e*, and the handle C, both hinged to the support A of the decapping-chamber G, said chamber and the decapper M, located therein, having spring-actuated ejector-pin, all substantially as described.

3. In a cartridge implement, the combination of the handles B and C, hinged to a chamber-support, A, the handle C bearing hinged ramrod *b*, and the handle B having the capper *a*, said ramrod and capper located opposite the ends of shell-retaining chamber F in support A, all substantially as described.

294,866. STONE-DRESSING MACHINE. ESSINGTON N. GILFILLAN and SAMUEL P. MCKELVEY, St. Louis, Mo.; said McKelvey assignor to said Gilfillan. Filed Nov. 7, 1883. (No model.)



Claim.—1. In a stone-dressing machine, the combination of a main frame, a vertically-adjustable frame therein, horizontal shafts journaled in the adjustable frame, belt-wheels on said shafts, belts on said belt-wheels, cutter-heads secured to said belts, means for operating the cutter-head belts, means for raising and lowering the vertically-adjustable frame, and means for supporting the stone to be dressed.

2. In a stone-dressing machine, the combination of a frame having plates or rails secured thereto, wheels journaled in said frame, endless belts carried by said wheels, cutter-heads having friction-rollers to bear on the rails, and means for operating the belts.

3. In a stone-dressing machine, in combination with the cutter-carrying belts properly supported and the truck for supporting the stone to be dressed, suitable mechanical means whereby the movement of the belts causes the intermittent movement of the truck, substantially as and for the purpose set forth.

4. In a stone-dressing machine, the combination of the stone-supporting truck provided with a rack, a pinion secured to one end of a shaft to engage the rack, two bevel-wheels on the pinion-shaft, a bevel-wheel on a swinging shaft adapted to be engaged with either of the bevel-wheels on the pinion-shaft, two spiders arranged on a shaft connected to the swinging shaft, and endless cutter-carrying belts adapted to operate the spiders to cause an intermittent movement of the truck, for the purpose set forth.

294,867. SAND AND GRAVEL EXCAVATOR, SEPARATOR, AND ASSORTER. NICHOLAS W. GODFREY, Northport, N. Y. Filed Sept. 29, 1883. (No model.)

Claim.—1. The combination of the wheeled supporting-house, the excavating-elevator extended outward from or through one side of the house, means for raising the free end of the elevator above the beach on which the house rests, and the discharge elevator or elevators extended from the house on the opposite side from the excavating-elevator, and adapted to counterbalance the same, whereby the apparatus may be shifted laterally along the beach in working condition, substantially as shown and described.

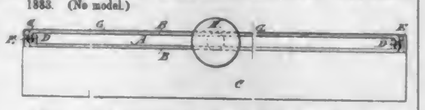
2. The combination, with the hopper and the screens in the screening and grading apparatus, of the tank *c*, supported above the same, the sprinkler G, arranged between the tank and screens, and supplied with water from the tank, and the pipe d^2, connecting the tank with the hopper, substantially as shown and described.

3. A screening and grading apparatus having the series of discharge-spouts, and the endless carriers or elevators adapted to receive from the spouts and deliver at a distance the several grades of material coming from the screens, substantially as shown and described.

294,868. TOY DOLL. HENRY A. GOFFE, Albany, N. Y. Filed Sept. 4, 1883. (No model.)

Claim.—As a new article of manufacture, a toy doll composed of a body-piece, A, of card-board or other suitable thin material, substantially

294,868.

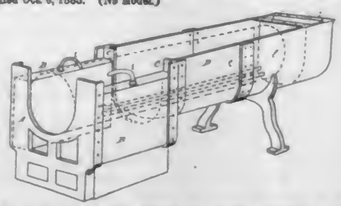


in the form shown and described, so as to expose the face and feet, having simulated apparel permanently secured thereto, and the whole permanently attached to a panel, H, as and for the purpose herein specified.

294,869. NECKTIE-FASTENER. ORIEL MUNSON GRAVES, Dayton, Wash., assignor of one-half to H. D. Graves, Portland, Oreg. Filed Oct. 6, 1883. (No model.)

Claim.—A necktie-fastener consisting of a piece of wire bent to form a central spring-loop, *a*, adapted to embrace the neck of the collar-button, and oppositely-extending arms *b*, terminating in inturned hooks *c*, for engaging with and securing the tie, substantially as herein described.

294,870. RULER. MONROE GREEN, Brooklyn, N. Y. Filed June 12, 1883. (No model.)



Claim.—1. The combination, with a ruler provided with a longitudinal frame forming ways, of a pen held in said ways and free to slide back and forth therein, substantially as herein shown and described.

2. The combination, with a ruler, of a longitudinal frame held on the top of the same, springs for pressing the frame upward, and a pen held to slide in the frame, substantially as herein shown and described.

3. The combination, with the ruler C, of the frame A, the springs D, for pressing the frame A upward, and of the guide-strip G, substantially as herein shown and described.

4. The combination, with the ruler C, of the frame A, held on the same, and the pen F, held between the wires or rods B of the frame, the pen being provided with recesses or notches for receiving the rods, substantially as herein shown and described.

294,871. SUPPORT FOR BOILERS. JOHN C. HAAS, Lansing, Mich. Filed Oct. 6, 1883. (No model.)

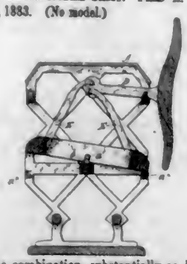
Claim.—1. A sectional support for boilers, consisting of the fire-box and combustion-chamber A, provided with side water-legs, B, and a water-leg, *a*, arranged in the rear of the boiler proper, and all detachably secured together, substantially as set forth.

2. A support or arch for boilers, consisting of the cast-iron front A, side water-walls, B, plate D, and combustion-chamber C, and provided with suitable pipes for connecting the side water-walls to the boiler, substantially as specified.

294,872. HARNESS-TUG. SAMUEL H. HAAS, Chicago, Ill., assignor to Charles J. Wright. Filed Aug. 8, 1883. (Model.)

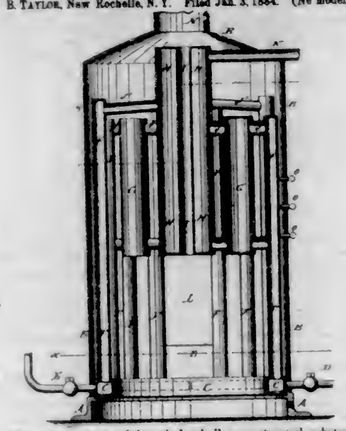
Claim.—1. A harness-tug consisting, substantially, of a U-shaped body normally open at its top, in combination with the spring-catch, which is pivoted to the outer prong of the tug, said catch normally projecting downward into the tug and adapted to catch over the top of the thill, substantially as set forth.

2. A harness-tug consisting, substantially, of a U-shaped body normally open at its upper portion, provided with a buckle at its top and a strap-loop at its bottom, in combination with the spring-catch pivoted to the outer prong of the tug, said catch normally projecting downward into the tug and adapted to engage with the top of the thill, substantially as set forth.



294,873. VALVE-GEAR. JAMES T. HALSEY, Richmond, Va. Filed Oct. 5, 1883. (No model.)

Claim.—1. The combination, in a valve-gear, of the eccentric, eccentric-yoke, valve-stem of the cut-off valve, valve-stem of the main valve, slide, and way for the slide, the arrangement and connection of the parts being such substantially as is set forth.



2. The combination, in a valve-gear, of the eccentric-yoke provided with a pivot, F, with the slide G.

294,874. REVERSIBLE SEAT. FRED H. HENRY, Wakefield, Mass. Filed Nov. 5, 1883. (No model.)

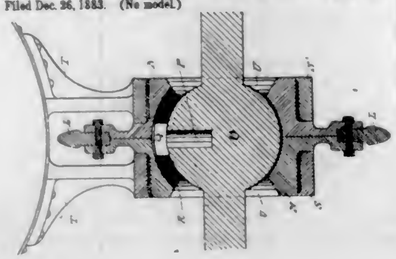
Claim.—The combination, substantially as before set forth, of the stands, the seat pivoted thereto, the back constructed with striker-arms, by which it is pivoted to the stands, and the suspension-rods for supporting, tilting, and locking the pivoted seat, each suspension-rod being at one end pivoted to a striker-arm, substantially as described, and at the other end to the seat.

294,875. UPRIGHT TUBULAR BOILER. RENE HENRY and HIRAM B. TAYLOR, New Rochelle, N. Y. Filed Jan. 3, 1884. (No model.)

Claim.—1. An upright tubular boiler constructed substantially as herein shown and described, and consisting of the annular tube C, the long upright tubes F, the shorter intermediate tubes, G, and central tube, H, having center flue, I, and the connecting-tubes J J', having right and left screw-threads on their ends, as set forth.

2. In an upright tubular boiler, the combination, with the outer upright tubes, of the inner upright tubes, communicating with the outer tubes at top and bottom, and the central tube, communicating with the inner tubes and with certain of the outer tubes by separate tubular connections, substantially as and for the purpose set forth.

3. In an upright tubular boiler, the combination, with the annular water-tube, of the outer upright tubes, the inner upright tubes, communicating with the inner tubes at top and bottom, and the central tube, communicating with the inner tubes and with certain of the outer tubes by separate tubular connections, substantially as and for the purpose set forth.



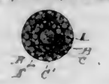
4. In an upright tubular boiler, the combination of the annular tube, the outer upright tubes, the inner upright tubes, communicating with the inner tubes and with certain of the outer tubes by separate tubular connections, and having the steam-outlet, and the central flue extending through the central tube, substantially as and for the purpose set forth.

5. In an upright tubular boiler, the combination, with the upright tubes F, the inner pipes, G, communicating at top and bottom with the pipes F, and the central tube, H, communicating with the tubes G and certain of the tubes F by separate tubular connections J J', of the annular tube C, provided with an inlet-pipe, E, and a blow-off cock, D, substantially as herein shown and described, whereby the feed-water will be distributed to all the said tubes, as set forth.

294,876. OINTMENT FOR TETTER. MANLIUS HUGGINS, Waynesborough, Miss. Filed Sept. 29, 1883. (No specimens.)

Claim.—The herein-described medical compound to be used for the cure of tetter and other cutaneous diseases, consisting of chrysophanic acid, pure glycerine, oil of sassafras, laudanum, and vaseline, in the proportions specified.

294,877. TRACTION-ENGINE. SAMUEL E. JARVIS, Lansing, Mich. Filed Dec. 26, 1883. (No model.)

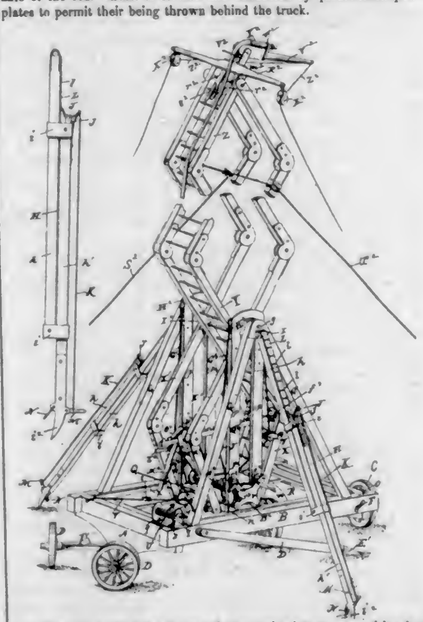


Claim.—1. In a traction-engine, the combination of the ball O, socket or two-part hub N, detachable sprocket-rim L', or its equivalent two-part box S S', provided with bracket-extensions T T', pin P, provided with bead Q, and segmental slot R, all combined and operating substantially as and for the purpose described.

2. As an improved sprocket-wheel in traction-engines, the two-part hub N, having a detachable toothed rim, as L', secured to its periphery by means substantially as set forth.

3. A sprocket-wheel made in two parts, and having a peripheral channel between the same, in which is secured a tooth-rim, substantially as described.

294,878. SHAFT FOR STEAMSHIPS. S. BRYAN JEROME, New Haven, Conn. Filed Aug. 20, 1883. (No model.)



Claim.—1. A shaft composed of straight wires wrapped in spiral coils of wire having journals, substantially as herein set forth.

2. In a shaft, the combination, with a core, A, of a layer or layers of collections of straight wires placed around the core, each collection being separately wrapped in a spiral coil, substantially as herein set forth.

3. A shaft composed of a core, A, a layer or layers of collections of straight wires, each collection being wrapped in a spiral coil of wire, and a wrapping of spirally-wound wire around each layer of collections, substantially as herein set forth.

294,879. FIRE-ESCAPE. EZRA RANDALL JOHNSON, Buchanan, Mich. Filed Nov. 19, 1883. (No model.)

Brief.—A sliding table provided on its under side with runners moves in the opening of the truck-frame, and the lower arms of the lazy-tongs are secured to said sliding table, and are extended by an arrangement of ropes and pulleys. A lever pivoted to one side of the lazy-tongs engages a rack-bar secured to the opposite side for tightening the device after it is extended. Extensible racked braces support the structure laterally. A swinging arm or lever having a universal movement and carrying a hose-nozzle is carried by the top of the structure. The axle of the rear wheels is divided and connected by quadrant-shaped plates to permit their being thrown behind the truck.

Claim.—1. In a fire-escape, the extension-braces, comprising bars connected together and sliding upon each other, a catch at the upper end of one of the bars, engaging with teeth or serrations on the other, and a hand-lever pivoted at the lower end of one of the bars, and connecting with the catch for withdrawing the same from engagement, as set forth.

2. In a fire-escape, the ladders constructed on the lazy-tongs principle, in combination with a frame provided with a central opening, a table sliding in said opening and connected to the ladders, runners attached to the under side of the table, and having a cross-bar secured thereto, a projection on the under side of the frame, against which the cross-bar is arranged to abut, and means for operating the table, as and for the purpose set forth.

3. In a fire-escape, the ladders constructed on the lazy-tongs principle, in combination with a rack-bar attached at one end with one side of the ladders, and a lever pivoted to the opposite side of the lazy-tongs, and engaging with the rack-bar, as set forth.

4. In a fire-escape, the ladders constructed on the lazy-tongs principle, in combination with a rack-bar, a lever adapted to engage with the same, and a detent-bar arranged to be either lifted from the rack-bar or engaged therewith to cause the forward movement of the same, as and for the purpose set forth.

5. In a fire-escape, the ladders constructed on the lazy-tongs principle, in combination with a rack-bar, a lever adapted to engage the same, a detent-bar pivoted at its end to an operating-lever, and a lifting-bar attached to the side of the detent-bar, as and for the purpose set forth.

6. In a fire-escape, the ladders constructed on the lazy-tongs principle, in combination with a frame and a sliding table, a drum or windlass provided with suitable operating means, a grooved block on the sides of the ladders, and a rope or chain passing from the drum, over suitable polleys, to the grooved block, as and for the purpose set forth.

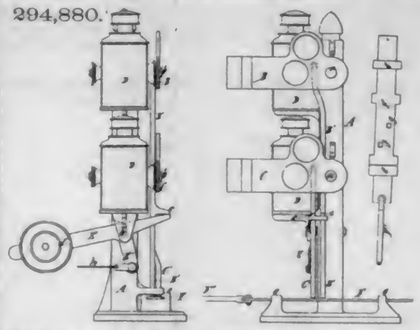
7. In a fire-escape, the ladders constructed on the lazy-tongs principle, in combination with a frame and a sliding table, a pair of bars on each side, carrying polleys at their upper ends, grooved blocks on the sides of the ladders adjacent to the polleys, a drum or windlass provided with suitable operating means, and a rope or chain connecting the drum with the polleys and grooved blocks, as and for the purpose set forth.

8. In a fire-escape, the ladders constructed substantially as explained, in combination with a frame and a sliding table, a pair of bars on each side, attached to the table and carrying polleys at their upper ends, grooved blocks on the sides of the ladders adjacent to the polleys, a rope or chain connecting with the polleys and grooved blocks, a drum or windlass to which the rope or chain is attached, a pawl and ratchet secured to the windlass or drum, and a set of gear-wheels and pinions arranged to operate the said windlass, as and for the purpose set forth.

9. In a fire-escape, the ladders constructed substantially as explained, and provided with suitable guy-lines, in combination with a frame and a table sliding in said frame, a pair of standards attached to the sides of the frame and converging toward their upper ends, a pair of bars secured at their upper ends to the said converging standards, and at their lower ends to the sliding table, polleys journaled at the upper ends of the bars, grooved blocks on the sides of the ladders adjacent to the polleys, a rope or chain connecting with the polleys and grooved blocks and attached to a drum or windlass, a pawl and ratchet secured to the latter, and mechanism for transmitting motion to the drum or windlass, as set forth.

10. In a fire-escape, a bar secured to the upper ladder, and carrying a lever having a universal movement, a hose fitted to said lever, and cords, also attached to the lever and passing through suitable polleys to the ground, as set forth.

11. In a fire-escape, a bar attached to the upper ladder, a U-shaped plate journaled in said bar, a lever pivoted in said plate, and having a hose-nozzle attached thereto, and cords connecting with said lever, and arranged to operate the same in the manner set forth.



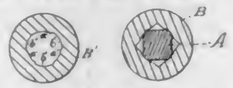
12. In a fire-escape, a bar provided with plates which hook at their upper ends over the top rung of the upper ladder, and encircle or clasp at their lower ends one of the lower rungs, a U-shaped plate journaled in said bar, a lever pivoted in the U-shaped plate, and having a hose-nozzle fitted thereto, a clamp for holding the nozzle in place, and cords connecting with the said lever, and arranged to operate the same in the manner set forth.

13. In a fire-escape, the truck having its front wheels arranged to be thrown at right angles thereto, the rear wheels being divided, as shown, and connected by quadrant-shaped plates, which permit the rear wheels to be thrown behind the frame or truck, as and for the purposes set forth.

294,880. RAILWAY-SIGNAL. HENRY JOHNSON, Eccles, County of Lancaster, England. Filed Aug. 15, 1883. (No model.)

Brief.—Each semaphore or other signal has a depending arm, whereby it is held at "danger" by a perforated sliding plate controlled by the switch-operating mechanism in such manner that "safety" cannot be displayed until the switch has first been properly set, and the sliding plate consequently shifted to bring a perforation under the proper signal-arm to permit it to come to "safety," and when the signal is so set the plate is thereby locked, and the switch cannot be changed until the signal has been again "dangered."

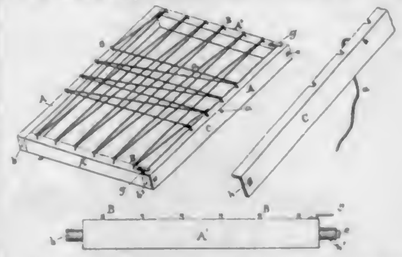
Claim.—1. The combination, with a semaphore-arm or other visual signal and a switch or switches, of a rod depending from the said signal,



and through which it is held in the "danger" position, a stop-plate arranged below the rod and preventing the downward movement of the same when the switch or switches is or are in the "danger" position, and connections between the switch or switches and plate, so that upon the movement of the switch or switches to a "safety" position the plate will be withdrawn from beneath the rod, thus enabling the rod and its signal to descend and place the signal in the "safety" position, substantially as described.

2. The combination, with two or more semaphore-arms or other visual signals and a switch or switches controlling two or more tracks, of rods depending from the signals, devices whereby the signals and rods are held in an elevated or "danger" position, one or more stop-plates arranged below said rods, connected with the switch or switches, so as to be moved therewith, and so constructed that to whichever operative position the switch or switches may be moved the said plate or plates will be withdrawn from below one or the other of said rods, and a lever or other means for releasing said rods from the devices which hold them elevated, whereupon one rod and signal will fall to the "safety" position while the other rod or rods will be arrested by said stop plate or plates, substantially as described.

3. The combination of the post or support A, one or more signals, B or C, and a rod or rods, B' or C', the weighted lever E, and one or more stop-plates, F, all constructed and adapted for operation substantially as herein described.

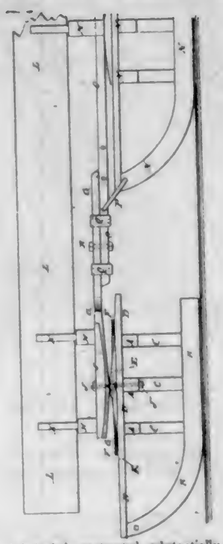


294,881. KNOB-SPINDLE ATTACHMENT. HORACE K. JONES, Hartford, assignor to the Russell & Erwin Manufacturing Company, New Britain, Conn. Filed Dec. 17, 1883. (No model.)

Claim.—A knob-spindle and socket provided each with two or more alternate concentric circular smooth holding-faces and relief-spaces, substantially as described, and for the purpose specified.

294,882. RED-SPRING FIRE-ESCAPE. MARY E. JONES, St. Paul, Minn. Filed Apr. 2, 1883. (No model.)

Brief.—The escape-rope is laced back and forth upon spring-hooks in the end and side bars, the end of the rope being fastened to a slotted metal bar forming one of the sides. By the removal of this metal bar the other bars forming the bed-bottom may be rotated, so that the rope may be removed readily.

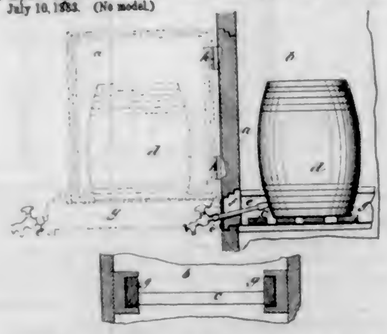


Claim.—1. The combination, in a fire-escape bed-bottom, with a frame supporting spring-hooks, and having round and square tenons on the ends of the end bars, of a slotted metal bar, whereby the end bars may be

rotated or held stationary by the removal or adjustment of said slotted metal bar, substantially as set forth and described.

2. The combination, in a fire-escape bed-bottom, of a metallic side bar, to which the suspending-cord is attached, having mortised ends, and end bars having round and square tenons and metallic springs, substantially as set forth and described.

294,883. BOB-SLED. JOSEPH HAINES KIRK, Brady, Clearfield County, assignor to himself and Miles A. Kirk, Bellefonte, Pa. Filed Jan. 11, 1884. (No model.)

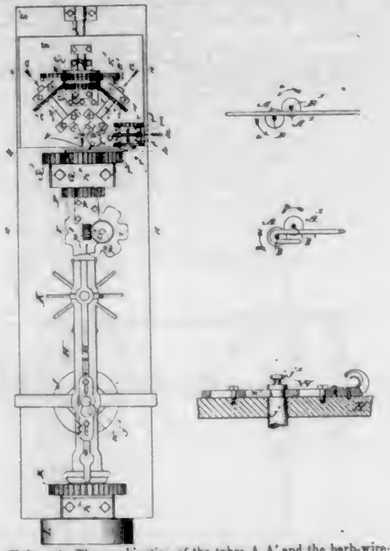


Claim.—1. A bob-sled constructed, substantially as herein shown and described, with a platform or double bolster and a jointed king-bolt, as set forth.

2. In a bob-sled, the combination, with the forward bob, A B C D, having saddle E, and the forward part, G, of the reach, of the platform or double bolster H I and the jointed king-bolt J, substantially as herein shown and described, whereby the said bob will be free to move in any direction without affecting the position of the said platform, as set forth.

3. In a bob-sled, the combination, with the forward bob, A B C D, the saddle E, the forward part, G, of the reach, and the platform H I, of the annular guard-plate F, substantially as herein shown and described, whereby the rocking and pitching of the said bob will be limited, as set forth.

294,884. BEER-COOLER. CHAS. L. KRUM, Minneapolis, Minn. Filed July 10, 1883. (No model.)



Claim.—1. The false rail or front *f*, containing a tap or faucet hole, in combination with the beer-cooler and its door *a*, to enable the door to open on its hinges, and to open and close the way for the sliding rack with the keg thereon, and having the faucet in it, substantially as described.

2. The combination of the false rail *f*, containing the tap or faucet hole or notch, with the slides *g* and rack *c*, and forming part of the same, to be drawn out with the slides, substantially as described.

3. The front rail, *f*, having the notch for the faucet *e*, notched plate *i*, and the slitted rubber packing *j*, in combination with the rack *c* and slides *g* of a beer-cooler, substantially as described.

294,885. BARB-WIRE MACHINE. GODFREY H. LASAR, St. Louis, Mo. Filed Mar. 12, 1883. (No model.)

Brief.—The main wires are fed continuously through two angularly-placed coiling-tubes mounted, with the cutters and barb-feeder, on a slide. The barb-wire is fed under one wire and over the other. One coiler begins to rotate and partially coils the free end of the barb-wire. The barb-wire is then cut. The other coiler then begins to rotate and to coil the other end of the barb. The two coilers continue rotating, each coiler completing the coiling of one end of the barb. The coiler which begins to rotate first completes its movement first. The wires are drawn forward, twisted, and spooled by the flier.

Claim.—1. The combination of the tubes A A' and the barb-wire-severing device T, and a slide, S, substantially as described.

2. The combination of the tubes A A' and a device for feeding the barb-wire across the rear ends of the tubes, and a slide, S, for the purpose described.

3. The combination, in a barbed-wire machine, of the strand-wire tubes A A' and the gears a' a^2 C C', the gear C being mounted on the hub of wheel *c*, and the gear C' being mounted on the hub of wheel *c'*, substantially as described.

4. The combination, in a barbed-wire machine, of the tubes A A', the gears a' a^2 C C' *c c'* E E', and the shafts D F, substantially as described.

5. The combination of tubes A A', arranged in different horizontal planes on a slide, S, with the shaft D, the gears C C' *c c'* on this shaft, and the gears a' a^2 on the said tubes, substantially as described.

6. The combination of the tubes A A', the gears a' a^2 C C' *c c'*, and shaft D on the broken gears E E', adjustably connected and applied on shaft F, substantially as described.

7. The combination of the tubes A A', the gears a' a^2 C C' *c c'*, the latter having broken flanges g^6, the gears E E', and the automatic locking devices G G', substantially as described.

8. The tubes A A', having slots a^1, a removable tube, a^4, projection a^5, and pins a^3 on the latter, and the nuts a^6, substantially as described.

9. The combination of the slotted and threaded tube a^6, the tube a^5, having twisting-lug a^7, and the nut a^8, as and for the purpose described.

10. The combination, in a barbed-wire machine, of a pair of strand-wire tubes, through which the strand-wires are delivered, and a device for feeding the barb-wire across the rear ends of the strand-wire tubes and severing it, as desired, into barb lengths, said strand-wire tubes being respectively provided with projections for bending the barb-wire around the strand-wires, and a supporting-slide, S, substantially as described.

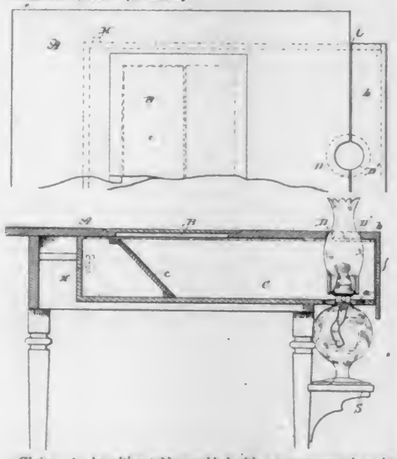
11. The combination, in a barbed-wire machine, of the tubes A A', a barbed-wire feeder, a slide, S, and the flier H, substantially as described.

12. The combination, in a barbed-wire machine, of the tubes A A',

a slide, S, the flier H, and the feed device I, substantially as described.

13. The combination, in a barbed-wire machine, of the tubes A A', a feeder for the barb-wire, a slide, S, the flier H, and the spool J, substantially as described.

14. The combination, in a barbed-wire machine, of the tubes A A', the slide S, the flier H, the feed device I, the guide K, and the spool J, substantially as described.



15. The combination, with the angularly-arranged tubes A A', a barb-wire-feeding device, and a slide, S, of the shaft F, the cam R, the pitman r', the spring r^3, the arm r^2, the ratchet r^1, and the feed-rollers r^{12} r^{13}, substantially as described.

16. The combination, with the angularly-arranged tubes A A', constructed as described, and mounted on a slide, S, of the shaft F, the cam *t*, the lever t^2, and the knife-slide t^1, as and for the purpose described.

17. The combination, with the tubes A A', and the slide S, of the slide t^1, the movable knife t^3, and the knife t^4, the said slide and slide-standard being cut away and perforated at t^5 t^5, substantially as described.

18. The combination of the slide S, the tubes A A', and the severing device T, the bed-plate S', the shaft F, and the cam *f*, substantially as described.

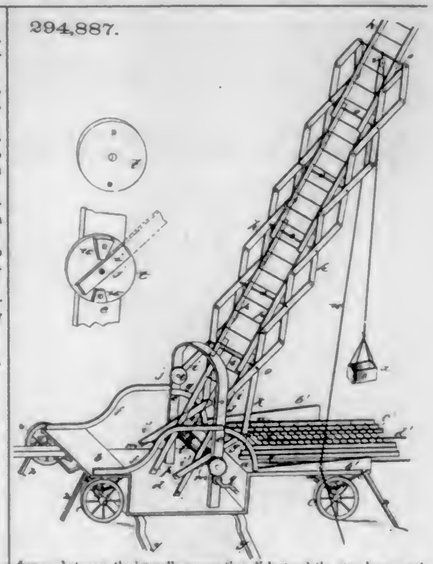
294,886. WRITING-TABLE. MARSHAL E. LENDEL, Homestead, Pa. Filed Oct. 4, 1883. (No model.)

Claim.—1. A writing-table provided with a transparent glass plate in its leaf and a drawer underneath containing a mirror, for the purpose substantially as set forth.

2. A writing-table provided with a transparent glass plate in its leaf and a drawer underneath containing a mirror that, when the drawer is drawn out to its full capacity, stands at an angle of forty-five degrees under the glass plate, substantially as described.

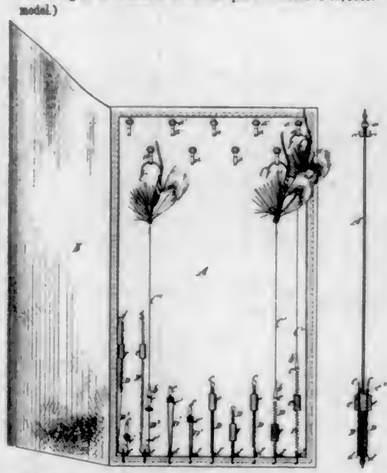
294,887. FIRE-ESCAPE. THEODORE P. LEFTON, Parsons, Kans., assignor to himself and Emma M. Curtis, same place. Filed July 17, 1883. (No model.)

Brief.—The lazy-tongs are extended by means of a windlass and chains which are secured to the lower bars on one side of the structure, which bars are provided with friction-rollers moving upon curved braces. The lower arms on the other side are pivoted between disks having stop-lugs above and below the pivot. The ladders are hung by the upper ends to the alternate joint-rods of the lazy-tongs arms.



Claim.—1. In a fire-escape, the combination, with the lazy-tongs extension-frames *h*, connected together by the joint-rods *o*, the ladders *p*, hinged at their upper ends to the alternate joint-rods *o*, and overlapping and resting against each other at their lower ends, windlass *l*, and frame *e*, having the disks *t*, of the joint-bars *i*, pivoted to said disks, joint-bars i^5 *k*, cords *m*, braces *g*, and rollers *n*, riding on said braces, substantially as shown and described.

2. In a fire-escape, the combination, with the lazy-tongs extension-frames *h*, ladders *p*, jointed thereto at their upper ends, frame *e*, braces *g*, jointed bars i i^5 *k*, rollers *n*, and windlass *l*, having the ropes *m*, of a truck having a platform, *a b*, provided with side rails, *b'*, and extending over its wheels, and depressed at *d* between the wheels, and detachable braces *y*, substantially as shown and described.

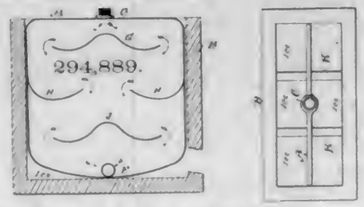


3. The combination of braces *g* and friction-rollers *n* with the joint-bars i^5 *k* of the extension-frames *h*, connected by bars *i* with the supporting-frame *e*, substantially as described.

4. The bars *i* of the extension-frames pivoted to the supporting-frame *e* between the laterally-supporting disks *t* and the stop-lugs *u*, substantially as described.

294,887.

294,888. FISHING-FLY BOOK. CHANCELLOR G. LEVISON, Brooklyn, N. Y., assignor to Thomas B. Mills, same place. Filed Dec. 20, 1883. (No model.)



Claim.—1. The combination, with the leaf of a fly-book having hooks or clips at one end and elastic or spring retainers at the other end, of eye-guides for the several retainers, each attached to the leaf and receiving a retainer through it, substantially as herein described.

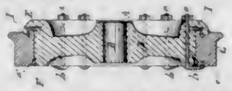
2. The combination, with the leaf, of elastic or spring retainers on opposite sides thereof, and an eye-guide consisting of a tube or ring inserted through the leaf and receiving the two said retainers through its portions which are presented on opposite sides of the leaf, substantially as herein described.

3. The combination, with the leaf A, having hooks or clips *a* at one end, of retainers, each consisting of the spring D and attached cord D^a, and a pulley, *f*, around which said cord passes, substantially as herein described.

294,889. LIQUID-COOLER. HERMAN LINDENBERG, Jersey City, N. J. Filed July 25, 1883. (No model.)

Claim.—1. A liquid-cooler made substantially as herein shown and described, and consisting of a flat sheet-metal vessel contained in a box

filled with ice, the liquid to be cooled being conducted through the said vessel, as set forth.



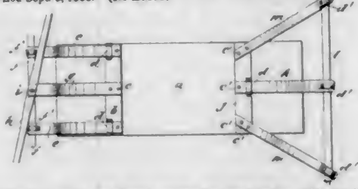
2. In a liquid-cooler, the combination, with the flat sheet-metal vessel A, of the screw-neck C, the spigot F, and the partitions G H J, substantially as herein shown and described, and for the purpose set forth.

3. In a liquid-cooler, the combination, with the vessel A, having rounded corners, of partitions G H J, the screw-neck C, and the spigot F, substantially as herein shown and described.

4. In a liquid-cooler, the combination, with the flat sheet-metal vessel A, of partitions G H J, the screw-neck C, the spigot F, and the ice-box B, substantially as herein shown and described.

5. In a liquid-cooler, the combination, with the flat sheet-metal vessel A, of the screw-neck C, the spigot F, and the ice-box B, having partitions K, substantially as herein shown and described.

294,890. CAR-WHEEL. WILLIAM I. LINDSAY, Cleveland, Ohio. Filed Dec. 1, 1882. (No model.)



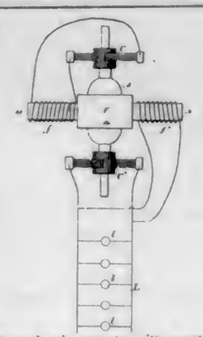
Claim.—1. The body and tire of the wheel, provided with the interlocking tongue and grooves, in combination with the bolt passing through the body, and provided with the pin for engaging the tire and with the nut for securing the parts together, substantially as and for the purpose set forth.

2. The body of the wheel, provided with the angle-iron, and with the annular tongue and groove for engaging the corresponding tongue and groove formed in the tire, in combination with the bolt and pin for engaging the body and tire, substantially as and for the purpose set forth.

3. The body and tire of the wheel, provided with the interlocked tongue and groove, in combination with the dowel-pin for engaging the adjacent faces of the body and tire, and the bolt and pin for securing the parts together, substantially as and for the purpose set forth.

4. In combination with the sections A B of the herein-described car-wheel, the dowel-pins *a'* and bolts *c* and re-enforcing angle-irons, substantially as and for the purpose set forth.

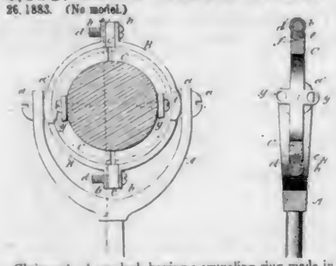
294,891. BUCKBOARD-WAGON. WILLIAM LOCKWOOD, Madrid, N. Y. Filed Sept. 8, 1883. (No model.)



Claim.—In a buckboard-wagon, the combination, with the buckboard *a* and the front bolster, *f*, and axle A and the hind axle, *l*, of the cross-pieces *b j*, secured to the buckboard a short distance inwardly from its ends, the central springs, *g k*, one secured to the under side of the front axle, *h*, and the cross-piece *b*, and the other to the same side of the hind axle, *l*, and the cross-piece *j*, the parallel side springs, *e e*, connected to the cross-pieces *b*, and above the front axle to the bolster *f*, and the rear oblique bars or braces, *m m*, secured to the cross-piece *j* and hind axle, *l*, as shown and described, and for the purpose set forth.

294,892. DYNAMO-ELECTRIC MACHINE. CHAS. M. LUNGREN, New York, N. Y. Filed Nov. 22, 1882. Renewed Aug. 14, 1883. (No model.)

Claim.—1. The combination of two or more dynamo-electric machines with two circuits and a shunt to one of the circuits, the first of such circuits passing through one field-helix of each generator, and through one or more of the armature-helices, the second circuit passing through one or more armature-helices through the external working-circuit and a shunt through reactionary helices in the field-magnets, substantially as specified.

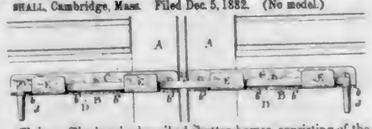


294,892.

2. In a dynamo-electric generator with an external circuit and resistances in multiple arc, two circuits, both of which pass through the field-helices differentially, and through armature-helices, one of which circuits is electrically distinct from the working-circuit, and the other of which is a shunt-circuit from the working-circuit, substantially as specified.

3. In a dynamo-electric machine, two independent circuits, one of which has a shunt circuit, the first circuit passing through an armature-helix, and through one of the field-helices, the other circuit through an armature-helix and the working-circuit, and the shunt therefrom passing through a helix of the field, so as to set up reactionary magnetism in proportion to the resistance in the working-circuit, substantially as specified.

294,893. OAR-LOCK. THOMAS MARSHALL, Ripon, Wis. Filed Dec. 26, 1883. (No model.)

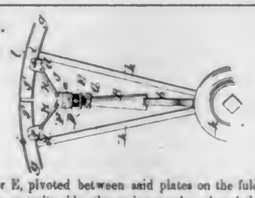


Claim.—1. A rowlock having a swiveling ring made in two parts, and provided with ears, between which are fitted elastic cushions, in combination with an oar-ring made in two parts, whereby the two segments of the latter are adapted to bear freely inside the former, and to be fastened at various points of the oar, as desired, substantially as set forth.

2. A rowlock having an oar-ring made in two parts, fitting loosely within a swiveling ring, the latter also made in two suitably-connected parts, between the points of contact of which are fitted elastic cushions, whereby the two separate segments of the oar-ring are adapted to be fastened at points of different diameters of an oar, or to oars of various sizes, substantially as set forth.

3. In a rowlock, the swiveling ring B, made in two parts, each having a shoulder, *a'*, and the ears *b*, in combination with the elastic cushions *c*, and the oar-ring C, made in two halves, substantially as shown and described, and for the purpose set forth.

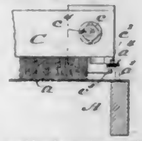
294,894. SHUTTER BOWER AND FASTENER. WILLIAM P. MARSHALL, Cambridge, Mass. Filed Dec. 5, 1882. (No model.)



Claim.—The herein-described shutter-bower, consisting of the similar plates B B, for attachment to the shutters, each having the vertical attaching-rim C, the sockets or holes b b' b^2 b^3 and lips E E, and the loose or removable bar D, having hooked ends *d d*, to engage the said sockets or holes to hold the shutters open or closed, as set forth.

294,895. COMBINED TIRE-TIGHTENER AND JACK. RILEY MCCLOSKEY and ALBERT E. TOZIER, Walla Walla, Wash. Filed Sept. 11, 1883. (No model.)

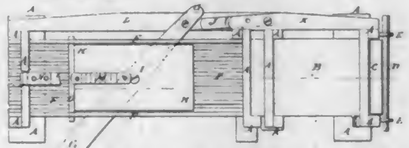
Claim.—1. The combination, with the lifting-screw, of the fast wheels C, having reversed ratchet-teeth *c c'*, the plates D D, loose on the



294,895.

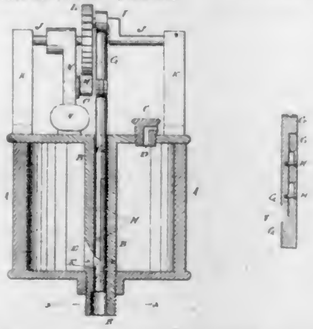
screw, the lever E, pivoted between said plates on the fulcrum-bolt *a*, and carrying on opposite sides the spring-pawls *c c'*, and the thumb-nut G, as and for the purpose specified.

2. In a tire-tightener, the combination, with the head-block arms H, of the shoes *d*, pivoted thereto, having a slot and provided with a set-screw, as shown and described.



294,896. BRUSH FOR FLOUR-BOLTS. THOS. MCCUDDEN, St. Louis, Mo. Filed Nov. 12, 1883. (No model.)

Claim.—1. The combination, substantially as described, of the bolt A, having the guides a^2 a^2, the brush C, the arms *c c*, irons *c' c'*, and the chest B.



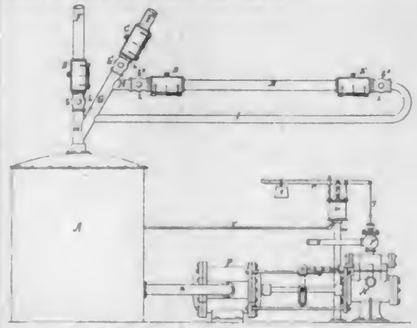
2. The combination, substantially as described, of the bolt A, having the guides a^2 a^2, the brush C, the arms *c c*, and the irons *c' c'*, provided with the lugs c^3 c^3, and the chest B.

294,897. BALING-PRESS. JOHN PERRY MCDONALD, Litchfield, Ill., assignor to himself and William H. Galloway, same place. Filed Sept. 6, 1883. (No model.)

Claim.—The follower-box F, slotted at the sides, the slotted follower H, the pivot-bolt I, passing through the center of follower, and the pivoted bar J arranged between supports K L, in combination with a lever, G, pivoted at its rear end to bar J and on the follower-bolt I, as and for the purpose specified.

294,898. VALVE-OILER. SAMUEL DAVIES MERSHON, Rahway, N. J. Filed Dec. 21, 1883. (No model.)

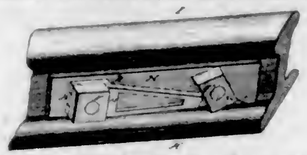
Claim.—1. An oiler constructed substantially as herein shown and described, and consisting of the oil-reservoir provided with a tube having an opening in one side, and a jointed discharge-rod having a recess in one side, and moved forward and back by a crank-shaft driven by a ratchet-wheel, pawl, and vibrating pendulum or lever, as set forth.



2. In an oiler, the combination, with the oil-reservoir A and the tube B, having side opening, E, of the jointed extensible sliding rod G, having oil-receiving recess F between the main part of said rod and the shoulder G' of the extensible part, whereby the size of the recess F may be regulated, and a driving mechanism, as set forth.

3. In an oiler, the combination, with the jointed oil-discharging rod G, of the crank-shaft J, the ratchet-wheel L, the weighted pawl M, and the vibrating pendulum or lever N, substantially as herein shown and described, whereby the said recessed rod will be operated at regular intervals to discharge oil, as set forth.

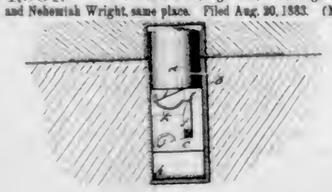
4. In an oiler, the oil-discharging rod G, made, substantially as herein shown and described, in two parts, halved to each other, connected adjustably by screws, and having a recess, F, between the end of one part and the shoulder of the other part, whereby the size of the said recess can be readily regulated, as set forth.



294,899. PNEUMATIC DISPATCH APPARATUS OR MECHANISM. GEORGE MILES, Wellesley Hills, Mass. Filed Sept. 25, 1882. (No model.)

Brief.—The valve of the steam-pump of an air-reservoir in a pneumatic dispatch apparatus is governed through a weighted valve mechanism operated by the pressure in said reservoir.

Claim.—The combination of the regulator or engine-starter, substantially as set forth, with the steam-engine, air-pump, air-reservoir, and one or more pneumatic dispatch-transmitting circuits, as described, all being adapted and to operate essentially as set forth.

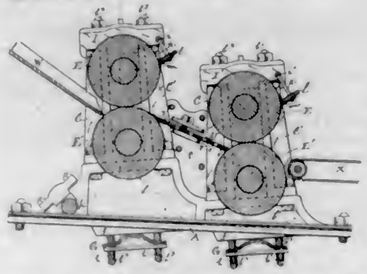


294,900. NUT-LOCK. WILLIS L. MOORE, Rochester, Minn., assignor of one-half to John T. La Du, same place. Filed Dec. 6, 1883. (No model.)

Claim.—1. In a nut-lock, a rigid non-elastic locking-plate provided with slot, jaws, and shoulder at one end, the jaws being adapted to pass beneath the nut and on either side of the nut-carrying bolt, the shoulder being adapted to fit against and engage the nut, and at the other extremity being adapted to partially pass by and lie against and hold in position a second nut at an adjusted distance from the first nut, thereby locking both said nuts, said locking-plate being capable of being removed and reapplied, either in the same place or elsewhere, without change or injury to its form or structure, substantially as and for the purpose set forth.

2. The non-elastic locking-plate A, having a slot, B, and jaws C, adapted to pass beneath the nut F and on either side of the bolt which carries nut F, the shoulder D, adapted to fit against and engage the nut F, and the end E, in combination with the nuts F and G, the fish-plate H, and the rail I, with its lower flange, K, all substantially as and for the purpose specified.

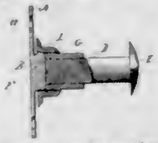
294,901. LOCK. DAVID MORER, Log Cabin, Ohio, assignor to himself and Nehemiah Wright, same place. Filed Aug. 20, 1883. (Model.)



Claim.—1. The combination, with the bolt *a* and case *b*, constructed to fit each other for guiding and supporting the bolt by the case only, of the wiper-stand A, embracing the section *c* of the bolt, having less thickness than the rest of the bolt, and the wiper *f*, supported in said stand and working in the notch *e* of the said section *c* of the bolt, substantially as described.

2. The combination, with the bolt *a*, having notched section *c* and undercut ledge *l*, of the wiper *f* and a spring, *k*, said spring being arranged to retain the wiper under or in contact with the said ledge, substantially as described.

3. The combination of notched section *c* of the bolt *a*, wiper *f*, and a spring, *k*, at each end of the notch, to retain the wiper in its positions, substantially as described.



294,902. CANE-MILL. DENIS A. MCLLANE, New Orleans, La. Filed Dec. 5, 1883. (No model.)

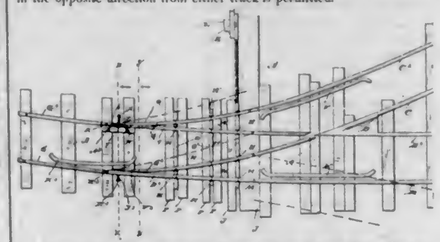
Claim.—1. The combination, in a cane-mill, of two sets of rollers, the first set being arranged at a greater height than its second set, with an intermediate longitudinally corrugated or ribbed slide, the channels of which are provided with perforations, substantially as and for the purpose set forth.

2. The combination, in a cane-mill, of a bed-plate provided with inclined planes *f* and inclined housing-bearings, as described, the housing-standards C C', caps I I', bolts b^3 b^3, and springs G, substantially as and for the purpose specified.

294,903. VEHICLE TOP-PROP. EDWARD NICHOLAS PELKER, Ionia, Mich. Filed Jan. 4, 1884. (No model.)

Claim.—1. In a vehicle top-prop, the combination, with the bed or base plate, of a post or stem having a head formed integral therewith at one end, a sleeve or collar encircling the inner end of the stem, and a clamping-cap securing the parts together, as set forth.

2. In a top-prop, the combination, with the bed or base plate having a slot, of a post or stem having its inner end entering the slot of the base-plate, a sleeve or collar, and a clamping-cap, as set forth.

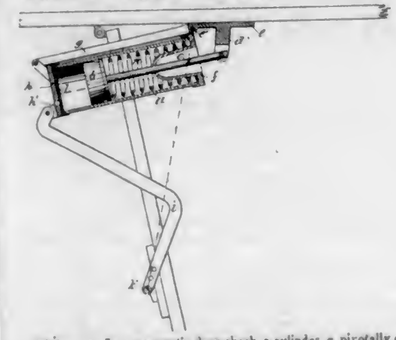


3. In a top-prop, the combination, with the base-plate having a wall projecting therefrom, and a slot in said wall, of a post or stem, a sleeve or collar fitting around the said post or stem, and a clamping-cap working over the said sleeve or collar, the inner end of the stem and collar fitting within the slot in the wall, as set forth.

4. In a top-prop, the combination, with the base-plate having a wall projecting outwardly therefrom, and a slot in said wall, of a post or stem, a sleeve or collar having projections fitting around the inner end of the post, said projections having screw-threads formed on their exterior faces, and a clamping-cap fitting over the collar and engaging with the screw-threads, as set forth.

5. In a top-prop, the combination, with the base-plate A, having wall B, provided with dovetailed slot C, of the post or stem having its end F dovetailed, a sleeve or collar, G, having dovetailed projections H H, and a clamping-cap, as set forth.

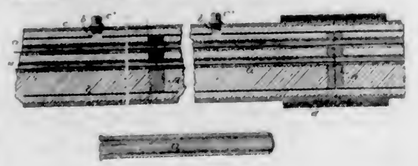
294,904. RAILWAY-SWITCH. WILLIAM W. PENNELL, Nashville, Ohio. Filed July 23, 1883. (No model.)



Brief.—The two point or inner rails of the main and siding switch-sections are secured to outer pivoted rails of said sections, the siding-point being secured by a spring-bolt to yield to the wheel-flange. The other point is formed with a groove for wheel-flange and bolted to a correspondingly-grooved block, the adjacent pivoted rail being cut away to receive the tapered end of the grooved point-rail. The vibrating ends of the switch-rails rest in beveled seats in shifting blocks, one of which is connected with an operating-lever. In the normal position of the tracks the main is closed to trains facing the points, while movement in the opposite direction from either track is permitted.

Claim.—1. The combination of the main track and sidings, the continuation of the main track, the rails Q and D^2 of the switch, pivoted at their ends adjoining the continuation of the main track, the rail U, having one end connected to the rail Q and cut down at W, the block or plate A^3, having the groove C^3, the rail G^3, connected to the pivoted end of rail D^2 by spring mechanism, and the sliding blocks or chairs for carrying the rails of the switch and retaining them in position, substantially as and for the purpose set forth.

2. The combination, with the main track and sidings, of the switch, comprising the rail Q, pivoted at R, and formed with the beveled notch S, the rail U, tapered at its end V to correspond to said notch S, and having this tapered end cut down at W, devices securing these rails together, the rail D^2, pivoted at E^2, the rail G^3, having the beveled end F^3, the spring-actuated bolt H^3, for securing these rails together, the plate A^3, having the groove C^3, and the sliding blocks having the recesses that receive the ends of the rails of the switch to operate and retain the same in position, substantially as and for the purpose set forth.



294,905. PNEUMATIC DOOR-CHECK. GUSTAVUS S. PERKINS, Hartford, Conn. Filed Aug. 21, 1882. (No model.)

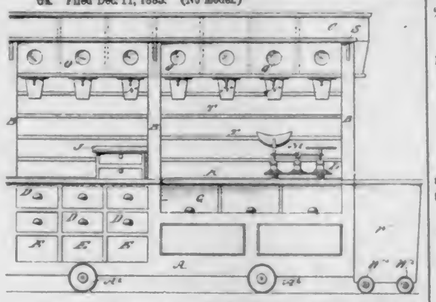
Claim.—1. In a pneumatic door-check, a cylinder, *a*, pivotally connected to guide-rods *g*, lever *i*, and bracket *k*, in combination with piston *b*, spring *n*, and rod *c*, pivoted to stand *e*, whereby the cylinder is reciprocated on the piston in opening and closing the door, all substantially as described, and for the purpose set forth.

2. In a pneumatic door-check, the combination of the cylinder *a*, having recessed head *f* and cap *h*, with vent h^3 and adjustable thumb-nut *m*, piston *b*, rod *c*, plate *e*, having standard *d*, guide-rods *g*, lever *i*, and bracket *k*, all substantially as described.

294,906. UNDERGROUND ELECTRIC-CONDUCTOR SYSTEM. THOMAS J. PERRIN, New York, N. Y., assignor to Charles P. Huntington, same place. Filed Aug. 31, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of a series of short flexibly-connected multitubular conduit-sections and the enveloping-pipe, which form a street-section.

2. The combination, substantially as set forth, of the short wire-containing tubes, the sustaining or coupling disks or end pieces, the enveloping flexible sheath, and enveloping-pipe.



3. The combination, substantially as set forth, of the several series of short wire-containing tubes, the bores of which are flared or enlarged at the ends, the end pieces or disks in which the tubes are carried end to end, and the outside pipe.

4. The combination, substantially as set forth, of the several series of short wire-containing tubes, the end pieces or disks in which the tubes are inserted, the flexible enveloping-sheath, the outside pipe, and an insulating compound which fills the flexible sheath and the space between the sheath and outside pipe.

5. The combination, substantially as set forth, of the outer box or casing of the test-box, the inner box, the intermediate water-proof composition, the water-proof washer or cover, and the flanged cap or top.

6. The combination of two or more multitubular street-sections, the wire-containing tubes in each street-section being made up of a series of short tubes, devices for supporting said short tubes in proper relation to each other within the outer pipe of the street-section, means for supporting such wire-containing tubes at the end of each street-section in proper relative position to coincide with the wire-containing tubes of the adjoining sections, and couplings for connecting the street-sections.

294,907. PORTABLE COUNTER. JOHN THOMAS PERRY, La Grange, Ga. Filed Dec. 11, 1883. (No model.)

Claim.—1. A counter provided with tracks on which a scale provided with wheels can run, substantially as herein shown and described.

2. The combination, with a counter, of a series of hoppers held above the same, and of a traveling scale on the counter, below the hoppers, substantially as herein shown and described.

3. A counter constructed with a series of hoppers held above the same, substantially as herein shown and described.

4. A counter provided with standards B, between the upper ends of which a series of hoppers are held, substantially as herein shown and described.

5. A counter provided with a series of hoppers held above the same, each of which hoppers is provided with a bottom opening and a sliding gate for closing the said opening, substantially as herein shown and described.

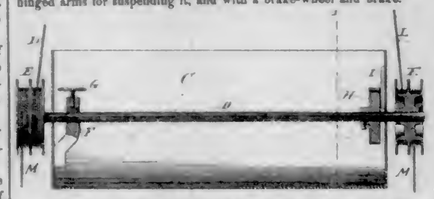
6. A counter provided with a series of hoppers held above the same, the spouts N, projecting downward from the bottom of the hoppers, the sliding gates O, and the bent rods P, secured to the gates, substantially as herein shown and described.

7. The combination, with a counter, of the hoppers C, each having an opening, *c*, in its bottom, the funnel-shaped spout N on the under side of each hopper, the sliding gate O, the grooved cleats *O'*, and the bent rod P, secured to the bottom of the gate, substantially as herein shown and described.

8. A counter provided with a series of hoppers having openings in their fronts, substantially as herein shown and described.

9. A counter provided with a series of hoppers having openings in their fronts and discharge-openings in their bottoms, the said discharge-openings to be provided with sliding gates, substantially as herein shown and described.

10. The combination, with a counter, of the standards B, the hoppers C, held between the upper ends of the same, and of a shelf, S, in front of the hoppers, substantially as herein shown and described.



11. The combination, with a counter, of the standards B, the shelves T, held between the standards, and of hoppers C, held between the upper ends of the standards, substantially as herein shown and described.

12. The combination, with the counter A, mounted on wheels, of the box W, connected with the counter, and also mounted on wheels, substantially as herein shown and described.

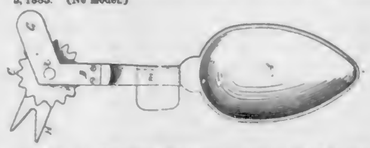
13. A counter provided with bins F, having quadrant covers, and with drawers D and a desk, J, substantially as herein shown and described.

294,908. FIRE-ESCAPE. EDUARD A. C. PETERSEN, Chicago, Ill. Filed Nov. 5, 1883. (No model.)

Brief.—The shaft mounted in the car is provided with double drums for the hoist and lowering ropes, and the car is provided with hinged arms for suspending it, and with a brake-wheel and brake.

Claim.—1. The combination of car C, shaft D, mounted therein, double drums E, keyed to said shaft, ropes M M L, pulleys *b*, and arms K, hinged to car C, the parts arranged as and for the purpose set forth.

2. The combination of car C, shaft D, mounted therein, wheel H, spring J, lever I, double drums E, keyed to shaft D, ropes M M L, pulleys *b*, and arms K, hinged to car C, the parts arranged as and for the purpose set forth.



294,909. LACE-FASTENING. HENRY H. PORTER, Littleton, N. H. Filed Aug. 2, 1883. (No model.)

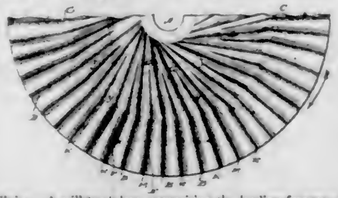
Brief.—Improvement on Letters Patent No. 275,942, dated April 17, 1883.

Claim.—A lace-fastener constructed substantially as herein shown and described, and consisting of an eyelet provided with two parallel transverse bars, one above the other, as set forth.

294,910. SPOON. WILLIAM PRADDEY, Lawrence, Mass. Filed Oct. 5, 1883. (No model.)

Claim.—1. The spoon, substantially such as described, combined with the blade J, arranged substantially as and for the purpose set forth.

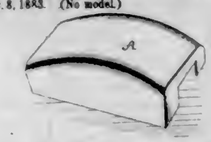
2. The spoon, substantially such as described, having the blade G, arranged substantially as and for the purpose specified.



3. The spoon, substantially such as described, combined with the fork H, arranged substantially as and for the purpose set forth.

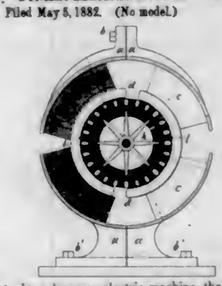
4. In a spoon substantially such as described, the wheel C, journaled in the outer end of the handle B, in combination with the fork H, substantially as specified.

5. In a spoon substantially such as described, the wheel C, journaled in the outer end of the handle B, in combination with the fork H and block G, substantially as set forth.



6. The improved pie-spoon herein described, the same consisting of the bowl A, handle B, knife J, wheel C, blade G, and fork H, constructed, combined, and arranged to operate substantially as specified.

294,911. MILLSTONE-DRESS. GEORGE WASHINGTON PRIOR, Booger's Store, Mo. Filed Aug. 22, 1883. (No model.)

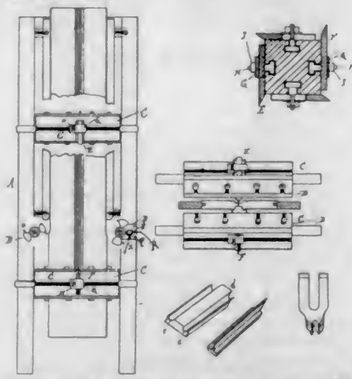


Claim.—A millstone-dress comprising the leading furrows, extending from the center or eye of the stone for about two-thirds of the distance to the edge of the stone, being drafted or carried tangentially to this point, and then carried out to the edge of the stone radially in relation to the eye of the stone, the short furrows between the leading furrows, carried from the edge of the stone inward for a suitable distance, and the lands, rounded or convexed for some distance from the eye or center of the stone, and having each side or etch of their flat outer portions also rounded, substantially as set forth.

294,912. CARRIAGE-TOP. THEODORE J. REED, Leavenworth, Kans. Filed Aug. 8, 1883. (No model.)

Claim.—As an improved article of manufacture, a seamless buggy or like top, having integral sides and back, and molded into shape from a single piece leather blank, or blank of equivalent material, substantially as set forth.

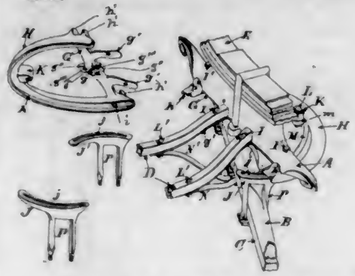
294,913. DYNAMO-ELECTRIC MACHINE. CHARLES RICHTER, Camden, N. J. Filed May 5, 1882. (No model.)



Claim.—1. In a dynamo-electric machine, the stationary magnets consisting of two sides, each in a single piece, constructed with slots c^3, to admit air, and provided with flanges *c*, upon which helices are wound, substantially as set forth.

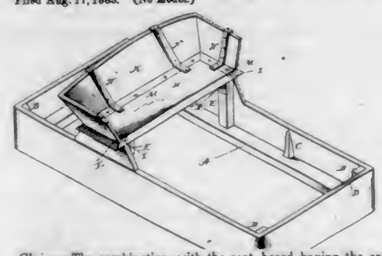
2. In a dynamo-electric machine, the stationary magnets consisting of two concavo-convex sides provided with inwardly-extending flanges *c*, upon which helices are wound, and polar extensions *d*, each of said polar extensions being attached to two of the flanges *c*, substantially as set forth.

3. In the armature of a dynamo-machine, the consecutive series of concentric iron-wire rings placed upon the periphery of the core, these rings having radial projections, leaving intervening channels for the reception of the inducing-coils, as shown and described.



294,914. PLANING-MACHINE. JAMES A. ROBERTS, Detroit, Mich., assignor of one-half to Wm. M. Dwight, same place. Filed Dec. 19, 1883. (No model.)

Claim.—1. In a tongue-and-grooving machine for making two strips simultaneously from one piece of board, an upper and lower cutter-head, each provided with two planer-knives upon opposite faces, and a set of beading and dividing tools adjustably secured upon the intermediate faces, in combination with two-edged grooving-tools and adjustable edge-guides, substantially as described.



2. In a planing-machine for making two strips of ceiling or flooring simultaneously from one board, a head provided with a set of planer-knives and a set of beading-tools, said beading-tools being adjustably secured to said head, in combination with a fixed and an adjustable side grooving-tool, whereby the machine is adapted to boards of different widths, and the bead can be formed at any desired point on said board, as and for the purpose herein described.

294,915. FIFTH-WHEEL. MICHAEL J. ROGERS, Cincinnati, Ohio, assignor to Thomas T. Haydock, same place. Filed Sept. 6, 1883. (No model.)

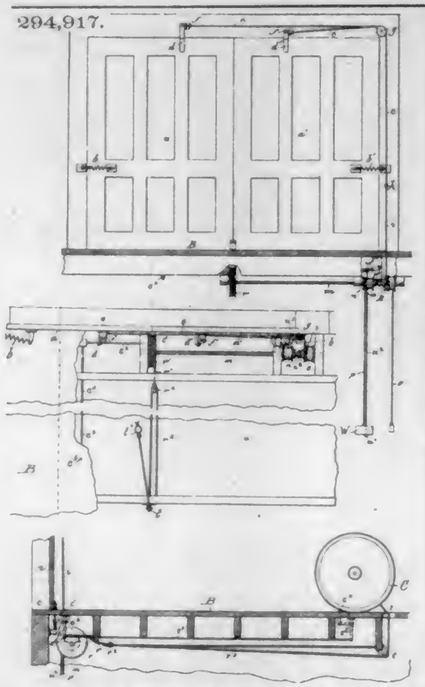
Claim.—The article of manufacture herein described, which consists in an upper member for fifth-wheels, having its semi-annular bar H formed in one piece with its cross-bar G, the annular bar having a downwardly-projecting peripheral lip, a brace-bolt lug, K, projections *A'*, to receive a head-block, and head-block bolt-holes *i* between the projections, and the cross-bar being located parallel with and beneath the head-block, and having rearwardly-extending tongues *g'*, formed with perch-bolt holes, the central king-bolt-head socket, *g*, king-bolt hole g^x, and lugs g''', having holes g''', to receive the ends of the spring-clip, as set forth.

294,916. CARRIAGE-SEAT. GEORGE ALONZO SEARS, Syracuse, N. Y. Filed Aug. 17, 1883. (No model.)

Claim.—The combination, with the seat-board having the seat J extending from its edges inwardly and terminating in the abrupt shoulder I, of the paper-board back or side flange, having the integral inwardly-projecting bottom flange, which is secured to the seat J, with its edge abutting against the shoulder I, whereby said edge is protected from fraying, substantially as set forth.

294,917. MECHANISM FOR OPERATING DOORS OF BUILDINGS. HARLIN J. SHAW, Somerville, Mass. Filed Jan. 14, 1884. (No model.)

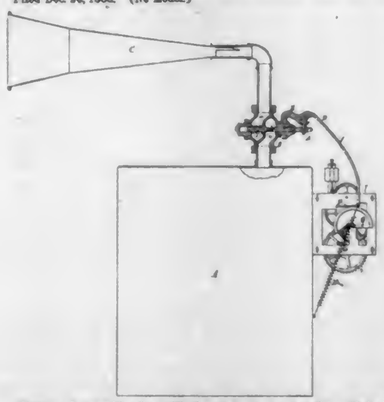
Brief.—Spring-opened doors released by wheel of engine or truck actuating bolt-releasing mechanism, the doors being closed through the action of a weight, which is elevated, and a clutch shifted through pulley and rope attachments actuated by the truck or engine upon leaving.



Claim.—1. The combination of the door of a building with actuating mechanism operated by the vehicle leaving the building, whereby the said door is automatically closed after the vehicle has passed out, substantially as described.

2. The combination of the door of a building and a spring or equivalent tending to open it with a door-holding device and actuating mechanism therefor controlled by the vehicle, substantially as described.

3. The door and cord connected therewith and winding-drum for the said cord, combined with an actuating-weight and winding device therefor operated by the vehicle leaving the building, substantially as described.

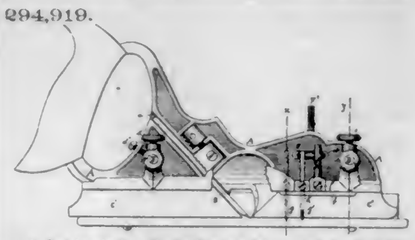


4. The door and actuating-weight for closing it, combined with the winding device for said weight and clutch, whereby it is engaged with and disengaged from the door, substantially as described.

294,917.

5. The door and actuating-weight therefor, combined with the winding-cord for said weight, provided with a spring-clamp for engaging a vehicle, substantially as described.

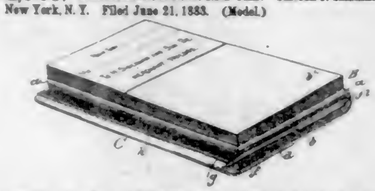
294,918. FOG-ALARM. ALANSON HENDLY SHERMAN, Somerville, Mass. Filed Dec. 26, 1883. (No model.)



Claim.—In combination with the steam-generator, the self-closing cock, and the horn arranged as described, the cock-valve-spindle-operating lever, its foot and actuating-spring, the rotary cam, and the clock-movement for revolving such cam, all being adapted substantially and to operate as set forth.

294,919. BENCH-PLANE. JACOB SIDDLEY, Wilkes-Barre, Pa. Filed July 6, 1883. (No model.)

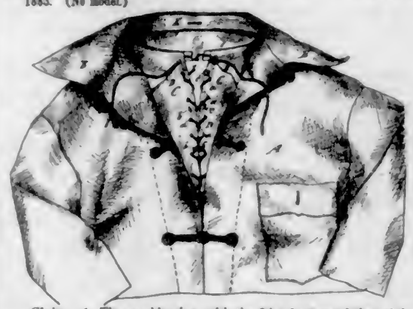
Claim.—1. In a bench-plane, the combination of the fixed and adjustable blades C C', each having a laterally-inclined perforation, with advance cutters *g g'* and clamp-screws *h h'*, the advance cutters projecting at their lower ends slightly beyond the outer side plane of the blades C C', substantially as set forth.



294,919.

2. In a bench-plane, the combination of the stock A, having a horizontal slot, a^2, at its front part, a stop-gage, F^2, the threaded shank of which is guided in holes of the stock, and a screw-nut, F, the rim of which is engaged by the slot a^2, so that the screw-nut F raises or lowers the stop-gage on being turned in one or the opposite direction, substantially as described.

3. In a bench-plane, the combination of the stock A, having a horizontal slot at its front part, a stop-gage, F^2, the threaded shank of which is guided in holes of the stock, an adjusting screw-nut, F, the rim of which is engaged by the slot a^2, and a gage or fence, E, having a side recess, *i*, for the stop-gage F^2, substantially as set forth.

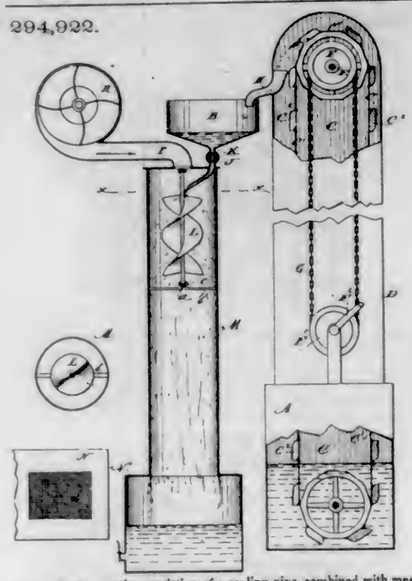


294,920. MEMORANDUM-BOOK AND PAD. SAMUEL J. SILBERMAN, New York, N. Y. Filed June 21, 1883. (Model.)

Claim.—1. The combination, with a memorandum-book, of the heavy-paper flap *d*, rivets or eyelets *d' d'*, a leaf, *f*, wider than the book-leaves, and the frame *g*, carrying a carbon-sheet, as described.

2. The book A, having pad B attached to one of its covers, in combination with the carbon-paper attachment C, attached to the other cover, substantially as described.

294,921. SHIRT. JULIUS SIMON, New York, N. Y. Filed Aug. 21, 1883. (No model.)



Claim.—1. The combination, with the false front consisting of the portions C C, provided with eyelet-holes or eyelets, of a lacing the two portions of which are separately laced through the eyelets in the two edges of the false front without connecting them, and means, substantially such as described, independent of the lacing, for connecting the two portions of the false front.

2. The combination, with a shirt or analogous garment provided with a collar, B, of the neckband E, attached to the shirt within the collar, and adapted to be turned inward and downward when not desired for use, or to be turned upward when it is desired to attach a linen collar to it, substantially as herein described, whereby provision is afforded for attaching a linen collar to the said neckband, while the collar B remains in its normal position on the outside of the shirt, in which position it will be covered and concealed by the vest of the wearer.

294,922. COLD-AIR-BLAST CENTRIFUGAL SIRUP-COOLER. ALBERT B. SMITH, Fairfield, Nebr. Filed Nov. 23, 1883. (No model.)

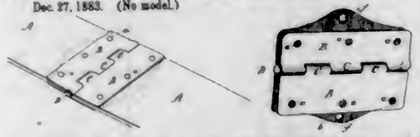
Claim.—1. The method of cooling sirup by subjecting it in a comminuted state to a current of cold air, substantially as specified.

294,922.

2. A sirup-cooler consisting of a cooling-pipe, combined with means for spreading the sirup on the inner surface of the said pipe, and means for conducting air through the pipe, substantially as herein shown and described.

3. In a sirup-cooler, the combination, with a cooling-pipe, of a revolving distributer for distributing the sirup on the inner surface of the tube, and means for forcing or conducting air through the cooling-tube, substantially as herein shown and described.

4. In a sirup-cooler, the combination, with a cooling-tube, of an air-forcing apparatus, and a revolving sirup-distributer operated by the current of air entering the cooling-tube, substantially as herein shown and described.



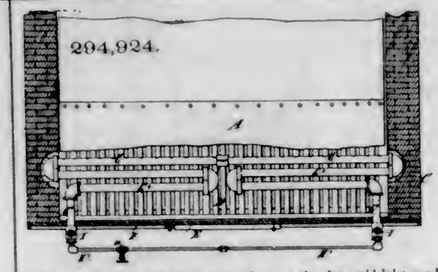
5. In a sirup-cooler the combination, with a cooling-tube, of a sirup-elevator, a revolving sirup-distributer within the cooling-tube, and of an air-forcing apparatus, substantially as herein shown and described.

6. In a sirup-cooler, the combination, with the cooling-tube M, of a revolving distributer in the same, and air-forcing apparatus, a regulating-tank, B, and means for raising the hot sirup into the regulating-tank, substantially as herein shown and described.

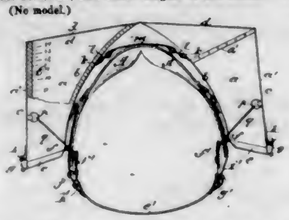
7. In a sirup-cooler, the combination, with the cooling-tube M, of the revolving-distributer L, the blower R, the regulating-tank B, the elevator C, and the hot-sirup tank A, substantially as herein shown and described.

8. In a sirup-cooler, the combination, with a cooling-pipe, of a sirup-distributer formed of a shaft on which spiral wings or blades are mounted, and of means for forcing air into the cooling-pipe, substantially as herein shown and described.

294,923. BELT-HINGE. EUGENE SMITH, San Francisco, Cal. Filed Dec. 27, 1883. (No model.)



Claim.—The plates B B, having their bent edges C C cut out like a hinge, so as to fit together, and provided with the rivet-holes *a*, and extensions *b*, having the rivet-holes *f*, in combination with the pin D, substantially as and for the purpose herein described.



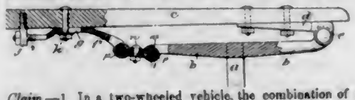
294,924. FURNACE FOR STEAM-BOILERS. JOHN B SMITH and CHARLES A. PEISSLER, Newark, N. J., and EDWARD FOX, Brooklyn, N. Y., assignors to themselves, and ANDREW ALBRIGHT, Newark, N. J. Filed Mar. 14, 1883. (No model.)

Claim.—The combination and arrangement, substantially as shown and described, with a furnace, of a perforated distributing-pipe, G, the inlets G', the steam-pipes and the air-pipes opening into said inlets, and the heating-coils G^2, interposed within the furnace between the inlets and the distributing-pipe, for the purpose specified.

294,924.

294,925. PACK-SADDLE. WILLIAM C. SMITH and WILLIAM L. HUNTER, Lone Pine, Cal.; said Smith assignor to said Hunter. Filed June 22, 1883. (No model.)

Claim.—1. The improved pack-boxes *a*, constructed substantially in the described form, with curved inner sides, *b*, and having open tops *d* and hinged bottoms *a*, and being adapted to be connected together and attached to a pack-saddle, substantially as described.



2. The improved pack-boxes *a*, suitably connected, and having curved sides *b*, to fit the sides of the pack-saddle, and provided with attaching-strap *k* and rings *l*, for connection by the strap *m* over the pack-saddle, substantially as described.

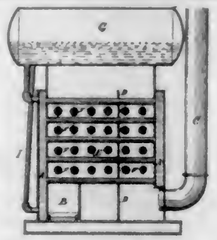
3. The improved pack-boxes *a*, having curved sides *b*, upper connections, *k l m*, attaching-rings *p*, and cords *q*, in combination with the pack-saddle A, substantially as described.

4. Improved pack-boxes, each provided with a filling-opening in its top, a discharge-opening at its bottom, a device for closing said discharge-opening, and means for connecting two together and attaching them to a pack-saddle, substantially as herein shown and described.

5. The combination, with the pack-saddle A, the pack-boxes *a*, and the lashing-cords, of the girth *d'*, provided with the loops *f'*, the ring *g'*, and the hook *j''*, substantially as herein shown and described.

294,926. TWO-WHEELED VEHICLE. NAHUM STARKEY and GEORGE W. CROWTHER, Amesbury, Mass. Filed Jan. 14, 1884. (No model.)

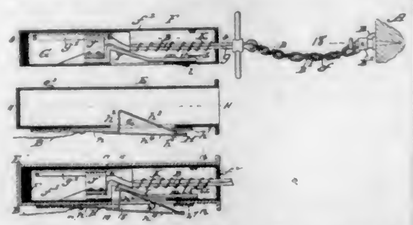
Claim.—1. In a two-wheeled vehicle, the combination of axle *a*, formed or provided with arms *b*, shaft *c*, plate *d*, secured to the shaft and pivotally connected with the rear arm *b*, and plate *f*, also secured to the shaft and connected with front arm *b* by a link, *k*, all substantially as specified.



2. In combination with axle *a*, having arms *b*, shaft *c*, pivotally connected with the rear arm, and also connected by a link with the front arm, and provided with means for adjusting the tension of said link, substantially as specified.

3. In a two-wheeled vehicle, the combination of axle *a*, having arms *b*, shaft *c*, pivotally connected with the rear arm, and a leather or other flexible link uniting said shaft with front arm, substantially as specified.

4. In a two-wheeled vehicle, the combination of axle *a*, having arms *b*, shaft *c*, eye-plate *d*, secured to the shaft and pivotally connected with rear arm *b*, plate *f*, secured to the shaft and connected by link *k* with the front axle-arm, and formed with slot *g*, to receive bolt *h*, and also formed with the rounded and threaded part *i*, extended through stud *j*, and provided with an adjusting-nut, all substantially as specified.



294,927. STEAM-BOILER. JOS. STEVENS, San Francisco, Cal. Filed Dec. 7, 1883. (No model.)

294,927.

Claim.—In a steam-boiler, the rectangular water-legs, with the horizontal pipes uniting the spaces upon opposite sides, the fire-place and chimney situated at the bottom and at opposite ends, and the vertical diaphragm or bridge-wall between, in combination with the cylindrical water and steam containing shell situated above and exposed to the heat of the furnace, as shown, and the circulating-pipes connecting the water-space of the cylinder with the upper and lower part of the water-legs, substantially as herein described.

294,928. ELECTRIC-WIRE CONNECTOR. THOMAS S. STEVENSON, St. Louis, Mo. Filed Sept. 27, 1883. (No model.)

Claim.—1. The combination of the car A, the removable part F of the joint, the support a', and the hood a^2, both support and hood being attached to said car, as described.

2. The combination of the car A, the supporting-chain f, the wedge G, and its casing f', substantially as described.

3. The combination of the electric wires B B', the wedge G, and the conductor-plates g' g^2, attached to the side of said wedge, substantially as described.

4. The combination of the electric wires B B', the conductor-tongue H, made of springy metal, and the part E of the joint, substantially as described.

5. The combination of the electric wires B B', the tongue H, made of springy metal, the part E of the joint, and the plate h' of said tongue H, substantially as described.

6. The combination of the tongue H, as described, the parts I I', and the wedge G, substantially as described.

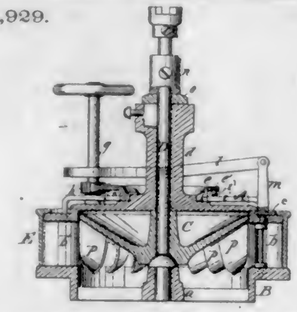
7. The combination of the parts E F of the joint, the tongue H, made of springy metal, the wedge G, the parts I I', fixed to the bottom of casing f', and the electric wires B B', substantially as described.

8. The combination of the wedge G, the conductor-plates g' g^2, attached to said wedge, the conductor-springs J J', the parts I I', fixed to the casing-bottom, and the spring-tongue H, substantially as described.

9. The combination of the electric wires B B', the wedge G, having connected therewith the plates g' g^2, the conductor-springs J J', the parts I I', attached to the casing, and conductor-plate L, substantially as described.

10. The combination of the parts E F of the joint, the spring-arm k, and the spring-tongue H, substantially as described.

11. The combination of the part F of the joint, the wedge G, having conductor-plates g' g^2 and a handle, g, the spring K, the part E of the joint, and the spring-tongue H, substantially as described, and for the purpose set forth.

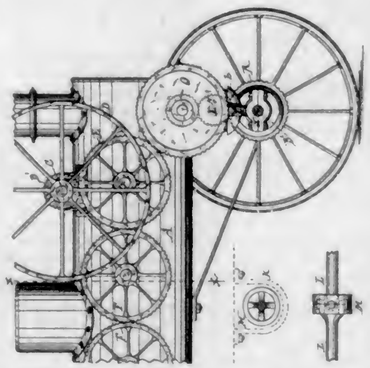


294,929. TURBINE WATER-WHEEL. ELDRIDGE W. STUBBS, Lincolnton, N. C. Filed Oct. 24, 1882. (No model.)

Claim.—1. In water-wheels, the pivoted guides b' and fixed guides b, in combination with the wheel C, and wheel-case provided with an outer ring-gate, substantially as shown and described.

2. In a water-wheel, the combination, with the ring e, provided with the projections e' and slots k, and means for operating the same, of the pivoted guides b', provided with the arms i, having projections i', substantially as herein shown and described.

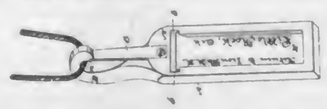
3. In a water-wheel, the combination, with the ring e, provided with the cogged segment f, the projections e', and slots k, and the shaft g, provided with the pinion h, of the guides b', the axles c, and the arms



294,929.

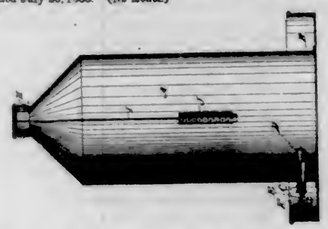
i, provided with the projections i', substantially as herein shown and described.

4. In a water-wheel, the combination, with the top plate, A, provided with the support m, of the yoke l, pivoted to the support m, and the flanged-ring gate E, hung upon said yoke, substantially as herein shown and described.



294,930. TRACTION-ENGINE. LOYAL C. TABER, Syracuse, N. Y. Filed Dec. 18, 1883. (No model.)

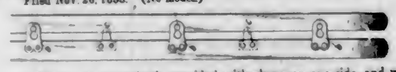
Claim.—1. In a traction-engine, an oscillatory supporting-axle having a central pivoted connection with the boiler, a counter-shaft extended through the center of said pivot and provided thereat with a universal joint, and mechanism for transmitting motion to the oscillatory axle through the medium of the said counter-shaft, substantially as set forth and shown.



2. In a traction-engine, the combination of a saddle or truck frame mounted on the forward axle and provided with a semi-spherical step, a hollow hemispherical bearing secured to the boiler and seated in the step, and provided on one side with an opening and at the opposite side with a rigid sleeve, a counter-shaft journaled in said sleeve and extended through the hollow bearing and its side opening, and provided in the center of said bearing with a flexible joint, a journal-bearing on the saddle for the oscillatory end of the counter-shaft, pinions on opposite ends of the counter-shaft, a gear-wheel on the axle meshing in the pinion on the oscillatory end of the counter-shaft, and a train of gears arranged to transmit motion from the driving-shaft to the pinion on the lineally-rigid end of the counter-shaft, substantially as described and shown.

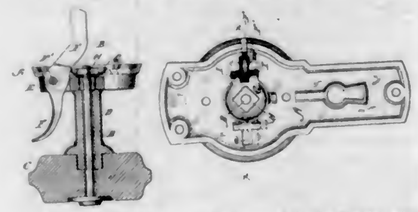
294,931. TAG-HOLDER. EDWARD H. TANNEHILL, Malvern Junction, Ark. Filed Oct. 19, 1883. (Model.)

Claim.—A tag or label holder having a hook made integral therewith and adapted to receive a snap-spring, an internal groove, D, closed at one end, and a portion, A', recessed at b, as shown and described.



294,932. POULTRY-FOUNTAIN. JOHN C. TAPPENNER, Bisbee, Ariz. Filed July 20, 1883. (No model.)

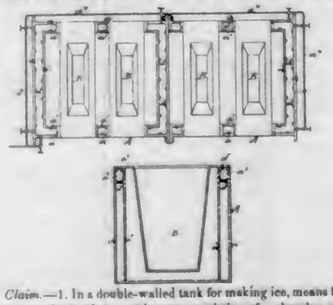
Claim.—1. In a poultry-fountain, an elevated reservoir, a surrounding open trough with a tapering tube opening from the reservoir to the trough, and a stopper fitted to the inner end of said tube and having a rod or stem extending out through the tube, and a hook or catch by which the stopper may be held back, substantially as herein described.



2. In a poultry-fountain, an elevated reservoir having a surrounding open trough, a tube connecting the trough and fountain, and a stopper or valve, by which the tube may be opened or closed, in combination with a removable screw-cap at the top of the reservoir, a rod depending from said cap, and a cage or cup suspended from the rod, so as to be removed with the cap without allowing the contents of the reservoir to escape, substantially as herein described.

294,933. CORSET-BUSK. ALFRED TAYLOR, Jr., Bridgeport, Conn. Filed Nov. 26, 1883. (No model.)

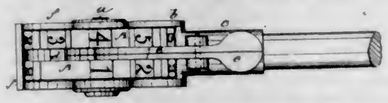
Claim.—A corset-busk provided with clasps on one side, and with a tongue extending from said busk at the opposite side and projecting beneath the other busk, which carries the studs.



294,934. LOCK-TRIMMING. EDWARD T. TAYLOR, Chicago, Ill., assignor to Gary G. Calkins, same place. Filed Oct. 30, 1883. (No model.)

Claim.—1. The combination of the plate A, having therein a slot, a, the latch-lever F, and a detachable fulcrum having hook-shaped arms for fulcruming the said lever between it and the plate A, substantially as and for the purposes specified.

2. The combination of the bolt B, nut H, plate or washer G, having hook-shaped arms I I, the slotted plate A, and the lever F, fulcrumed in the said arms, substantially as and for the purposes specified.



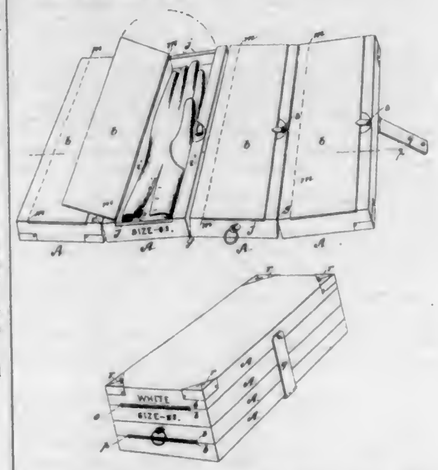
294,935. ICE-MAKING MACHINE. GEORGE TAYLOR, Everett, and FRED S. PEARSON, Medford, Mass. Filed Dec. 12, 1883. (No model.)

Claim.—1. In a double-walled tank for making ice, means for equally and evenly distributing a refrigerant consisting of a chamber partitioned off from the top of each space between the walls, and having its bottom provided with outlets next to the walls, as set forth.

2. In an ice-making apparatus, a tank having four double walls, as described, in combination with one or more tanks having three double walls, and adapted to be joined one to another, substantially as and for the purpose set forth.

294,936. TIMBER AND LUMBER STAMP. LEVI THRUSH and LEONARD WILSON, Brookville, Pa. Filed Nov. 28, 1882. (Model.)

Claim.—A timber and lumber stamp provided with two separate stamp-wheels, A A, having the inside ratchet-wheels, d d, and the two lever-pawls e e, arranged side by side on the same fulcrum, said pawls being provided at the rear with flattened ends supported by springs, and both adapted to be operated simultaneously by the same thumb, as described.

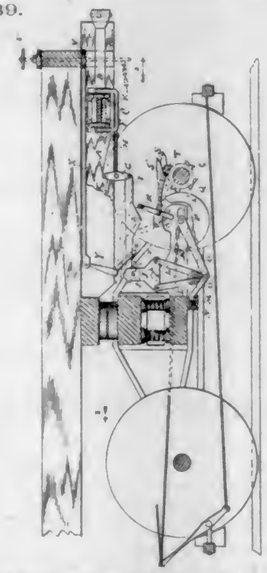


294,937. HOSE-PATCH. GEO. W. TOWLE, Jr., San Rafael, Cal. Filed Apr. 30, 1883. (No model.)

Claim.—1. A hose-patch consisting of the band A, having tongues a a and slots a' a', whereby it may be adjusted around the hose and locked, and having the longitudinal ribs d' on its inner surface, near its edges, substantially as and for the purpose herein described.

2. A hose-patch consisting of the band A, having tongues a a and slots a' a', whereby it may be adjusted around the hose and locked, and having the longitudinal ribs d' and the cross-ribs d on its inner surface, substantially as and for the purpose herein described.

294,938. FOLDING CASE. AUGUSTUS TRAVER, New York, N. Y. Filed Apr. 19, 1883. (Model.)



Claim.—As an improved article of manufacture, a series of boxes or cases substantially of equal size, consisting of four or more, hinged together alternately at the bottom and top, and provided each with a cover, and adapted to be unfolded to expose each opening surface, and to be refolded into one compact case, substantially as set forth.

294,939. CAR-BRAKE. WILLIAM B. TURNER, New York, N. Y., assignor of one-half to Cornelius Beard, same place. Filed Apr. 26, 1883. (No model.)

Claim.—1. In a momentum car-brake operative at all rates of speed, the combination, with the draw-bar and the brakes, of a double-acting lever, a tripping device, and other intermediate mechanism, substantially as described, between the draw-bar and brakes, constructed to operate the brakes when the car is traveling with either end forward and in either direction of the draw-bar's motion, as set forth.

2. In a car-brake operative at all rates of speed, and operated by

294,939.

the contact of friction-pulleys, the combination, with such pulleys and the draw-bar, of double-acting lever, a tripping device, and other intermediate mechanism, substantially as described, between the draw-bar and friction-pulleys, constructed to put such pulleys into operation when the car is running with either end forward and in either direction of draw-bar motion.

3. The combination, in a momentum car-brake, of a draw-bar constructed and arranged to act on the brake through intermediate mechanism in both directions of its movement, and a tripping device constructed to act independently of the brakes or draw-bar, and to operate by and at each change in direction of wheel rotation, substantially as described.

4. The combination, in a momentum car-brake, of a draw-bar constructed and arranged to act on the brake in both directions of its movement, a double-acting lever, and a tripping device constructed to cause the draw-bar to reverse its action on said double-acting lever, for the purpose set forth.

5. The combination, in a car-brake, of a double-acting draw-bar, a friction apparatus for operating the brake, and double-acting lever and other intermediate connections, substantially as described, between the draw-bar and friction apparatus, constructed to operate the brake with either end of the car forward and at any rate of speed, as set forth.

6. In a momentum car-brake operative at all rates of speed, the combination, with a movable draw-bar and an operating-bar connected therewith, of a friction-pulley and a double-acting lever and other intermediate connections for transmitting the motion of the draw-bar to the friction-pulley, constructed to move said pulley toward its operating means in both directions of the draw-bar's motion, substantially as described.

7. In a momentum car-brake operative at all rates of speed, the combination, with a movable draw-bar, an operating-bar connected therewith, a double-acting lever, a friction-pulley, and mechanism connecting the double-acting lever and pulley, constructed to move said pulley toward its driving-pulley in either direction of draw-bar motion, substantially as described.

8. The combination, with a movable draw-bar, an operating-bar connected therewith, a double-acting lever, a friction-pulley, a toggle-lever for holding the friction-pulley in connection with its driving-pulley, and means for operating said toggle-lever in the same direction in either direction of draw-bar motion, substantially as described.

9. The combination, with the double-acting draw-bar, a double-acting lever, and intermediate connections, substantially as described, between the two, of a toggle-lever for moving the friction-wheel, and links connecting the opposite arms of the double-acting lever with the toggle-levers, as set forth.

10. The combination, with the double-acting draw-bar, a double-acting lever, and intermediate connection, substantially as described, between the two, of a toggle-lever for moving the friction-wheel, a spring-bearing for one end of said toggle-lever, and links connecting the opposite sides of the double-acting lever with the toggle-lever, as set forth.

11. The combination, in a car-brake, of a double-acting draw-bar and a double bell-crank lever, with a reversible connection between said draw-bar and lever, constructed to move said lever in one direction only when in one of its positions, and to move it in the other direction only when its position is reversed, substantially as described.

12. The combination, with a double-acting draw-bar, of a double-acting lever, a loose reversible connection between the draw-bar and lever, acting on said lever in both directions, and means for holding the latter in its normal position during the reversal, substantially as described.

13. The combination, with a double-acting draw-bar, of a double-acting lever, a loose connection between the draw-bar and lever, acting in both directions on said lever, and mechanism performing the double function of holding said lever in its normal position and moving the friction-pulley, all substantially as described.

14. The combination, in a car-brake operative at all rates of speed, with a moving draw-bar and a double-acting lever loosely connected therewith, of a tripping device constructed to reverse the connection between said draw-bar and lever, whereby said draw-bar, through said loose connection, operates said lever in both directions of the draw-bar's motion, substantially as described.

15. The combination, in a car-brake, of a moving drawing-bar connected to a multiplying-lever, a double-acting lever, an operating-bar loosely connecting said multiplying-lever with the double-acting lever, and a tripping device constructed to reverse the connection between the operating-bar and the double-acting lever, substantially as described.

16. The combination, with a moving draw-bar for operating automatic brakes, and a hand-brake device, of a tripping device constructed to break the connection between the draw-bar and the brakes by the action of the hand-brake-operating device, substantially as described.

17. The combination, with a moving draw-bar for operating an automatic brake, and a hand-brake device, of a tripping mechanism operated by putting the hand-brake into operation, substantially as described.

18. In a brake mechanism in which the motion of the draw-bar throws the brake into action, the combination, with said draw-bar and its connecting-bar I, of the recessed wheel V, means for operating said wheel, lever W, a tripping device operating on the connecting-bar, and a connection between said lever W and the tripping device, substantially as described.

19. In a brake mechanism, the combination, with the moving draw-bar and an operating-bar connected therewith, of the hand-wheel U, the notched wheel V, the staff connecting said wheels, the lever W, rod X, and tripping device Y Z, substantially as described.

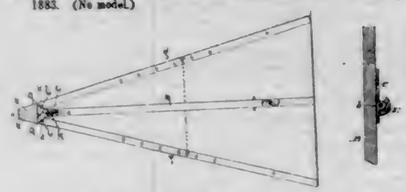
20. In a brake mechanism, the combination, with the moving draw-bar and the operating-bar connected therewith, of a pivoted rocking tripping device acted on by the change of direction of rotation of the car-wheels, and acting directly on the swell of the operating-bar, substantially as described.

21. In a brake mechanism, the combination, with the moving draw-bar and the operating-bar connected therewith, of a rocking lever, two rods pivoted thereto on the same side of its fulcrum, each rod having a tooth facing opposite to the tooth on the other, and a toothed collar provided with oppositely-acting teeth revolving with the car-axle, substantially as described.

22. In a car-brake, the combination, with a double-acting draw-bar, a double-acting lever connected with said draw-bar by a reversible connection, of a tripping device provided with two dogs, each having a tooth set in opposite directions to that on the other, and pivoted above the line of the centers of the car-axles, and a toothed collar constructed to revolve with the car-axle, and to engage alternately with the opposite teeth of the dogs on the change in the direction of wheel rotation, substantially as described.

23. The combination, with the axle of a car, and the double-acting draw-bar D, of the loose clevis F, the multiplying-lever G, connected therewith, the operating-bar I, the double-acting lever J, slotted links L, toggle O O', and friction-pulley N, all constructed and arranged to operate substantially as shown and described.

24. The combination, with the moving draw-bar D, of the loose clevis F, the multiplying-lever G, connected therewith, the operating-bar I, having swell i, the double bell-crank lever J, links L L', toggle O O', pulley Q, connected with the brake, toothed collar T, revolving with the car-axle, rods S S', and the rocking lever R, all constructed and arranged to operate substantially as shown and described.



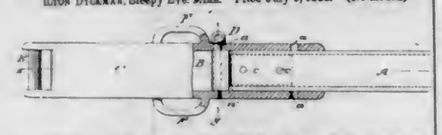
294,940. PROCESS OF EXTRACTING OILS AND FATS FROM FISH. PETER C. VOGELIUS, Gloucester, Mass. Filed July 6, 1883. (No specimens.)

Claim.—1. The improved process of extracting oils from fish, consisting in subjecting the fish to the action of plaster-of-paris or some similar water-absorbing agent, whereby the water is removed therefrom, and then mingling the fish with a suitable solvent, whereby the oil in the fish is dissolved, substantially as described.

2. The improved process of extracting oils from fish, consisting in heating the fish, subjecting the same to water-absorbing agents, and then to the dissolving action of solvents, substantially as described.

3. In the process of extracting oil from fish, the subjection of the latter to the water-absorbing action of plaster-of-paris or equivalent absorbents, substantially as specified.

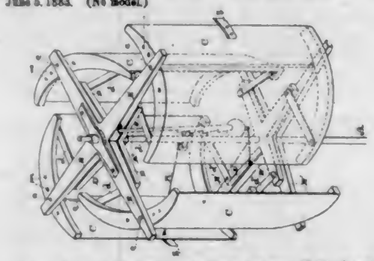
294,941. EASEL. EMIL WERNER, Philadelphia, Pa. Filed Dec. 20, 1883. (No model.)



Claim.—1. In an easel, laterally-movable legs, a stationary piece between the upper ends thereof, and a hinged prop, in combination with a hinge, one butt of which is formed with laterally-extending wings, which are attached to the legs by pivotal screws or bolts, and connected at the top with said stationary piece, the other butt being connected at the bottom with the hinged prop, substantially as and for the purpose set forth.

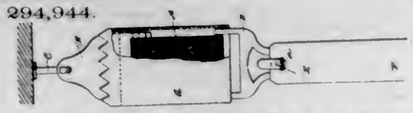
2. In an easel, a prop and laterally-movable side legs, and stationary piece between the top of the legs, in combination with a hinge having one butt formed with wings attachable to the legs by pivotal screws or bolts, and the other butt connected with a stop which is adapted to abut against the first-named butt when the prop is unfolded, substantially as and for the purpose set forth.

3. The prop, side legs, and stationary top piece, in combination with a hinge formed with wings and a stop, the upper inner corners or ends of the side legs being chamfered, substantially as and for the purpose set forth.



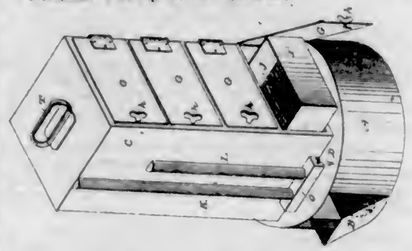
294,942. TRACE-BUCKLE. FERDINAND WETSTEIN and FRANK HAMILTON DUCKMAN, Sleepy Eye, Minn. Filed July 9, 1883. (No model.)

Claim.—1. In a trace-buckle, the box C, provided with the end loop or rod, E, the edge loops F at or near the center of its length, and holes *a a'*, and adapted to receive the end of a trace, and to be secured thereto by a pin passing through the holes and an eye in the end of the trace, substantially as herein shown and described.



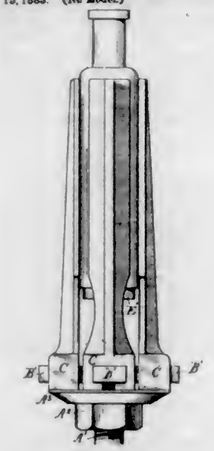
2. The trace A, provided with eye B, in combination with the box C, having the series of holes *a a'* made in its edges, and the pin D, adapted to pass through the said holes and the eye B, substantially as and for the purposes set forth.

294,943. WINDMILL. CHARLES W. WHITE, Santa Rosa, Cal. Filed June 5, 1883. (No model.)



Claim.—In a windmill, the shaft A, cross-frames B B', the cross-frames D D', loose on said shaft, and connected by pivoted arms *d d'* to the vanes, in combination with the adjustable concavo-convex vanes C, pivoted vertically between the cross-frames, and provided with holes *m* and pivot-rods *c*, and means for turning said vanes at an angle to receive the wind, the hanging bars E, provided with weights F, and connected with one edge of each vane, and the operating-rope, all substantially as shown and described.

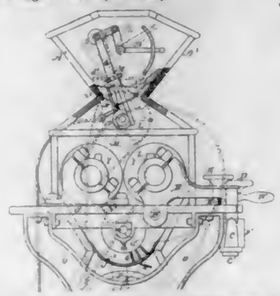
294,944. RAZOR-STROP ATTACHMENT. EMIL F. WIESLER, Milton, Wis., assignor to himself and William H. Borden, same place. Filed Dec. 1, 1883. (No model.)



Claim.—The holder-plate B, provided with an eye, and the spring A, secured at one end to said plate, in combination with the frame D, secured to spring A, and provided with a hook, and the case G, secured at one end to said plate B, and open at the other end, substantially as described, whereby first the whole device may be hung upon a nail or hook, and a razor-strop may be suspended at full length, and whereby the strop may be used at full length under any desired degree of tension on the spring, for the purpose specified.

294,945. STEAM COOKING APPARATUS. GEORGE W. WILLIAMS, Portis, Kans. Filed Sept. 18, 1883. (No model.)

Claim.—In a steam cooking apparatus, the combination, with the boiler A, of a casing, C, separated into a series of compartments having doors G, pipes K L M N, communicating with the boiler independently of each other and extending up along the length of the casing, bends or joints *k m n o*, connecting with the top of the pipes and extending into the interior of the compartments, valve-chambers O P, located at the rear end of each pair of pipes, and valves *p q r s*, adapted to slide in said chambers, as and for the purpose set forth.



294,946. CLAMP FOR HOLDING BOTTLES. JOSEPH B. WILSON, Clayton, N. J., assignor of one-half to Joseph Wharton, Philadelphia, Pa. Filed Nov. 15, 1883. (No model.)

Claim.—1. An improved implement for holding bottles while finishing the necks thereof, consisting of a hollow central shaft provided with radiating guides upon the end thereof, bearing parallel fluted jaws radially adjustable thereon, in combination with a table adapted to support the bottom of the bottle, and having a screwed stem fitting adjustably in a corresponding nut formed in the said hollow central shaft, substantially as and for the purpose set forth.

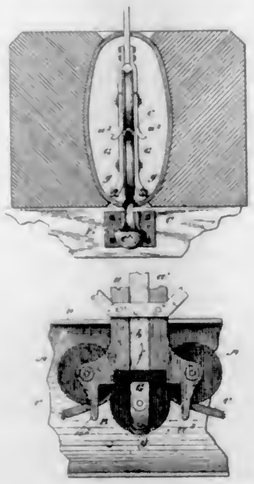
2. In an implement for holding bottles while finishing the necks thereof, a hollow central shaft internally screw-threaded, and provided with a screw fitting adjustably as to length therein, and bearing a table

294,947. ROLLER FLOUR-MILL. ABRAHAM N. WOLF, Allentown, Pa. Filed Aug. 20, 1883. (No model.)

Claim.—1. The combination of the hopper provided with slots through its ends, the swinging levers, which are pivoted at their upper ends, inside thereof, and have the feed-board connected to them near their lower ends, and a mechanism which is connected with the pivoted levers for causing them to reciprocate, and thus keep the feed-board in motion, substantially as shown and described.

3. The combination of the hopper, the swinging feed-board, pivoted arms connected thereto, pivoted levers upon the outside of the hopper, and revolving cams for moving the levers, and thereby imparting a constant reciprocating motion to the board, substantially as shown and described.

3. The combination of the hopper, the reciprocating feed-board, pivoted arms A^4, connected thereto, the pivoted operating-levers upon the outer ends of the hopper, and operating-cams, with the bell-crank levers A′ and connecting-links, substantially as set forth.



4. The combination of the frame, the bar C, provided with the box F, the spiraled boss a^5 *x*, the bolt which passes through the bar, the coil-spring, and a hand-lever having a spiral formed at its inner end, substantially as specified.

5. The combination of the frame, the two side levers, B, the bolts and wheels E E′, connected therewith, the levers D′, the spiraled boss a^5 *x*, bolt C, bar C′, and coil-spring, substantially as shown.

6. The combination of the rolls Y Y′, a revolving spiral brush, G, which brushes both rollers at once, the trough f^3, the scalping-reel I, and screen J, substantially as shown and described.

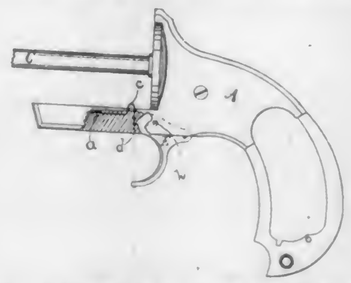
294,948. GRIPPING MECHANISM FOR TRACTION-CABLE RAILROADS. JOHN W. YOUNG, Fort Marcual, Ariz. Filed Mar. 17, 1883. (No model.)

Brief.—Gripping-sheaves arranged relative to each other, so that when applied the cable will be positively nipped between them. The movable hanger has depending arms carrying one of the sheaves, which arms rest upon the bottom of the cable-tunnel when the car is at rest, thus steadying the grip-frame while the cable is running through the grip.

Claim.—1. In a grip mechanism for traction-cables, the combination of two sheaves for gripping an endless traveling cable with mechanism for operating one or both of the sheaves, said sheaves not being directly opposite to each other with respect to the cable, but so arranged that they will press on both sides of the cable when the grip is applied to its full extent, substantially as and for the purpose set forth.

2. In a grip mechanism for traction-cables, the combination of two sets of sheaves for gripping an endless traveling cable, one of which sets may consist of a single sheave, with mechanism for operating one or both sets of sheaves, said sheaves alternating with each other, and arranged so that they will press on both sides of the cable when the grip is applied to its full extent, substantially as and for the purpose set forth.

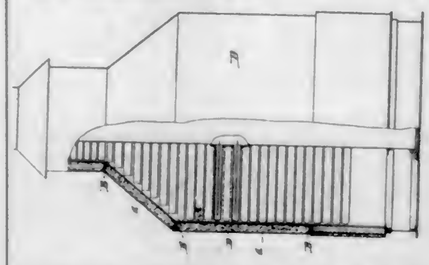
3. In a grip mechanism for endless traveling traction-cables, the combination of sheaves A A′ and sheave B with mechanism for drawing the latter sheave in toward the former pair of sheaves, the sheave B being placed opposite the space between the sheaves A A′, and the width of the space between the sheaves A and A′ being less than the diameter of the sheave B plus twice the thickness of the cable to be used, said sheaves being constructed so that they will pinch the cable when the grip is applied to its full extent, substantially as and for the purpose set forth.



4. In a grip mechanism for endless traction-cables, the combination of the movable hanger *b*, supporting-legs G, and cable-lifting sheave B, journaled in said legs, with the cable-guide D, and suitable cable-gripping and sheave-lifting devices on a car, substantially as herein set forth.

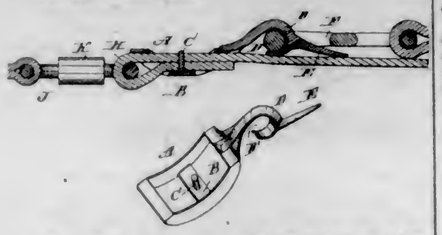
5. In a grip mechanism for endless traction-cables, the combination of the stationary hangers *a a′*, having bottom outwardly-turned guides, a^2, with the sheaves A A′ and the movable hanger *b* and sheave B, substantially as and for the purpose set forth.

294,949. MANUFACTURE OF WROUGHT-IRON. CHRISTOPHER ZOE, Pittsburg, Pa. Filed June 18, 1883. (No specimens.)



Claim.—The process of improving the quality of wrought-iron without destroying its weldable quality as such by intermixing steel therewith, in about the proportions specified, during the puddling or boiling process, as it comes to or approaches nature, substantially as described.

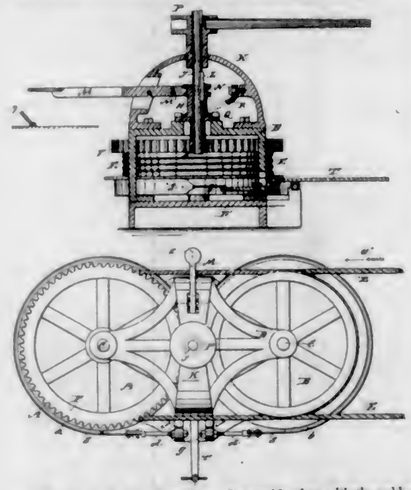
294,950. CYLINDER-STOP FOR REVOLVERS. FRANK H. ALLEN, Norwich, Conn. Filed Aug. 9, 1883. (No model.)



Claim.—In combination with the trigger E, the within-described cylinder-stop, made of a single continuous piece of flattened wire bent substantially as shown, having a suitable arm adapted to lie in the frame, an upward extension, *a*, to engage the cylinder-notch, and the downward extension and bend *d*, to engage a suitable notch in the trigger, said stop being held in the frame and operated as and for the purpose specified.

294,951. STEAM-BOILER COVERING. HENRY F. ALLEN, New York, N. Y. Filed Nov. 24, 1883. (No model.)

Claim.—The combination, with a boiler, of vertical and horizontal ribs formed of double channel or T irons secured on the outer surface of the shell, plates secured to the outer edges of the ribs, and of non-conducting material placed between the plates and the shell, substantially as herein shown and described.



294,952. TRACE-CARRIER. LOUIS T. ANDERSON, Carroll, Iowa. Filed Aug. 24, 1883. (Model.)

Claim.—The buckle-frame A, provided with a cross-piece, B, having a pin or tongue, C, and with a hook, D, having a projecting guard, E, said hook and guard being arranged to extend in opposite directions, substantially as herein shown and described.

294,953. FRICTION-DRUM FOR INCLINED-PLANE CABLE-RAILWAYS. EARLE C. BACON, Brooklyn, assignor to Copeland & Bacon, New York, N. Y. Filed Dec. 3, 1883. (No model.)

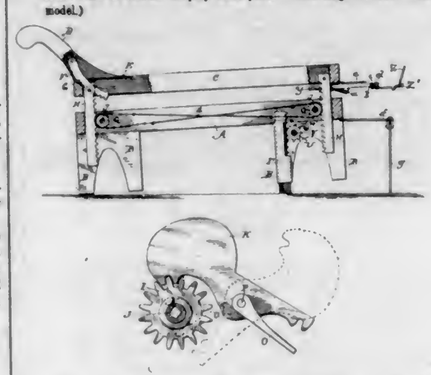
Brief.—The endless cable of an inclined railway is rove around two drums at the top of the incline, a strap-brake being applied to each drum and operated by one lever. The initial movement is given to the loaded car through a vertically-adjustable rotary shaft carrying at its lower end a pinion which is capable of meshing with a gear upon one of said drums.

Claim.—1. In a cable-railway, the combination, with the cable, of two friction-drums, around which the cable passes, and of a brake-band for each drum, substantially as herein shown and described, and for the purpose set forth.

2. In a cable-railway, the combination, with the cable, of two friction-drums, around which the cable passes, a brake-band for each drum, and of devices for applying both brake-bands simultaneously, substantially as herein shown and described, and for the purpose set forth.

3. In a cable-railway, the combination, with the cable, of two friction-drums, around which the cable passes, a brake-band for each drum, and a lever connected with both bands, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with a friction-drum, of a brake-band, S, the lever T, the rod *d*, and the tension-adjusting nut *g*, substantially as herein shown and described, and for the purpose set forth.

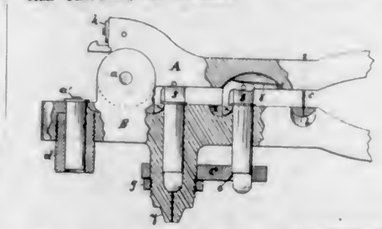


5. The combination, with a friction-drum for a cable, of a cog-wheel united with the said drum, and of a pinion mounted on a shaft that can be rotated, which pinion is adapted to be engaged with the cog-wheel, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with a friction-drum for a cable, of a cog-wheel united with the said drum, of a pinion mounted on a shaft that can be rotated, and devices for engaging the pinion with the said cog-wheel, substantially as herein shown and described, and for the purposes set forth.

7. The combination, with the cable-drum A, of the cog-wheel F, united with the same, the shaft J, provided with devices for turning it, the sleeve H, the pinion G, mounted thereon, and devices for vertically adjusting the said sleeve, substantially as herein shown and described, and for the purpose set forth.

8. The combination, with the cable-drum A, of the cog-wheel F, united with the same, the shaft J, provided with devices for turning it, the sleeve H, the pinion G, the lever M, the ratchet-wheel Q, and the pawl R, substantially as herein shown and described, and for the purpose set forth.



294,954. SOFA-BEDSTEAD. JOHN BAGGS, Baltimore, Md., assignor of one-half to Charles Shipley, same place. Filed Aug. 17, 1883. (No model.)

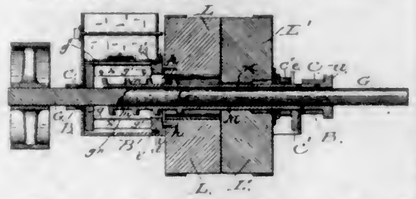
Claim.—1. A shaft shaped at its end to be engaged by a wrench, and provided with a toothed wheel, and a frame in which said shaft is journaled, in combination with a latch pivoted to said frame, having teeth to engage said wheel, a wrench having a hub shaped to engage the end of said shaft, as described, and an arm secured to said latch to engage said hub, substantially as described, whereby the said latch will be restrained from engaging the wheel by the wrench when the latter is in place on the shaft, but will be free to engage said wheel when the wrench is removed.

2. The combination, with a lounge having legs at its four corners, of the racks I′, having feet to stand on the floor, and connected to the lounge near its foot-legs, substantially as described, whereby they may slide vertically, the shaft V, journaled in the lounge, the pinions U, fixed on said shaft, the latches W, and the rod X, connecting them, journaled in the lounge, as shown and described.

294,955. CARTRIDGE IMPLEMENT. JOHN H. BARLOW, New Haven, Conn. Filed Jan. 5, 1884. (No model.)

Claim.—1. The combination, in a cartridge-reloading implement, of the two levers A and B, hinged together, one of said levers being provided with a suitable loading-chamber, also a separate chamber, *d*, which is adapted to be used, in connection with the lever A, as a shell reducer and recapper, the other lever being provided with a suitable device for withdrawing the cartridge from the chambers, substantially as and for the purpose described.

2. The combination, in a cartridge-reloading implement, of the two levers A and B, hinged together, one of said levers being provided with suitable loading-chambers, the other lever having one or more movable latches adapted to pass under the rim of the cartridge-head when the cartridge is seated in the loading-chambers, engaging therewith to withdraw the same from the loading-chambers, as set forth.



3. The combination, in a cartridge-reloading implement, of the two

levers A and B, hinged together, one of said levers having suitable devices for extracting the cartridge from the chambers, the other lever being provided with loading-chambers, together with the taper projection *y*, for expanding the mouth of the shell, substantially as described.

4. The combination, in a cartridge-reloading implement, of the lever A, provided with the movable latches *x x*, for the purpose described, the lever B, provided with a loading-chamber, a separate chamber, *d*, arranged to operate as a shell reducer and recapper, also an aperture for crimping the loaded cartridge, arranged to operate in connection with the radially-adjustable crimp-plate C, substantially as set forth.

5. The combination, in a cartridge-reloading implement, of the shell-expander *y*, reducing-chamber *d*, radially-adjustable crimp-plate C, movable latches *x x*, together with the hinged levers A B, having suitable loading-chamber, all arranged to operate substantially as and for the purpose shown and described.

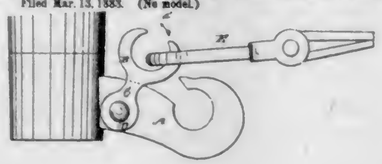
294,956. GRINDING-MILL. JOHN H. BEAR, West Manchester, Pa. Filed Dec. 12, 1883. (No model.)

Claim.—1. In a grinding-mill, the plate B', annular heads *g g'*, the connecting-pieces *g''*, and knives *h'*, in combination with the feeding devices, shaft G, sleeve M, and burrs L L', substantially as and for the purpose set forth.

2. The shaft G and annular heads *g g'*, in combination with beveled connecting-pieces *g''*, knives *h'*, plate *e''*, guides *e'*, and the plates B' and D, all constructed to operate substantially as set forth.

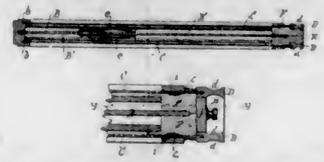
3. The sleeve M, having a spiral flange, *m*, formed on one end, in combination with hopper F, having guides *f''' f'''*, curved plates B' and D, and burrs L L', substantially as and for the purpose set forth.

4. The frame A and wedge-shaped block C', with projections *e e* formed thereon, in combination with the sleeve M, the shaft G, the adjustable bifurcated wedge C'', and the vertical burrs L L', substantially as and for the purpose set forth.



294,957. PRIMER. THOMAS G. BENNETT, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Dec. 31, 1883. (No model.)

Claim.—1. The herein-described primer, consisting in the combination of the principal cup *a*, the auxiliary cup *b*, of less diameter than the principal cup, containing the fulminate, and constructed with a flange, *c*, around its edge, of larger diameter than the internal diameter of the principal cup, and with one or more notches or openings, *e*, from the cup, the said auxiliary cup containing the fulminate introduced into the principal cup with its open mouth toward the bottom of the principal cup, and whereby said flange acts as a brace against the inner side of the principal cup, to hold the auxiliary cup in its central position upon the bottom of the principal cup, substantially as described.

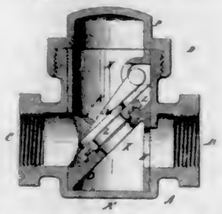


2. The herein-described primer, consisting in the combination of the principal cup *a*, the auxiliary cup *b*, of less diameter than the principal cup, containing the fulminate, and constructed with a flange, *c*, around its edge, of larger diameter than the internal diameter of the principal cup, the flange cut or notched at one or more points, *d*, the said auxiliary cup containing the fulminate introduced into the principal cup with its open mouth toward the bottom of the principal cup, and whereby said flange acts as a brace against the inner side of the principal cup, to hold the auxiliary cup in its central position upon the bottom of the principal cup, substantially as described.

294,958. WHIFFLETREE-HOOK. WILLIAM H. BEST, Eastport, Mich. Filed Mar. 13, 1883. (No model.)

Claim.—The combination, with the whiffletree-hook A, carved in a horizontal plane, of the spring guard or plate B, pivoted to the upper face of the hook A, and upwardly-arched at its middle and crescent-shaped at its free end, so that when closed the inner edge of the crescent coincides with the opening in the hook and closes its lateral passage, and also bites the upper face of the hook to retain the guard closed, substantially as shown and described.

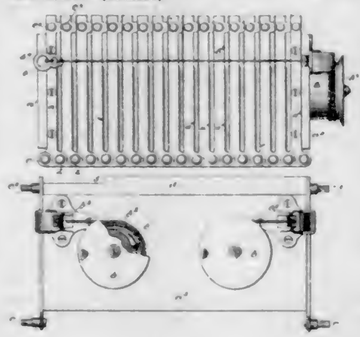
294,959. PLATE-HOLDER. THOMAS HENRY BLAIR, Boston, Mass., assignor to the Blair Tourograph Company, same place. Filed Jan. 6, 1883. Renewed Feb. 9, 1884. (No model.)



Claim.—1. In combination with the frame A and partition, the adjustable bars F F, these bars closing the mouths of the plate-chamber, respectively, and when in their inmost positions extending into such chamber beyond the inner edge of the frame, substantially as stated.

2. In combination with the frame A and the partition B, dividing such frame centrally of the adjustable bars or gates F F, the central ribs, E E, upon such bars, and the keys *f f*, operating with the said ribs E E, and the abutments *g g*, substantially as and for purposes stated.

3. In combination with each dark-slide C, the bar D, having the grooves *d* in opposite sides, and the rib E, shaped to fit said grooves, substantially as described.



4. In combination with the frame A and partition B, the dark-slides C C with the grooved bars D, the bars D with their ribs E, and adjustable with respect to the said frame and partition, and the keys *f f*, engaging at one end the said rib, and at the other the abutments *g g*, all substantially as explained.

294,960. CHECK-VALVE. JAMES H. BLESSING, Albany, N. Y. Filed Dec. 19, 1883. (No model.)

Claim.—The combination, in a check-valve, of the removable frame O, supporting the valve-seat L on an angle with the passage through the valve, with the frame N, supporting the check-valve M and locking the frame O in the valve, and the cap P, closing the valve-casing and simultaneously locking the frames N and O within the valve, substantially as described.

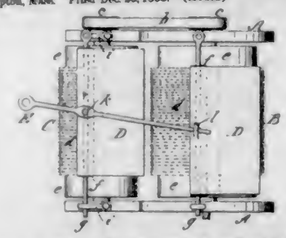
294,961. SIGNATURE-PRESENTING MECHANISM FOR BOOK-SEWING MACHINES. EDWARD S. BOYNTON, Bridgeport, Conn. Filed Nov. 12, 1881. (No model.)

Claim.—1. A signature-holder composed of a series of chain-jointed end pieces and connected plates carried thereby, to operate substantially as described.

2. In a signature-holder, two parallel plates of different widths connected at their ends with end pieces, to thereby leave between the plates a suitable opening for the passage of the devices which are to remove the signatures from the said plates, substantially as described.

3. The end pieces *a'*, combined with the two parallel plates *d d'*, connected therewith, the latter being cut away at 5, to permit the signature to be acted upon at its head, substantially as described.

4. The plates *d d'*, combined with the attached end pieces *a'*, provided with independent feeding-pins *e'*, substantially as described.



5. A signature-holder composed of chain-jointed end pieces and connected plates, combined with the heads and with the spring-actuated drums, and cords to clamp the end pieces together, substantially as described.

6. In a signature-holder, the end piece *a*, provided with a hook, and the end piece *a'* and head *a²*, combined with the spring-actuated drums, and cords provided with double eyes *b'*, substantially as described.

7. The shaft *e* and star-wheels thereon and guides B, combined with the chain-jointed signature-holder, to operate substantially as described and separate the adjacent end pieces and plates for the reception of signatures.

8. The shaft *e*, star-wheels, guides B, and chain-jointed signature-holder, combined with the side-register mechanism to push into line the ends of the signatures on the plates of the holder, substantially as described.

294,962. CARD-SHARPENING APPARATUS. JOHN BRIERLEY, Easthampton, Mass. Filed Dec. 20, 1883. (Model.)

Claim.—1. The combination, with the card and doffer cylinders B C, mounted to revolve in a suitable frame, of the sharpeners D D, secured to tubes *f f*, which are in turn mounted on transverse rods *g g*, secured to the frame above said cylinders B C, and a lever, E, pivoted to one sharpener and loosely engaging the other sharpener by a suitable connection, whereby when motion is imparted to said lever the tubes and their sharpeners will be reciprocated, substantially as set forth.

2. The combination, with card and doffer cylinders, of rods *g g*, secured to the frame above said cylinders, as shown, tubes *f f*, mounted on said rods, and carrying flexible sharpeners D D, of greater width than the toothed surfaces of said cylinders, the lever E, pivoted to one sharpener, D, and extending loosely through an eye, *i*, on the other sharpener, whereby the sharpener when reciprocated by said lever will at all times rest on the toothed surfaces of said cylinders, substantially as set forth.

294,963. BARBED FENCE. WILLIAM F. BROCK, New York, N. Y., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass. Filed Dec. 17, 1881. (No model.)

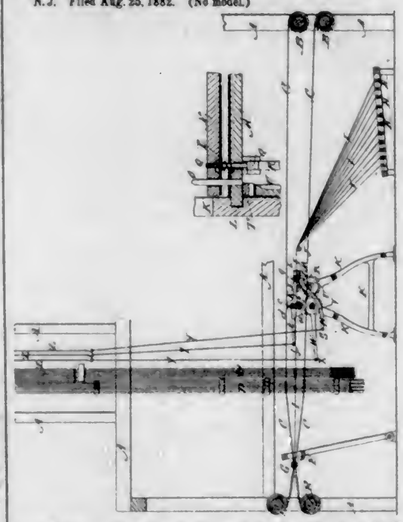
Claim.—1. A metallic fencing-strip with barbs B cut on one or both edges thereof and integral therewith, the central portion of the said strip being folded twice upon itself, as specified, so that the barbed edges project beyond the folded portion, substantially as described.

2. The improvement in the art of forming a metallic fencing-strip, the same consisting in cutting points or barbs on one or both edges of a thin metal strip and folding the central part of the strip twice upon itself, as specified, thereby leaving the barbed portion projecting beyond the folds, substantially as described.

294,964. CORN-PLANTER CHECK-ROWER. GEORGE W. BROWN, Galesburg, Ill. Filed Dec. 14, 1883. (No model.)

Claim.—1. In a check-rower, in combination, a supporting-head, forked lever, front guide-pulley, and a guard-finger adapted to swing away from said guide-pulley, substantially as and for the purpose specified.

2. In a check-rower, in combination, a supporting-head, forked lever, front guide-pulley, and a guard-finger hinged to the supporting-head by means of a slot, *c*, and pin *i*, and provided with a lower part, *h'*,

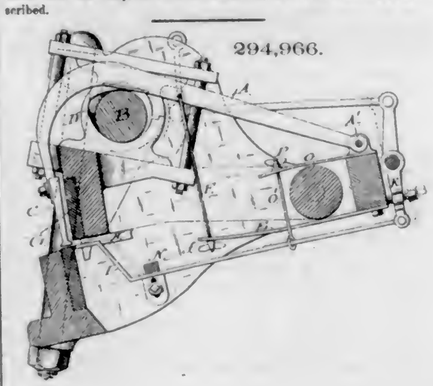


294,964.

adapted to come in contact with the part *c'* of the slot *c*, substantially as and for the purpose specified.

3. In a check-rower, in combination, a supporting-head, C, forked lever, front guide-pulley, and a guard-finger, H, constructed and hinged in the head C, substantially as and for the purpose specified.

294,965. MECHANISM FOR DELIVERING PILE-WARPS IN LOOMS FOR WEAVING DOUBLE PILE FABRICS. FRANK CHABOT, Paterson, N. J. Filed Aug. 25, 1882. (No model.)

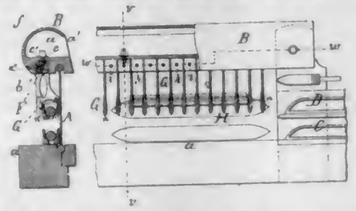


Claim.—1. The combination, with the clamping-bars M N, the clamping-rollers *b d*, and the supporting-frame, of Jacquard mechanism and means connecting the latter with said bars and rollers, whereby the latter are caused to clamp and feed forward the pile-warp, as set forth.

2. The combination, with the Jacquard hooks Z, the cross-bars M N, and the springs P, of the eyebolts Q, levers R, rack-bars T, gear-wheels U V, levers W, and means for connecting the levers R W with the Jacquard hooks, substantially as herein shown and described.

3. The combination, with the Jacquard hooks and rollers *b d*, of the gear-wheels *a* V, the levers W *e*, and means for connecting said levers with the Jacquard hooks, substantially as herein shown and described.

294,966.



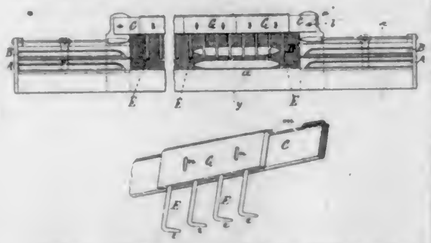
294,966. SHEARING-MACHINE. HARVEY B. CHESS, Pittsburg, Pa. Filed Nov. 2, 1883. (No model.)

Claim.—1. In shears for cutting sheet metal, the fingers I, with suitable mechanism for operating the same, the adjustable stop N, and adjustable spring C, in combination with the knife G and gages H, substantially as and for the purpose set forth.

2. In shears for cutting sheet metal, the knives G G′ and gages H, in combination with the clamps C and fingers I, all constructed to operate substantially as and for the purpose set forth.

294,967. LOOM FOR WEAVING DOUBLE PILE FABRICS. CHAS. COUPLAND, Seymour, Conn. Filed Mar. 29, 1883. (No model.)

Claim.—1. The combination, with the reed and lay of a loom, and upper and lower shuttle-boxes at each end of the lay, of a fixed upper skeleton raceway composed of vertical prongs, having coincident notches arranged in a horizontal series, an upper shuttle having a part or portion corresponding in shape to the said coincident notches, a lower raceway, and a lower shuttle, whereby provision is made for simultaneously weaving duplicate fabrics without rubbing contact of the upper shuttle with the warp, substantially as herein set forth.



2. The combination, with the reed and lay of a loom, of a top rail, B, having an internal longitudinal chamber, *a*, and in its under side a longitudinal groove, *b*, a bar, F, carrying a skeleton raceway, and adjusting-screws *c*, for vertically adjusting said bar with reference to the top rail, all substantially as and for the purpose herein set forth.

3. The combination, with the top rail, the lay, and reed of a loom, of the skeleton race composed of vertical fingers or prongs G, having the notches *r*, openings *r′*, and slits *r″*, and a shuttle constructed with a spline, *t*, and rib *s*, whereby the shuttle is supported during its flight without contact with the adjacent warp, substantially as and for the purpose herein set forth.

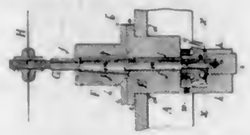
4. The combination, with the reed and lay of a loom, of the top rail, B, having the longitudinal chamber *a* and longitudinal opening *a′*, and constructed with a longitudinal groove, *b*, in its under side, a bar, F, composed of the plate *g*, and blocks *h*, and screws *i*, the fingers or prongs G, arranged to receive and suspend a shuttle at the lower ends during its flight, and the screws, *m*, all substantially as and for the purpose herein set forth.

5. The combination, with the reed and lay of a loom, of a fixed upper skeleton raceway composed of vertical prongs constructed with notches *r*, openings *r′*, and elongated bulb-shaped spurs *s*, an upper shuttle constructed with the rib *s* and spline *t*, a lower raceway, a lower shuttle, and upper and lower shuttle-boxes, the whole arranged for joint use and operation, substantially as and for the purpose herein set forth.

294,968. LOOM FOR WEAVING DOUBLE PILE FABRICS. CHAS. COUPLAND, Seymour, Conn. Filed Mar. 29, 1883. (No model.)

Claim.—1. The combination, with the top rail of the reed of a loom, of a skeleton race having pivotal connection with said top rail, and bolts or set-screws *r*, for retaining said skeleton in fixed position during the normal use and operation of the loom, all substantially as and for the purpose herein set forth.

2. The combination, with the top rail of the reed of a loom, of a longitudinal adjustable bar, C, and a skeleton race pivotally attached to the said bar, all substantially as and for the purpose herein set forth.



3. The combination, with the top rail of the reed of a loom, of a skeleton race formed in sections, each composed of a plate, G, and a number of prongs or fingers, E, attached to the said plate, a longitudinally-adjustable intermediate bar, C, and hinges or pivots connecting the aforesaid sections to the said bar, all substantially as and for the purpose herein set forth.

4. The combination, with the top rail of the reed of a loom, of a skeleton race formed in sections, each composed of a vertically-slotted plate, G, and prongs or fingers E, attached to said plate G, a bar, C, longitudinally adjustable with reference to the top rail, hinges or pivots connecting the said sections to the said bar, and bolts or set-screws arranged to pass through the vertical slots of the plates of the sections and hold the latter in due relation with the bar C, all substantially as and for the purpose herein set forth.

5. The combination, with the top rail of the reed of a loom, of a bar, C, formed with longitudinal slots, bolts or set-screws *a′*, constructed and arranged to pass through said slots and retain the said bar in due relation with the top rail, a skeleton race pivoted to the bar C, and bolts or set-screws for fixing said skeleton race in firm relation with the bar, all substantially as and for the purpose herein set forth.

6. The combination, with the top rail of the reed of a loom, of the skeleton race, formed of sections, each composed of a vertically-slotted plate, G, and prongs or fingers E, attached to said plate G, the bar C, having the longitudinal slots *b′*, the bolts or set-screws *a′*, for retaining the bar C in due relation with the top rail, hinges or pivots *m*, for connecting the plates G to the bar C, and bolts or set-screws *r*, for fixing the plates G in due relation with the bar, all substantially as and for the purpose herein set forth.

294,969. SPINDLE AND BEARING FOR ROTARY CUTTERS OF MACHINES FOR CUTTING DOUBLE PILE FABRICS. CHAS. COUPLAND, Seymour, Conn. Filed Mar. 29, 1883. (No model.)

Claim.—1. A spindle, G, for carrying a rotary knife or cutter, constructed with the upwardly-tapering part *m*, the shoulder *r*, the cylindrical part *n*, and the conical extremity *s*, substantially as and for the purpose herein set forth.

2. The bearing E, having a conical step, *a′*, and cylindrical bore *f*, and the cap F, having the upwardly-tapering bore *j*, in combination with the spindle G, constructed with the upwardly-tapering part *m*, shoulder *r*, cylindrical part *n*, and conical extremity *s*, all substantially as and for the purpose herein set forth.

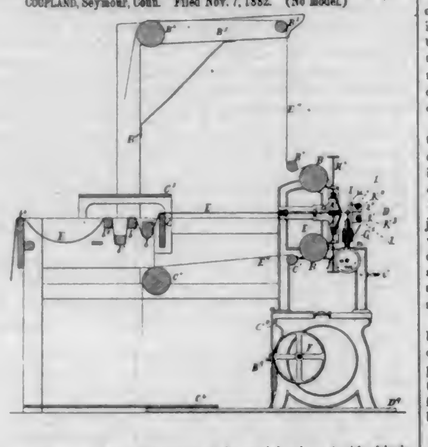
3. The combination of the bearing E, having the step *a′*, cylindrical bore *f*, and flange *c*, the cap F, having the upwardly-tapering bore *j* and flange *c′*, and the bolts or set-screws A′, with the spindle G, constructed with the upwardly-tapering part *m*, shoulder *r*, cylindrical part *n*, and conical extremity *s*, all substantially as and for the purpose herein set forth.

4. The combination of the bearing E, having the cylindrical bore *f*, lateral recess *g*, and step *a′*, and the cap F, having the upwardly-tapering bore *j*, with the spindle G, constructed with the upwardly-tapering part *m*, shoulder *r*, cylindrical part *n*, and conical end *s*, all substantially as and for the purpose herein set forth.

5. The combination of the bearing E, having the cylindrical bore *f*, lateral recess *g*, and step *a′*, the cap F, having the upwardly-tapering bore *j* and flange *c′*, and the bolts A′, with the spindle G, constructed with the upwardly-tapering part *m*, shoulder *r*, cylindrical part *n*, and conical extremity *s*, and a circular knife or cutter, H, attached to the upper end of said spindle, all substantially as and for the purpose herein set forth.

6. The combination of the movable block *i*, constructed with the conical bearing *a′*, screw *k*, bearing E, constructed with the lateral recess *g*, flange *c*, and cylindrical bore *f*, and the cap F, constructed with the upwardly-tapering bore *j*, with the spindle G, constructed with the upwardly-tapering part *m*, shoulder *r*, cylindrical part *n*, and conical extremity *s*, all substantially as and for the purpose herein set forth.

7. The combination of the bearing E, constructed with the cylindrical bore *f*, chamber *u*, and passage or opening *n′*, and the cap F, constructed with the upwardly-tapering bore *j*, with the spindle G, constructed with the upwardly-tapering part *m* and cylindrical part *n*, all substantially as and for the purpose herein set forth.



8. The combination of the cap F, constructed with the opening or orifice *r′* and upwardly-tapering bore *j*, and the bearing E, constructed with the chamber *u*, passage *n′*, and cylindrical bore *f*, with the spindle G, constructed with the upwardly-tapering part *m* and cylindrical part *n*, all substantially as and for the purpose herein set forth.

9. The combination of the plug *c‴*, of porous permeable material,

the bearing E, constructed with the chamber *u*, passage *n′*, and cylindrical bore *f*, and the cap F, constructed with the upwardly-tapering bore *j*, with the spindle G, constructed with the upwardly-tapering part *m* and cylindrical part *n*, all substantially as and for the purpose herein set forth.

10. The combination of the bearing E, constructed with the chamber *u*, opening or passage *n′*, and the coincident opening or passage *n⁴*, the screw *r‴*, and cylindrical bore *f*, and the cap F, constructed with the upwardly-tapering bore *j*, with the spindle G, constructed with the upwardly-tapering part *m* and cylindrical part *n*, all substantially as and for the purpose herein set forth.

294,970. MACHINE FOR CUTTING DOUBLE PILE FABRICS. CHAS. COUPLAND, Seymour, Conn. Filed Nov. 7, 1882. (No model.)

Claim.—1. The combination of the straining-bars A A′ with the rolls B B′, means for operating said rolls, tension-bar C, arranged with its upper edge substantially in line with the space *a* between the straining-bars, supplemental tension-bars *b b′ b″*, &c., arranged behind the bar C, a series or system of circular cutters arranged to rotate coincident with the space *a*, means for operating said cutters, two series of rollers arranged to co-operate with the rolls B B′ in drawing the double pile fabric to the cutters, and means for operating said series of rollers, all substantially as and for the purpose herein set forth.

2. The combination, with straining-bars, and means, substantially as described, for drawing the double pile fabric to and between the same, of a bar carrying a series or system of circular cutters, D, extending, substantially, the width of the fabric to be cut, arranged opposite to or coincident with the space between the said bars, and gears or toothed pinions attached to the spindles of said cutters, driving-gears arranged to co-operate with the gears or pinions aforesaid, and means for transmitting a reciprocating motion to the cutter-carrying bar, all substantially as and for the purpose herein set forth.

3. The combination of a spindle, I, carrying a circular cutter, D, with a shell or socket for receiving and supporting the bearing portion of said spindle, a stuffing-box at the bottom of said shell or socket, a gear or pinion attached to the lower end of said spindle, projected through the stuffing-box aforesaid, means for driving the said pinion, and a bar, G′, for carrying the cutter in due relation to the double pile fabric to be severed, all substantially as and for the purpose herein set forth.

4. The combination of a cutter and its carrying-spindle I, cylindrical as to its lower portion, tapered as to its upper portion, and circumferentially recessed at or near the middle of such cylindrical part, with a shell or socket-cylindrical as to the lower and tapering as to the upper part of its interior, an oil-inlet pipe coincident with the circumferential recess aforesaid, and a bar, G′, for carrying the cutter on the spindle in due relation with the double pile fabric to be severed, all substantially as and for the purpose herein set forth.

5. The combination, with the straining-bars A A′, and means, substantially as described, for drawing the double pile fabric to and between the same, of the reciprocating bar G′, carrying a series or system of circular cutters, extending, substantially, the width of the fabric to be cut, having gears on their spindles, means for reciprocating said bar, a secondary shaft, *n*, also carried by the bar G′, and provided with a series or system of gears or toothed wheels for transmitting a positive or non-slipping rotatory motion to the spindles of the cutters, and means for rotating said shaft, substantially as and for the purpose herein set forth.

6. The combination of a circular cutter, D, and a spindle tapered at its upper part, with a shell or socket composed of an internally-cylindrical flanged sleeve, I′, and a cap, I‴, having a tapering interior or chamber, and a reciprocating bar, G′, arranged to carry the cutter in due relation with the double pile fabric to be severed, all substantially as and for the purpose herein set forth.

7. The combination of a cutter and its carrying-spindle, tapered as to its upper portion, cylindrical as to its lower portion, circumferentially recessed at or near the middle of its said cylindrical portion, and having the thin or thread-like spiral groove *r²* above the circumferential recess, with a shell or socket internally cylindrical below and tapered above, and a bar, G′, for carrying the cutter on the spindle in due relation with the double pile fabric to be severed, all substantially as and for the purpose herein set forth.

8. The combination of a cutter and its carrying-spindle I, a shell or socket for holding the bearing portion thereof, a bar, G′, for supporting and carrying the said shell or socket, and a bolt or pin, *r⁴*, extended transversely through the bar G′, with its side fitted into a groove or notch formed in one side of the shell or socket, whereby provision is made for retaining the socket securely upon the bar G′, as the latter carries the cutter in due relation with the double pile fabric to be severed, all substantially as and for the purpose herein set forth.

9. The combination of the spindle I, cylindrical as to its lower and tapering as to its upper portion, provided at or near the center of its cylindrical part with a circumferential recess, and having at its extremity a screw-thread, *s*, with a circular cutter, D, nuts J and J′, a shell or socket composed of the sleeve I′, and cap I‴, a stuffing-box, *n‴*, at the bottom of the sleeve I′, a toothed gear or pinion, *n′*, at the lower projecting end of the spindle, an oil-feeding pipe, *r*, arranged coincident with the circumferential recess of the spindle, a bar, G′, for carrying the circular cutter in due relation with the double pile fabric to be severed, and a bolt or pin, *r⁴*, passed transversely through the bar G′, with its sides fitted into a notch or recess formed in the adjacent surface of the sleeve I′, all substantially as and for the purpose herein set forth.

10. The combination, with the bar G′, means for reciprocating said bar, the cutters and the spindles provided with the pinions *n′*, of the secondary shaft *n*, supported in bearings connected to the said bar G′, and provided with gears *m′*, through which a rotary motion is communicated to the spindles of the cutters, means for rotating said shaft, a collar, K, fast upon the shaft *n*, cheeks K′, and the bracket G×, depending from the bar G′, substantially as and for the purpose herein set forth.

11. The combination, substantially as described, of a series or system of sharpening devices corresponding in number with the cutters, with a series or system of circular cutters extending, substantially, the width of the fabric, and a bar arranged to carry the said cutters in due relation with the double pile fabric to be severed, and means for operating the said cutters, all substantially as and for the purpose herein set forth.

12. The combination, with the reciprocating bar G′ and the circular cutters carried on said bar G′ in due relation to the double pile fabric to be severed, of a shaft supported in suitable bearings upon said bar G′, sharpening devices provided on said shaft, and which by the rotation of the said shaft are brought at intervals upon the circumferential or edge portions of the rotary cutters, and means for actuating the said shaft, the cutters, and the bar G′, all substantially as and for the purpose herein set forth.

13. The combination, with the reciprocating bar G′ and the circular cutters carried by said bar in due relation with the double pile fabric to be severed, of two shafts, K² and K², supported in bearings upon the said bar G′, means whereby said shafts are geared together for simultaneous rotation in opposite directions, each shaft being provided with sharpening devices, which by the rotation of the two shafts are brought at intervals upon the opposite upper and lower edge portions or edges of the rotary cutters, and means for actuating the cutters, the bar G′, and the shafts K² and K², all substantially as and for the purpose herein set forth.

14. The combination, with the bar G′, means for reciprocating said bar, the cutters carried by said bar, and means for rotating the same, of the standards *u* and the two parallel shafts K² and K², the latter having its end projected, and formed with a longitudinal spline, *u′*, gear-wheels connecting said shafts, the pinion *u‴*, the yoke *u²*, the wheel D′, and means for operating said wheel, gearing, substantially as described, for connecting the pinion *u‴* with the wheel D′, and sharpening devices attached to the shafts K² and K², adapted to be applied at intervals to the upper and lower circumferential portions or edges of the rotary cutters by the rotation of the said shaft, substantially as and for the purpose herein set forth.

15. The combination, with circular cutters and means for rotating the same, of arc-shaped sharpening-blocks *m×*, springs for supporting said blocks, shafts carrying said blocks, and means for rotating said shafts, all substantially as and for the purpose herein set forth.

16. The combination, with circular cutters arranged to act in due relation with the double pile fabric to be severed, of sharpening devices composed of an adjustable block, *b×*, an adjusting screw-bolt, *f×*, a spring, K×, an arc-shaped sharpening-block, *m×*, and a shaft carrying the said parts and arranged in relation with the cutters to bring the sharpening-blocks in contact with the cutters during a portion of the revolution of said shaft, means for actuating said shaft and the cutters, and means for

transmitting movement from one to the other of the shafts K^2 K^3, all substantially as and for the purpose herein set forth.

17. The combination, with a circular cutter and its spindle, means for operating said spindle, and straining-bars, across which the double pile fabric may be strained in opposite directions, of the brace f^9, with the block $b^\times$, spring $K^\times$, block $m^\times$, shaft K^3, means for connecting block $b^\times$ to the said shaft, and means for actuating said shaft, all substantially as and for the purpose herein set forth.

18. The combination, with circular cutters arranged to act in due relation with the double pile fabric to be severed, of a shaft arranged parallel with said cutters, and radially bored to receive bolts $f^\times$, the said bolts $f^\times$ constructed with flanges $g^\times$ and squared ends $j^\times$, blocks $b^\times$, adjustable by means of the bolts $f^\times$, arc-shaped sharpening-block $m^\times$, connected with the blocks $b^\times$, springs $K^\times$, a bar, $i^\times$, attached to the shaft, to retain the bolts $f^\times$ by bearing against the flanges of the said bolts $f^\times$, and means for actuating the cutters and shaft, all substantially as and for the purpose herein set forth.

19. The combination of the following elements, to wit: straining-bars, across which the parts of the double pile fabric may be strained in opposite directions, rolls arranged to draw under tension the said fabrics across the said straining-bars, a series or system of circular cutters, a series or system of sockets for receiving the bearings of the spindles of the cutters, and provided with stuffing-boxes at their lower ends, a reciprocating bar constructed to carry said sockets and cutters, and means, substantially as described, for actuating the said parts in unison, substantially as and for the purpose herein set forth.

20. The combination of the following elements, to wit: straining-bars, across which the parts of the double pile fabric may be drawn in opposite directions, rolls for drawing said parts in opposite directions across said bars, tension-bars for resisting the traction of the aforesaid rolls to duly strain the double pile fabric as it is drawn over the straining-bars, a series or system of circular cutters extending, substantially, the width of the fabric, carried by spindles of length greater than the diameter of the cutters, and means, substantially as described, for actuating the said parts in unison, substantially as and for the purpose herein set forth.

21. The combination of the following elements, to wit: straining-bars, across which the parts of the double pile fabric may be strained in opposite directions, to present the pile under tension to the action of the cutters, a series or system of circular cutters extending, substantially, the width of the fabric, provided with gears for driving the same with a positive or non-slipping motion, sharpening devices for maintaining uniformly keen edges upon the said cutters, a bar arranged to carry the said cutters and gears, and means, substantially as described, for actuating the said parts in unison, substantially as and for the purpose herein set forth.

22. The combination of the following elements, to wit: straining-bars, across which the parts of the double pile fabric may be drawn in opposite directions, means, substantially as described, for varying or adjusting the space between the said straining-bars, a series or system of circular cutters extending, substantially, the width of the fabric, arranged opposite and parallel with the center of said space, means, substantially as described, for straining the parts of the double pile fabric in opposite directions across the straining-bars, and means, substantially as described, for simultaneously rotating the cutters each upon its own axis, and reciprocating said cutters as a series or system, all substantially as and for the purpose herein set forth.

23. The combination of straining-bars A A′ with vertical guides for controlling the vertical movement thereof, means, substantially as described, for directing the vertical movement thereof, means, substantially as described, for adjusting and retaining the said straining-bars at varied distances from each other, as required by the exigencies of work, a series or system of circular cutters placed coincident with the space *a* between said straining-bars, means for rotating said cutters, and means for reciprocating the same, substantially as and for the purpose herein set forth.

24. The combination of a series or system of circular cutters with means for operating said cutters, straining-bars A A′, provided at their ends with vertical tongues $B^\times$, brackets having vertical guides $C^\times$ for receiving said tongues, and means, substantially as described, for adjusting the distance between the said straining-bars, substantially as and for the purpose herein set forth.

25. The combination of straining-bars A A′, screws $A^\times$, for limiting the distance between the said straining-bars, brackets having nuts $W^\times$, and screw-shafts $H^\times$ and $I^\times$, acting to rigidly hold the said straining-bars in position with reference to each other, substantially as and for the purpose herein set forth.

26. The combination of brackets $D^\times$, carrying straining-bars A A′, with a series or system of circular cutters placed coincident with the space between said straining-bars, means for operating said cutters, and screws $G^\times$, for adjusting said brackets, and consequently the straining-bars, with reference to said cutting device or mechanism, substantially as and for the purpose herein set forth.

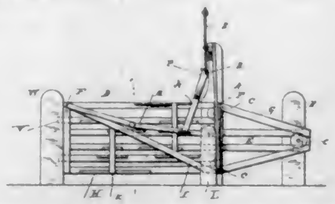
27. The combination of the brackets $D^\times$, having extensions $E^\times$ and nuts $s^\times$, and carrying the straining-bars A A′, with the screws $G^\times$, means, substantially as described, for preventing the longitudinal movement of the said screws, a series or system of circular cutters placed coincident with the space *a* between said straining-bars, means for rotating said cutters, and means for reciprocating the same, all substantially as and for the purpose herein set forth.

28. The combination of the straining-bars A A′, constructed with the vertical tongues $B^\times$, with the brackets $D^\times$, constructed with the vertical guides $C^\times$, shoulders or nuts $w^\times$, and nuts $s^\times$, the screw-shafts $H^\times$ and $I^\times$, guides for controlling the backward or forward movement of the brackets, screws $G^\times$, for affording such backward and forward movement, and means, substantially as described, for adjusting the space between the straining-bars A A′, substantially as and for the purpose herein set forth.

29. The combination of the fixed dovetail horizontal guides $F^\times$ with the brackets $D^\times$, constructed with extensions $E^\times$, having longitudinal grooves corresponding to the guides $F^\times$, the screws $G^\times$, for moving the extensions $E^\times$, and consequently the brackets $D^\times$, upon the horizontal dovetail guides $F^\times$, the straining-bars A A′, carried by the said brackets, a series or system of circular cutters placed coincident with the space *a* between said straining-bars, means for rotating said cutters, and means for reciprocating the same, all substantially as and for the purpose herein set forth.

30. The combination, with the brackets $D^\times$, having extensions $E^\times$, and the guides $F^\times$, of the straining-bars A A′, carried by said brackets, the screws $G^\times$, and squared ends $x^\times$, arranged to give motion to the said brackets, the collar $u^\times$, constructed with circumferential grooves $u^{\times\times}$, the sleeve or bearing $t^{\times\times}$, and tangential pin $w^{\times\times}$, passed through the said collar, and with its side inserted in the circumferential groove of the shaft, substantially as and for the purpose herein set forth.

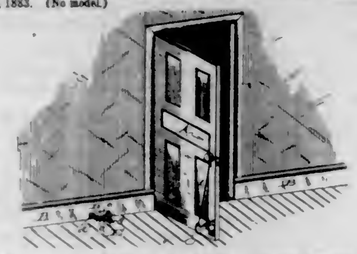
31. The combination, with the rolls B B′, the straining-bars, the series or system of cutters arranged coincident with the space between the said straining-bars, and the series of rollers B'' B^3 B^4 and C' C'', of the pulleys a^3 and b^7, the belt c^7, means for actuating the rolls B B′, and means for actuating the cutters, all substantially as and for the purpose herein set forth.



32. The combination of the rolls B B′ and means for actuating said rolls, with straining-bars A A′, cutting mechanism arranged coincident with the space between the said straining-bars, means for disconnecting the rolls B B′ from the driving or motive power, and means for applying a brake to neutralize the acquired momentum of the rolls simultaneously with the disengagement of the latter from the driving mechanism or motive power, substantially as and for the purpose herein set forth.

33. The combination of straining-bars A A′ with cutting mechanism arranged to operate coincident with the space between said bars, rolls B B′, means for driving said rolls from the shaft E^4, shaft E^4, means for driving said shaft, lever A^7, rod g^3, having the laterally-projecting inclined plane, means for operating said rod, and means operated by said rod for disconnecting the driving means of shaft E^4 from said shaft, all substantially as and for the purpose herein set forth.

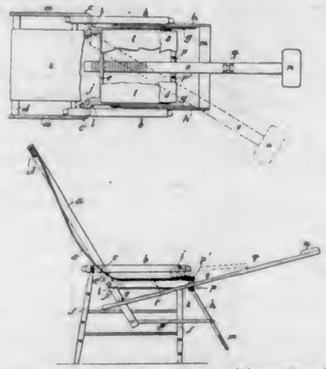
34. The combination, with the bar G′, means for reciprocating said bar, a shaft, *n*, and a series of cutters, said shaft and cutters being carried by said bar, gearing for transmitting motion to said cutters from said shaft, and means for operating said shaft, of a bracket, $G^\times$, made in two connected parts and provided with cheeks K′, and the collar K on the aforesaid shaft *n*, all substantially as and for the purpose herein set forth.



35. The combination, with a bar, G′, means for reciprocating said bar, a series of cutters carried by said bar, a shaft, *n*, mounted in bearings upon the said bar G′, and having a spline formed thereon, and gearing for imparting a rotary motion from said shaft *n* to the cutters, of a pulley, n', provided with an internal groove for the reception of the spline on the said shaft, fixed bearings for said pulley, and means for operating said pulley, all substantially as and for the purpose herein set forth.

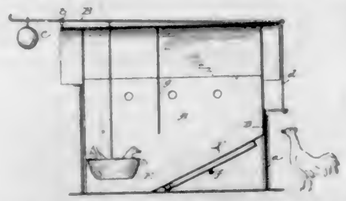
294,971. GATE. GEO. M. CUSTER, Mattoon, Ill. Filed Sept. 10, 1883. (No model.)

Claim.—A gate the horizontal rails of which are provided with horizontal cleats located alternately near the top and bottom, upon the sides of said rails, and having vertical braces to cover them, and a diagonal brace over said vertical braces, in combination with a post or posts carrying rollers which play between the rails and between the cleats, substantially as described.



294,972. DOOR-CHECK. LELAN A. DAVIS, Newark, Md. Filed Dec. 8, 1883. (No model.)

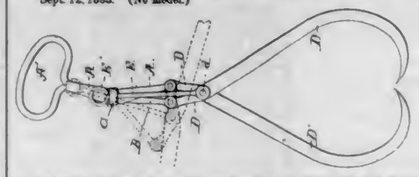
Claim.—1. In combination with the latch C, pivoted between the vertical side wings of a casting, and a cushion which extends below the same, said latch being provided with a rod for operating the same from the door-knob, a retaining-catch, E, with a cushioned end, *g*, pivoted between projecting wings *e e*, with serrated edges for the reception of projecting pins *f f* upon the catch, substantially as shown, and for the purposes set forth.



2. The casting D, provided with horizontally-extending side wings with serrated edges, and an adjustable catch, E, having projecting pins *f f*, in combination with the pivoted latch C, the parts being organized substantially as shown.

294,973. RECLINING-CHAIR. ISAAC DEPPEN, Hyde Park, Pa. Filed Mar. 21, 1883. (No model.)

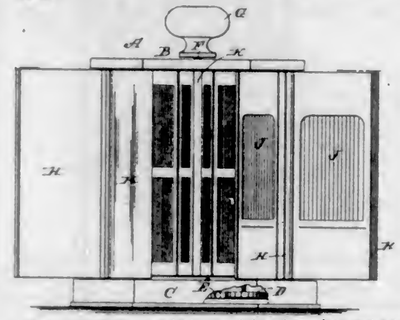
Claim.—In a reclining-chair, the combination of the leg-frame having arms *b*, the back having cross-bar *c* and side bars, *a a*, bent at *a'*, the seat-frame pivoted to said back at *l*, the foot-rest frame pivoted at *i* to arms *b* and to the seat-frame at *k*, and having cross-bar *p*, and the bar *o*, carrying foot-rest and having diagonally-opposite serrations, as and for the purpose specified.



294,974. HEN'S NEST. IRA B. DILLON, Visalia, Cal. Filed Oct. 26, 1883. (No model.)

Claim.—1. The combination, with the box or house, of the lever B, pivoted at *b*, and provided on one end with weight C, the door D, suspended from the opposite end, and the nest E, suspended from lever B between the door D and pivot *b*, substantially as described, and for the purpose set forth.

2. The combination of the suspended nest on the lever B, the weight C, and the suspended door D with the pivoted platform F, the door *a*, and partition *g*, the parts being constructed and operated substantially as described.



294,975. ICE-TONGS. WILLIAM DIMOND, Huntington, Ind. Filed Sept. 12, 1883. (No model.)

Claim.—1. In an ice-tongs substantially as described and shown, the combination, with the pivoted grapples, the handle-bar, and the connecting-strap, of the operating-rod having its lower end secured to the grapples at the pivot thereof, and its upper end held in suitable guides and contiguous to the hand-hold, as and for the purposes specified.

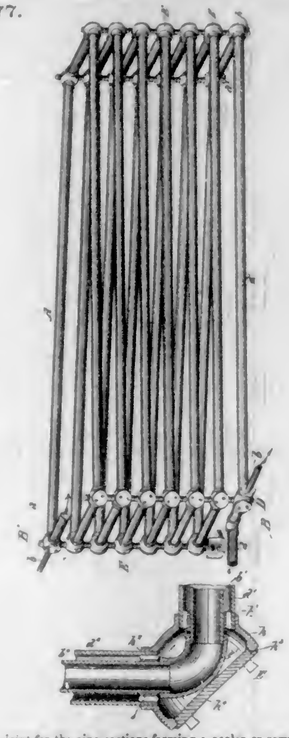
2. The ice-tongs composed of the handle-bar bent midway its ends, the connecting-strap pivoted to the handle-bar at the angle or bend thereof, and the guide or keeper swiveled to the handle-bar at the same point, the grapples pivoted together and at their upper ends, the one to the handle-bar and the other to the connecting-strap, and the operating-rod passed through the swiveled guide or keeper and secured at its lower end to the grapples at the pivot thereof, all arranged and operating substantially as and for the purposes specified.

294,976. PICTURE-EXHIBITOR. ABRAHAM J. DWORSKY, MARCUS B. KRAMER, and SIMON PHILLIPS, New York, N. Y. Filed Aug. 29, 1883. (No model.)

Claim.—1. A picture-exhibitor consisting of a casing constructed with a series of swinging doors provided in the inner sides with recesses, in each of which one or more picture-holding frames are hinged, substantially as herein shown and described.

2. A picture-exhibitor consisting of a casing constructed with a series of swinging doors provided in the inner sides with recesses, in each of which one or more picture-holding frames are hinged, and with a central standard, on which a series of picture-holding frames are hung, substantially as herein shown and described.

3. A picture-exhibitor consisting of a casing constructed with a series of swinging doors provided in the inner sides with recesses, in each of which one or more picture-holding frames are hinged, combined with mechanism for opening or closing all the doors simultaneously, substantially as herein shown and described.



4. In a picture-exhibitor, the combination, with a casing, of a series of swinging doors provided in the inner sides with recesses, in each of which one or more picture-holding frames are hinged, a central standard, picture-holding frames hung on the same, a pinion mounted on the bottom pivot of each door, a cog-wheel engaging with each pinion, a spindle passing loosely through the standard, on the lower end of which spindle the said cog-wheel is mounted, and of a knob or handle on the upper end of the spindle, substantially as herein shown and described.

294,977. COOLER OR REFRIGERATOR FOR ICE-MACHINES. WM. EBERHARDT, Allegheny, Pa. Filed Dec. 3, 1883. (No model.)

Claim.—1. In a cooler or refrigerator, the combination of a series of two or more sections of pipe suitably connected and a series of two or more sections of smaller pipe suitably connected, arranged within the first series, and entirely surrounded thereby at and around the joints, as well as throughout their lengths, substantially as set forth.

2. In a cooler or refrigerator, a series of two or more sections of pipe suitably connected, in combination with a series of two or more sections of smaller pipe suitably connected, arranged and supported centrally within the first series, and entirely surrounded thereby at and around the joints, as well as throughout their lengths, substantially as set forth.

294,977.

3. In a joint for the pipe-sections forming a cooler or refrigerator, a combination of a shell suitably connected with the water-pipe sections and an elbow located within said shell, and connected with the gas-pipe sections arranged within the water-pipes, substantially as set forth.

4. As a joint for the pipe-sections of a cooler or refrigerator, the hemispherical shell A, having threaded openings h' h^2, the pipe-sections screwed into said openings, in combination with the elbow d', arranged within the shell, and the gas-pipe sections arranged within the water-pipe sections and connected to said elbow, substantially as set forth.

5. As a joint for the pipe-sections of a cooler or refrigerator, the hemispherical shell A, having a threaded opening, h' h^2, the water-pipe sections screwed into said openings, in combination with the elbow d', arranged within said shell, the gas-pipe sections arranged within the water-pipe sections and connected to the elbow, and the winged thimbles c, substantially as set forth.

6. As a coupling for uniting gas and water pipes to a cooler or refrigerator, a shell, d, having the threaded openings d'' d^2 d^3, the water-pipe sections screwed into the openings d' and d^2, in combination with the elbow e, located within said shell, the gas-pipe sections connected with said elbow, one of the sections being arranged within one of the water-pipe sections, and the perforated plug f, surrounding the other gas-pipe section and screwing into the opening d^3, substantially as set forth.

7. As a joint or coupling for a cooler or refrigerator, a hemispherical shell having suitable threaded openings for the reception of pipe-connections, and an opening in its flat side, in combination with a plug or cover therefor, substantially as set forth.

8. The method of cooling gases, which consists in circulating the gas to be cooled in one direction through the pipes of a cooling apparatus, and in forcing the cooling medium in an opposite direction through pipes arranged outside of the gas-circulating pipes, substantially as set forth.

294,978. TREATING VOLATILE AND INFLAMMABLE FLUIDS AND OILS. SOLOMON M. EBERMAN, New York, N. Y. Filed Dec. 20, 1883. (No specimens.) Patented in England Aug. 16, 1883, No. 3,972.

Brief.—Improvement on Letters Patent No. 282,970, dated August 14, 1883, to same inventor.

Claim.—1. As a new article of manufacture, a hardened mass, block, or cake of granulated, thickened, partly-solidified, or solidified volatile and inflammable fluid or oil, substantially as described.

2. As a new article of manufacture, a hardened mass, block, or cake of thickened, partly-solidified, or solidified volatile and inflammable fluid or oil, combined or mixed with a combustible substance, substantially as described.

3. As a new article of manufacture, a hardened mass, block, or cake of thickened, partly-solidified, or solidified volatile and inflammable fluid or oil, combined or mixed with a viscous, gelatinous, cementitious, or binding substance, substantially as described.

4. As a new article of manufacture, a hardened mass, block, or cake of thickened, partly-solidified, or solidified volatile and inflammable fluid or oil, combined or mixed with a combustible substance, and a viscous, gelatinous, cementitious, or binding substance, substantially as described.

5. As a new article of manufacture, a hardened mass, block, or cake of thickened, partly-solidified, or solidified volatile and inflammable fluid or oil, combined or mixed with a substance or substances for the purpose of protecting the mass, block, or cake from atmospheric or other influences, substantially as described.

6. As a new article of manufacture, a hardened mass, block, or cake of thickened, partly-solidified, or solidified volatile and inflammable fluid or oil, combined or mixed with a viscous or binding material and an earthy or other protective substance, for the purpose of protecting the mass, block, or cake from atmospheric or other influences, substantially as described.

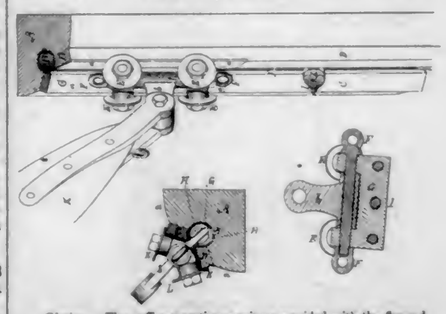
7. As a new article of manufacture, a hardened mass, block, or cake of solidified or thickened volatile and inflammable fluid or oil, provided with a coating for protecting the said mass, block, or cake from atmospheric and other influences, substantially as described.

8. As a new article of manufacture, a combination of oil with a volatile alkaline substance or substance having alkaline properties, substantially as described.

9. The herein-described process of producing hardened, weather-resisting blocks, cakes, or masses of volatile and inflammable fluid or oil, consisting in thickening, solidifying, or granulating the oil or fluid and then mixing it with an earth, substantially as described.

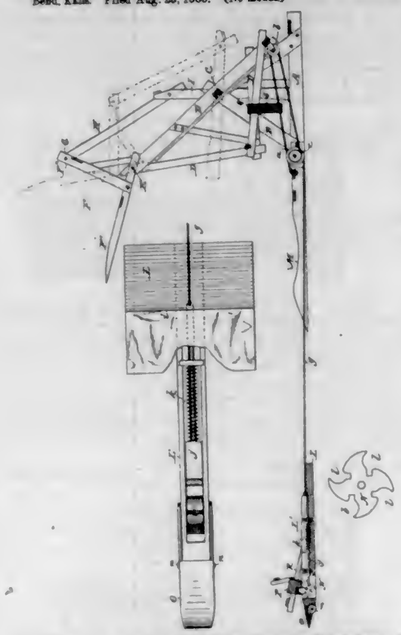
10. The herein-described process of producing hardened, weather-resisting blocks, cakes, or masses of volatile and inflammable fluid or oil, consisting in thickening, solidifying, or hardening the oil and providing it with a protective coating, substantially as described.

11. The herein-described process of mixing oils with other substances for the purpose of thickening, solidifying, or hardening the said oils, consisting in carrying out the said operation in vacuo, substantially as described.



294,979. RIVET. ANDREW EPPLER, Jr., Boston, Mass. Filed Aug. 14, 1883. (No model.)

Claim.—1. A rivet or similar article having a head, and teeth bent from the inner circular edge or margin of said head, said teeth being separated by spaces, and being narrower and thinner at the points than at the bend, where they are united to the head.



2. A rivet or similar article having a head with a round central perforation, and teeth extending from the inner edge of said head at about a right angle thereto, said teeth being separated by spaces at their line of union with the head, substantially as shown and described.

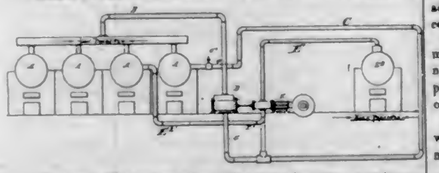
294,980. GAFF-SUPPORT FOR VESSELS. GEORGE IRA FIELD, Fall River, Mass. Filed Dec. 26, 1883. (No model.)

Claim.—The gaff-supporting carriage provided with the flanged wheels, the swinging arm, and the flange and its friction-rollers, essentially as described, in combination with the mast having the bearing-rails and the open tube or groove, as explained, all being adapted and arranged substantially and to operate as set forth.

294,981. HAY AND STRAW STACKER. MORTON B. FITTS, Great Bend, Kans. Filed Aug. 23, 1883. (No model.)

Claim.—1. A straw or hay stacker consisting of a stationary base-frame, a swinging frame supported therein, a rocking straw-holder, F, carried upon the end of the swinging frame, the bars H, and the weighted levers I, all combined substantially as shown and described.

2. The combination, with the stationary base-frame and the swinging frame D, carrying the straw-holder at its end, of a counter-weight arranged upon the opposite side of the fulcrum from the straw-holder, and arranged, as described, to rise when the straw-holder falls, as set forth.



3. The combination, with the straw holding and elevating devices, of a windlass, a hitch or trip device, and a separable rake, the said windlass being connected to the tripping devices and the elevating devices, as described, and the rake adapted to connect with the tripping device to elevate the straw-holder, and then be disconnected therefrom, as described, whereby the single team of horses is made to gather and stack the straw and hay.

4. The combination, with a windlass and the stacker-frame, of the spring hitch or trip L L', ropes connecting the same to the windlass, the trip-wheel N, and a rope connecting the locking-bolt of the trip to the windlass, substantially as shown and described.

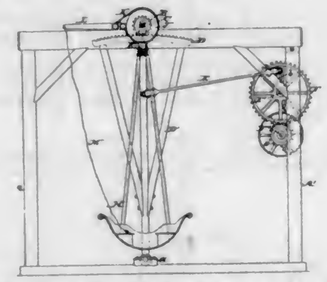
5. The combination, with the straw-elevating devices and the windlass for working them, of the rigid guides M M, and the adjustable hitch or trip L L', as and for the purpose described.

6. The adjustable hitch or trip L L', having a pivoted hood or nose, in combination with a separable rake adapted to ride upon the same, as described.

294,982. METHOD OF AND APPARATUS FOR STEAM-HEATING. MARK S. FOOTE, Burlington, Iowa. Filed June 30, 1883. (No model.)

Claim.—1. The process of supplying steam in a steam-supply system, consisting of, first, generating steam at a low pressure in suitable steam-generators, and then pumping or otherwise forcing said steam by an exterior power into and forward through the mains and service-pipes, thereby creating an artificial circulation, substantially as described.

2. The method of supplying steam in a steam-supply system, consisting, first, of generating steam at a low pressure in steam-generators, and then passing the same through a pump operated by steam or other exterior power, thereby pumping the steam forward through the mains and service-pipes, and thus creating an artificial circulation, substantially as described.



3. The method herein described for supplying steam in a steam-supply system, consisting of, first, generating the steam at a low pressure in suitable generators, and then by a suitable pump or equivalent mechanism forcing the steam forward at a higher pressure into the service-pipes and mains, substantially as described.

4. In a steam-supply system, generators for generating steam at a low pressure, a pump or other mechanism adapted to receive and force the steam forward under increased pressure into the mains, and a graduated valve or its equivalent for confining the steam within the main until it shall have reached a previously-determined degree, substantially as described.

5. In a steam-supply system, generators for generating steam at a low pressure, a pump or equivalent for receiving said steam and forcing it forward under increased pressure into the mains, said main eventually discharging again into the generators, and a graduated valve or equivalent for regulating the pressure within the main, and adapted to open by excessive pressure and permit the steam or condensed water to discharge back into the generators, substantially as described.

6. In a steam-supply system, generators for generating steam at a low pressure, a pump for receiving and forcing said steam forward at an increased pressure, a steam-engine for actuating the pump, said steam-engine being fed from a steam-generator at a high pressure, and a conduit leading its exhaust-steam into the generators A or mains C of the steam-supply, substantially as described.

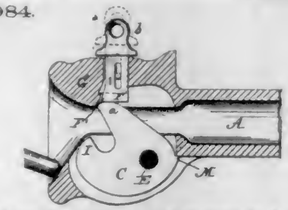
294,983. SWING. ISAAC N. FORRESTER, Camden, N. J. Filed Aug. 18, 1883. (No model.)

Claim.—1. A swing hung loosely on a shaft which is adapted to rock or be continuously rotated in reverse directions, in combination with devices for coupling said swing and shaft, whereby the swing may be set in motion by the operation of said devices and stopped by the release of the same without stopping the rocking shaft, substantially as and for the purpose set forth.

2. A swing hung loosely on a shaft, and means for clamping the swing and shaft, in combination with means for rotating said shaft in reverse directions, whereby the swing and shaft may be continuously coupled and the swing receive motions in both directions from the shaft, substantially as and for the purpose set forth.

3. A swing, in combination with a shaft from which it depends, a pinion on said shaft, a toothed segment attached to an oscillating frame and engaging with said pinion, and mechanism for coupling said swing and shaft, substantially as and for the purpose set forth.

4. A swing hung loosely on a rocking shaft and means for rotating said shaft in reverse directions, in combination with a head or pulley on said shaft, a coupling or clutching device connected with the swing, adapted to engage with said head, and a lever for operating said device, combined and operating substantially as set forth.

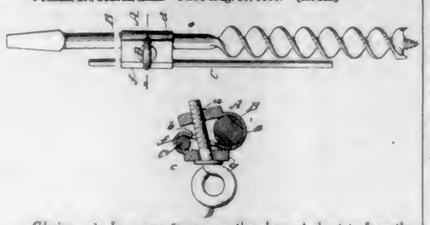


5. A swing, in combination with a reversely-rotating shaft and means for operating the same, a head on said shaft, a friction-strap connected with the swing, freely encircling said head, and a lever for compressing said strap on the head, the lever being connected with both ends of the friction-strap, substantially as and for the purpose set forth.

6. A swing, rocking shaft, and connected gearing, in combination with a pitman or rod and a crank-wheel, said rod being adjustably connected with said wheel, substantially as and for the purpose set forth.

294,984. CAR-COUPLING. DONALD FRASER and VIRTUS L. RICE, Minneapolis, Minn. Filed Jan. 4, 1884. (No model.)

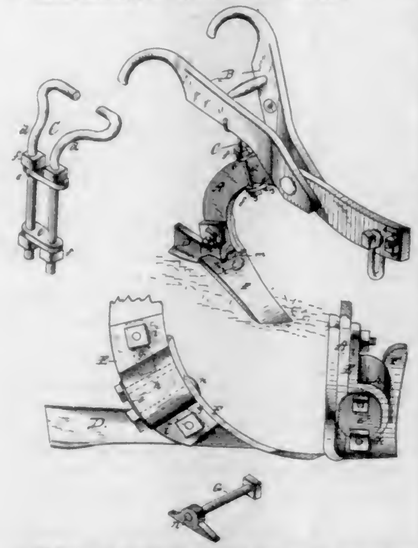
Claim.—1. In a car-coupling, a cam disk or plate, C, pivoted eccentrically in the draw-head, as set forth, provided with projections I



294,984.

and *a*, and stop M, in combination with the slotted pin F, as set forth.

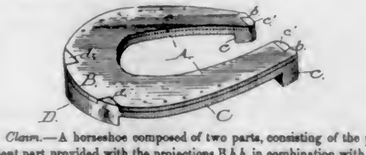
2. In a car-coupling, the draw-head provided with an open slot, in which is pivoted the cam-plate C, as described, said cam-plate being provided with a stop, M, which impinges against the draw-bar at the rear end of said slot, as and for the purpose set forth.



294,985. GAGE ATTACHMENT FOR BORING-BITS, &c. JOHN FULLER, Sr., Seneca, Kans. Filed Aug. 15, 1883. (Model.)

Claim.—1. In a gage for augers, the clamp A, bent to form the loops *d* and *f*, and thickened or re-enforced at its ends, substantially as and for the purposes set forth.

2. In a gage for augers, the clamp-plate A, bent to form the loops *d* and *f*, re-enforced at its ends and formed with the holes *a b c*, in combination with the screw D and bar C, arranged to operate substantially as set forth.



294,986. PLOW. DAVID A. C. FUNDERBURK and JEFFERSON L. FUNDERBURK, Bainbridge, Ga. Filed Sept. 4, 1883. (No model.)

Claim.—1. In combination, the plow-beam, the landside, formed with elongated bolt-holes, and the side frame, E, having elongated bolt-holes, the said landside and frame being removably and adjustably secured to the beam, substantially as and for the purpose set forth.

3. In combination with the beam-handles of a plow, said handles being pivotally secured to the beam, the stirrup C, consisting of the two side bars, *d d*, pivotally attached to the handles, the upper or lower plates or washers, *e e*, and the adjusting-nuts *f f*, said plate and adjusting-nuts, with the side bars, being adapted to embrace the plow-beam, substantially as and for the purpose set forth.

294,987. CAR-COUPLING. GARRETT B. GANO, Easton, Md. Filed Jan. 15, 1884. (No model.)

Claim.—1. The draw-head, in combination with the independent weighted link-sustaining levers H F, for the purpose set forth.

2. The curved dog B, pivoted behind the center, in combination with the vertically-sliding plate *a*, provided with vertically-moving rods *b b*, substantially as and for the purpose set forth.

3. The car-coupling herein described, having the draw-head A, curved dog B, pivoted behind the center, the sliding plate *a*, provided with slot *b'* and rods *b b*, lever C, having foot-piece *p*, and weighted levers H F, all constructed, arranged, and operated as set forth.

294,988. HANDLE FOR TRUNKS, &c. GEORGE SHATTUCK GATES, Athol, Mass. Filed Dec. 26, 1883. (No model.)

Claim.—A trunk-handle which consists of the metallic pockets E, having the horizontal slots *d*, in combination with the flexible strip A, metallic spring B, covering C, and studs *c*, the latter arranged in and passing through the strip and covering, and extending into the slots *d*, as set forth.

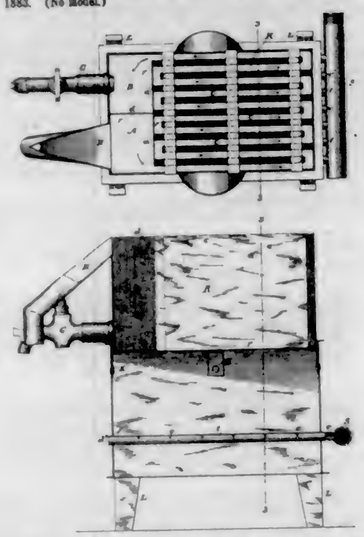
294,989. MACHINE-SHAFT AND ITS BEARINGS. GEORGE SHATTUCK GATES, Athol, Mass. Filed Jan. 16, 1884. (No model.)

Claim.—1. The combination, with the tubular or chambered shaft and one or each of its steps, and the pivot or pivoted journal thereof, of the spring and valve and valve-seat arranged within the shaft, the educt leading from such seat to the bearing-surfaces of the step and pivot or pivoted journal, and the valve-opener extended into and through the educt, all being applied and for use and to operate substantially as set forth.

2. The combination, with the tubular shaft and its pivotal journals, and steps arranged in it, and provided with educts and valve-seats, as set forth, of the valve-openers extended from the journals through the educts and the valves and their spring arranged in the shaft and between the valve-seats, all being substantially as represented.

294,990. HORSESHOE. GREEN CLAY GOODLOE, Washington, D. C. Filed Dec. 17, 1883. (No model.)

Claim.—A horseshoe composed of two parts, consisting of the permanent part provided with the projections B *b b*, in combination with the removable part, having the toe D, recesses *d d*, and heel-pieces *c'*, adapted to fit in the upper part, and secured thereto by screws, substantially as shown and described.



294,991. PUNCH. GEORGE H. GOODMAN and JAMES B. HUNT, Otego, N. Y. Filed June 14, 1883. (No model.)

294,991.

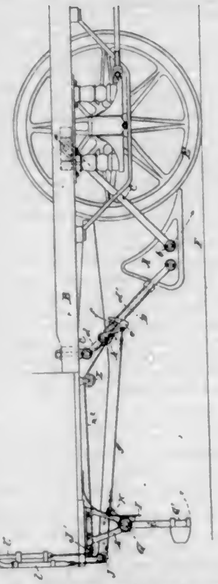
Claim.—The herein-described punch, provided at its lower portion with cutting-faces inclined in opposite directions, said faces crossing the base of the punch at its center, substantially as shown, and for the purpose set forth.

294,992. APPARATUS FOR HEATING WATER, &c., FOR DOMESTIC AND OTHER PURPOSES. WATSON A. GOODYEAR, New Haven, assignor of one-half to Landon Ketchum, Saugatuck, Conn. Filed Oct. 6, 1883. (No model.)

Claim.—1. In an apparatus for heating water and other liquids, a metallic heating-vessel, R, divided internally into a series of parallel vertical compartments, *c c*, connected with each other and terminating in the chambers A and B, through which the liquid to be heated passes, and having the open spaces *a a* between all the compartments, whereby the vessel is divided vertically, substantially as and for the purposes specified.

2. The combination, substantially as hereinbefore set forth, of the parallel water-heating compartments or chambers communicating with each other in series, the intervening spaces constituting flues for heating said compartments, the supply and discharging chambers A and B, in which the respective ends of said series of compartments terminate, and an overflow-spout leading from the upper portion of said supply-chamber.

3. The combination, substantially as hereinbefore set forth, of a narrow continuous water-heating chamber folded or wound upon itself throughout its entire length, so as to leave a narrow flue intervening between each adjacent fold, and terminating at both extremities in enlarged chambers or compartments.



4. The combination, substantially as hereinbefore set forth, with a heating-vessel consisting of a continuous narrow water-containing chamber folded or wound upon itself, and having heating-flues intervening between the successive folds, substantially as described, of a gas-stove consisting of the horizontal gas-burner J, composed of parallel pipes *p p*, leading from the supply-pipe S, and extending within an inclosing-case of suitable proportions for receiving said water-containing chamber, substantially as described.

294,993. ROWLOCK. SAMUEL H. HAAS, Chicago, Ill., assignor to Charles J. Wright. Filed Aug. 10, 1883. (No model.)

Claim.—1. The combination of a rowlock with the spring-catch I, which is pivoted to one of the prongs of the rowlock, and which catch extends downward into the rowlock, so as to engage with the top of the oar and prevent it from having any vertical play in the rowlock, the spring-snap being provided with a suitable handle for drawing the catch back out of position, substantially as shown.

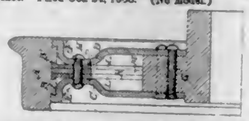
2. The combination of a rowlock with the spring-catch I, which extends downward into the rowlock, so as to engage with the top of the oar and prevent it from having any vertical play, the shank B of the rowlock being provided with suitable means for preventing the rowlock from turning into such a position that the handle of the spring-catch cannot be readily taken hold of to release the oar, substantially as specified.

294,994. CAR-BRAKE. WILLIAM HACKLÄNDER, Ehrenfeld, Germany. Filed Jan. 15, 1884. (No model.) Patented in Germany Feb. 25, 1882, No. 19,464.

Claim.—1. The combination, with a railroad-car, of a brake-shoe suspended, as described, by arms C D underneath the car, and a swinging brake, bar, or frame, G', under the end of the car, connected, as described, to a latching device on arm D, whereby the swinging of said bar or frame back and under the car will automatically detach said latching device and permit the said brake-shoe to drop downward upon the railroad-track in front of and under the car-wheel, all as specified.

2. The combination, with a railroad-car, of the shoe A, arms C and D, the latter formed of two parts, *d d'*, provided with the described latching device, the chain or cord connected to said latching device and passing around a loose pulley, J, under the platform of the car, upward above the same, all as and for the purpose described.

294,995. CAR-WHEEL. JOHN A. HAGAN, Three Rivers, Mich., assignor, by mesne assignments, to the Hagan Steel Car Wheel Company, same place. Filed Aug. 21, 1883. (No model.)



Claim.—1. The combination, with a tire for a car-wheel having a dovetail annular groove in its inner face, of a sectional dovetail ring secured in such groove, substantially as set forth.

2. The combination, with a hub of a car-wheel and its tire provided with a sectional dovetail ring, of side plates or disks pressed between the hub and tire and bolted to the hub and ring, substantially as set forth.

3. In a car-wheel, the combination, with a hub and tire provided with a sectional dovetail ring, of side plates or disks having flanged rims, and bolted to the hub and ring, substantially as set forth.

4. In a car-wheel, the combination, with a hub and a tire provided with an internal sectional dovetail ring, of side plates or disks with rims curving outwardly from the depending flange, and bearing against the tire, and bolted to the ring and hub, substantially as set forth.

294,996. CAR-WHEEL. JOHN A. HAGAN, Three Rivers, Mich., assignor, by mesne assignments, to the Hagan Steel Car Wheel Company, same place. Filed Oct. 24, 1883. (No model.)

Claim.—1. A tire for a car-wheel, having an inserted ring in its inner face, and grooves of dovetail, tongue-and-groove, or equivalent sectional form in its sides, substantially as set forth.

2. The combination, with a tire for a car-wheel, having an inserted ring in its inner surface and grooves in its sides, of side plates or disks forming the body of the wheel, substantially as set forth.

3. The combination, with a tire for a car-wheel, having an inserted ring in its inner surface and grooves in its side, of side plates or disks with rims curving outwardly, and with return-flanges interlocking with the grooves in the sides of the tire, substantially as set forth.

4. In a car-wheel, the combination, with side plates or disks having flanged rims or rims curving outwardly, of brackets supporting said rims, substantially as set forth.

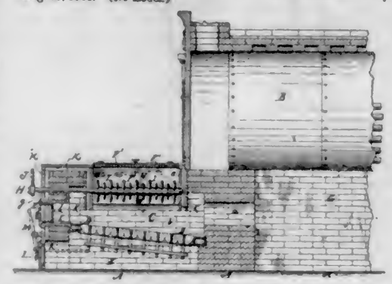
5. The combination, with a tire for a car-wheel, having a ring inserted and secured in its inner surface, of side plates or disks recessed or grooved to interlock with projections on the sides of the inserted ring, substantially as set forth.

6. In a car-wheel, the combination of the tire having annular grooves in its sides, and the body of the wheel composed of one or more disks, the same being flanged at the periphery for the purpose of forming a tire-seat, of a ring or rings on the wheel-body, and formed so as to interlock with the grooves in the sides of the tire, substantially as set forth.

7. In a car-wheel, the combination of the tire having annular grooves in its sides and an annular ring in its inner surface, with a wheel-body composed of one or more disks, the same being flanged at the periphery for the purpose of forming a tire-seat, of a ring or rings on the wheel-body, and formed so as to interlock with the grooves in the sides of the tire, substantially as set forth.

8. In a car-wheel, the combination, with the tire having an annular web or ring in its inner surface and annular grooves in its sides, of dovetail or tongue-and-groove sectional form, of side plates or disks forming the body of the wheel, with rims curving outwardly from the annular web or ring and forming the tire-seat, and having return-flanges interlocking with the annular grooves in the sides of the tire, and securing the tire to the wheel-body, substantially as set forth.

294,997. CAR-WHEEL. JOHN A. HAGAN, Three Rivers, Mich., assignor, by mesne assignments, to the Hagan Steel Car Wheel Company, same place. Filed Jan. 16, 1884. (No model.)



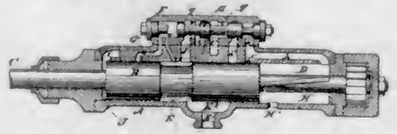
Claim.—1. The combination, with a car-wheel tire, of two inserted sectional rings on its inner face near its edges, where least wear occurs, substantially as and for the purpose set forth.

2. The combination, in a car-wheel, of a tire having two inserted sectional rings near its edges, and side plates or disks, with inwardly-projecting flanges placed inside of the rings, substantially as set forth.

3. In a car-wheel, the combination, with the tire having the two inserted sectional rings placed outside of the flanged disks or side plates, of the distance-pieces and the bolts passing through them, substantially as set forth.

4. In a car-wheel, the combination, with the hub, tire, and side plates, or body portion of the wheel, of two rings on the inner face of the tire, at least one of which is inserted in sections, and to which rings the body portion of the wheel is secured, substantially as set forth.

294,998. BOILER-FURNACE. JOSEPH J. HALL, Chicago, Ill., assignor to Hall's Automatic Feed Boiler Furnace Company, same place. Filed Aug. 13, 1883. (No model.)



Claim.—1. The combination, in a furnace, of the coking-oven F, the retorts C C, and the rocking breaker and stoker centrally pivoted, the said coking-oven opening into the said retorts, and all arranged substantially as shown and described with relation to each other, for the purposes set forth.

2. The combination, in a furnace, of the coking-oven F, the retorts C C, and a stoker and breaker centrally pivoted in the said coking-chamber, and consisting of the rocking shaft *g*, having thereon the fingers I I, and provided with an actuating lever or handle, substantially as and for the purposes set forth.

3. The combination, in a furnace, of the coking-oven F, the retorts C C, and an air-chamber, K, the latter extending from the ash-pit up the front of the furnace, thence over the front wall, and thence around the sides and ends of the coking-oven, and entering the said retorts, substantially as and for the purposes specified.

294,999. STEAM ROCK-DRILL. FREDERIC A. HALSEY, New York, N. Y., assignor to the Rand Drill Company, same place. Filed Jan. 16, 1884. (No model.)

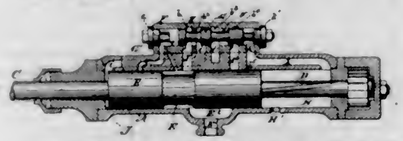
Claim.—1. In a steam rock-drill or analogous machine, the cylinder, the elongated circumferentially-grooved piston, and the described means for distributing the steam to both ends of the cylinder, together with steam-induction passages leading from the said circumferential chamber of the piston, and located, one or all, relatively to the piston, as described, so that the piston, in its either stroke, closes the respective inlet-ports before it reaches the limit of its stroke, whereby the steam is used expansively during a portion of the stroke of the piston, as specified.

2. In a steam rock-drill or analogous machine, the cylinder and elongated circumferentially-grooved piston, and the induction and eduction steam passages for distributing steam to the cylinder, substantially as described, and the single circumferentially-grooved steam-moved valve working in the described chambered valve-chest, and co-operating with the piston to distribute the steam to both ends of the cylinder, all constructed and arranged to operate as and for the purpose specified.

3. In a steam rock-drill or analogous machine, the cylinder, the elongated circumferentially-grooved piston, the described circumferentially-grooved steam-moved valve in the described valve-chest, and the steam passages or ports located relatively to each other and to the piston and valve, as described, whereby, while said valve operates to control the distribution of steam to the ends of the cylinder, the piston operates directly as a cut-off to the inlet-ports, as specified.

4. The combination, in a steam rock-drill or analogous machine, of the cylinder A, the elongated circumferentially-grooved piston B, valve-chest F, single valve G, the steam-inlet port I, and the exhaust-passage i', and the passage i, which serves both as an induction and eduction port for the lower end of the cylinder, substantially as and for the purpose specified.

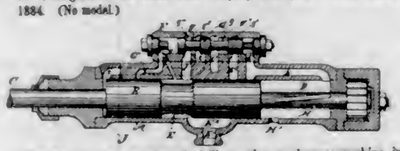
5. In a steam rock-drill or other analogous machine, the combination of the cylinder A, elongated circumferentially-grooved piston B, single valve G, valve-chest F, and the steam-inlet port *e*, controlled directly by the said piston, and communicating between the steam-chest E, formed by the circumferential groove in the piston and the lower end of the valve-chest, whereby steam is introduced into the lower end of said valve-chest from the said steam-chest in the cylinder, as and for the purpose described.



6. In a steam rock-drill or other analogous machine, the combination of the cylinder A, elongated circumferentially-grooved piston B, valve G, and the valve-chest F, with the steam-passage h opening at one end into the upper end of the cylinder, and at the other end into a branch passage, h', controlled by the piston, and opening at one end into the upper end of the valve-chest, and at the other end into the cylinder, whereby steam is introduced from the steam-chest in the piston, both into the upper end of the cylinder and the upper end of the valve-chest, substantially as and for the purpose described.

7. The cylinder provided with the longitudinal groove E', and the supply-pipe F', communicating therewith, and the elongated piston provided with the circumferential groove, forming a steam-chest in the cylinder communicating with said groove E', as and for the purpose described.

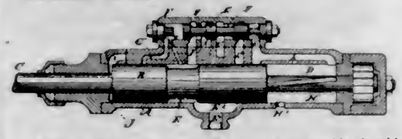
8. In a steam rock-drill or analogous machine, the cylinder, the elongated circumferentially-grooved piston, and the described means for distributing the steam to the cylinder, the combination, with the piston, of an inlet-passage to conduct steam from the circumferential chamber in the piston, to be distributed to the upper end of the cylinder, said passage being governed by the piston, and located relatively thereto, as described, so that the piston, in its upward stroke, closes said passage before reaching its termination, whereby the steam is used expansively during a portion of the upward stroke, as specified.



9. In combination with a steam-moved valve, means for introducing live steam into one end of the valve-chest, while the other end of the valve-chest is in communication with the end of the main cylinder containing expanded steam, whereby the valve is moved by the excess of the pressure of live steam acting upon one end of it over the pressure of expanded steam acting upon the other end of it.

295,000. STEAM ROCK-DRILL. FREDERIC A. HALSEY, New York, N. Y., assignor to the Rand Drill Company, same place. Filed Jan. 16, 1884. (No model.)

Claim.—In a steam rock-drill or other analogous machine, the cylinder and piston, the passages for distributing steam to the cylinder, and the valve governing said passages, together with the exhaust-port leading from the upper end of the cylinder and governed by the piston, and located relatively thereto, as described, so that the residual steam remaining in the upper end of the cylinder after the exhaust is confined therein and retained while the piston makes its upward stroke, and until on its return-stroke the exhaust is again opened, whereby the steam in its compression assists in arresting and terminating the upward stroke, and by its re-expansion assists in propelling the piston in its downward stroke, as described.



295,001. STEAM ROCK-DRILL. FREDERIC A. HALSEY, New York, N. Y., assignor to the Rand Drill Company, same place. Filed Jan. 16, 1884. (No model.)

Claim.—1. In a steam rock-drill or other analogous machine in which the length of the working-stroke is subject to variation, the combination, with the main piston and a valve governing the inlet-port to the lower end of the cylinder, of a passage for the transmission of steam whereby said valve is actuated, said passage being constricted, as and for the purpose described, and an inlet-passage to the upper end of the cylinder arranged so that it is closed before the piston reaches the limit of its downward stroke, as described.

2. In a steam rock-drill or other analogous machine in which the length of the working-stroke of the piston is subject to variation, the combination, with the main piston, the inlet-passages to the cylinder leading from the valve-chest, and the valve governing said passages, of the port *a*, leading to the valve-chest, governed by the piston and located relatively thereto, as described, so that it is opened when the piston in its downward stroke reaches the point of limit of the shortest practical working-stroke which in practice it is intended to be permitted to make, and the inlet-port h^2, for conducting steam to the upper end of the cylinder, which actuates the piston in its downward stroke, also governed by the piston and located relatively thereto, as described, so that it is closed before the piston reaches the end of its downward stroke, whereby the steam is used expansively during a portion of said stroke, all constructed and arranged to operate as and for the purpose specified.

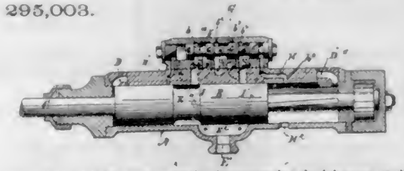
295,002. VALVE-GEAR FOR ROCK-DRILLS. FREDERIC A. HALSEY, New York, N. Y., assignor to the Rand Drill Company, same place. Filed Oct. 26, 1883. (No model.)

Claim.—1. In a steam rock-drill or analogous machine in which the length of its working-strokes is liable to variation, the combination, with a steam-moved valve governing the inlet-port to the lower end of the cylinder, of a passage communicating with the valve-chest for the transmission of steam, by the agency of which the valve is shifted to introduce steam to the lower end of the cylinder, said passage being suitably constricted, as described, to so limit the transmission of steam that between the commencement of the movement through it of the steam whereby the valve is shifted and the actual shifting of the valve there shall necessarily occur a determinate delay, in which the piston may move beyond the point of the shortest working-stroke which, in practice, it is intended to be permitted to make, and make its longer strokes, as described, by the time steam is introduced into the lower end of the cylinder, as and for the purpose specified.

2. The method of decreasing the steam-cushioning in the working-stroke of the piston of a rock-drill or other analogous machine liable to make strokes of variable length, which consists in the application, at the time the piston reaches its shortest practical stroke, of a gradually-increased steam-pressure to the steam-moved valve governing the inlet-port to the lower end of the cylinder, whereby between the beginning of said pressure and the shifting by it of the said valve there will necessarily occur a determinate delay, as and for the purpose specified.

3. In a steam rock-drill or other analogous machine wherein the piston is liable to make strokes of variable length, the combination, with the piston and a steam-moved valve governing the inlet-port to the lower end of the cylinder, of an exhaust-passage from the upper end of the valve-chest and an inlet-passage to the lower end of the valve-chest, said inlet-passage being constricted, as described, for the purpose of compelling the gradual admission of steam to the valve-chest, whereby there shall necessarily occur a determinate delay between the commencement of the transmission of steam through said inlet-passage to shift the valve to admit steam to the lower end of the cylinder and the actual shifting of the valve, as and for the purpose described.

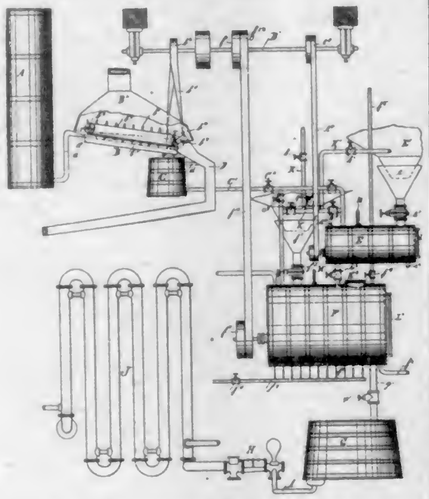
4. In a steam rock-drill or other analogous machine wherein the piston is liable to make strokes of variable length, the combination, with the piston and a steam-moved valve governing the inlet-port to the lower end of the cylinder, of an inlet-passage to the lower end of the valve-chest and an exhaust-passage from the upper end of the valve-chest, the said exhaust-passage being constricted, as described, for the purpose of compelling the gradual exhausting of the steam from said upper end of the vale-chest, whereby there will necessarily occur a determinate delay between the opening of said exhaust-passage and the shifting of the valve, as and for the purpose described.



5. In a steam rock-drill or other analogous machine wherein the piston is liable to make strokes of variable length, the combination, with the piston and a steam-moved valve governing the inlet-port to the lower end of the cylinder, of the inlet-passage to the lower end of the valve-chest and the exhaust-passage from the upper end of the valve-chest, both being suitably constricted to conjointly retard the action of the steam to shift the valve, whereby there shall necessarily occur a determinate delay between the commencement of the movement through said passage of the steam to shift the valve to admit steam to the lower end of the cylinder and the actual shifting of said valve, as and for the purpose described.

6. In a steam rock-drill or other analogous machine, the steam-moved valve governing the distribution of steam to the cylinder, and the inlet and exhaust passages to and from said valve, one of said passages—either the inlet or exhaust—at one end of the valve-chest, being constricted, as described, relatively to the corresponding passage at the other end of said chest, whereby the valve has a slow motion in one direction and a quick motion in the opposite direction, as and for the purpose described.

295,003. VALVE-GEAR FOR ROCK-DRILLS. FREDERIC A. HALSEY, New York, N. Y., assignor to the Rand Drill Company, same place. Filed Jan. 17, 1884. (No model.)



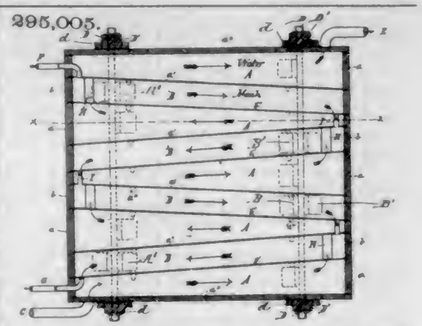
Claim.—In a steam rock-drill comprising the main cylinder and piston, the steam-moved valve, the described passages for distributing steam to the cylinder and valve-chest and exhausting steam therefrom, the combination, with the piston governing the exhaust-ports from the

295,003.

valve-chest, and the steam-moved valve governing the inlet-port to the lower end of the cylinder, of the inlet-passages to the valve-chest, that establish open communication between the ends of the valve-chest and the live-steam supply, the said inlet passage leading to the lower end of the valve-chest being of comparatively small cross-area or conducting capacity, whereby there necessarily occurs a determinate delay between the opening of the exhaust at the upper end of the valve-chest and the shifting of the valve to open the inlet-port to the lower end of the cylinder in which the piston may move from the point of the shortest working-stroke, which in practice it is intended to be permitted to make, to the termination of its longer strokes, by the time the steam is admitted to the lower end of the cylinder.

295,004. APPARATUS FOR MASHING GRAIN. TIMOTHY HAYES, Anderson's Ferry, Ohio. Filed Nov. 6, 1883. (No model.)

Claim.—1. The combination of the separator B, the tub C, to receive the slop therefrom, the tanks E and F, each composed of an inner and outer shell and provided with an agitator, the pipe C', leading from tub C and communicating by branch pipes with the tanks E and F, said pipes being provided with suitable valves, means for introducing small grain into tank E, means for introducing large grain and steam into tank F, the line-shaft B', and belts connecting said line-shaft with pulleys on the shafts of agitators in tanks E and F, and the pulley on a traveling belt of the separators, substantially as described.



2. The combination, with pipe *a*, tub C, spout D, and pipe *d*, connecting tub C with spout D, of the separator composed of the screen *b*, the belt b^2, provided with brushes b', and trough b^3, substantially as described.

3. The combination, with pipe *a*, tub C, and spout D, of the separator composed of the screen *b*, the belt b^2, provided with brushes b', trough b^3, and brushes b^2 b^3, substantially as described.

4. The combination of tanks E and F, communicating through pipe E^3, provided with a valve, pipe c', leading from pipe C' to tank E, pipe c^3, leading from pipe C' to tank F, pipe K, connecting pipes c' c^3, and pipe K', leading to pipe K, the several pipes being provided with valves, substantially as described.

5. The combination of mixing-tank E and mashing-tank F with slop-tank C and receiving-tank G, pump H, and cooler J, substantially as and for the purpose described.

295,005. APPARATUS FOR COOLING MASH, &c. TIMOTHY HAYES, Anderson's Ferry, Ohio. Filed Nov. 17, 1883. (No model.)

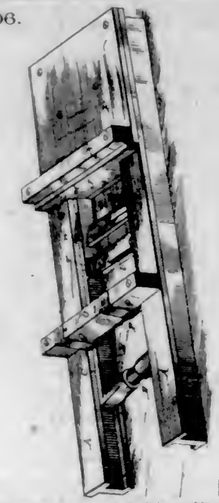
Claim.—1. In an apparatus for cooling mash in transit from the mash-tub to the fermenting-tank, the combination of a series of inclined closed chambers, A, for the passage of the cooling agent, a series of inclined closed chambers, B, for the passage of the mash, said closed chambers alternating one above the other and reversely inclined, the pipes H, alternately connecting the ends of the closed chambers for the cooling agent, the pipes I, alternately connecting the ends of the closed chambers for the mash, the inlet-pipe F, for entrance of the mash to the upper mash-chamber, the outlet-pipe G, for the discharge of the mash from the lower mash-chamber, and the inlet and outlet pipes C and E, connected, respectively, with the upper and lower closed chambers for the cooling agent, substantially as described.

2. The combination of the series of inclined closed chambers A, for the passage of the cooling agent, the inclined closed chambers B, for the passage of the mash, alternately interposed between the other closed chambers, the bottom wall of one chamber constituting the top wall of the adjacent chamber, the pipes H, alternately connecting the ends of the closed chambers for the cooling agent, the pipes I, alternately connecting the closed chambers for the mash, and the pipes F and E, C and G, connected, respectively, with the uppermost and lowermost closed chamber, substantially as described.

3. The combination of the reversely-inclined chambers A and B, alternately disposed one above the other, and connected alternately at their ends, respectively, by the pipes H and I, for the passage in opposite directions of the cooling agent and the mash, the cheek-pieces A' and B' on the side walls of the chambers, the vertical tie-bolts D and nuts D', clamping all the chambers together and engaging the cheek-pieces, and the respective inlet and outlet pipes C, F, G, and E, substantially as shown and described.

4. The combination of the reversely-inclined chambers A and B, alternately disposed one above the other, the bottom of one chamber constituting the top of the adjacent chamber, and said chambers alternately connected at their ends, respectively, by the pipes H and I, for the passage in opposite directions of the cooling agent and the mash, the cheek-pieces A' and B' on the side walls of the chambers, the cheek-pieces *d* on the top and bottom chambers, the connecting-bolts and nuts clamping the chambers together and engaging the respective cheek-pieces, and the inlet and outlet pipes C and F, E and G, substantially as described.

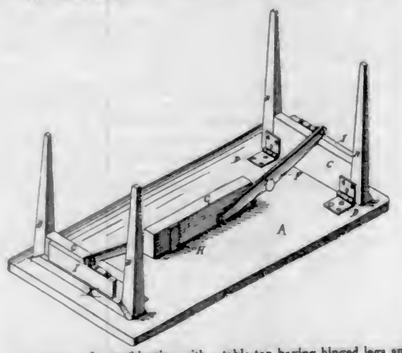
5. The combination of the inclined chambers A and B, alternately arranged one above the other, and connected as described, and having dowel-pins d' on the lower edge of each chamber, engaging the upper edge of the adjacent chamber, with the vertical tie-bolts D and nuts D', for clamping the chambers one upon the other, substantially as described.



295,006. SHINGLE-MACHINE. ELLIS R. HEWETT and GALEN F. JAMES, Tenino, Wash. Filed Nov. 10, 1883. (No model.)

Claim.—1. The combination, in a shingle-machine, of two parallel ways, a reciprocating frame having a frow and two shaving-knives, one of which has means for gradually bringing it closer to the other, and provided with wedge-shaped blocks at the upper sides of its side pieces, above and slightly in front of the frow, and two cross-pieces forming a frame for holding the block to be cut up, one of which cross-pieces has a spring-actuated cross-plate resting with its end upon the upper surfaces of the side pieces of the frame and of the parallel ways, adapted to be raised by the wedge-shaped blocks, allowing the frow to pass under its lower edge, as and for the purpose shown and set forth.

2. The combination, in a shingle-machine, of two parallel ways having cross-pieces upon their upper sides, forming a frame for holding the block, a plate having a toothed edge fastened upon the ends of flat springs under one of the cross-pieces, and a sliding cutter-frame having blocks upon its upper side engaging the plate and pushing it back at the back-stroke of the frame, as and for the purpose shown and set forth.

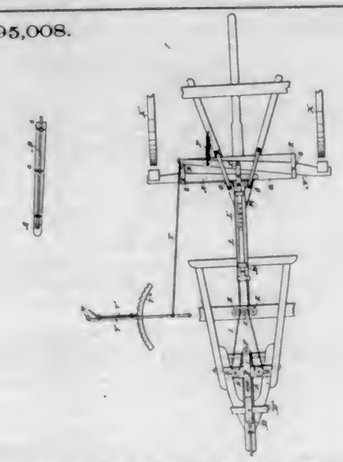


3. The combination of two parallel ways having inwardly and

295,006.

downwardly inclined grooves in their inner sides, a plate fastened across the inner ends of the ways, a plate having a transverse recess in its outer end, a longitudinal recess in its upper side, and fastened to the under side of the aforesaid plate, a transverse plate having its ends cut out to form steps and lugs, as described, fastened upon the free end of a spring secured with its inner end in the inner end of the recess in the aforementioned plate, and bearing with its lower edge against the bottom of the transverse recess in the same plate, a cross-piece having a spring-actuated toothed plate under its under side, and fastened upon the upper sides of the ways, a reciprocating frame sliding in the ways, having a plate at one end, transverse slots in its side pieces near their middle, and wedge-shaped blocks upon the upper sides of said side pieces, a transverse frow fastened at the outer end of the bottom plate of the frame a distance above the same, a stationary lower shaving-knife fastened below and to the rear of the frow, and an upper shaving-knife sliding with its ends in the transverse slots in the frame and in the grooves in the ways, all constructed to operate as and for the purpose shown and set forth.

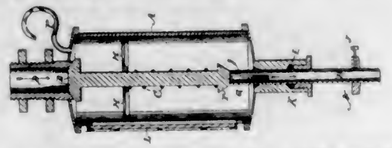
295,007. TABLE. EDGAR R. HINMAN, Ilion, N. Y. Filed July 12, 1883. (No model.)



Claim.—In combination with a table-top having hinged legs and provided with jointed braces, the rectangular block G, provided with elastic plates and secured longitudinally to the under side of the table-top, and having pivotally attached on opposite sides thereof the jointed braces, substantially as described, and for the purpose set forth.

295,008. WAGON-BRAKE. JAMES HOGGINS, Denton, Nebr. Filed Dec. 15, 1883. (No model.)

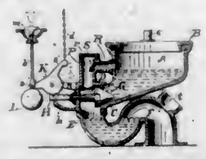
Claim.—1. The combination, with the brake-levers, of a pull-rod, L, the chain I, wheels K K K, wheels G G, and the backlash-rod B B', carrying wheel F, adapted to bear against the chain, as and for the purpose described.



2. The combination of the sliding cuff A, rod B B', bearing wheel

295,008.

F, the wheels G G, chain I, wheels K K K, extension-rod L L', brake-levers N N, and spring P, substantially as and for the purpose described.



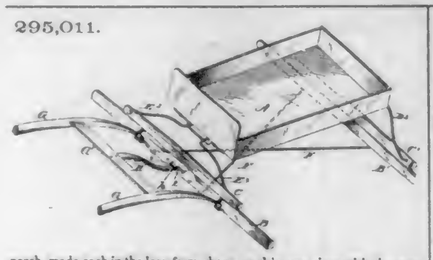
295,009. BOTTLE-FILLING DEVICE. PHILIP J. HOGAN, Negaunee, Mich. Filed May 25, 1883. (No model.)

Claim.—1. A chamber having a pipe in its upper end to connect it with a tank or other receptacle for fluids, a valve-seat in said pipe, and an aperture and valve-seat in the lower end of the chamber, in combination with two puppet-valves constructed to fit said seats alternately, a stem connecting them, and a hollow stem projecting from the lower valve through its seat below and beyond the exterior of the chamber, said hollow stem being perforated through its sides near the lower valve, substantially as and for the purpose specified.

2. The combination, with the chamber and the valves constructed to slide vertically therein, as described, and having a tubular stem extending therefrom, of a collar vertically adjustable on said stem, substantially as described, whereby the upward thrust of a bottle may close the inlet to said chamber, as set forth.

295,010. WATER-CLOSET. STANTON M. HOWARD, Wheeling, W. Va. Filed Mar. 13, 1883. (No model.)

Claim.—1. The combination, with the basin A, of the discharge-pipe having an upward extension or chamber, P, and the horizontal overflow-pipe R, connecting said chamber P and the basin, and having the valve S, substantially as described.



2. The combination of the basin A, the discharge-pipe and trap, the horizontally-sliding valve and vertical pull-rod, and connections between the valve and pull-rod, which permit the valve to slide horizontally, and a connection between the pull-rod and flushing-cistern.

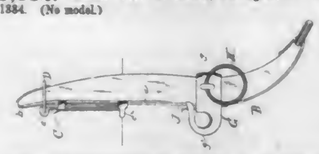
3. The combination, in a water-closet, of the bowl A, valve-chamber D, and trap F, with conical plug-valve G, valve-stem H, lever-pinion K, weight L, pull *b*, chain *d*, and tank N, substantially as and for the purpose herein described.

295,011. ROAD-WAGON. MOSES G. HUBBARD, Norristown, Pa. Filed Nov. 23, 1883. (No model.)

Claim.—1. In a road-wagon, the combined torsion-springs and

295,011.

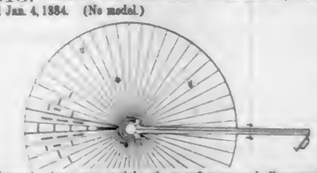
perch, made each in the loop form shown, and in one piece with the arms connecting the same with the axle, the transverse connecting portion of one loop being provided with a guiding-loop for the torsion-rods of the other loop, substantially as described.



2. In a road-wagon, the torsion-rods E E', made in one piece, with the arms thereof connected to one and the same bolster or axle, in combination with the torsion-rods D and D', connecting with one and the same bolster or axle, and independently secured at their opposite ends upon either side of the rods E E', substantially as described.

3. The torsion-rods E E', made substantially in loop form, with the arms thereof connected to one and the same axle or bolster, and the torsion rods D and D', having the arms thereof connecting with one and the same bolster or axle, said rods being independently secured at their opposite ends upon either side of the rods E E', and all of said torsion-rods serving the function of a perch, in combination with an auxiliary perch, substantially as and for the purpose described.

4. The combination, with the axles and the thills or draft attachment pivoted thereto, of a spring rigidly connected to the cross-bar and pivoted to the axle in line with the other pivotal connections therewith, and operating substantially as and for the purposes described.



5. In a road-wagon, the combination of the torsion-springs, the elastic bolsters, and the cross-perches constructed and arranged substantially as described.

295,012. HAME. JOHN W. HUDSON, Wellington, Ill. Filed Jan. 19, 1884. (No model.)

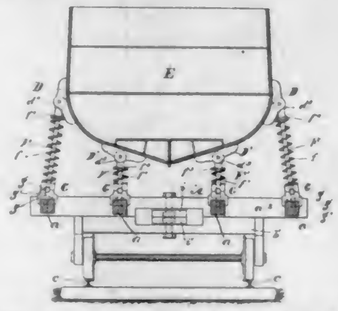
Claim.—In combination with the parts A *a*, as shown, and the iron B, having a series of apertures, *f*, the slide C, having attachments D D' and arms *c*, and the flat spring E, secured to said slide, and having bolt *e*, as and for the purpose set forth.

295,013. SHIELD FOR FIRE-ARMS. JAMES HUNTER, Camden, N. J. Filed Jan. 4, 1884. (No model.)

Claim.—1. As a new article of manufacture, a bullet-proof shield constructed so as to be folded into compact form, as described, and having, when expanded, a central opening for the reception of the barrel of a fire-arm, as set forth.

2. The combination of a fire-arm with a bullet-proof shield attached to and carried by the barrel of said fire-arm, and capable of being folded, as set forth.

3. The combination of a fire-arm with a folding shield of bullet-proof material attached to and carried by the barrel of the fire-arm, but constructed so as to be readily detached therefrom, as set forth.



4. The within-described folding shield for fire-arms, the same comprising a series of connected segments, *a*, of bullet-proof material, side bars, *b*, and a slotted plate, *d*, adapted to the barrel of the fire-arm, as set forth.

5. The combination, in a fire-arm shield, of the segments *a*, overlapping each other and having pins *f* and slots *g* for their guidance and retention, as set forth.

6. The combination of the fire-arm with the folding shield having opposite projecting bars *b b*, serving as a rest, as set forth.

295,014. MARINE-RAILWAY CARRIAGE. WILLIAM H. H. HUNTER, Cincinnati, and JERVIS HARGITT, Hamilton, Ohio. Filed Apr. 19, 1883. (No model.)

Brief.—This carriage for transporting canal-boats over land embraces a train of railway-trucks, a platform supported by the train, and self-adjusting spring-standards arranged upon the platform in two or more continuous rows, the standards of each row being bound together by elastic connections, the standards being adapted and arranged, as described, to fit and support the boat.

Claim.—1. In a carriage for transferring vessels, the combination of a system of railway-trucks, B B', a horizontal frame or platform, A, spindles F F', springs *f f'*, and ribs D D', pivoted to the upper ends of the spindles and adapted to automatically adjust themselves in the arc of a circle to conform to the configuration of the hull of the vessel, substantially as described.

2. The combination of a system of railway-trucks, B B', a horizontal platform, A, a series of yielding ribs, D D', capable of automatically adjusting themselves to conform to the hull of a vessel, and elastic connections between the ribs to permit them to move laterally, substantially as described.

3. The combination of the trucks B B', the horizontal platform A, the abutments G, journaled thereon, the spindles F F', supported at the lower ends on the journaled abutments, the springs *f f'*, and the ribs D D', pivoted to the upper ends of the spindles and adapted to conform to the configuration of the hull of a vessel, substantially as described.

4. The combination, with ribs D D or D' D', of the spring-barrel H, spring *h'*, rod A, and rod and piston A^2, substantially as and for the purpose described.

5. The combination, with the ribs D or D' and the frame A, of the spindles F or F', springs *f* or *f'*, and adjustable abutments G, substantially as and for the purpose described.

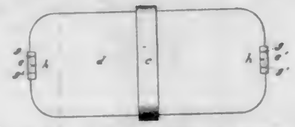
6. The combination, with the railway-truck B', of the flexible shear or clevis I and horizontal frame or platform A, arranged and operating substantially as and for the purpose described.

295,015. METHOD OF MANUFACTURING MATERIAL FOR MAKING TRUNKS, PORTMANTEAUS, &c. OTTO JACOBI, Dresden, Saxony, Germany. Filed Sept. 24, 1883. (No specimens.)

Claim.—The process of manufacturing a durable material for the manufacture of trunks, portmanteaus, and other objects from specially-prepared sail-cloth, in combination with one or more layers of parchment, substantially as and for the purpose set forth in the foregoing specification.

295,016. MANUFACTURE OF CUTLERY-HANDLES. SILAS E. JERALDS and EDWIN R. LAWTON, West Cheshire, Conn. Filed Mar. 26, 1883. (No model.)

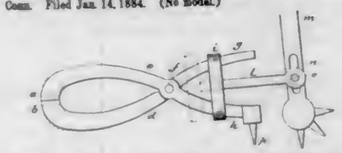
Claim.—1. A tubular blank for a hollow handle, having at one end a projecting lip or lips adapted to be bent edge to edge and united to form the butt or outer end of the handle.



2. The method of making a handle for cutlery or other articles, consisting in introducing a tapering tool into a tube and giving to the latter, either by contraction or expansion, a tapering shape, withdrawing the tool, bending the lips edge to edge and soldering the edges together for the purpose of completing the handle, substantially as set forth.

3. As an improvement in the manufacture of handles for cutlery and other articles, the method of cutting out the large end of a metallic shell sufficiently to leave a lip or lips integral with the sides and adapted to close the said end, then bending the said lip or lips edge to edge and soldering or brazing the edges together.

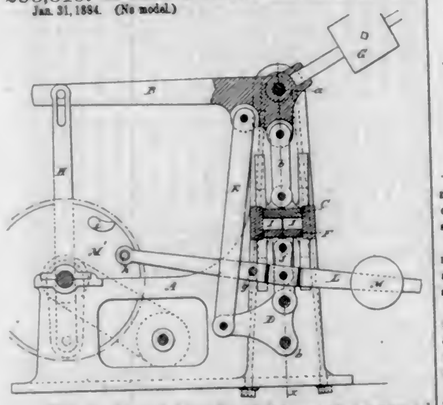
4. As an improvement in the manufacture of handles for cutlery and other articles, the method of constructing a metallic shell having at its outer end one or more lips or projections integral therewith, and adapted to be bent inward and close and form the outer end of the handle, then bending said lip or lips edge to edge and brazing or soldering the edges together.



295,017. FRUIT-BASKET FASTENER. CHARLES HENRY JOHNSON, Busti, N. Y. Filed Aug. 9, 1883. (No model.)

Brief.—The fasteners are permanently affixed to the basket. One end of the cover is inserted under one fastener, one cover is ben top in the center, and its other end is inserted under the other fastener, when it is permitted to spring to place. It may or may not be secured by nails through the upper end of the fasteners.

Claim.—A fruit-basket having the fasteners *c c'* provided with the inwardly-extending flanges *f*, permanently secured to the hoop of the basket, one at each end, in combination with the flexible cover *d*, adapted to be held in place on the basket, substantially as specified.

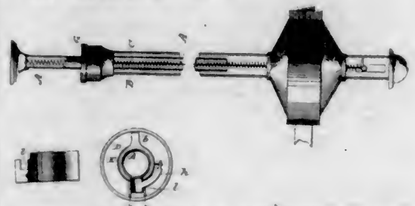


295,018. CARPET-STRETCHER. JAMES C. KELLEY, Middletown, Conn. Filed Jan. 14, 1884. (No model.)

Claim.—1. The combination of the jaws *a b*, attached, respectively, to levers *d e*, crossing each other and hinged together, the levers beyond the hinge having arms *g h*, a loop, *i*, around the arms, a lever, *m*, hung to said loop, said lever fitted with a spur to engage the floor as a fulcrum, and the arm *h*, constructed with one or more spikes, *p*, substantially as and for the purpose described.

2. The combination of the jaws *a b*, attached, respectively, to levers *d e*, crossing each other and hinged together, the levers beyond the hinge having arms *g h*, a loop, *i*, around said arms, with a lever, *m*, constructed with a slot, *n*, through which slot connection is made with said loop, substantially as described.

295,019. BRICK-MACHINE. LEWIS B. KENNEDY, Keokuk, Iowa. Filed Jan. 31, 1884. (No model.)



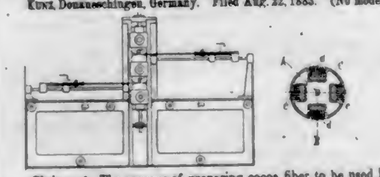
Claim.—1. The levers B and D, with their respective plungers and connecting-rods, arranged and operating in the manner described, in combination with the clay-feeding device located at the side of the machine, as set forth.

2. A brick machine the upper and lower plungers of which are moved in opposite directions to compress the clay by a single operating-lever, as described, in combination with devices, substantially such as described, for charging the clay into the mold and pushing the brick from the ejecting-plungers, said devices being located and operated from the side of the machine, as set forth.

3. The lever D, as described, provided with the arms *c*, in combination with the lower plunger, F, as and for the purpose set forth.

4. The lever L, provided with the adjustable weight M, pivoted in the frame A, and adapted to be operated by the cam *i*, in combination with the lower plunger, as set forth.

295,020. EXTENSION-CHANDELIER. JOHN C. KNIGHT, Meriden, Conn., assignor of one-half to the Meriden Malleable Iron Company, same place. Filed Nov. 26, 1883. (No model.)

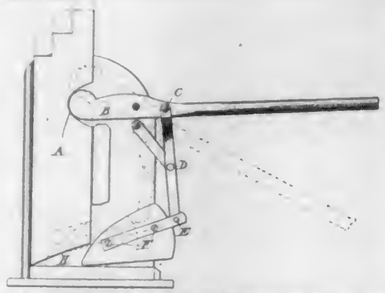


Claim.—1. The combination of the stationary inner tube or rod, A, the outer tube carrying the lamps, and constructed with a recess or shoulder, D, the divided ring-shaped spring E, surrounding the inner tube, and constructed to take a bearing upon the bottom of the shoulder or recess D, and so as to closely embrace the inner tube, the cam *f* between the divided ends of the spring, the said cam provided with an arm, *h*, extending therefrom, and a connection from the arm downward, whereby said cam may be turned to relieve its grasp upon the inner tube, substantially as described.

2. The combination of the inner tube or rod, A, the outer tube, B, carrying the lamps, the divided ring-shaped spring E, arranged in a recess in the outer tube, and so as to embrace the inner rod or tube and take a bearing upon the bottom or top of said recess, as the case may be, a cam, *f*, between the ends of said divided ring-shaped spring, said cam provided with an arm, *h*, and connection therefrom downward, whereby said cam may be turned to release the grasp of said spring upon the inner rod, substantially as described.

3. The combination of the inner stationary tube or rod, A, the outer movable rod, B, constructed with an internal recess, D, the divided ring-shaped spring E, arranged in said recess, and constructed to grasp the inner rod, one of the ends of the divided spring constructed with a notch, *l*, the cam *f*, with its arm *h*, arranged in said notch *l* as a fulcrum, the cam standing between the divided ends of the ring-shaped spring, and a connection from the arm downward, whereby said cam may be turned, substantially as described.

295,021. PROCESS OF AND APPARATUS FOR PREPARING FIBER FOR THE MANUFACTURE OF BRUSHES AND BROOMS. FRIDA KUNZ, Donaueschingen, Germany. Filed Aug. 22, 1883. (No model.)



Claim.—1. The process of preparing cocoa fiber to be used in the manufacture of brushes, consisting in subjecting their ends to the action of heated rolls provided with circumferential ribs, and brushes of bristles and wires, and then greasing the same, substantially as described.

2. The combination of the frame *a a*, having journaled therein the rolls *b b*, said rolls being provided with circumferential ribs *c*, brushes *e*, and wire brushes *d*, and means for heating the same, substantially as described, and for the purpose specified.

3. The combination, with the frame *a a*, having journaled therein the steam-heated rolls *b b*, said rolls being provided with circumferential ribs *c*, brushes *e*, and wire brushes *d*, of the vertically adjustable clamps *f f'*, all constructed and arranged substantially as shown and described, and for the purpose specified.

295,022. WAGON-JACK. GILBERT LA ROCK, Adams, N. Y., assignor to Wyatt A. Hammond, same place. Filed Aug. 10, 1883. (No model.)

295,022.

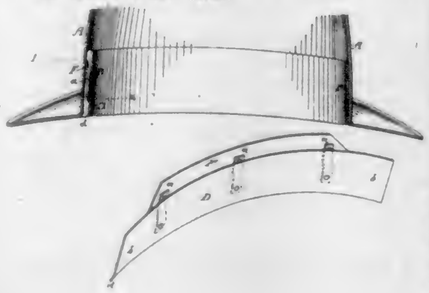
Claim.—The lever B, provided with the toggle-joint D E and wedge F, in combination with the lifting-bar grooved at A, to act as a fulcrum, and provided with steps to receive the weight to be lifted.

295,023. DOMINO. JESSE L. LAW, Mount Vernon, N. Y. Filed Aug. 9, 1883. (No model.)

Brief.—Uses the dies described in Letters Patent of Shepherd, March 27, 1883, No. 274,868, and disclaims the invention in Letters Patent No. 162,072, April 13, 1875, and No. 273,559, March 6, 1883. The material called "chrolithion" is that described in Letters Patent No. 143,772, October 21, 1873.

Claim.—1. A domino consisting of a base, A, of wood or other suitable material, provided with a face or covering, B, of celluloid or similar material—such as xylonite, coralline, or chrolithion, or of vulcanized rubber, said face or covering having pressed into or upon it spots or marks D, substantially as set forth.

2. A domino consisting of a base, A, of wood or similar material, provided with a face or covering, B, and with a back, C, of celluloid, xylonite, coralline, chrolithion, or similar material, or of vulcanized rubber, said face or covering having pressed into or upon it spots or marks D, substantially as set forth.

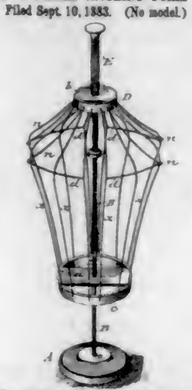


3. A domino consisting of a base, A, of wood or similar material, provided with a face or covering, B, of celluloid, xylonite, coralline, chrolithion, or similar material, or of vulcanized rubber, said face or covering having pressed into or upon it spots or marks D, and being provided with a pivotal pin, H, substantially as set forth.

4. A domino consisting of a base, A, of wood or similar material, provided with a face or covering, B, of celluloid, xylonite, coralline, chrolithion, or other similar material, or of vulcanized rubber, said face or covering having pressed into or upon it spots or marks D, and being provided with a pivotal pin, H, and with a raised border or edge, E, substantially as set forth.

5. A domino provided on its face with a raised rim, E, and a pivotal pin, H, said point rising above the level of the upper edge of said rim, as shown and described.

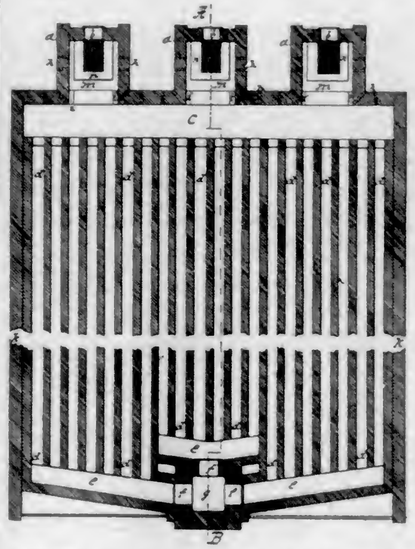
6. A domino provided on its face with the denomination or pictures of playing-cards between and around its spots, as shown and described.



295,024. VENTILATED HAT. EDWIN M. LESCHER, Philadelphia, Pa. Filed Nov. 26, 1883. (Model.)

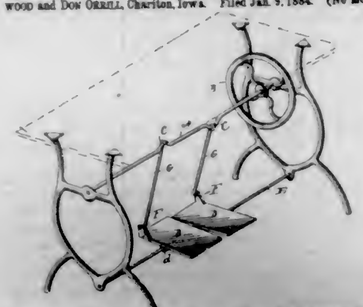
Claim.—1. The combination of the hat-body and sweat-band with the strip F, secured to the body, the strip D, secured to the sweat-band, and having free ends *b*, and the interposed springs, *a*, as set forth.

2. The combination of the sweat-band with the strip D, supported by springs *a*, and having a crimped lower edge, *d*, as set forth.



295,025. ADJUSTABLE CLOTHING-FORM. WALTER LEIGH, New Haven, Conn. Filed Sept. 10, 1883. (No model.)

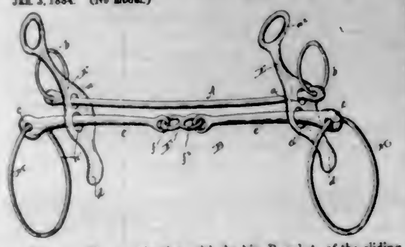
Claim.—1. The clothing-form herein described, consisting, essentially, of the base A, upright notched bar B, hoops C and D, slide E, catch-lever F, arms *n*, sections *d*, and ribs *x*, all the said parts constructed and combined, as shown and set forth.



2. In a clothing-form, the slide E and catch-lever F, engaging the notches on the upright bar B, in combination with the sections *d*, and arms *n*, pivoted to the sections and to the slide to spread the ribs of the form, as set forth.

295,026. BRICK-DRYING KILN. BENJAMIN G. LOCKETT, JAMES W. ENGLISH, and JOHN W. MURPHEY, Atlanta, Ga. Filed Sept. 21, 1883. (No model.)

Claim.—The combination, in a brick-drying kiln, of the fire-boxes *a a*, front hot-air space or spaces, *c c*, cold-air chambers *m*, having draft-openings *h i*, rear hot-air passages, *e e e*, disconnected from each other, the longitudinal flues *d d*, and the chimney *g*, having valved openings *f f f*, communicating with the rear hot-air passages and flues, whereby hot air is accumulated at the back end of any or all of said flues, substantially as shown and described.

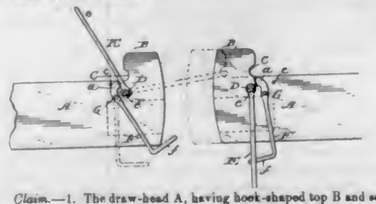


295,027. SEWING-MACHINE TREADLE. GEORGE ALONZO LOCKWOOD and DON ORRILL, Charlton, Iowa. Filed Jan. 9, 1884. (No model.)

Claim.—1. In a foot-power, the operating-shaft, formed in one piece, with cranks or wrists at each end turned at an angle to each other, in combination with the rod E, a pair of treadles pivoted at their centers upon the rod, and pitmen connecting each of the treadles to one of the cranks or wrists, for the purpose set forth.

2. In a foot-power, the operating-shaft, formed with cranks or wrists at each end turned at an angle to each other, in combination with the rod E, a pair of treadles, D, pivoted at their centers upon the rod, and formed with arms F, extending upwardly therefrom, and pitmen connecting each of the arms F to one of the wrists or cranks, as set forth.

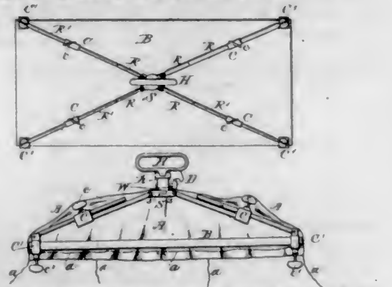
295,028. BRIDLE-BIT. LEONARD S. LOWCOCK, Belvidere, Ill. Filed Jan. 3, 1884. (No model.)



Claim.—1. The combination, with the bits B and A, of the sliding bars E, having apertures *a a'*, connecting said bits together, and provided with apertures a^2 in their upper ends above the rings *b* of the upper bit, A, as and for the purpose specified.

2. In a bridle-bit, the sliding bar having the central and upper apertures, and provided with an extension below the central aperture, as shown and described, and for the purpose set forth.

3. The combination, with the driving-bit having the double-eyed central link, the jaw-links hinged thereto at their inner ends, and the check-bit A, having rings *b*, of the sliding bars E, having central apertures for the two bits, whereby they move to and from the central portion of the bits, said bars provided at their upper portions with apertures for the passage of the straps, and having at their lower portions outwardly-curved extensions *d d*, as shown and described, and for the purposes set forth.



295,029. CAR-COUPLING. JOSHUA LOW, Steubenville, Ohio. Filed Feb. 8, 1884. (No model.)

Claim.—1. The draw-head A, having hook-shaped top B and semicircular recess C, and provided with the U-shaped link E, curved at *e*, and the frame F, having forwardly-projecting portion *f* and dogs *a*, as and for the purposes set forth.

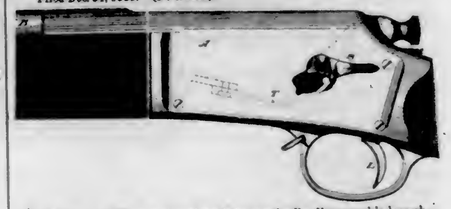
2. The combination, with the draw-head A, having hooked-shaped top B, recess C, and stud *c*, of the link E and frame F, having forward-projecting portion, *f*, and dogs *a*, substantially as and for the purposes set forth.

295,030. CARRIER FOR PAINTINGS AND OTHER ANALOGOUS WORKS OF ART. CLEMENT MAROT, Troyes, France. Filed Oct. 13, 1883. (No model.) Patented in France May 5, 1883, No. 155,204.

Claim.—1. The herein-described carrier, consisting, essentially, of a series of arms or rods constructed of sections capable of being extended and contracted, and when adjusted as to length locked in position, a handle-support to which one end of said rods is flexibly or pivotally connected, and a clamping device flexibly or pivotally connected to the other end of each rod, to which clamping device the object to be carried is secured, as described.

2. The herein-described carrier, consisting, essentially, of a series of rods or arms flexibly or pivotally connected with a support or handle at one end, and flexibly or pivotally connected at their other ends to fastening devices to which the article to be supported is attached, in combination with a flexible cover adapted to be secured to the support or handle and around the object carried by the carrier, as described.

3. The herein-described carrier, consisting of a series of sectional or extensible and adjustable rods, a sectional handle or support to which one end of said rods is flexibly or pivotally connected, devices for securing the sections of the rods in the position to which they may be adjusted, and clamping devices flexibly or pivotally connected with the opposite end of said rods, and a flexible covering, A, substantially as and for the purpose specified.



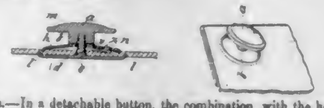
4. The combination of the rods R, carrying clamps C, and the support S, and handle H, to the sections *s s'* of which support said rods are hinged, with the rods R' and their clamps C', substantially as described.

5. The combination, with the support S, its stud s^2, perforated as described, and the rods R R', of the perforated and socketed handle H and the pin D, substantially as described, for the purpose specified.

6. The combination, with the rods R R' and the support S, composed of two sections, *s s'*, the former carrying a stud, s^2, provided with a transverse aperture, of the socketed handle H, also provided with an aperture, and the retaining-pin D, substantially as and for the purpose specified.

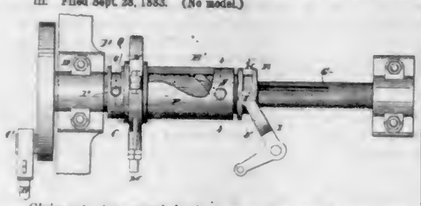
7. The combination, with the rods R R', the support S, its stud s^2, and the washer W, of the socketed handle H and pin D, said stud and handle being perforated to receive the pin D, as described, for the purpose specified.

295,031. MAGAZINE FIRE-ARM. WILLIAM MASON, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Dec. 31, 1883. (No model.)



Claim.—1. The combination of the longitudinally-movable breech-piece and longitudinal hammer arranged through said breech-piece, a sear and projection therefrom constructed and arranged, respectively, so that the sear may engage a shoulder on the hammer and the said projection a corresponding notch in the breech-piece when the breech-piece is in its closed position, combined with a cam in connection with a lever on the outside of the receiver, substantially as described, whereby said sear and projection may be thrown into locking engagement with the breech-piece and hammer at full-cock or out of such locking engagement without releasing the hammer from its full-cock position.

2. The combination of a longitudinally-movable breech-piece, a hammer arranged longitudinally through the breech-piece, the trigger-



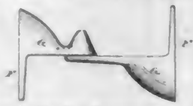
piece constructed with a sear, *d*, to engage a corresponding shoulder on the hammer, and with the projection *g*, to engage a corresponding notch in the breech-piece when the breech-piece is in its closed position, a cam, *l*, arranged through the side of the receiver, provided with a suitable handle upon its outside, the trigger-piece provided with shoulders *m n*, upon which the said cam will operate, substantially as described.

295,032. BUTTON. WILLIAM H. MATTHEWS, Livingston, Tex. Filed Nov. 17, 1883. (No model.)

Claim.—In a detachable button, the combination, with the hollow threaded shank of the button-head, having end serrations, *g*, and the base-disk *d*, having a central screw, of the loose clamp-disk *h*, applied on the screw, and having a spring-pawl or projection to engage the serrations of the shank, substantially as specified.

295,033. REVERSING-VALVE GEAR. EDWIN D. MCLEAN, Marissa, Ill. Filed Sept. 28, 1883. (No model.)

Claim.—1. An eccentric having a sleeve formed with circumferentially-extending slot, to receive a radial pin on the shaft and permit the sleeve to be turned.

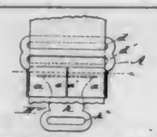


2. The combination of an eccentric having a sleeve formed with circumferentially-extending slot, a shaft, a radial pin occupying said slot, a cam-sleeve to slide endwise and keyed to the shaft, spiral groove and pin connection for the sleeves, and means to retain the eccentric to desired position.

3. The combination of an eccentric having a sleeve formed with circumferentially-extending slot and a radial pin, a crank-shaft having a feather longitudinally thereof, a collar intermediate of the eccentric-sleeve and crank-shaft, having a screw occupying the circumferentially-extending slot, and securing the collar to the crank-shaft, a cam-sleeve in line with the collar, having a spiral slot to receive the eccentric-sleeve pin, and a groove to receive the feather on the crank-shaft, and means to retain the eccentric in desired position.

4. An eccentric having capacity for rotary adjustment on the crank-shaft of a steam-engine, in combination with an actuating cam-sleeve, E, and cam-pin in the eccentric-sleeve working in the spiral cam groove or slot E' of sleeve E, and the pin or screw R, working in slot *p* of the eccentric-sleeve.

5. The combination of shaft A, eccentric and sleeve O P, having slot *p*, studs or screws R and S, cam-sleeve E, with cam groove or slot E' and groove H, and the operating device I J K, all substantially as and for the purpose set forth.



295,034. BLIND-HINGE. JOSEPH B. MERRIAM, Meriden, Conn., assignor of one-third to Everett B. Richmond, same place. Filed Oct. 1, 1883. (No model.)

Claim.—The herein-described improvement in hinges, consisting of the plates F, by which the hinge is secured, an arm extending in a plane at right angles from each of said plates and midway of the height of the said plates, the said plates contracted in width from the plane of the working-surface of the arm, each arm starting from its plate in two parts, G G, and coming together forward of the plates, so as to form a brace-like support for the arm, and so as to leave an opening, H, in front of the plates between the parts G G, the said plates F constructed with countersunk holes *a a*, and the arms constructed, respectively, the one with a socket, J, and the other with a stud, *d*, and with the locking-shoulders L, each of said two parts of the hinge cast complete in one and the same piece, substantially as described.

295,035. SUSPENDER-BUCKLE. WILLIAM E. T. MERRELL, Philadelphia, Pa., assignor to John W. Bruff, same place. Filed Jan. 22, 1884. (No model.)

295,035.

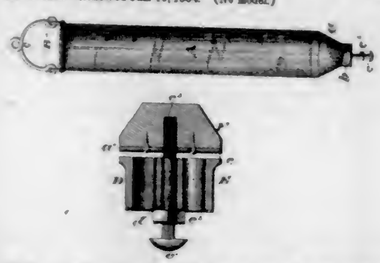
Claim.—1. A suspender-buckle having a frame or bow formed with a spring-clamp, divided at its center and integral therewith, and adapted to embrace and bind the web or suspender-cloth, substantially as described.

2. In a suspender-buckle, the combination, with a frame or bow having a spring-clamp to embrace the web or suspender-cloth, and slotted to receive a tongue, of a buckle-tongue adapted for the attachment of the suspender-straps, and having a flanged edge or lip to impinge upon the web or cloth and hold it against the clamp, substantially as described.

3. The buckle frame or bow consisting of the metallic plate A, struck up or bent into shape, and having the inwardly-turned leaves or wings *a a*, forming a clamp spring or springs, and forming the elongated space *b*, substantially as described.

4. The combination of the buckle-frame consisting of the plate A, provided with inwardly-bent elastic clamp-arms *a a*, and having the slot *s* and the movable tongue H, fitting and working in said slot, and formed with the flange or lip *h*, substantially as described.

295,036. SAFETY-PIN. FREDRICK MEYERS, Brooklyn, N. Y. Filed Jan. 15, 1884. (No model.)

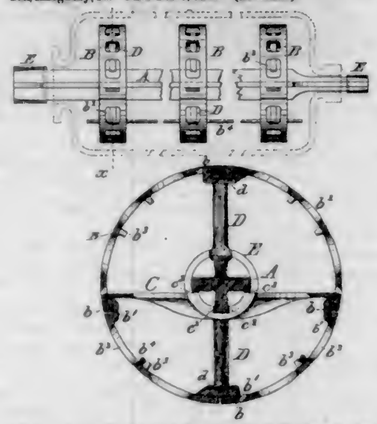


Claim.—A safety-pin composed of two flat coils, *a a'*, of wire, arranged at a distance apart, a bar, *b*, connecting the outer extremities of both coils, a pin, *c*, forming an extension of the inner extremity of the coil *a*, and a point-protector, *d*, arranged to stand away from the under side of said coil, each of said coils having the convolutions thereof arranged one within the other, substantially as shown and described.

295,037. WATCH-MAKER'S SIGN. EDWD. C. MILLER, Bellefontaine, Ohio. Filed Mar. 9, 1883. (No model.)

Claim.—In a watch-maker's sign, the combination of post A, having reduced end A', watch-casing B, having braces G, extending across the casing, and stem B', having opening F, a block, D, having opening C and secured to the bottom of the casing, and a removable pin, E, secured to the end of the post and fitting in the opening in the stem, as set forth.

295,038. WELL-BUCKET. FRED E. MILLER, Lincoln, Nebr. Filed Oct. 2, 1883. Renewed Jan. 19, 1884. (No model.)



Claim.—1. The combination, with the well-bucket having an aperture at its lower end, of the disk D, arranged in said aperture, and having the central passage and one or more intermediate water-passages, the headed rod arranged in said central passage, and the valve F, screwed upon the upper end of the rod, and arranged to close and open the outer passages of the disk, substantially as described.

2. The combination, with the well-bucket having the conical lower end portion open at its bottom, of the disk D, arranged within the opening at the bottom, and having the flange *e* arranged to rest by gravity on the tapering inner surface of the conical lower end portion of the bucket, said disk having central valve-rod passage, and one or more suitable water-passages, the headed rod E, arranged in the central passage of the disk, and the valve F, secured to the inner end of said rod, and arranged to open and close the water-passages of the disk, substantially as described.

3. The combination, with the disk D, having central valve-rod passage and water-passages at the sides thereof, of the valve-rod E, arranged through said central passage, and provided with stop e^3 and the valve F, screwed upon the inner end of said rod, substantially as and for the purpose set forth.

4. The combination, with the bucket A, having the conical lower portion, *a*, terminated by the cylindrical ring *b*, of the perforated disk D, arranged to fit within the said ring, and provided with the flange *e*, resting by gravity upon the inner surface of the conical portion of the bucket, the valve-rod passing loosely through the center of the disk and projecting below the same, and the valve F, screwed upon the inner end of the said valve-rod, and adapted to rest upon the disk as its seat when the bucket is suspended, substantially as set forth.

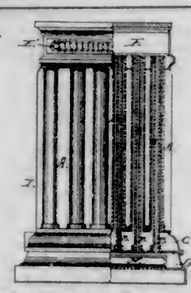
295,039. CORE-BARREL. WILLIAM T. MORRERLEY and ROBERT TAYLOR, Allegheny, Pa. Filed Dec. 8, 1883. (No model.)

Claim.—1. In a core-barrel, the combination of a bar or arbor and one or more stays or supports connected removably thereto, each of said supports being composed of a series of plate-sections, the width of face of which is less than the length of the core to be formed, and their length less than the diameter thereof, these members being combined for joint operation to admit of the displacement and separate withdrawal of the sections, after the completion of the casting, through an end opening therein substantially less in diameter than the body thereof, substantially as set forth.

2. In a core-barrel, the combination of a bar or arbor, one or more sectional supports connected removably thereto, and a ring or sleeve fitting on said bar at one or both of its ends over interposed channels or recesses, said rings being of less diameter than the supports, and acting as end bearings for the core, as well as providing vents for the gases in casting, substantially as set forth.

3. In a core-barrel, the combination of a bar or arbor, a support formed of sections having interlocking ends, a transverse brace bearing against the sections of the support, and a key-piece bearing at its inner end against the arbor, and at its outer end against the sections of the support, substantially as set forth.

4. In a core-barrel, the combination of a bar or arbor, a support composed of interlocked sections and a transverse brace, a key-piece bearing against the arbor and the sections, and a cushion or packing-piece of wood or other shrinkable material interposed between the outer end of the key-piece and the sections, substantially as and for the purpose set forth.



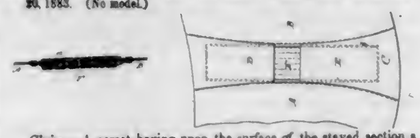
5. In a core-barrel, the combination of a bar or arbor, two or more supports attached removably thereto, and longitudinal bars or rods resting upon pins or projections on said supports, substantially as set forth.

6. A transverse brace for a core-barrel, having a central recess provided with bearings for the sides of a bar or arbor, and tongues upon its ends adapted to engage the sections of a support, substantially as set forth.

295,040. STEAM-RADIATOR. DOCTOR F. MORGAN and JOHN ROBB, Akron, Ohio. Filed July 6, 1883. (No model.)

Claim.—1. The herein-described radiator, consisting of the steam-tubes A, provided with the interior air-tubes, B, and partitions D, having

295,040.



openings *a*, hollow base C, provided with supply-pipe F, exhaust-pipe F', and partition C', air-reservoir G, provided with the supply-pipe G', damper H, and opening *c*, the hollow top or cover E, having perforated plate or screen E', and the deflecting-shield I, all substantially as and for the purpose specified.

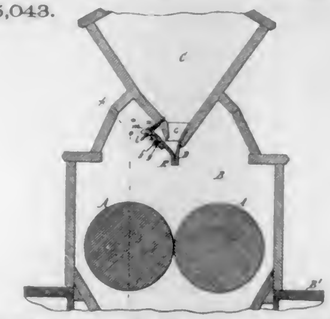
2. The air-reservoir G, provided with supply-pipe G', hollow top or cover E, provided with the perforated plate or screen E', and the deflecting-shield I, in combination with the steam-tubes A, air-tubes B, and base C, substantially as and for the purpose specified.

3. The steam-tubes A, provided with the air-tubes B and central partitions, D, having openings *a*, in combination with the shield I, hollow base C, and top E, substantially as and for the purpose specified.

295,041. CORSET. ISAAC NEWMAN, New Haven, Conn. Filed Aug. 20, 1883. (No model.)

Claim.—A corset having upon the surface of the stayed section a pocket, D, at the upper part, and a pocket, E, at the lower part, the said two pockets extending toward each other, their adjacent ends open but distant from each other, so as to leave a space between said open ends, combined with an auxiliary bone, *d*, stay F, corresponding in width to the said pockets, the said space between the pockets permitting the introduction of said stay F first one end into one pocket, and then the other end into the other pocket, the stay thus introduced overlying the stayed section, substantially as described, and so as to serve as an auxiliary support to the stays of the section.

295,042. DEVICE FOR ATTACHING THE RIBS AND BRACES OF UMBRELLA-FRAMES. MATTHEW NIAL, Troy, N. Y. Filed Sept. 21, 1883. (No model.)



Claim.—1. In an umbrella-frame fastening, the combination of the hinging-hook *h'*, formed on the hinging end of each of the ribs, the hinging-hook h^3 on the hinging end of the braces, with the said hooks on the ribs constructed to attach to the fixed ferrule, and said hooks on the braces to the sliding ferrule, in the manner herein shown and described.

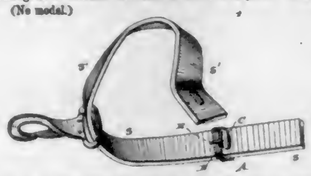
2. In an umbrella-frame, the combination of open-mouth sheath-tips on the umbrella-cover to receive the tip ends of each of the ribs, hinging-hooks on the hinging ends of the ribs, hinging-hooks on the hinging ends of the braces, said hooks on the ribs being constructed to attach to the fixed ferrule, and those on the braces to the sliding ferrule, in the manner herein shown and described.

295,043. FEED MECHANISM FOR ROLLER-MILLS. BARNIM F. ORTMAN, Buffalo, assignor of one-half to George Urban, Jr., Cheektowaga, N. Y. Filed Oct. 13, 1883. (No model.)

Claim.—1. The combination, with a feed-hopper, of a feed-gate provided on its face with inclined or curved ribs or corrugations trending from the middle of the feed-gate toward both ends thereof, and mechanism whereby a longitudinal reciprocating movement is imparted to the feed-gate, substantially as set forth.

295,043.

2. The combination, with a feed-hopper, of a pivoted feed-gate, means whereby the feed-gate can be swung on its pivot to regulate the flow of material from the feed-hopper, and mechanism whereby a longitudinal reciprocating movement is imparted to the feed-gate, substantially as set forth.



3. The combination, with a feed-hopper, of a delivery-plate having its face provided with ribs or corrugations, an adjustable feed-gate provided on its face with inclined or curved ribs or corrugations trending from the middle of the feed-gate toward both ends thereof, and mechanism whereby a longitudinal reciprocating movement is imparted to the feed-gate, substantially as set forth.

4. The combination, with a feed-hopper, of a reciprocating rod, *f*, a feed-gate, E, pivoted to said rod, and mechanism whereby the feed-gate can be adjusted on said rod to regulate the flow of material from the hopper, substantially as set forth.

5. The combination, with a feed-hopper, of a reciprocating rod, *f*, a feed-gate, E, pivoted to said rod, and provided with a slot, *m*, screw-bolt *l*, spring *n*, and thumb-nut *o*, substantially as set forth.

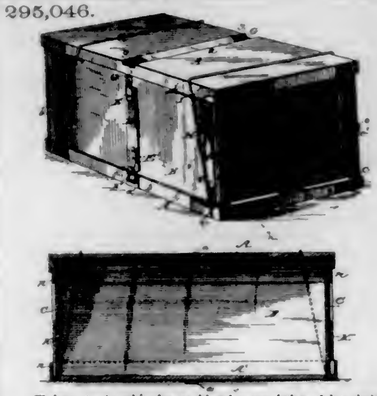
6. The combination, with a feed-hopper, of a delivery-plate, D, having ribs or corrugations *p* and a plain face, *p'*, and a reciprocating feed-gate, E, having ribs or corrugations *q* and a plain face, *q'*, substantially as set forth.

295,044. LOOP-BUCKLE FOR HARNESS. JAMES A. PARK, Lansing, Mich., assignor of one-half to Puella E. Park, same place. Filed Oct. 20, 1883. (No model.)

Claim.—1. A loop-buckle consisting of a substantially rectangular loop provided on one of its bars with an inclined angular shank having a button-head at its outer end, which projects beyond the body of the loop, as set forth.

2. A loop-buckle consisting of a rectangular loop having a shank projecting from one of its sides, and formed with an angular end, E, a button-head being formed at the outer end of said shank, substantially as set forth.

295,045. WELL-DRILL. FRED D. PARKER, Denver, Colo. Filed Nov. 2, 1883. (No model.)



Claim.—1. A drill-tool constructed of a single piece of tubing of suitable diameter, having diametrical slots at the lower end, leaving downward extensions, which are provided with a series of cutting-edges at their lower ends, substantially as specified.

2. A device for removing the débris from wells drilled or bored as described, consisting of a tube corresponding in size diametrically with the drill-tube, and having a hinged annulus at its lower end, adapted to operate substantially in the manner specified.

295,046. RESHIPPING PACKING-BOXES. JOSEPHUS S. PARKER and WILSON M. BAKER, Urbana, Ohio; said Parker assignor to said Baker. Filed Dec. 22, 1883. (No model.)

295,046.

Claim.—1. A reshipping packing-box consisting of detachable sides and top and bottom caps, the box being held in position by detachable strips which engage with rings or hooks on the caps, substantially as and for the purpose set forth.

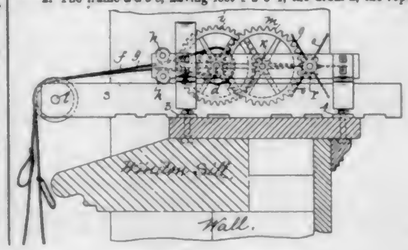
2. A reshipping packing-box consisting of top and bottom caps and detachable sides and ends provided with cleats, as described, and side fastening-strips, one end of each strip engaging with a bolt let into the edge of the top cap, the opposite end of said strips engaging with a ring or loop secured to the bottom cap, substantially as and for the purpose set forth.

3. A box with detachable ends and sides, having cleats, as described, and provided with sliding rods I, having bent ends, one end of said rods being adapted to turn over the cleats on the ends of the box, substantially as set forth.

4. A packing-box having detachable sides and ends provided with cleats, as described, said cleats being secured to the sides and ends so as to leave a space between them, and provided with a hook, *o*, and eye *o'*, which engage with each other in the space between the cleats, substantially as set forth.

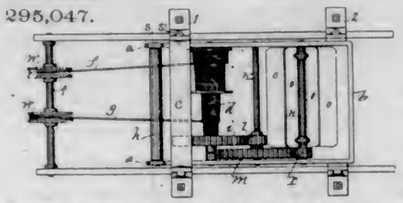
5. A reshipping packing-box having detachable ends provided with the rods K, having bent ends, the lower ends of said rods entering holes or openings in the bottom cap of the box, substantially as and for the purpose set forth.

6. A reshipping packing-box consisting of top and bottom caps and detachable sides and ends, the ends and sides, when detached, adapted to pack in one of the caps, said caps being held in position by a hook, G, and ring or loop F, secured to said caps, substantially as and for the purpose set forth.



7. A reshipping packing-box consisting of top and bottom caps and detachable sides and ends, one of said caps having a screw-threaded hook, and means, in connection with the other cap, for engaging the hook and nut, by means of which the caps are tightened or loosened, substantially as and for the purpose set forth.

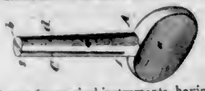
295,047. FIRE-ESCAPE. ROBERT B. PARROTT, Indianola, Iowa. Filed Oct. 15, 1883. (No model.)



Brief.—The duplex drum, ropes, fan-governor, and connecting gearing are mounted in an adjustable frame carrying guide-sheaves, and are inclosed in a case having openings at its sides.

Claim.—1. A fire-escape and governing device for lowering persons and objects from elevated positions, composed of the following elements, to wit: a frame or box, a duplex drum, two ropes or wire cables, a fan-governor connected with the drum by gearing, and an adjustable frame carrying sheaves for directing the ropes relative to objects projecting from a wall, substantially as set forth.

2. The frame *a a b c*, having feet 1 2 3 4, the drum *d*, the ropes *f*

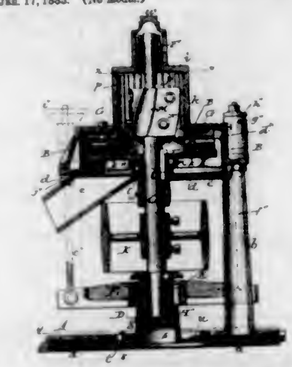


295,047.

and *g*, the rollers *h h*, the gearing *i k l m r*, the fan-governor *n o*, and the adjustable frame *s s t*, carrying independent sheaves *w w*, arranged and combined substantially as shown and described, to operate in the manner set forth, for the purposes specified.

3. The combination of a box or case having openings at its side to admit air, and openings for the passage of the racks and the exhaustion of air at its rear end, with the drum *d*, gearing *i k l m r*, the fan-governor *n o*, and the frame *s s t*, carrying sheaves *w*, substantially as and for the purposes set forth.

295,048. TUNING-PEG FOR MUSICAL INSTRUMENTS. MARIE E. PATTERSON, St. Louis, Mo. Filed Sept. 3, 1883. (No model.)



Claim.—1. A peg for musical instruments, having a piece of elastic material in the shank thereof, substantially as and for the purpose specified.

2. The peg A, having the shank *a'*, the slot *b*, and the elastic material *c*, substantially as described, and for the purposes specified.

3. The peg A, with the shank *a'*, having a piece of elastic material inserted therein, in combination with neck E of a musical instrument, substantially as described.

4. The peg A, having the head *a* and shank *a'*, the piece of elastic material C, inserted in the slot *b*, and the hole *d*, in combination with the neck E, having the hole *e*, substantially as set forth, and for the purpose specified.

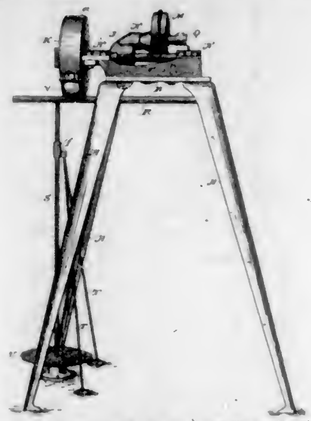
295,049. GRINDING-MILL. GEORGE RAYMOND and ALBERT RAYMOND, Chicago, Ill., assignors of one-half to Orville H. Tobey, same place. Filed Jan. 17, 1883. (No model.)

Claim.—1. In a machine for reducing cane and similar materials, the grinding-disks, in combination with the rotary cutter-head provided with external knives, the head or turret having the throat or inlet, and the stationary upright blade located at the side of the throat and arranged to act in immediate proximity to the rotary blades, as described, whereby the stalks are first divided by a shearing action into lengths and subsequently subjected to a grinding action.

2. The head or turret A, provided with internal ribs and with a feed throat or opening, in combination with the upright knife secured to its side and the cutter-head provided with blades N, arranged to move in close proximity to the fixed blade, but at a distance from the ribs, whereby the ribs are adapted to check the inward motion of the cane or other material during its severance by the knife.

3. In combination with the rotary head having the upright knives thereon, the encircling turret provided with internal ribs, a knife fixed at one side of the inlet-opening, and the feed spout or throat arranged to deliver the material at one side of the rotary head, whereby the stalks are caused to be drawn automatically inward and their advance retarded, so that they may be severed by the knives.

4. In a convertible hopper for a grinding-mill, the body provided with movable end boards, *s'*, substantially as described, whereby it may be adapted at will for use with a reciprocating slide or with a feed-worm.



5. In combination with the shaft bearing the socket, the base-plate *a*, adjustable plate S, and the bolts *t* and *u*.

6. The hopper provided with the removable end boards, *s'*, and with the pinion *l'*, having a crank-pin thereon, whereby it is adapted for operation in connection with a worm or with a reciprocating slide, as occasion may require.

7. The hopper *d'*, provided at one end with the outlet-opening and the depending plate *v'*, in combination with the feed-worm *w'*, the worm-supporting plate *w'*, and the screws for securing said plate in position.

8. In combination with the lower grinding-disk, its spindle, and the bridge-tree, the suspension-rod *f''*, and the spring to sustain the same, the suspension-rod *d''*, and its nuts *i''* and *j'''*.

295,050. METHOD OF AND APPARATUS FOR TREATING PELTS. CHARLES F. RITCHEL and GEORGE DOOLITTLE, Bridgeport, Conn., assignors of one-third to Thomas B. Doolittle, same place. Filed AUG. 9, 1883. (No model.)

Claim.—1. In a machine for treating pelts, the combination of a support over which the skin may be drawn, a vacuum-chest, K, provided interiorly with a revolving plucking-cylinder, I, having a series of ports, *b*, in the periphery thereof, through which the ends of the master-hairs are drawn, a rubber or other flexible roll, Q, hung in the end of a stationary hanger, and arranged to impinge against and be driven by frictional contact with the cylinder I, means for driving the cylinder, and an exhaust-fan connected with the vacuum-chest K, substantially as and for the purpose set forth.

2. The combination and arrangement of the cylinder I, arranged within the vacuum-chest K, and connected by bolts or otherwise with the flanged end of a sleeve, E, provided with a driving-pulley, J, the central stationary shaft, D, extending within the chest K, hanger P, and rubber roll Q, substantially as and for the purpose set forth.

3. In combination with the support R and vacuum-chest K, the guard-plates V, for controlling the skin after the removable of the band, substantially as hereinbefore set forth.

4. In combination with the vacuum-chest K, cylinder I, and roll Q, the stripper or guard-plate W, substantially as and for the purposes set forth.

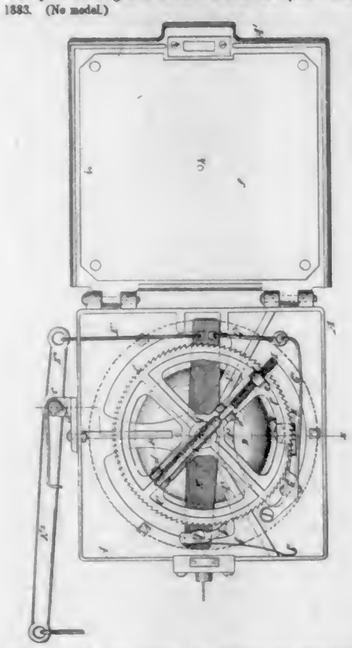
5. The revolving cylinder I, provided with a series of ports, *b*, having one side of each beveled, substantially as and for the purpose set forth.

6. The supporting-bar R, having its rear end hinged to the frame of the machine and its front end resting upon a vertically-adjustable rod, S, substantially as and for the purpose set forth.

7. The rod S, connected at its lower end to a revolving plate, V, by a quick screw-thread, and adapted to be raised and lowered by the rotation of the plate V, substantially as and for the purpose set forth.

8. The combination and arrangement of the supports A, plate B, bed C, bearings A' A'', shaft D, sleeve E, flange F, cylinder I, pulley J, vacuum-chest K, hanger P, roll Q, exhaust-fan, and trunks N O, substantially as shown and described.

9. The cylinder I, provided with inlet-ports in its periphery for the reception of the master-hairs, and adapted to be rotated to pull said hairs, substantially as hereinbefore set forth.



10. The method of properly presenting the master-hairs of pelts to

the action of plucking mechanism, which consists in the employment of an air-current toward the plucking mechanism, and placing the pelt within the influence of said current, whereby the hairs are caused to travel toward and within the bite of the plucking mechanism, substantially as hereinbefore set forth.

11. The method of plucking pelts, consisting in placing the same within the influence of an air-current toward the plucking mechanism, then grasping said hairs thus presented and pulling the same bodily from the skin, substantially as hereinbefore set forth.

12. The method of plucking pelts, consisting in placing them within the influence of an air-current toward the rotary plucking mechanism arranged within an exhaust or vacuum case, drawing said hairs out by rotary action, and discharging the same into a suitable cage or receptacle, substantially as hereinbefore set forth.

295,051. FARE REGISTER OR RECORDER. REUBEN M. ROSE, Brooklyn, N. Y., assignor to David F. Atkins, same place. Filed Jan. 3, 1883. (No model.)

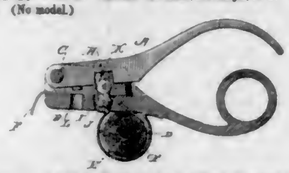
Claim.—1. In a fare register and indicator, the combination of a concealed dial and means for recording or marking thereon, a visible dial and an index for indicating thereon, and a hollow spindle carrying said index, and serving as a passage for a rod by which the recording or marking device may be operated or moved to cause it to register or mark on the concealed dial, substantially as described.

2. The combination, with a ratchet-wheel, a hollow spindle on which the wheel is mounted, and means for imparting a step-by-step rotation to the said wheel, of a dial, a radial arm carried by said wheel and provided with a marking device, and a pin adapted to be inserted through the hollow spindle to press upon the said arm, and so cause its marking device to make a deep or heavy impression on said dial, substantially as herein described.

3. In a fare register and indicator, the combination of a case composed of two portions hinged together, a spindle and a marking device adapted to turn therewith, both being supported and carried wholly by one portion of the case, a filing or indicating point on the other portion of the case in such position that when the case is closed said point will be opposite the center of the spindle, and a paper or analogous dial provided with a hole adapted to said filing or indicating point, whereby provision is afforded for properly centering the dial relatively to the spindle when the case is opened to enable the dial to be placed in position, substantially as described.

4. The combination, with the ratchet-wheel C, means for imparting to it a step-by-step rotary motion, and a radial arm provided with a marking device carried by said wheel, of the back plate, A', provided with a central gage, and the dial J, provided with a central opening, substantially as and for the purpose herein described.

5. The combination, with a fare register or indicator case having a bridge provided with a central bearing extending across it and dividing it into two compartments, of a spindle fitting the bearing, a ratchet-wheel and its actuating-lever mounted on the spindle on one side of the bridge and in one of said compartments, a bell approximately concentric with the spindle and arranged on the other side of the bridge in the other compartment, and a bell-hammer actuated by said ratchet-wheel and extending across or beyond the bridge to operate on the bell, substantially as herein described.

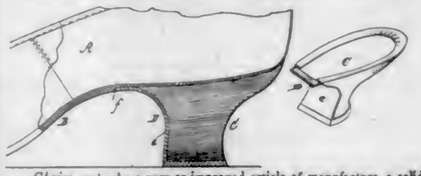


6. The combination, with a bell-hammer and a spring for impelling it against a bell, of a pull-rod or device for operating the bell, and a connection between the spring and pull-rod or device, whereby the force of the spring will be increased at the time the blow is struck by the hammer, substantially as and for the purpose herein described.

7. The combination, with the ratchet-wheel C and the bell-pawl G, of the spring G', connected with the bell-pawl, mechanism for imparting a step-by-step rotation to the said wheel, and a pull-rod or device connected with the said mechanism for operating it, and also connected with said spring for simultaneously increasing its force, substantially as herein described.

8. The combination of the spindle B, wheel C, lever E, pull-rod or device E', actuating-pawl *b*, bell D, bell-pawl G', and rod G², all arranged and adapted to operate substantially as herein described.

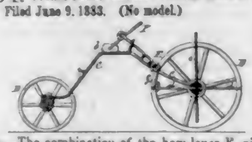
9. The combination, with the visible dial *j* and hand or pointer *l*, of the setting bar or arm L, the notched rim *m*, and the removable stop-pin *p*, all arranged and adapted to operate substantially as and for the purpose herein described.



295,052. PUNCH. REUBEN M. ROSE, Brooklyn, N. Y. Filed June 6, 1883. (No model.)

Claim.—1. A punch having a pair of jaws carrying, respectively, male and female dies, the lower jaw having a slot through it from its under side, and carrying a drum upon which the strip is coiled, and from which it is fed through the slot to a position between the jaws, substantially as described.

2. A ticket or strip punch comprising a pair of jaws carrying male and female dies, and mechanism, substantially as described, for feeding the strip intermittently, the lower jaw having a slot through it, and carrying a box with a drum therein, upon which the strip is coiled, and from which it is fed through the slot to a position between the jaws, substantially as set forth.

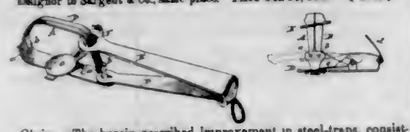


295,053. HEEL FOR SHOES. WOLF ROSENKEN and LOUIS ROSENKEN, New York, N. Y. Filed Jan. 9, 1884. (No model.)

Claim.—1. As a new or improved article of manufacture, a solid heel having the breast curved forwardly and faced with a layer of sole-leather, substantially as and for the purpose described.

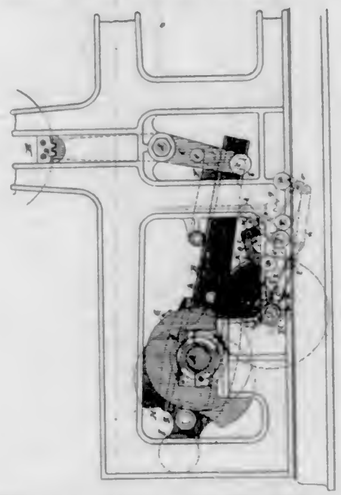
2. The combination, with a slipper, of a solid heel having the breast curved forwardly and faced with a layer of sole-leather flush with the sole of the slipper, the lower heel portion of the sole being cut away to let in the heel, substantially as described.

295,054. CORNSTALK-RAKE. GEORGE ARTHUR RENYAN, Augusta, Kans. Filed June 9, 1883. (No model.)



Claim.—The combination of the bow-lever F, pivoted to the rear of driver's seat, the links, and sliding stop E with the revoluble rake-head having devices adapted to engage with said stop, as shown and described.

295,055. CORD ATTACHMENT FOR SEWING-MACHINES. JOS. S. SACKETT, New Haven, Conn., assignor of one-half to Jane Halliwell, same place. Filed Sept. 10, 1883. (No model.)



Claim.—The herein-described attachment for sewing-machines, consisting of the corder B, composed of the tubular portion *s*, and wings *f f*, formed as an integral part of said tubular portion, parallel with and distant from each other less than the internal diameter of the tubular portion, the space between the wings opening into said tubular portion, the said corder attached to or made a part of the presser-foot A, the said presser-foot constructed with a transverse slot, *h*, on the side opposite the tubular portion of the corder, substantially as described.

295,056. ANIMAL-TRAP. HENRY B. SARGENT, New Haven, Conn., assignor to Sargent & Co., same place. Filed Oct. 31, 1883. (Model.)

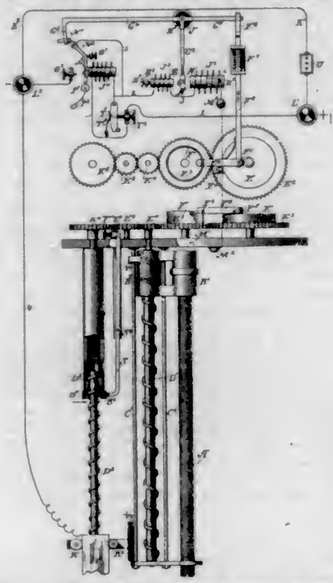
Claim.—The herein-described improvement in steel-traps, consisting in the spring, its active end twisted to bring it into a plane inclined to the base of the trap, the highest side being that which bears upon the jaw over which the trip is engaged, and whereby, when the trap is set, the locked jaw will bring the said twisted end into a plane substantially parallel with the base of the trap and hold the jaws in a corresponding parallel plane, and substantially as specified.

295,057. STOP-CYLINDER PRINTING-MACHINE. WALTER SCOTT, Plainfield, N. J. Filed Mar. 29, 1883. (No model.)

Claim.—1. The combination, with the crank-shaft and sliding bar, of an impression-cylinder having a toothed segment, a toothed lever arranged to engage with said segment, a lever, as M, for lifting said sliding bar, a rock-shaft, as *p*, having connections whereby it is adapted to be actuated by the operator, means for connecting the said rock-shaft with the lever M, and mechanism for preventing the rotation of the said rock-shaft when the impression-cylinder is in motion, all substantially as set forth.

2. The combination, with the lever C, sliding bar B, and mechanism, substantially as described, for reciprocating said bar, of gear-wheels as J K, a cam, as *i*, a rod, as *l*, a lever, as M, and tripping mechanism substantially as described, adapted to be actuated by the operator for raising the upper end of the lever M, and thereby breaking the connection between the bar B and lever C, and keeping the said bar and lever disconnected at pleasure, as set forth.

3. The combination, with the bar B, of a lever, as M, connecting-rod, as *n*, arm, as *o*, and rock-shaft, as *p*, substantially as described.



4. The combination, with the bar B, of a lever, as M, connecting-rod, as *n*, arm, as *o*, rock-shaft, as *p*, and a mechanism, substantially as described, for preventing the movement of the parts, except when the impression-cylinder is at rest.

5. The combination, with the bar B, of the lever M and its operating mechanism, and mechanism, substantially as described, adapted to be actuated by the operator, for elevating the upper end of said lever and keeping the same elevated at pleasure, all substantially as set forth.

6. The combination, with the bar B and lever M, of a lever, as *o*, a rod, as *y*, and actuating-cams, as *z z'*, substantially as described.

7. The combination, with the bar B, of a lever, as M, connecting-rod, as *n*, arm, as *o*, rock-shaft, as *p*, a second lever, as N, provided with a catch, as *w*, a connecting-rod, as *t*, and actuating-cams, as *r r'*, all arranged and combined as and for the purpose specified.

295,058. ELECTRIC-LIGHT REGULATOR AND CUT-OUT. ROBT. J. SHERRY, New York, N. Y. Filed July 17, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the electrodes of an arc-lamp, the mechanical clamping mechanism, a helix situated in a shunt-circuit spanning said electrodes, a core revolved within said helix upon its central longitudinal axis, and means, substantially such as described, co-operating with said core, to operate said clamping mechanism.

2. The combination, substantially as hereinbefore set forth, of the electrodes of an arc-lamp, mechanism for producing a constant force tending to diminish the distance between said electrodes, a grasping mechanism, a helix situated in a shunt-circuit spanning said electrodes, an electro-magnetic core within said helix revolving upon its central longitudinal axis, and means, substantially such as described, co-operating with said core, to operate said grasping mechanism and separate said electrodes.

3. The combination, substantially as hereinbefore set forth, of the electrodes of an arc-lamp, a mechanical clamping device, mechanism for producing a constant force tending to detain said clamping device in a non-clamping position, a cylindrical core revolving on its vertical longitudinal axis under reciprocal changes in the strengths of the main and branch currents, operating to bring said clamping mechanism into action when turning in one direction, and to return said clamping device to said non-clamping position when turning in the other direction.

4. The combination, substantially as hereinbefore set forth, of a central electro-magnetic core revolving upon its vertical longitudinal axis, and polarized by the current which traverses a derived circuit spanning an electric arc, a right-angled extension to said core, an electro-magnet polarized by the light-producing current to a similar polarity to that of said extension, but of greater intensity, for actuating said extension, and a clamping mechanism of an electric-arc light actuated by the rotary movements of said core.

5. The combination, substantially as hereinbefore set forth, of the electrodes of an arc-light, supported, respectively, by a screw revolving

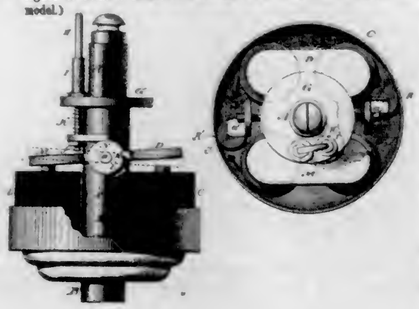
in a nut and a nut revolving upon a screw, mechanism actuated by a spring-power for approximating said electrodes, a clamping mechanism actuated by the movements of a polarized armature for grasping through intermediate mechanism said electrodes and subjecting them to the action of said polarized armature.

6. The combination, substantially as hereinbefore set forth, of the electrodes of an arc-lamp, screw and nut bearings for supporting the same and allowing their vertical motion, mechanism actuated by a spring-power for approximating said electrodes, a core revolving on its central longitudinal axis under simultaneous increases in the strength of current traversing the main circuit and decreases in the strength of current traversing the shunt-circuit, and vice versa, and clamping mechanism actuated correlatively with said movements.

7. The combination, substantially as hereinbefore set forth, of the electrodes of an arc-lamp, a clamping mechanism, a shunt-circuit spanning said electrodes, a helix in said shunt-circuit, a core revolving on its vertical longitudinal axis within said helix, means, substantially such as described, for causing the revolution of said core, and intermediate mechanism whereby the motions of said core are communicated to said clamping mechanism.

8. The combination, substantially as hereinbefore set forth, of the electrodes of an arc-lamp, nut and screw bearings substantially such as described, a train of mechanism actuated by a spring-power for advancing said electrodes toward each other, a shaft, a clamping mechanism by which said shaft may be attached to the said advancing mechanism, a revolving core for impelling said shaft in such direction as to reverse the approximating action of said advancing mechanism, a helix in a shunt-circuit spanning the electric arc surrounding said core, an extension of said core, and an electro-magnet situated in the main circuit for attracting said extension.

9. The combination, substantially as hereinbefore set forth, of an armature polarized by the current which traverses a derived circuit spanning an electric arc, a soft-iron core polarized by the light-producing current to a polarity opposite to that of the said armature, and mechanism operated by the movements of said armature to close a shunt spanning the electric arc.

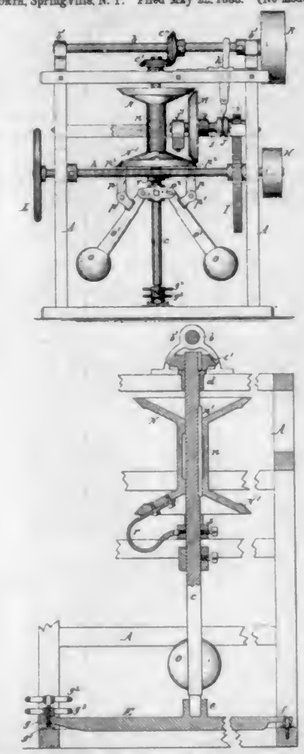


10. The combination, substantially as hereinbefore set forth, of a core rotated upon its vertical longitudinal axis, and polarized by a current traversing a derived circuit spanning an electric arc, a soft-iron attracting-piece polarized by the light-producing current to a polarity opposite to that of said core, and mechanism operated by the movements of said core upon its axis to close a shunt-circuit spanning the electric arc.

11. The combination, substantially as hereinbefore set forth, of a core situated in the helix of a shunt-circuit spanning an electric arc, an extension-piece of said core, whereby the same may be revolved by virtue of the attraction of said extension-piece for a piece of soft iron polarized by the light-producing current, a second extension of said core, a subsidiary lever operated by the movements of said second extension, and contact-points carried by said subsidiary lever for closing a cut-out shunt-circuit spanning said electric arc.

12. The combination, substantially as hereinbefore set forth, of an extension to a core revolving upon its central vertical axis, two fixed attraction-pieces polarized by the light-producing current for determining the direction in which said core shall turn, mechanisms by which a movement in one direction separates the electrodes, mechanisms by which given motion in the opposite direction allows their approximation, and mechanism, by which further motion in this latter direction operates a shunting device for short-circuiting said light.

13. The combination, substantially as hereinbefore set forth, of the electrodes of an arc-lamp, one or more co-operating levers slightly turned upon their fulcrums by the pressure of said electrodes one upon the other, contact-points normally together, but separated by the turning of said levers, and a shunt-circuit spanning said arc-lamp thereby opened.



295,059. ELECTRIC GAS-LIGHTER. EDWIN L. SHUTE, Ansonia, assignor to John E. Earle, New Haven, Conn. Filed Nov. 3, 1883. (No model.)

Claim.—1. In an electric gas-lighting apparatus, the combination of the gas cock and burner, two magnets—one in connection with the circuit for opening the supply of gas, the other in connection with the circuit for cutting off the supply of gas—the armatures of said magnets in connection with the gas-cock, the magnet R in connection with the magnet for cutting off the supply of gas, and a spring-dog arranged to automatically lock the gas-cock in its open position, said dog attached to or made a part of the armature of said magnet R, and whereby said dog will be released from its engagement upon the closing of the circuit for cutting off the gas, substantially as described.

2. In an electric gas-lighting apparatus, the combination of the gas cock and burner, two magnets—one in connection with the circuit for opening the supply of gas, the other in connection with the circuit for cutting off the supply of gas—the armatures of said magnets in connection with the gas-cock, the magnet R' in connection with the magnet for opening the supply of gas, and a spring-dog arranged to automatically lock the gas-cock in its closed position, said dog attached to or made a part of the armature of said magnet R', whereby said dog will be released from its engagement upon the closing of the circuit for letting on and lighting the gas, substantially as described.

295,060. GOVERNOR FOR WATER-WHEELS. CHARLES J. SHUTTLEWORTH, Springville, N. Y. Filed May 22, 1883. (No model.)

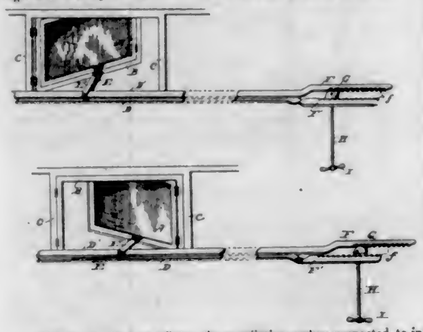
Claim.—1. The combination, with a ball-governor, of a spring secured with one end to the spindle of the governor, and with its opposite end to a collar or sleeve which is moved by the governor-balls, the spring being adapted to resist any movement of the governor-balls out of their normal position in either direction, substantially as set forth.

2. The combination, with mechanism whereby the supply of water or other actuating agent is controlled, of a ball-governor, a spindle to which the governor-balls are attached, and an adjustable step supporting said spindle, whereby said spindle can be raised or lowered to regulate the normal speed of the machine, substantially as set forth.

3. The combination, with a vertical spindle, and mechanism whereby the same is rotated, of the connected wheels N N', mounted on the spindle, an intermediate wheel, M, connected with the gate mechanism, a ball-governor connected with the wheels N N', and mechanism whereby the spindle can be raised and lowered, substantially as set forth.

4. The combination, with the spindle c, of the connected wheels N N', a ball-governor, e, connected with said wheels, and a spring connecting said wheels with the spindle, substantially as set forth.

5. The combination, with the spindle c and connected wheels N N', of a spring connecting said wheels to the spindle, and made adjustable on the spindle, substantially as set forth.



6. The combination, with the spindle c, connected wheels N N', and a ball-governor connected with said wheels, of the wheel M, shaft j, coupling J, pinion i, gear I, gate-shaft h, and wheel H, substantially as set forth.

7. The combination, with the wheel M, whereby the gate mechanism is actuated, of the spindle c, connected wheels N N', mounted on said spindle, and a ball-governor mounted on the spindle, and an adjustable bridge-tree, E, on which the spindle is supported, substantially as set forth.

8. The combination, with the wheel M, whereby the gate mechanism is actuated, of the spindle c, connected wheels N N', a ball-governor connected with the spindle and the wheels N N', a spring, r, whereby the wheels N N' are connected with the spindle, and an adjustable bridge-tree, E, upon which the spindle is supported, substantially as set forth.

295,061. VENTILATOR. JACOB G. SLATER, Albany, N. Y., assignor of one-half to Nelson Fitch, same place. Filed Sept. 28, 1883. (No model.)

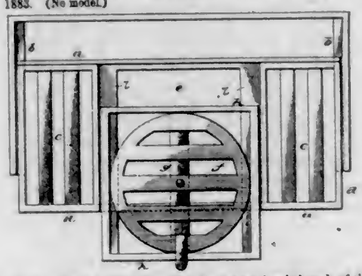
Brief.—Ventilators consisting of operating-sashes hinged in operating-rims, the same being operated by toothed rods engaging with a segment, whereby the ventilator can be operated in either direction.

Claim.—1. In a ventilator, the ventilating-sashes connected to inclosing-rims, the latter being hinged to the sash-frames, in combination with a pair of rods or bars provided with arms connecting with each of the sashes, and also with the rims, and means for operating the said rods or bars to cause either the opening of the rims or the opening of the sashes independently of the rims, as set forth.

2. In a ventilator, the ventilating-sashes connected to inclosing-rims, the latter being hinged to the sash-frames, in combination with a pair of rods or bars provided with arms connecting with the sashes and rims, the front ends of said bars being provided with teeth with which a segment engages, and means for operating said segment, as and for the purpose set forth.

3. In a ventilator, the ventilating-sashes hinged to inclosing-rims, the latter being likewise hinged to the sash-frames, in combination with a pair of rods or bars provided with arms connecting with the sashes and rims, the front end of the said bars or rods being provided with teeth, a segment alternately engaging with said teeth, a rod for operating the segment, and a knob or handle for the rod, as and for the purpose set forth.

4. In a ventilator, the ventilating-sashes A and the rims B, in combination with rods D D', arms E E', said rods D D' having outwardly-extending arms F F', the inner faces of which are provided with teeth, a segment, G, rod H, and knob or handle I, arranged and operating for the purpose set forth.



295,062. MANUFACTURE OF RUBBER BOOTS OR SHOES. ELISHA STOUT, Lambertville, N. J. Filed Jan. 3, 1884. (No model.)

Claim.—1. A boot or shoe composed of a sheet of duck or like fabric, having on its opposite sides films or sheets of rubber pressed into the fabric, and a lining of felt or similar heavy fabric cemented to the interior film or sheet of rubber, substantially as shown and described.

2. The method herein described of making a fabric for the manufacture of boots and shoes, which consists in applying a film or coating of rubber to each surface of a piece of textile fabric, pressing the rubber into the interstices of the fabric by the action of revolving rollers, and finally cementing a sheet of felt or like material to one of the films or coatings of rubber, substantially as set forth.

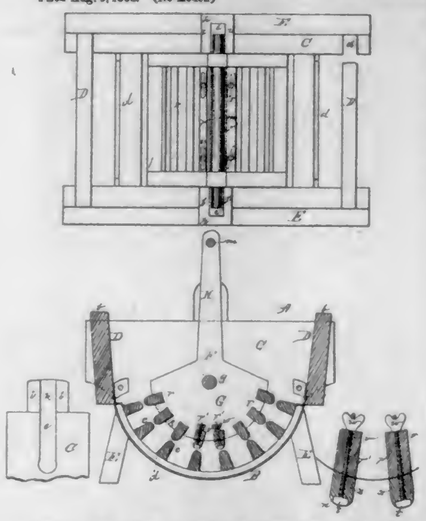
295,063. GRATE. JAMES G. SMITH, Cleveland, Ohio. Filed Aug. 22, 1883. (No model.)

Claim.—The combination, with the supporting-ledges b, of the sliding removable grate a, provided with the central rectangular opening, c, and ledges i i, the central rectangular sliding frame, h, having the cross-bar g, and the rotary grate f, pivoted to the said cross-bar, all adapted to operate in connection with a stove or fire-place, substantially as specified.

295,064. REVOLVER. JOHN T. SMITH, Rockfall, Conn. Filed Dec. 31, 1883. (No model.)

Claim.—1. In a revolver, the combination of the frame and barrel hinged together forward of and carrying the cylinder, the ejector-spindle moving longitudinally through the cylinder, its forward end extending into a recess above the hinge, the disk *f* within the hinge and fixed to the frame, so as to turn with it, the dog *l*, hinged to said disk, its nose constructed and arranged to engage the forward end of the spindle when in the closed position, and so that in the opening movement the said dog will force the ejector-spindle rearward and escape therefrom at the extreme rear position of the ejector-spindle, and a spring arranged to force said spindle rearward so soon as it escapes from the dog, substantially as described.

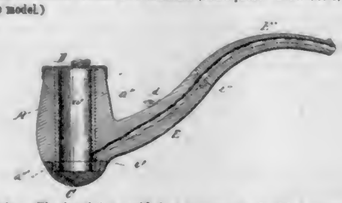
2. The combination of the frame A, barrel B, hinged thereto forward of and carrying the cylinder, the disk *f*, arranged in a recess in the hinge, but fixed to the frame, the dog *l*, hinged to said disk, the ejector-spindle moving longitudinally through the cylinder, its forward end extending into a recess above the dog, the barrel or forward hinged portion constructed with the incline *r* forward of the hinge, and upon which the dog *l* will strike in the closing movement, substantially as described.



3. The combination of the frame A, barrel B, hinged thereto forward of and carrying the cylinder, the disk *f*, arranged in a recess in the hinge, but fixed to the frame, the dog *l*, hinged to said disk, the ejector-spindle moving longitudinally through the cylinder, its forward end extending into a recess above the dog, the barrel or forward hinged portion constructed with the incline *r* forward of the hinge, and upon which the dog *l* will strike in the closing movement, the said dog constructed with a flat surface, *t*, and a spring, *s*, arranged to bear upon said flat surface, whereby the said dog is held in the open position, substantially as described.

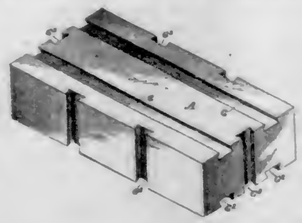
4. The combination of the frame A, barrel B, hinged thereto forward of and carrying the cylinder, the disk *f*, arranged in a recess in the hinge, but fixed to the frame, the dog *l*, hinged to said disk, the ejector-spindle moving longitudinally through the cylinder, its forward end extending into a recess above the dog, the barrel or forward hinged portion

constructed with the incline *r* forward of the hinge, and upon which the dog *l* will strike in the closing movement, the ejector-spindle constructed with a recess *u*, substantially as described.



5. In a revolver, the combination of the frame and cylinder with the headed screw H, introduced in the end of the arm above the cylinder, and so as to overlap the rear end of said cylinder, one side of the said head removed, substantially as and for the purpose described.

295,065. WASHING-MACHINE. RANSOM SMITH, Cottage Grove, Oreg. Filed Aug. 9, 1882. (No model.)

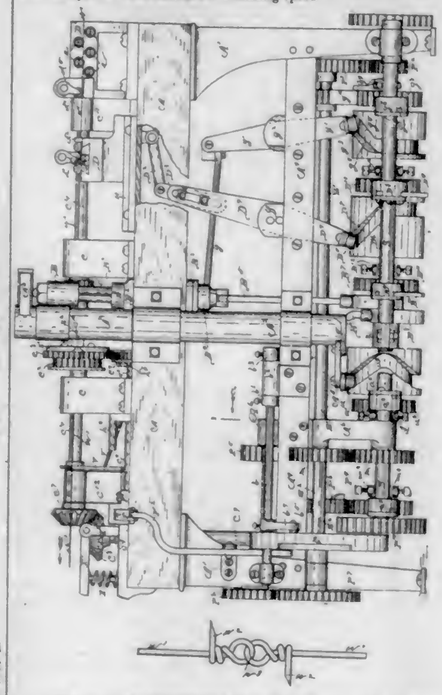


Claim.—In a washing-machine, the combination, with the tub A, having the transverse bars c in its lower portion, of the swinging rubber F, having the transverse ribs or bars *r r'*, the adjustable under sections, *z*, of the middle ribs, and the clamp-screws *v* and thumb-nuts *w*, substantially as specified.

295,066. TOBACCO-PIPE. GEORGE W. SNOOT, Washington, D. C., assignor of one-half to John H. D. Nordeman, same place. Filed Oct. 5, 1883. (No model.)

Claim.—The bowl A, provided at its lower end with a contracted and externally-threaded portion, *a'''*, and having the lining *a'*, extending the whole length of its chamber, in combination with the recessed bottom piece, C, suitably threaded to engage the threaded portion of the bowl, substantially as set forth.

295,067. DOVETAILED GROOVED BRICK FOR BUILDING PURPOSES. GEORGE E. STEARNS, New York, N. Y. Filed Jan. 22, 1884. (No model.)



Claim.—1. A brick having one or more dovetailed grooves across its top and bottom.

2. The combination of two or more bricks placed one above the other, each having dovetailed grooves across its upper and lower surfaces, and interlocked by a layer or layers of mortar between the said surfaces and filling said grooves.

3. A brick having dovetail grooves crossing its upper and lower surface, and similar grooves crossing its ends and sides, substantially as described.

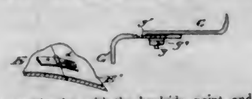
295,068. MACHINE FOR MAKING BARB-WIRE. JOS. S. STEPHEN, Joliet, Ill. Filed Sept. 4, 1883. (No model.)

Brief.—A single wire is fed by a reciprocating carriage and passes by the side of an upright needle. It is cut off between the needle and the carriage, and the rear end is bent to one side by bending-dies. This end is then fed forward past the other side of the needle. The needle is raised, carrying the ends of the wire upward. A looper loops the ends of the wire. Wrapping-spindles then advance and wrap the ends of the loops about the wire. The projecting ends of the loops form the barbs. A clamp in one wrapping-spindle clamps the wire while it is operated upon, and then opens to permit the passage of the barb. The barbed wire passes through a spring-guide, a stop-gage determining the distance apart of the barbs, and to a winding-spool.

Claim.—1. The combination of the reciprocating head D, swinging arm *d*, spur-wheel feed *d'*, ways H H, pitman D^2, arms D^3 and D^4, friction-roller D^5, and cam D^6, all arranged to operate as and for the purpose set forth.

2. In the barbing-machine described, the oscillating arm D^4, having the extension D^3, in combination with the cam D^6 and reciprocating head D, carrying devices for feeding the wire, and pitman D^2, as and for the purpose set forth.

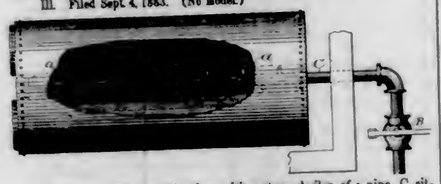
3. In the barbing-machine described, the fingers *y y*, in combination with the cutting-dies *i i'*, and the reciprocating sliding head D, and feed *d* and *d'*, and means for operating the fingers and dies, as and for the purpose set forth.



4. In the barbing-machine described, the needle r^2, having its point curved in a direction at right angles with the strand-wire, and having its side immediately below said curve hollowed, as and for the purpose stated.

5. In the barbing-machine described, the needle r^2, having the form shown and described, in combination with the shafts r^4 r', coiling-pins r^5 r^3, link r^6, crank b^2, rock-shaft *b*, crank b^1, and cam b^4, all arranged to operate as and for the purpose set forth.

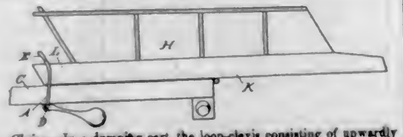
6. In the barbing-machine described, the combination of the reciprocating head D, provided with a suitable grip-feed for feeding the wire into the machine, cutting-off dies *i i'*, bending-fingers *y y*, reciprocating needle r^2, coiling-pins r^5 r^3, and the mechanism described for operating said several parts, as and for the purpose set forth.



7. In the barbing-machine described, the feed consisting of the spur wheel or roller *d'*, suspended in and in combination with the swinging arm *d*, as and for the purpose set forth.

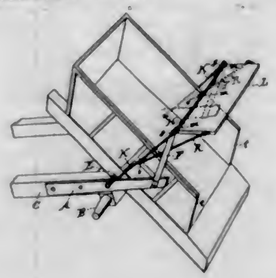
295,069. PLOW. GEO. STRUDEL, Chilton, Wis. Filed Sept. 3, 1883. (No model.)

Claim.—In combination with the landside, point, and beam of a plow, the mold-board made in sections with beveled edges, and hinged together, as shown, the section F' being adjustable, and having eye G^3, the bar G, having wide tooth *g'* and bolt *g*, the ratcheted arm G', having slot g^2, and the ratchets occupying either side of said slot, the bar G' being pivoted loosely to the landside, the bar G similarly pivoted to the movable section of the mold-board, and the nut g^4, for adjustably locking the bars G G' together, all as and for the purposes set forth.



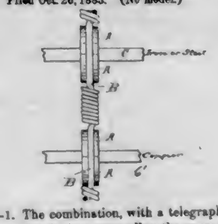
295,070. STEAM-BOILER CLEANER. ROBERT STEWART, Pittsfield, Ill. Filed Sept. 4, 1883. (No model.)

Claim.—1. The combination, with a steam-boiler, of a pipe, C, situated near the bottom thereof, and provided with short tubes *a*, having sharp beveled ends *d'*, and a valve, B, all of the above parts combined and adapted to operate as described.



2. The combination, with a steam-boiler, of a pipe, C, situated near the bottom thereof, and provided with a series of short tubes, *a*, having sharp beveled ends *d'*, the said pipe C being greater in cross-section than the sum of the areas of the cross-sections of the short tubes, substantially as set forth.

295,071. DUMPING-WAGON. THOMAS S. STEWART, Saltsburg, Pa. Filed Dec. 10, 1883. (No model.)

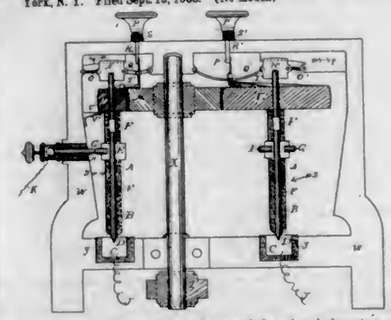


Claim.—In a dumping-cart, the loop-clevis consisting of upwardly and outwardly curved arms, connected at their upper ends by a cross-bar having a forwardly-projecting arm, and provided at their lower ends with eyes by which they are journaled to the shafts, and a rearwardly-extending weight-arm, by which the loop is held in engagement with the forwardly-projecting ends of the body-rails, substantially as shown and described.

295,072. AUTOMATIC END-GATE. THOMAS S. STEWART, Saltsburg, Pa. Filed Dec. 15, 1883. (No model.)

Claim.—In a dumping-cart, the combination, with the body D and shafts C, of the side-bars A, secured to the rear ends of the shafts, the standards F, secured at their lower ends to the side-bars, the transverse bar H, journaled in the upper ends of the standards, carrying the hinged end-gate L, the pivoted straight rods R, connected at their forward ends to the outer side walls of the cart-body, and at their rear ends to the lower side edges of the end-gate, and the brace-rods K, extending from the side-bars to the upper ends of the standards, substantially as specified.

295,073. TELEGRAPH-WIRE SUPPORTER. ROSS C. STONE, New York, N. Y. Filed Oct. 26, 1883. (No model.)



Claim.—1. The combination, with a telegraph-wire, of a divided insulator, a suspensory device surrounding the same, and a telegraph or transmitting wire suspended therefrom.

2. The combination, with a line-wire, as C, of two half-disks, as A A, of insulating material, a sustaining-wire, as B, secured around said parts A A, and the suspended wire, as C', substantially as described.

3. The combination, with line-wire C, of half-disks A A, of insulating material, secured thereto by wire loop B, the second pair of half-disks A A, suspended and secured by said loop B, and the wire C', passing through the suspended insulator, all substantially as shown and described.

295,074. TELEGRAPHIC TRANSMITTER. ROSS C. STONE, New York, N. Y. Filed Sept. 13, 1883. (No model.)

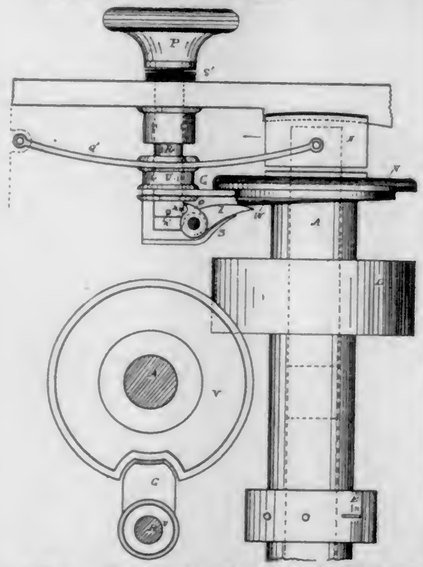
Claim.—1. The method of transmitting electric impulses, which consists in driving the contact or contacts of a series which makes the impulses constituting one letter or character at a given rate of movement, and the part of the same series which makes the impulses constituting another letter or character at a different rate of movement, substantially as set forth.

2. A series of spindles adapted to open and close an electric circuit by their movement, substantially as described, and mechanism to move various spindles of the series at different rates of speed, in combination, substantially as described.

3. A friction-driver of the character described, a series of vertical spindles arranged outside the driver, adapted, as described, to produce electrical impulses, and mechanism, substantially as described, to throw one or another of the spindles into contact with the driver, so as to be propelled thereby, all in combination, as set forth.

4. The combination, with a friction-driver, as M, of a series of spindles adapted to give electrical impulses by mechanism substantially as described, and a series of friction-drivers, as L, one on each spindle, the same being of various sizes, so that the spindles may be speeded differently, as set forth.

5. A friction-driver, a series of vertical spindles adapted to transmit electrical impulses, as described, and a series of keys adapted by suitable connections to throw the spindles into contact with the driver, all in combination, substantially as stated.



6. A friction-driver, a series of vertical spindles adapted to transmit electrical impulses, substantially as described, movable bearings supporting one end of said spindles, and a series of keys adapted to move said bearings, so that the spindles may be driven by the driver, all in combination, substantially as stated.

7. A friction-driver, a vertical spindle adapted to transmit electrical impulses constituting a telegraphic character, mechanism for throwing said spindle into position to be operated by said driver, and mechanism for retaining the spindle in contact with the driver, so that the spindle shall make a complete revolution, and stop at the close of the revolution, in combination, as set forth.

8. The combination of a friction-driver, a series of spindles adapted to transmit electrical impulses, as described, sliding bearings for said spindles, keys for moving said bearings, and an escapement or stop which throws the friction devices out of contact when the spindle has made a complete revolution, as set forth.

9. The combination of a friction-driver, a series of insulated spindles for transmitting electrical impulses, as described, sliding boxes for throwing the spindles into contact with the driver, toggle-levers for actuating said sliding boxes, and keys for operating the toggle-levers, as set forth.

295,075. TELEGRAPHIC TRANSMITTER. ROSS C. STONE, New York, N. Y. Filed Sept. 13, 1883. (No model.)

Claim.—1. The combination, with a spindle adapted by its rotation to open or close an electrical circuit, of a key and connecting mechanism adapted, as described, to unlock said spindle, and mechanism, substantially as described, adapted to lock the spindle when it has completed a single revolution, as set forth.

2. The combination, with a spindle adapted by its rotation to open and close an electrical circuit, of a locking-plate thereon, a locking device engaging with said plate, and a key adapted to disengage the locking device from the notch in the plate, as set forth.

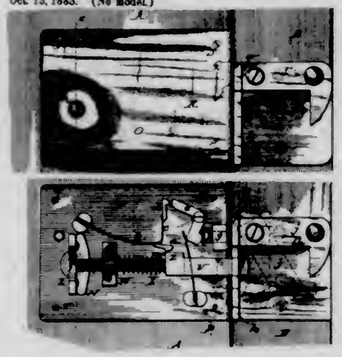
3. The combination, with a spindle of the character described, of a notched disk thereon, a locking device engaging the notch in said disk, a key adapted to disengage the locking device from said disk, and mechanism, substantially as described, which holds the locking mechanism from the disk during one revolution of the spindle, but locks the spindle at the completion of the revolution, as set forth.

4. A spindle adapted by its rotation to open and close an electrical circuit, a notched disk on said spindle, a locking device adapted to engage the notch in said disk, a key for disengaging the locking device from the disk, and mechanism, substantially as described, which is adapted to release the key from the locking device and permit it to return to its normal position while the spindle is revolved, substantially as described, all the elements in combination, as set forth.

5. A spindle adapted by its rotation to open and close an electrical circuit, a notched disk on said spindle, a locking device adapted to engage the notch in said disk when in one position, but to be forced out of the notch and held out by the disk during one revolution of the spindle, a spring which tends to press the locking device into the notch of the disk, a key for forcing the locking device out of the notch in the disk, and mechanism, as described, for releasing the key from the locking device while the spindle rotates, all in combination, as set forth.

6. The spring-key, the locking device secured loosely thereto, a spring tending to draw the locking device into the notch in the disk, a spindle of the character described, which carries said disk and a cam, and a latch actuated by said cam to disconnect the key from the locking device, all in combination, substantially as stated.

7. A spindle of the character described, a notched disk thereon, provided with a face-cam, as set forth, a locking device adapted to engage the notch in the disk when forced into said notch by a spring, a spring-key adapted to force the locking device out of the notch in the disk, a latch which normally holds the locking device in position to move with the key, but is operated to release the key from the locking device by the action of the cam, and a spring which tends to force the latch into engagement with the key, the specified elements in combination, all substantially as set forth.



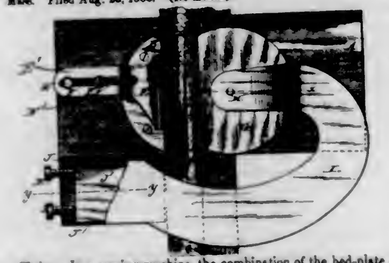
295,076. COMPASSES. FRITZ SAMUEL SVENSON, Lund, Skåne, Sweden. Filed Oct. 10, 1883. (No model.) Patented in Sweden July 3, 1883, No. 237.

Claim.—1. In compasses for use in blackboard or similar drawing, the combination of a sharp metallic point at the end of one of the legs, and a rubber block slipped over the point, the latter penetrating the block, covering the entire point or needle, excepting the extreme point, as and for the purpose shown and set forth.

2. The combination of the ruler having the crayon-holding block at one end, a slotted block sliding adjustably upon the ruler, and having a needle at its lower end, and a rubber block slipped upon the needle, the latter penetrating the block and covering the entire needle, excepting the point, as and for the purpose shown and set forth.

295,077. LOCK. FRITZ SAMUEL SVENSON, Land, Skane, Sweden. Filed Oct. 15, 1883. (No model.)

Claim.—1. The combination of a main bolt in a lock having its outer end cut off square, actuated or shot by a spring, and having a shoulder facing outward, a spring-catch adapted to engage the shoulder upon the bolt when the latter is drawn back, and having an upright spring-catch upon its upper side adapted to be engaged by the arm of a bell-crank, a bell-crank pivoted in the lock-casing, a beveled spring-bolt bearing with its inner end against the other arm of the bell-crank, and a catch-plate having a slot for the reception of the main bolt, and a removable flange adapted to be struck by the beveled spring-bolt, as and for the purpose shown and set forth.



2. The combination of a main bolt in a lock having means for drawing it back, and having a spring for shooting it, and having its outer end cut off square and an outwardly-facing shoulder upon its upper side, a beveled spring-catch adapted to engage the shoulder when the bolt is drawn back, and having an upright spring provided with a beveled catch at its upper end, a bell-crank having one arm adapted to engage the catch upon the end of the upright spring, when the spring-catch engages the shoulder upon the bolt, a beveled spring-bolt bearing with its inner end against the other arm of the bell-crank, a catch-plate having a slot for the reception of the end of the main bolt and a slot below the same, and a hook pivoted upon the inner side of the door-frame or the plane part of the catch-plate, having one end turned up to form a flange adapted to be brought in line with the slotted flange of the catch-plate, and to be struck by the spring-bolt, and having its hooked end adapted to be turned down to pass through the lower slot in the flange of the catch-plate into a corresponding slot in the front plate of the lock-casing, as and for the purpose shown and set forth.

295,078. REMEDY FOR HERNIA. EDWARD C. THATCHER, Kansas City, Mo. Filed Jan. 18, 1884. (No specimens.)

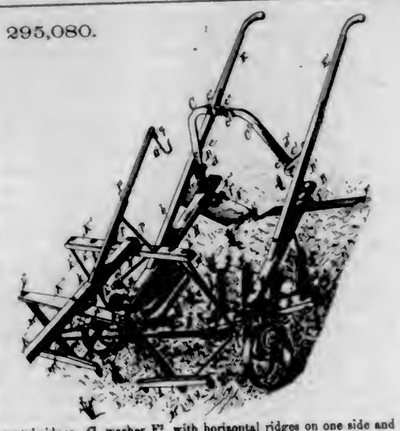
Claim.—1. An improved medical compound consisting of glue, sugar, honey, gutta-percha, glycerine, borax, alum, sulphur, black-lead, nitrate of potash, bitartrate of potash, and camphor, in or about in the proportions above set forth.

2. A medical compound for the treatment of hernia, consisting of glue, sugar, honey, gutta-percha, glycerine, borax, alum, sulphur, black-lead, nitrate and bitartrate of potash, and camphor, mixed and formed into pads, as above described, and adapted for use in combination with a portable electric element, as and for the purpose set forth.

295,079. SEWING-MACHINE GUIDE. WALES B. THAYER, Brockton, Mass. Filed Aug. 28, 1883. (No model.)

Claim.—In a sewing-machine, the combination of the bed-plate A, having fixed bearing-block J', throat-plate B, having the feed-slot C and needle-hole D, adjustable spring-guide E, bent arm or plate I, provided with the box J, rotary gage-disk G, and adjusting-screws K K, all constructed and combined to operate substantially in the manner and for the purpose set forth.

295,080. CULTIVATOR. AUGUSTUS C. TOWER and JUSTUS D. TOWER, Mendota, Ill. Filed June 13, 1883. (No model.)



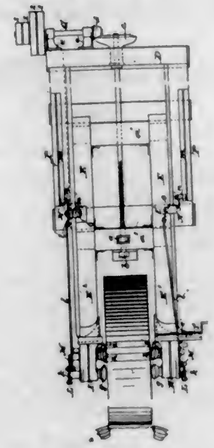
Claim.—1. In a cultivator, the combination, with the frame, of the clod-crushing plates F, loosely suspended from the rear part of the machine by adjustable bearings, whereby the vertical elevation and inclination of the said plates may be regulated at will, substantially as set forth.

2. In a cultivator having two tooth-beams adapted to operate on each side of a row of corn, &c., backward-extending beams bearing clod-crushing plates at their rear ends, in combination with the rear bow connecting said beams, and formed in two parts, C and C', adjustably united at top to regulate the distance apart of the rear end of the machine, substantially as set forth.

3. In a cultivator, the combination of the tooth-beams A with the backward-extending beams B, pivoted thereto, and the rods B^2, connecting the beams A and B, and having slots b^2 at their forward ends, whereby the said beams may be adjusted at the angle desired with respect to each other and secured in such position, substantially as set forth.

4. The plate F', having vertical arm *f*, with slot *f'*, and inner horizontal ridges, *f'*, washer F^2, with horizontal ridges on one side and radial ridges on the other, and hanger F^3, with flange having inner radial ridges, in combination with the plate F, having loops or brackets f^2, substantially as set forth.

295,080.



5. In combination with the rear beams and handles of a cultivator, the braces D and D', having diagonal slots *d* and *d'*, and arms e and *e'*, and the connecting-bow consisting of two arms, C and C', perforated and slotted at their upper overlapping ends, and pivoted at their lower ends to the said braces, and adapted to be adjustably secured by the bolts *c*, *c'*, and c^4, substantially as set forth.

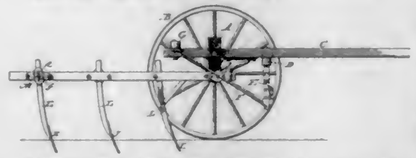
6. The metallic tooth-beams A, formed of double-angle iron, the front vertical flange of which is of less depth than the rear vertical flange, and each provided with the notches *a* on the under side, in transverse line with each other, and with perforations in the top flange, in combination with the teeth or knives A', having curved cutting-blades and round shanks, and the eyebolts *a'* and nuts a^2, whereby the said teeth or knives may be secured with their blades at any inclination from a vertical line desired, and with their rear ends projecting downward, substantially as set forth.

7. In combination with the front beams of a cultivator having the eyebolts *l' l'*, the tongue K, rear cross-bar, K', with vertical braces *k'*, diagonal braces L L, bolted to the tongue and to the vertical braces *k'*, and ending in hooks *l l*, for engagement with the said eyebolts *l' l'*, evener K^2, having metal straps M, suspended therefrom, and rods M^2, connecting the lower ends of the said straps with the diagonal braces L, substantially as set forth.

8. In combination with the diagonal braces L, the clamping-plates N, adjustably secured thereto, and having hooks *n*, integral with said plates, whereby the closed links at the ends of the chains may be readily attached thereto or detached therefrom, substantially as set forth.

295,081

295,081. MACHINE FOR DRESSING GRINDSTONES. FRANK TREE, Westminster, England, assignor to A. C. Baldwin, Boston, Mass. Filed Oct. 18, 1883. (No model.) Patented in England Jan. 20, 1883, No. 341.



Brief.—The sides of the stone are dressed by cutters mounted upon arms that project forward in parallel lines from a carriage which is advanced in a direction at right angles to the axis of the stone. The cutter-shafts are automatically rotated in their supporting-sockets, so that the bearing-point of each cutter against the stone shall always be in one of the radial lines of the stone. For this purpose the cutters, which are of the self-rotating variety, are set obliquely to their carrying-bars.

Claim.—1. In a machine for making grindstones, a frame provided with projecting parallel arms carrying slides and cutters, and adapted to be moved toward and from the stone to be dressed, in combination with the journals for the stone-spindle, arranged at right angles to the line of feed of the frame, as set forth.

2. In a stone-dressing machine, a movable frame bearing a series of cutters, said cutters being mounted in the cutter-bars with their axes inclined to the axes of the bars, the cutter-bars being connected by means of arms to a rod which is automatically moved by the forward movement of the frame, whereby the relative positions of the cutters are changed as they are moved toward the eye of the stone.

3. The combination of the cutters *g* and *h*, mounted in the cutter-bars, with their axes inclined to the axes of said bars, the pivots of which are provided with arms L and M, and connected together by the bars or links K, with the rods *l*, bell-crank levers N, guides P, and guide-slots M.

295,082. WHEEL-CULTIVATOR. NEWTON THOWBRIDGE, Council Grove, Kans. Filed Oct. 11, 1883. (No model.)

Claim.—1. In a cultivator, the combination of the wheeled draft-frame having cultivator-beams jointed thereto, the evener D, pivoted to the under side of the frame in advance of the axle, and provided with hangers E, the rear evener, G, pivoted to the upper side of the frame at a distance substantially such as specified in rear of the axle, and the connecting-rods F, extending from the ends of the rear evener to the lower ends of the respective hangers, whereby the power or draft applied to propel the machine is caused to sustain the forward end of the draft frame or tongue.

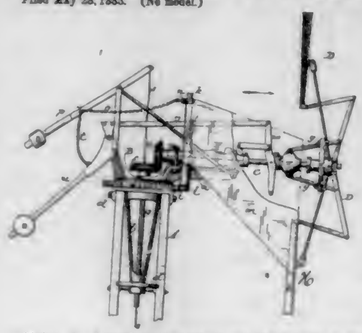
2. In combination with a drag bar or beam, the bracket *n*, having its ends secured to the beam, and its central portion offset laterally and slotted vertically, as described, the shovel-standard inserted between the bracket and the beam, and the fastening-bolt, applied as described.

3. The improved bracket, having its two ends adapted for attachment to the beam, its middle portion offset laterally and elongated vertically, to receive the shovel-standard on the inside, with a slot in said elongated portion.

295,083. TOY. ANTON TRUNK, Bridgeport, Conn. Filed Jan. 23, 1884. (No model.)

Claim.—1. As a new article of manufacture, a knife having attached at the rear portion of the handle a cap adapted to be turned around, and thereby produce, by friction against a leaden or other plate or disk, a series of sounds, substantially as described.

2. The combination, with the handle of a knife, of an independent cap secured to the handle in such manner as to turn freely, and a leaden or other suitable plate or disk placed between said handle and cap, substantially as shown and described.



3. In combination with a knife-handle, the plate or disk, of lead or other suitable material, adapted to be attached over said handle, and having a projection extending within an independent cap secured to the handle so as to turn freely, substantially as and for the purposes set forth.

4. As a toy, a leaden or other plate or disk adapted to be placed over the rear end of a knife-handle, and having a projection on its rear face, in combination with a cap adapted at its forward portion to accommodate said projection, and secured in position by a screw or nail passed loosely through said cap and plate into the handle, substantially as set forth.

5. The combination of the handle A, plate D, constructed as described, cap H, and screw K, substantially as set forth.

6. The plate D, having projections E F, and with central opening, G, in combination with the handle A, having recess C, cap H, with central opening, J, enlarged at the forward portion, and screw K, substantially as and for the purposes hereinbefore set forth.

295,084. WINDMILL. HENRY K. UNDERWOOD, Waukegan, Ill., assignor of one-half to John F. Powell and R. John Douglas, same place. Filed May 23, 1883. (No model.)

Claim.—1. A vertical wind-wheel and a turn-table to sustain the same and permit it to swing horizontally with the wind, in combination with a pawl-and-ratchet mechanism to lock the table against rotation in one direction, a vane to cause the engagement of the pawl, a weighted lever provided with manual devices whereby it may be elevated, and connecting devices between said lever and the pawl for the purpose of disengaging the latter, said connections constructed as described, to remain inoperative when the lever is depressed.

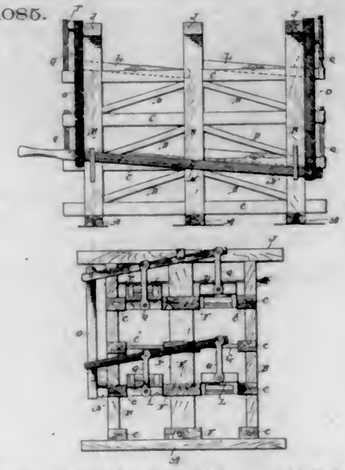
2. In combination with the fixed toothed plate, the turn-table having the wheel thereon, the vertical shaft provided with the dog and vane, and the weighted lever *p*, connected therewith.

3. In combination with the rosette-wheel and its turn-table, the pawl-and-ratchet devices to lock the turn-table, the rock-shaft connected to the pawl, the vane and arm attached to the rock-shaft, the weighted lever connected with said arm, and the cord or chain *s*, connected with the lever.

4. In combination with the horizontally-turning turn-table, the toothed disk and the locking-dog having its forward end adapted to engage the teeth, and the rear end adapted to serve as a stop to limit its movement.

5. The vertical horizontally-swinging wind-wheel with feathering blades, combined with automatic mechanism, substantially as described, to govern the position of the blades, automatic locking mechanism, combined with a vane to control the swinging action of the wheel, and a manual device, *s*, connected, substantially as described, with the governing and also with the locking mechanism, whereby the operation of the manual device is caused to serve the double purpose of adjusting the blades to an inoperative position and of unlocking the wheel, that it may swing freely in either direction.

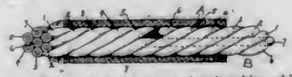
6. A vertical wheel sustained by a turn-table and arranged to swing horizontally to follow the course of the wind, in combination with an automatic device to lock the head against rotation in one direction, a chain or equivalent manual device to disengage the locking device, an automatic governing mechanism to control the speed of the wheel, and a connection, substantially as described, between the locking and governing devices, whereby the two are permitted to operate independently, but their simultaneous operation by hand permitted.



7. In combination with the vertical rosette-wheel and its turn-table, the wheel-governing collar *x*, and the weighted lever *u*, connected therewith, the pawl-and-ratchet mechanism to control the rotation of the turn-table in one direction, the vane *m*, and the opposing lever *p*, weighted out of action, both connected with the pawl, the connection *t* between the two levers, and the rod or chain *s*, connected with lever *p*, whereby, raising the upper lever by hand, the lower one may be raised simultaneously therewith.

8. In combination with the wheel and its turn-table, the stationary toothed plate, the vane upon the turn-table, and the pawl attached directly to the vane-shaft.

9. The combination, in a wind-wheel, of the device to lock the turn-table against rotation, the lever connected therewith and provided with a manual device, the lever to govern the speed of the wheel, and a connection between the two levers, whereby the governing devices are permitted to operate independently of the locking devices, but the manual action of the two simultaneously permitted.



295,085. RACK FOR HOLDING BARRELS. WILLIAM WALTER, Latrobe, Pa. Filed Oct. 2, 1883. (No model.)

295,085.

Claim.—The combination of a suitable frame or rack, with the two seperate sets of tilting devices L, which are pivoted at their centers and arranged end to end, with the operating-lever N, connecting-rods O, pivoted levers P, and the rods Q, which connect the tilting devices to the levers P, substantially as shown and described.

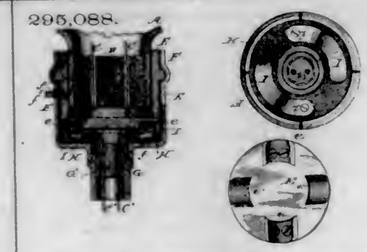
295,086. COMPOUND ELECTRIC CABLE. RICHARD S. WARING, Pittsburg, Pa. Filed Dec. 28, 1883. (No model.)

Claim.—1. The method of forming electric cables, which consists in twisting together one central and a series of surrounding insulated electric conductors for a short distance, interchanging in position the central or core conductor and one of the outside conductors, so as to bring the central conductor into the outer series, and repeating these steps at suitable intervals throughout the entire length of the cable, substantially as set forth.

2. The method of forming electric cables, which consists in twisting together one central and a series of surrounding insulated electric conductors for a short distance, interchanging in position the central or core conductor and one of the outside conductors, so as to bring the central conductor into the outer series, repeating these steps at suitable intervals throughout the entire length of the cable, and inclosing the prepared cable within a metallic sheath, substantially as set forth.

3. An electric cable having a central and a series of surrounding insulated conductors twisted together, each surrounding conductor in turn forming the center or core of the cable, substantially as set forth.

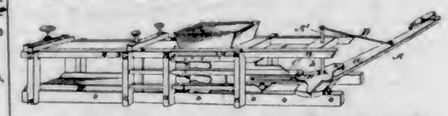
4. An electric cable having a central and a series of surrounding insulated conductors twisted together, each surrounding conductor in turn forming the center or core of the cable, in combination with a suitable metallic covering or sheath, substantially as set forth.



295,087. HOLDER FOR THE CARBONS OF INCANDESCING ELECTRIC LAMPS. ALEXANDER WEIHL, St. Denis, Md., assignor to the Viaduct Manufacturing Company of Baltimore City. Filed July 28, 1883. (No model.)

Claim.—The holder herein described for carbon filaments, consisting of a piece of wire having its end flattened, the flat portion pierced with a hole corresponding to the shape of the filament, bent over on the line of said hole, and pressed on a form of the shape in section of the filament, thus forming a tube to receive the carbon, substantially as and for the purpose set forth.

295,088. ELECTRIC LAMP. ALEXANDER WEIHL, St. Denis, Md., assignor to the Viaduct Manufacturing Company of Baltimore City. Filed Aug. 9, 1883. (No model.)



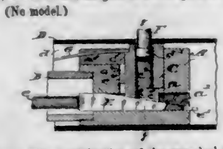
295,088.

Claim.—1. The combination of the metallic cup, slotted as described, the wooden cup inserted therein and held by the spring of the metal, the metal plates on the wooden cup connected to the lamp-wires, and the metallic spring-plates secured to the insulating-ring, as and for the purpose set forth.

2. The combination, in an electric lamp, of a wooden cup to receive the globe, having the wires passed through it and secured to metal plates on its bottom, a metallic cup encompassing said wooden cup and having within it a non-conducting ring, to which are secured two spring-plates for attachment to the outer wires, a circumferential slot in the metallic cup, and a pin passing through said slot and entering the wooden cup, whereby the relation of the cups to each other may be changed, as set forth.

295,089. BALING-PRESS. CHAS. E. WHITMAN, St. Louis, Mo. Filed Feb. 6, 1884. (No model.)

Claim.—1. In a horizontal baling-press, the combination of a bell-crank lever with a pitman, traverser, sweep, and press-box, substantially as described.



2. In a horizontal baling-press, the combination of the slotted pitman with the traverser, bell-crank lever, and sweep, substantially as described.

3. In a horizontal baling-press, the combination of the sweep provided with a lug or lugs, bell-crank lever or levers, or the equivalent thereof, as set forth, with the pitman and traverser, substantially as described.

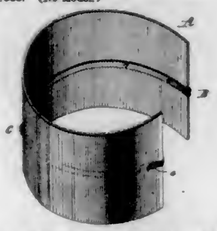
4. In a horizontal baling-press, the combination of a bell-crank lever provided in one of its arms with a series of holes or apertures, a pitman also provided with a series of holes, and a suitable connecting pin or bolt for increasing or diminishing the power, and yet advancing the traverser to the same point, substantially as set forth.

5. In a horizontal baling-press, a connecting-link between the bell-crank lever and sweep, for securing them rigidly together at the commencement of the baling operation, substantially as described.

295,090. DEVICE FOR PUNCHING METAL TUBES. GEORGE W. WHITMAN, St. Louis, Mo., assignor to M. C. Bignall, same place. Filed Sept. 8, 1883. (No model.)

Claim.—1. The combination of the mandrel A, the tube B, the die C, the wedge E, and handle *e*, substantially as described.

2. The combination of the mandrel A, the tube B, the die C, the wedge E, the handle *e*, and the spring G, substantially as described.



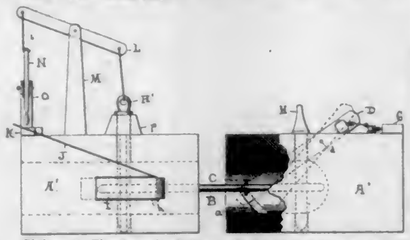
3. The combination of the mandrel A, having the perforations *a* and *a'*, as described, the die C, having the perforations c^3 c^3, as described, and the wedge E, substantially as described.

4. The mandrel having the perforations *a* and *a'* and the slot a^2, the die C, having the projection c^4, the wedge E, and the spring G, substantially as described.

5. The combination of the mandrel A, the die C, and wedge E, said wedge being flattened on the under side, and moving in a groove of corresponding shape in the mandrel, and said die being guided in its movement in the mandrel, as and for the purposes set forth.

6. The combination of the mandrel A, having the groove a^2, the tube B, having the holder *b*, the die C, having the shoulder c^3, and the spring G, substantially as described.

295,091. CUFF-HOLDER. C. MADISON ALEXANDER, Brightwood, D. C. Filed Aug. 9, 1883. (No model.)



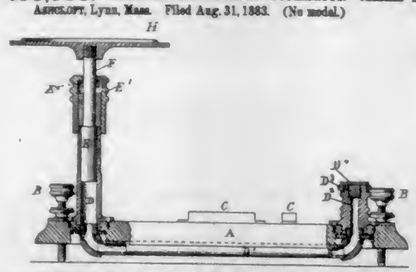
Claim.—1. An appliance to be attached to a cuff, consisting of a spring adapted to be secured to it, so as to distend the same, and provided with means for holding it in a coat-sleeve, all substantially as specified.

2. An appliance adapted to be attached to a cuff, consisting of a spring having its ends bent, as described, to embrace the edges of the cuff, and provided with points at suitable intervals to hold it to the cuff, substantially as set forth.

3. An appliance adapted to be attached to a cuff, consisting of a spring having the ends bent and pointed, so as to hold the cuff within the sleeve, substantially as specified.

4. An appliance adapted to be attached to a cuff, consisting of a spring having its ends bent, as described, and provided with a button or projection midway between its ends, substantially as specified.

295,092. CAR-COUPLING. SIDNEY D. ASPLE, Salisbury, Ill. Filed Dec. 13, 1883. (No model.)

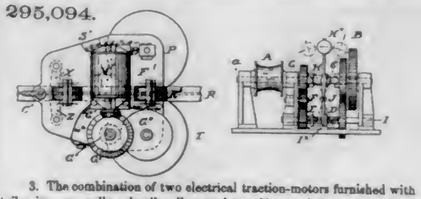


Claim.—1. The draw-head A, provided with the tilting-rod C, in combination with the link B, substantially as described.

2. The draw-head A′, provided with the block I, and the compound levers L and N, substantially as described.

3. The combination of the draw-head A, with its tilting-rod C, and the draw-head A′, with its block I, substantially as described.

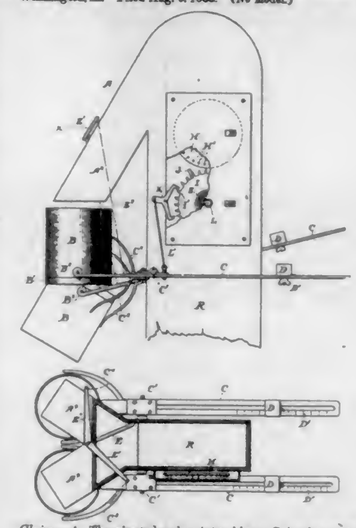
295,093. PRESSURE-GAGE-TESTING APPARATUS. CHARLES E. ASHCROFT, Lynn, Mass. Filed Aug. 31, 1883. (No model.)



Claim.—In a pressure-gage-testing apparatus, the combination of the weight-disk H, piston E, and cylinder D with the tube D′ D^2 and coupling-joint D^3, operating substantially as described, and for the purpose set forth.

295,094. SYSTEM OF ELECTRICAL HAULAGE. WM. E. AYRTON and JNO. PERRY, London, England. Filed Apr. 18, 1883. (No model.) Patented in England July 17, 1882, No. 3,380.

Claim.—1. The combination of an electrical traction-motor furnished with tail-grips, a hauling-line, and a winding-winch, substantially as herein described.

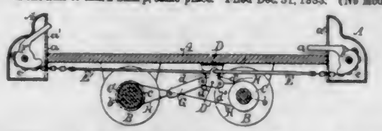


2. The combination of two or more electrical traction-motors furnished with tail-grips, a hauling line or lines, and one or more self-reversing winding-winches, substantially as herein described.

295,094.

3. The combination of two electrical traction-motors furnished with tail-grips, an endless hauling-line, and a self-reversing winding-winch upon the boat, wagon, car, or train, to effect systematic alternate haulage by winding, substantially as herein described.

295,095. GRAIN WEIGHER AND REGISTER. GEORGE D. BAIRD, Washington, Ill. Filed Aug. 6, 1883. (No model.)



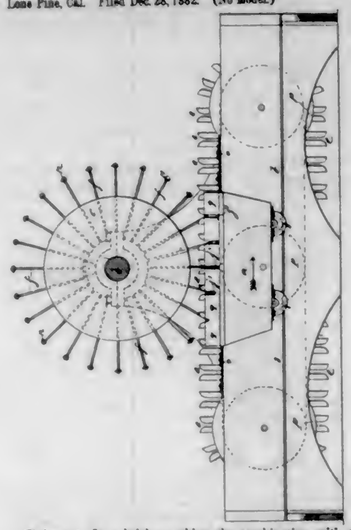
Claim.—1. The pivoted and weighted lever C, having springs C^2 C^3, and the pivoted and weighted bucket B, in combination with the spout A, having valve L, and means whereby the movements of said lever C shall open and close said valve, for the purpose set forth.

2. The weighted and pivoted lever C and the pivoted bucket B, in combination with the connecting-rod L′, pallets K, and wheel I, having spring S, substantially as and for the purpose specified.

3. The pivoted levers C, having weights D and springs C^2 C^3, and the buckets B, having pivoted supports B^2 and weighted bottoms B′, in combination with the bifurcated spout A, having valve E, handle E′, and cords E^2, substantially as and for the purpose set forth.

4. The pivoted and weighted lever C, having springs C^2, and the pivoted bucket B, having means whereby it shall return to its vertical position after being emptied, in combination with a spout and valve therein having means by which the movements of said lever shall open and close the same, for the purpose set forth.

295,096. CAR-BRAKE. ELIJAH E. BAKER, Providence, R. I., assignor of one-half to Mark Sharp, same place. Filed Dec. 31, 1883. (No model.)



Claim.—1. An improved car-brake consisting of a band passing continuously from one axle to another, and provided with the foot-levers a, arranged and operating as described.

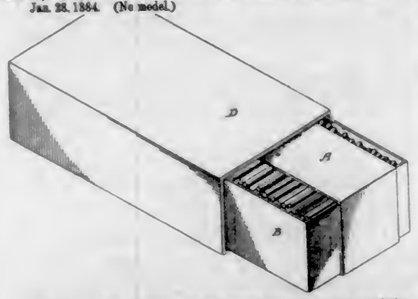
2. The combination, with the axles carrying the grooved friction-disks, and the brake-band, arranged as described, of the lever D′, the link G, the brake-rod, and the eccentric foot-levers, mounted upon the platform and operating as described.

3. The combination, with the brake-band, arranged as described,

and the operative connections therefor, of the sectional shoe, the spring-releasing connections, and the axles provided with the grooved disks.

295,097. BRICK-CUTTING MACHINE. THOMAS MILES BANNISTER, Lone Pine, Cal. Filed Dec. 28, 1882. (No model.)

Claim.—1. In a brick-machine, the combination, with the rotary cutters d, of an endless belt, o, provided with guides e, arranged in pairs, with an opening between them, substantially as herein shown and described, whereby a square cut will be insured, as set forth.

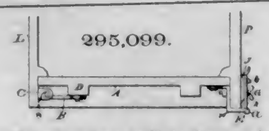


2. In a brick-machine, the combination of the heads c c, and the arms f, carrying cutters d, with the truck a, and the endless belt o, provided with the guides e, substantially as shown and described.

3. The wire cutters d of a brick-cutting reel, mounted on spring-arms f, arranged between supporting-pins g h, and connected to pins i in the reel-heads, substantially as described.

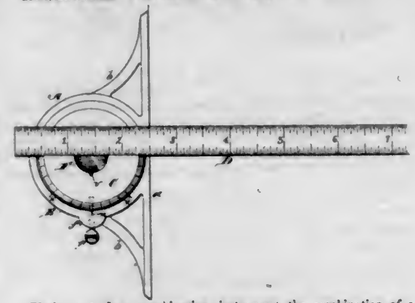
4. In a reel of clay-cutting wires, d, mounted on spring-arms f, the arrangement of the supporting-pins over which the arms spring, whereby said arms may have greater range for springing when cutting the clay than when returning therefrom, substantially as described.

5. In a reel of clay-cutting wires, d, mounted on spring-arms f, which are supported between pins g and h in the reel-heads, the said supporting-pins located in the heads to allow the said arms greater range of spring in one direction than the other, substantially as described.



295,098. MATCH-BOX. JACOB C. BAUER, Philadelphia, Pa. Filed Jan. 28, 1884. (No model.)

Claim.—The within-described match-box, the same consisting of the combination of the tray B, the outer casing, D, and the band A, extending longitudinally over and under the tray, all substantially as set forth.



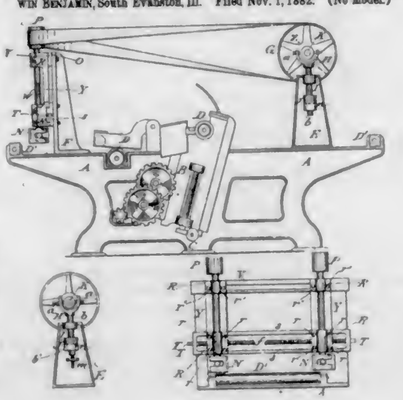
295,099. WAGON END-GATE. GEORGE BECKER, Mansfield, Ohio. Filed Apr. 12, 1883. Renewed Feb. 13, 1884. (Model.)

Claim.—The combination of the end-gate A, hinged to the wagon-body by the hinges B C, the part C being formed with the curved slot

s, whereby the end-gate may readily be disconnected from the body, with the catch E, formed of the plates W and N, adapted to hold the gate closed by means of the bolt G, and plate J, provided with the knob b, as specified.

295,100. COMBINED BEVEL AND T-SQUARE. STEPHEN H. BELLOWS, Athol, Mass. Filed Jan. 7, 1884. (No model.)

Claim.—1. In a combination-instrument, the combination of a straight-edge, a recessed base supported therefrom, a disk capable of rotation therein, provided with a groove immediately upon one side of its median line, and means for securing the base and disk in any relative position, substantially as described.



2. In a combination-instrument, the combination of the recessed base suitably supported from a straight-edge, a grooved disk capable of rotation therein, and having a conical opening in its center, and a bevel-headed screw and nut for locking the two together, substantially as described.

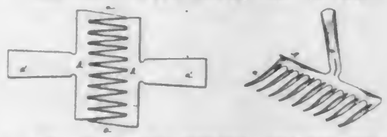
3. In a combination-instrument, the recessed base, grooved disk capable of rotation therein, and the conical-headed screw having a portion of its head cut away to form part of the groove, substantially as described.

4. In a combination-instrument, the recessed base, having aperture A through its flange, the rotatable disk C, seated in the recessed base, and adapted to carry the rule or level, as described, and provided with apertures i in its periphery, extending inwardly at right angles to the axis of rotation, and the pin p, adapted to pass through A and take in one of the apertures i, substantially as described.

5. The combination of a bubble-glass or spirit-level, a strip upon which it is mounted, a rotatable disk grooved to receive the strip, and into or from which it may be readily placed or removed at will, a base supported from and by a straight-edge, and recessed upon its face to receive and support the disk, the disk being arranged to rotate therein, and means for clamping the bubble-glass or spirit-level at any desired angle whatever to the straight-edge, substantially as described.

295,101. JOINTING ATTACHMENT FOR PLANING-MACHINES. EDWIN BENJAMIN, South Evanston, Ill. Filed Nov. 1, 1882. (No model.)

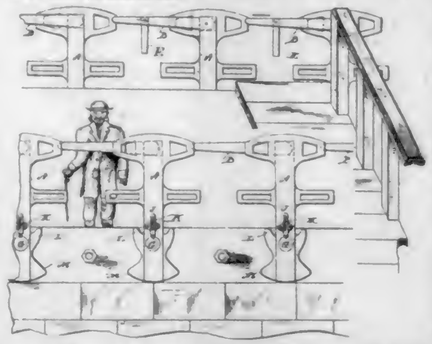
Claim.—In a jointing attachment to wood-planing machines, the standards E and F O, attached to the top of the planer-frame, the standards E, to support the drive-shaft K, and the standards F O, to support the jointing devices, consisting in the combination of the cutter-heads supported by adjustable box-standards Y, having sliding bearings in the bars V *f*, as and for the purpose specified.



295,102. INTERNAL STOPPER FOR BOTTLES. HENRY BENSON, Nottingham, England. Filed Dec. 29, 1883. (Model.) Patented in England Apr. 21, 1882, No. 1,898, and in France Dec. 14, 1882, No. 151,557.

Claim.—1. In a bottle-stopper, the stud chambered at its upper and lower ends, and centrally perforated, and formed with a circumferential groove, in combination with the washer fitted in said groove and projecting beyond the sides of the stud, and the plug passed through the central perforation and upper chamber, and provided with a washer at its lower end, fitting within the lower chamber of the stud, substantially as described.

2. The stopper composed of the stud chambered at its upper and lower ends, and perforated and provided with a circumferential washer, in combination with the plug passed through the perforation and chambers, and provided with a washer at its lower end and a spring at its upper end, within the chamber, to hold the washer against the base of the stud, substantially as and for the purpose set forth.



295,103. RAKE. SAMUEL BOOKER, Tiffin, Ohio, assignor of one-half to Robert Tschumy, same place. Filed May 1, 1883. (No model.)

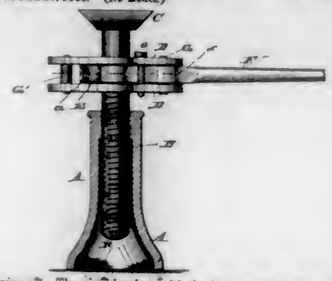
Claim.—As an article of manufacture, a sheet-metal rake having the rake-head, teeth, and shank integral, the head of the rake being curved in cross-section, and the teeth convexed on their inside or working faces, substantially as described.

295,104. GUARD-FENCE FOR DRAW-BRIDGES. ANDREAS BOSCH, Prairie du Chien, Wis. Filed Dec. 4, 1883. (No model.)

Brief.—Independent pivoted sections in the approach with a pivoted bar having a depending bar are held in vertical position by a gravitating latch engaging a notch of the pivotal bolt. The latch is released by an arm on the bridge-section, and the pivoted sections are moved out of the way by projections on the bridge-section acting on cams on the pivoted sections.

Claim.—1. A fence which is composed of pivoted sections, in combination with latching devices, and with brackets O, applied to the draw, and adapted for adjusting the fence-sections above and below the level of the roadway, substantially as described.

2. The combination of pivoted fence-sections constructed with cams L M on their ends, latching devices, and brackets applied to the draw and adapted to operate substantially as described.

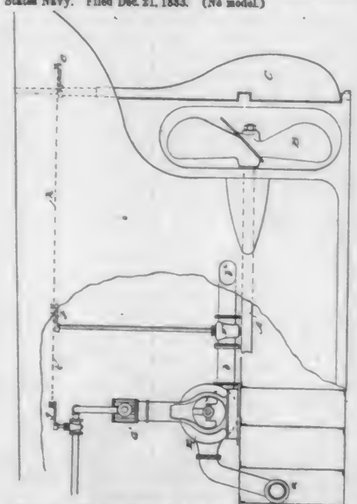


3. Fence-sections A, pivoted to the stationary part of a bridge by means of a bolt, O, having notched heads, in combination with gravitating latches and means for releasing these latches from said bolt-heads, substantially as described.

4. The combination, with swinging pivoted fence-sections, of separate arms, one pivoted to each section, substantially as described, whereby the spaces between said sections can be closed when the sections are thrown up.

5. In combination with a bridge-draw, brackets O, provided with beveled ends, and pins N, pivoted fence-sections constructed with cams M L, and provided with latching devices, substantially as described.

6. The combination of the swinging sections A, the pivoted closing-arms B, and the pivoted gravitating pieces E, substantially as described.

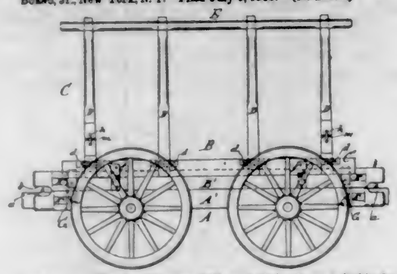


295,105. LIFTING-JACK. MORDECAI BROWN, Huntington, W. Va., assignor to himself, Robert T. Oney, and Chris Yatter, all of same place. Filed Dec. 29, 1883. (No model.)

Claim.—1. The combination, with the jack-screw, its standard, and perforated hub, of the loose collars, the fulcrum-pin, and a lever-dog having a hook and tooth, all constructed and adapted to operate substantially in the manner and for the purposes described.

2. A lever-dog adapted for a lifting-jack, constructed as described, consisting of a long lever having formed on one end a fulcrum-hook and an engaging-hook, substantially as specified.

295,106. STEERING APPARATUS. ROBERT M. G. BROWN, United States Navy. Filed Dec. 21, 1883. (No model.)

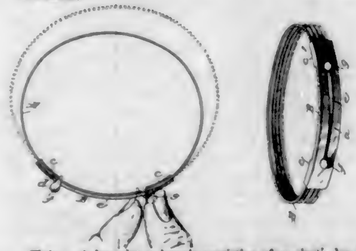


Claim.—1. The combination, with the rudder and rudder-operating mechanism, of a hydraulic steering apparatus independent of the rudder, but connected with and operated by the same mechanism through the instrumentality of which the rudder is operated.

2. The combination, with the rudder and tiller for operating the same, of a hydraulic steering apparatus connected with and operated by said tiller, said parts being organized and arranged substantially as hereinbefore set forth, so that the hydraulic apparatus shall be called into action only when the tiller moves beyond a predetermined distance to one side or the other of its amidships position.

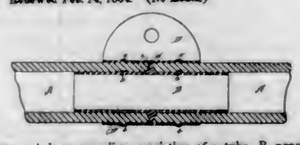
3. The combination of the pump, its operating mechanism, and inlet and outlet branches, the throttle-valve, the two-way cock for diverting the discharge into one or the other of said outlet branches, the rudder, and the tiller connected to and adapted to operate simultaneously the throttle-valve, the two-way cock, and the rudder—claiming none of these elements separately, but only the combination of all of them when arranged to co-operate in substantially the manner hereinbefore set forth.

295,107. WAGON FOR TRANSPORTING SUGAR-CANE. TACITO BUENO, Jr., New York, N. Y. Filed July 9, 1883. (No model.)



Claim.—1. The combination, with a truck having a suitable frame and wheels, of a detachable cart or wagon frame constructed, substantially as herein shown and described, with a rectangular bottom having vertical sides hinged thereto, adapted to be held in an upright position by suitable braces, and adapted by lowering to serve as discharge chutes or guides, said frame being provided with suitable clamps for coupling it to a cart or car-truck body, as set forth.

2. The combination, with the frame-bottom B' and vertical sides C C, of fastenings *d*, hinges *f*, braces *g h*, and coupling-clamps G, all constructed and arranged substantially as herein shown and described.

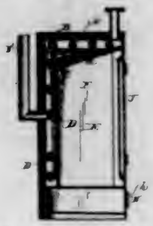


3. The combination, with the removable cart or wagon frame B, constructed substantially as herein shown and described, and provided with the coupling-clamps G, of the cart or wagon body A, as set forth.

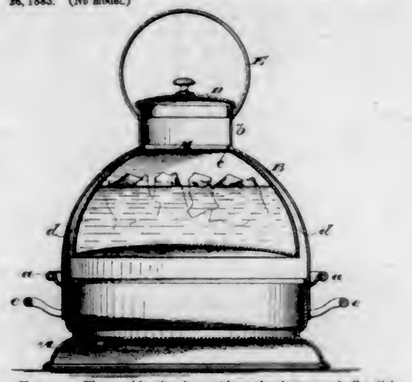
295,108. BRACELET. CHARLES R. BOSSER, Attleborough, Mass., assignor to Burrows, Thompson & Short, same place. Filed Jan. 24, 1884. (No model.)

Claim.—A bracelet or bangle consisting of an elastic band, A, slotted piece B, in combination with a pin set in free end or ends of the band, substantially as described.

295,109. HOSE-COUPLING. WILLIAM H. BULKLEY, Cleveland, Ohio, assignor of one-half to Alfonso Charbonneau, same place. Filed Sept. 8, 1883. Renewed Feb. 14, 1884. (No model.)



Claim.—A hose-coupling consisting of a tube, B, provided with peripheral ridges *b c*, a plate, *d*, and a collar, D', provided with grooves *a*, adapted to correspond with ridges *b*, and having wings D, provided with screw F and nut G, substantially as and for the purposes described.



295,110. REFRIGERATOR. JOHN BURKE, Niles, Mich. Filed Dec. 12, 1883. (No model.)

Claim.—The herein-described refrigerator, consisting of an outer and inner casing, a series of pipes or tubes arranged between said casings, an inner portion, E, having the inclined roof, ventilator I, doors J J, consisting of the frame-work, and having the center portion formed of glass, openings *j'* in the side of the doors to register with openings in the casings, said doors having strips of rubber arranged upon their upper and lower edges, and the slides H H, substantially as set forth.

295,110.

295,111. BUTTER-DISH. ANDREW J. CHASE, Boston, Mass. Filed Dec. 26, 1883. (No model.)

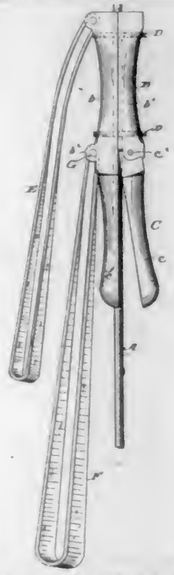
Claim.—1. The combination, in a refrigerating butter or similar dish, of a dome or cover and an ice-receptacle suspended therein, the dome or cover and ice-receptacle being united together at an opening common to both, whereby the ice-receptacle may be charged without detachment from the dome or cover, substantially as described.

2. The combination, in a refrigerating butter or similar dish, of a dome or cover, an ice-receptacle suspended therein, and a neck common to both, the dome and ice-receptacle being united at the base of the neck, whereby the ice-receptacle may be charged without detachment from the dome or cover, substantially as described.

3. The combination, in a refrigerating butter or similar dish, of a receptacle for the article to be cooled, a dome or cover, an ice-receptacle suspended therein and rigidly attached thereto, and a neck or opening for the ice-receptacle, passing through the dome-cover and controlled from the exterior thereof, substantially as described.

4. The combination, in a refrigerating butter or similar dish, of a receptacle for the article to be cooled, a dome or cover, an ice-receptacle suspended therein and of such smaller dimensions than the interior of the dome or cover as to form an air-circulating chamber around the ice-receptacle, and a neck or opening common to both, the dome or cover and ice-receptacle being united together at the base of the neck or opening, substantially as described.

5. The combination, in a refrigerating butter or similar dish, of a receptacle, A, a cover, B, a suspended ice-receptacle, C, a neck, *b*, common to both, and a cap or cover, D, substantially as described.



295,112. FIRE-ESCAPE. JAMES M. CHESNUT, Muncy, Pa. Filed Nov. 12, 1883. (No model.)

Brief.—A friction device for a fire-escape, consisting of two handles having a straight passage-way from end to end for the rope, one handle being incompressible, the other compressible.

Claim.—1. The herein-described device for descending a fixed rope, consisting of the combination of two handles, both constructed to surround the rope, and having a straight passage-way from end to end for the same, one of said handles being incompressible and of a form adapting it to be firmly grasped without arresting the passage of the rope, and the other made in part of a movable portion adapted to compress the rope under the grasp of the operator and act as a brake, substantially as set forth.

2. The herein-described device, consisting of the combination of the incompressible hollow handle B, adapted to surround the rope, the part c^3, rigid therewith, and the part *c*, movably connected therewith, said parts

295,112.

c^2 and c forming the compressible handle C, also adapted to surround the rope, substantially as set forth.

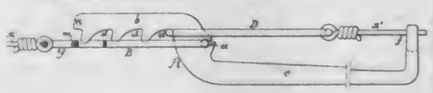
3. The herein-described device, consisting of the combination of the two metallic castings B c^2 and c, pivoted together, and forming the hollow incompressible handle B and the hollow compressible handle C, substantially as set forth.

4. The herein-described device, consisting of the combination of the three metallic castings b, c^2, b', and c, connected by bolts or rivets D and pivot c^2, and forming the handles B and C, substantially as set forth.

5. The herein-described device, consisting of the combination of the hollow handle B, made in two parts, b b', adjustably connected with one another, and the hollow handle C, having one portion attached to the part b and the other portion movably connected with the part b', whereby it may act as a brake to hold the rope, substantially as set forth.

6. The herein-described device, consisting of the combination of the incompressible handle B, the brake-handle C, made in two parts, between which the rope is adapted to be held, one part being rigid with the handle B and the other pivoted thereto, and means for adjusting the said pivot of one part toward or from the other part, substantially as set forth.

7. The herein-described device, consisting of the combination, with the part B, surrounding the rope, and adapted to support the weight of the operator, of the brake c c^2, having the cone-shaped throat c^2, for grasping the rope, substantially as set forth.



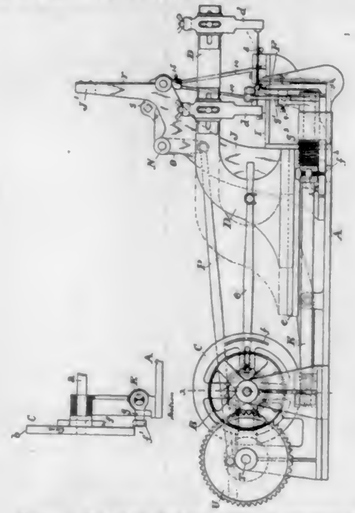
295,113. SUBSTANCE FOR RENDERING FABRICS WATER-PROOF. LYMAN P. CONVERSE, Chicago, Ill., assignor to the Water-Proof Fabric Company, of New York. Filed Aug. 22, 1882. Renewed Feb. 12, 1884. (Specimens.)

Claim.—1. The process herein described of producing a pliable waterproofing compound unaffected by variations of temperature, which process consists in boiling linseed-oil at a temperature of from 620° to 700° Fahrenheit, as hereinbefore set forth.

2. As a new article of manufacture, a pliable water-proof substance unaffected by variations of temperature, consisting of linseed-oil boiled at a temperature of from 620° to 700° Fahrenheit.

3. The hereinbefore-described waterproofing compound, consisting of linseed-oil which has been independently boiled at a temperature of between 620° to 700° Fahrenheit, combined with copal-varnish and a pigment, substantially as hereinbefore set forth.

295,114. DEVICE FOR CONNECTING AND STRETCHING FENCE-WIRES. HILLBURN DARLINGTON, Concord, Delaware County, Pa. Filed Dec. 14, 1883. (No model.)

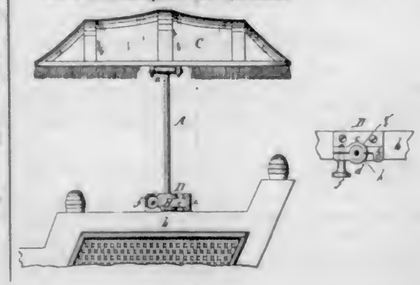


Claim.—1. The combination of cords or wires x x' with a tightening device comprising a lever, A, the short arm of which has notches d, with two links, B and D, one connected to one wire and having the lever pivoted to it, and the other connected to the opposite wire and adapted to engage with the notched arm of the lever, as set forth.

2. The combination of the lever A with the link B, hung thereto, and having a bar, m, adapted by contact with the short arm of the lever to limit the movement of said link, as set forth.

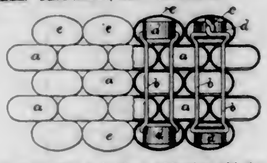
295,115. COMBINED SAW FILING AND SETTING MACHINE. JACOB S. DEITRICK and WILLIAM T. SMITH, Baltimore, Md. Filed Apr. 24, 1883. (No model.)

Brief.—The saw is intermittently fed under a reciprocating file and past two stationary anvils and swinging hammers, by which the saw-teeth are simultaneously sharpened and set.



Claim.—1. The herein-described mechanism, consisting of a bell-crank lever, one arm of which carries two pivoted fingers, s—one at each side—a stop-pin, 23, to prevent movement of the fingers one way, and a spring, 24, to hold the fingers against the stop-pin, the fingers adapted so that one will bear down while the other bears up, in combination with hammers, each secured to a collar pivoted on a shaft and provided with a shoulder, p^3, on which the pivoted finger bears, as set forth.

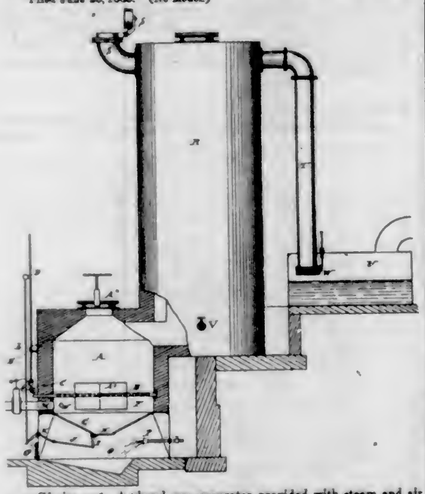
2. The herein-described adjustable bell-crank lever for actuating the hammers, consisting of the part 18, having a slot, 21, and set-screws 19 and 20, and the part O, having a laterally-projecting square head, 22, which occupies the aforesaid slot, as set forth.



3. The combination of a reciprocating file-holder, two hammers to set the saw-teeth, and mechanism for connecting and operating them, consisting of the shaft a, provided with a crank to give motion to the file-holders, and also with a gear-wheel, V, and a shaft, T, provided with a gear-wheel, U, double the size of the first-named gear, and a crank, R, to give motion to the hammers, as set forth.

295,116. CANOPY-STANDARD FOR CHILDREN'S CARRIAGES. GEORGE A. ELLIS, Gardner, Mass., assignor to Seth Heywood, Henry Heywood, George Heywood, Alvin M. Greenwood, and Amos Merrill, New York, N. Y. Filed Apr. 27, 1883. (No model.)

Claim.—An adjustable support for canopies of carriages, consisting of the two standards A, pivoted at the sides of the canopy, and having the spheres B at their lower ends, combined with the two brackets D on the carriage-body, each consisting of the hinged parts c and d, having hemispherical cavities to form sockets for the spheres on the ends of the standards, and clamping-screws f, substantially as and for the purpose described.



295,117. ORNAMENTAL CHAIN. JOHN EITHEIM, North Attleborough, Mass. Filed Jan. 17, 1884. (No model.)

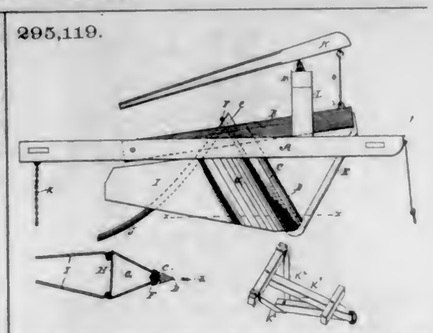
Claim.—1. In a roller-chain, the combination, with the units a a and staples b b, of the washer d, having a closed end and open sides to receive the staples, as described.

2. The combination, with the units a a and staples b b, of the open-sided cup-shaped washer d and the end caps, e e, as described.

295,118. GAS APPARATUS. ARTHUR O. GRANGER, Philadelphia, Pa. Filed June 25, 1883. (No model.)

Claim.—1. A closed gas-generator provided with steam and air pipes at the bottom and an outlet at the top, in combination with a rocking or shaking grate, whereby the fire may be raked without admitting air to the bottom of the generator, a chamber below said grate-bars, having an inclined or sloping bottom terminating in a hole, an ash-pit below said chamber, and a water sprinkler or nozzle to wet the ashes in said ash-pit, substantially as and for the purpose specified.

2. A closed gas-generator provided with steam and air pipes at the bottom and an outlet at the top, in combination with a rocking or shaking grate, whereby the fire may be raked without admitting air to the bottom of the generator, a chamber below said grate-bars, having an inclined or sloping bottom terminating in a hole, a valve to close said hole, an ash-pit below said chamber, and a water sprinkler or nozzle to wet the ashes in said pit, substantially as and for the purpose specified.



3. The generator A, having chamber F, provided with an inclined or sloping bottom, G, having an opening therein, and an ash-pit, O, in combination with valve H and sprinkler-nozzle P, substantially as and for the purpose specified.

295,119. TILE-LAYING MACHINE. JESSE THOMAS GRAVES and BENJAMIN F. BELT, Cole, Iowa. Filed Sept. 10, 1883. (No model.)

Claim.—1. The combination of the stock, the supporting-frame, the cutter-blade connecting the lower end of the stock with the frame, and having an arm extended up behind the stock, and the shield formed of two plates hinged to said arm, substantially as shown and described.

2. The combination, with a suitable frame, of the V-shaped stock inclined forward at its lower end, the cutter-blade connecting the lower

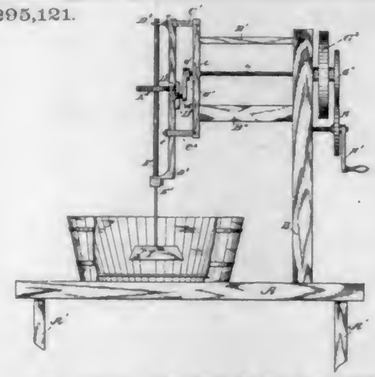
295,119.

end of the stock with the frame, and having an arm extended up behind the stock, the shield formed of two plates hinged to said arm, the supplemental shield arranged between said plates and connected thereto, and having sides which incline toward each other at the rear, and the tile-trough secured to the stock, and supported in the supplemental shield, substantially as shown and described.

3. The frame K', having the V-shaped blade K^3, set with the planes of its sides or wings extended in a transverse direction, approximately, in the line of the trench, and intersecting each other longitudinally in the trench, substantially as shown and described, and for the purpose set forth.

295,120. KITCHEN-CABINET. HIRAM HANNA, Columbus, Ohio. Filed May 28, 1883. (No model.)

Claim.—In a kitchen-cabinet, the combination, with the meal-bin L, having a removable cover, the latter being provided with the door N and screen O, situated below the door, of the detachable drawer secured to the under side of the cover below the screen, substantially as set forth.

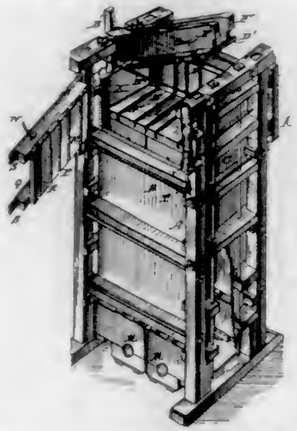


295,121. MOTOR. JOHN A. HART, HARROW SCOTT, and BENJAMIN F. PANCOAST, Iola, Kans. Filed Sept. 5, 1883. (No model.)

Claim.—1. In a motor for washing-machines, churns, and similar devices, the combination of the vertical slide, the shaft journaled on the face thereof, and provided with a ratchet-wheel, the slotted horizontal slide having a pallet engaging the ratchet-wheel, the inclined bar, and operating-framing and operating mechanism, substantially as set forth.

2. In a motor, substantially as described and shown, the combination of the vertical slide, the shaft journaled on the face thereof, the ratchet-wheel secured on said shaft, the horizontal slide provided with pallet, and having its end extended to engage the wheel and limit its revolution at each stroke of the machine, and the necessary operating mechanism, as set forth.

3. A motor having a vertical slide, a shaft journaled thereon and carrying the implement to be operated, and means for partially revolving said shaft at each stroke of the machine, substantially as set forth.

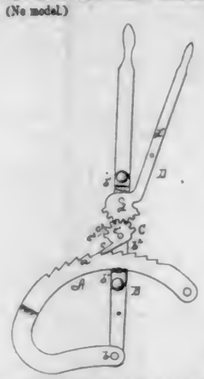


295,121.

4. The combination of the vertical slide, the cleats secured on the rear face thereof, and the operating-shaft having a suitable crank, the pin whereof is arranged and operates between the cleats on the slide, as set forth.

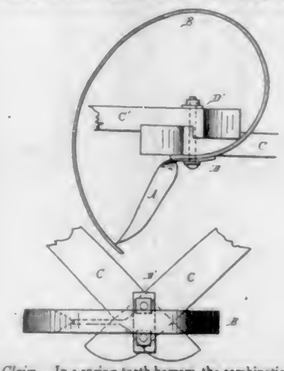
5. The motor, substantially as described, composed of the slide, the shaft journaled on the face of said slide, and provided with the ratchet-wheel, the horizontal slide provided with a suitable pallet, the inclined bar engaging the horizontal slide, and suitable framing and operating devices, as set forth.

295,122. BALING-PRESS. D. BRODHEAD HENDRICKS, Glasco, N. Y. Filed Dec. 27, 1883. (No model.)



Claim.—1. The combination of the press-frame forming the press-box at its upper end, the follower sliding in the frame, the long toggle-arms having pulleys at their lower ends and hinged to the follower at their upper end, the lower toggle-arms secured in pairs at their lower ends upon cross-pieces pivoted at the lower end of the frame, and having the long toggle-arms pivoted at their middle between the upper ends of the lower toggle arms, and the rope secured at one end passing over the pulleys and attached to means for drawing it, as and for the purpose shown and set forth.

2. The combination of the side or end piece of the press-box, pivoted at its lower end upon a transverse rod between the corner-posts of the frame, at the upper end of the same, the eccentric cross-bar pivoted between the corner-posts of the press-frame, near the upper end of the pivoted side piece, and the handle pivoted in the eccentric cross-bar, and having means for securing it at the upper end of the frame, as and for the purpose shown and set forth.

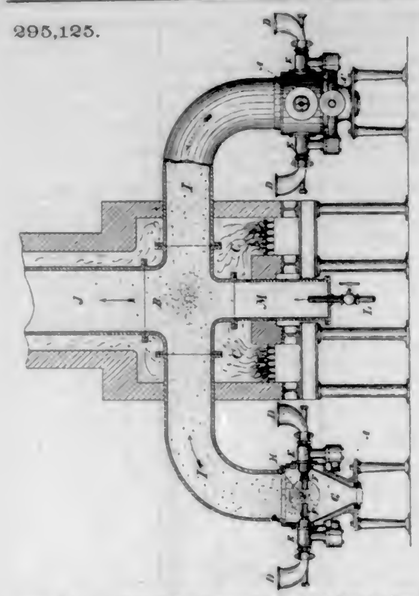


3. The combination of the hinged door having the longitudinal bars reduced at their free ends, the swinging locking-bar hinged upon the corner-post and having the projecting lips, the handle pivoted at one end between the said lips, and the hook upon the outer side of the door, adapted to hold the free end of the handle, as and for the purpose shown and set forth.

295,123. VEHICLE-BRAKE. JOHN C. HERMAN, St. Louis, Mo. Filed Oct. 3, 1883. (No model.)

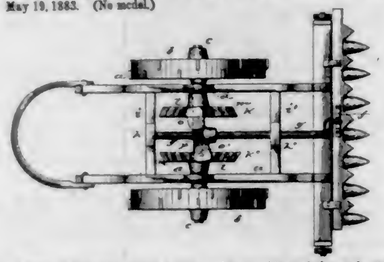
Claim.—In a vehicle-brake, the rack A and main lever B, in combination with the pawl C, having the gear c', and the pawl-operating lever D, having the gear d, the lever D being pivoted to the lever B above the pawl C, the pivots of the two being in line, and such gears being in the line of the lever B, turning simply on their pivots as centers, and their contracting edges engaging between such pivots, as described, whereby the pawl and lever are operated like a train of gearing, as and for the purpose set forth.

295,124. HARROW. ISAAC LEMON, Nebraska City, Nebr., assignor of one-half to William Nelson, same place. Filed Aug. 25, 1882. (No model.)



Claim.—In a spring-tooth harrow, the combination, with the spring-tooth B, of the cutter A, having its cutting-edge presented vertically in the direction of the line of draft, its upper end twisted and bent horizontally at right angles to the cutting-edge, and adapted to travel directly in advance of the tooth, with the said bent arm of the cutter removably secured to the under side of the tooth, substantially as described, and for the purposes specified.

295,125. METHOD OF PULVERIZING, DESULPHURIZING, AND OTHERWISE TREATING METALLIFEROUS ORES. FREDERIC A. LUCKENBACH, New York, N. Y., assignor to the Pneumatic Pulverizer Company, same place. Filed Feb. 9, 1882. Renewed Jan. 11, 1884. (No model.)



Claim.—1. The herein-described process of treating metalliferous ores or similar substances, consisting of the following steps: first, subjecting them to a concentrated current of highly-superheated dry steam or other heated vapors or gases or currents charged with materials for which the elements of such ores have affinities; second, pulverizing such ores or materials by impact with other bodies by the force of such current; third, converging the products to a second retort or heating chamber; fourth, subjecting the products in such second retort or heating chamber to the action of additional gases or materials, for the purpose of further elimination of objectionable elements.

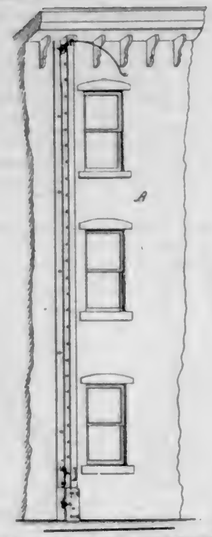
2. The herein-described process of treating metalliferous ores or similar substances, consisting of the following steps: first, subjecting them to a concentrated current of highly-superheated dry steam or other heated vapors or gases or currents charged with materials for which the elements of said ores have affinities; second, pulverizing them by impact with other bodies by the force of such current.

295,125.

295,126. MOWING-MACHINE. JAMES EDWARD MENDENHALL, Springfield, Ohio, assignor of one-half to Salathiel H. Knox, same place. Filed May 19, 1883. (No model.)

Claim.—The combination, in a mowing-machine, of the main driving-axle, the cam-wheels secured thereon, and having star-pointed outward-beveled cam-teeth, the rock-shaft, the T-shaped arm secured to said shaft, and having arms inclined both vertically and transversely, as described, and the cutter-bar, all substantially as set forth.

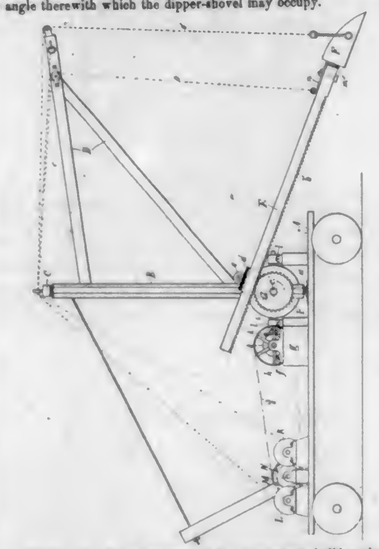
295,127. FIRE-ESCAPE. WILLIAM M. MILLER, New Cumberland, W. Va., assignor of two-thirds to Robert Hamilton and William Hooper, both of same place. Filed Dec. 28, 1883. (No model.)



Brief.—A lever is pivoted to the inner bar of the ladder and to the lifting-rod and raises the outer bar. A locking-box embraces the lower ends of the ladder when closed.

Claim.—1. In a fire-escape, the angle-irons c c', one of which is secured to the walls of a house, in combination with the rounds a, pivotally secured to the angle-irons, whereby the angle-irons may be folded together or opened out into ladder form, and the box l, adapted to inclose the lower ends of the angle-irons when folded together, and provided with a suitable fastening device, substantially as set forth.

2. In a fire-escape, the angle-irons c c', in combination with the rounds a, pivotally secured to the angle-irons, the chain e, rod f, and lever g, said lever being adapted to raise the outer leg of the ladder, and to hold it in such raised position, substantially as set forth.

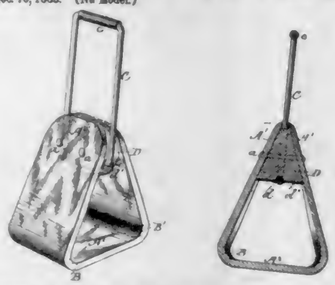


3. In a fire-escape, the angle-irons c c', in combination with the rounds a, pivotally secured to the angle-irons, the chain e, rod f, lever g, and the box l, adapted to inclose the lower ends of the angle-irons and the handle of the lever when the ladder is folded, and provided with a door, substantially as set forth.

295,127.

295,128. EARTH-EXCAVATOR AND EMBANKMENT-BUILDER. MICHAEL J. MULVIHILL, Warren County, and JOHN DARE TENNEY, Vicksburg, Miss. Filed Oct. 12, 1883. (No model.)

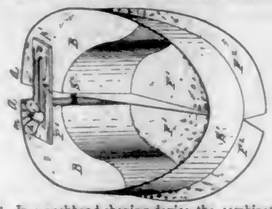
Brief.—On a swinging crane or jib carrying a dipper-beam, the dipper of which is hinged to be operated independently by a separate chain from that controlling the dipper, is mounted a shaft having means for thrusting and retracting the dipper-beam, and carrying a conical drum formed with several friction-faces at different angles, to engage, in any of the positions to which the crane may be turned, with friction-wheels slid on their shaft into and out of connection with such drum. A plate bolted to the dipper-beam and slotted for adjustment determines the angle therewith which the dipper-shovel may occupy.



Claim.—1. In an excavator and embankment-builder, the shaft thereof, and mechanism connecting it directly to the shovel-beam, which shaft has a circumferential motion in common with the crane, and is provided with a friction-drum having a series of frictional surfaces differing in angle of inclination, combined with a pair of friction-wheels on a shaft, and susceptible of movement to and from the surface of the said drum, and means to effect the said movement of the friction-wheels, substantially as and for the purpose specified.

2. In an excavator and embankment-builder, a swinging jib, and a longitudinally-moving shovel-beam supported from the said jib, and adapted for elevation and depression, combined with a shovel hinged to the outer end of the said shovel-beam, and connected by an independent rope or chain to the said jib, whereby it may be emptied of its contents without affecting the position of the said beam, substantially as specified.

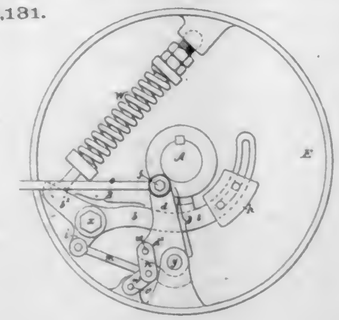
3. In an excavator and embankment-builder, a shovel-beam and shovel hinged together and supported independently by ropes or chains, combined with an adjustable stop secured only to the said shovel-beam, and adapted to be projected and held at various distances beyond the end thereof, to limit the possible angle of the said shovel with reference to its beam when the former is elevated, substantially as specified.



295,129. SADDLE-STIRRUP. STEPHEN A. NOLEN, Searcy, Ark. Filed Dec. 10, 1883. (No model.)

Claim.—1. A bent wooden stirrup narrower at one end than at the other, and provided with saw-kerfs B and B', converging toward the narrower end, substantially as and for the purpose described.

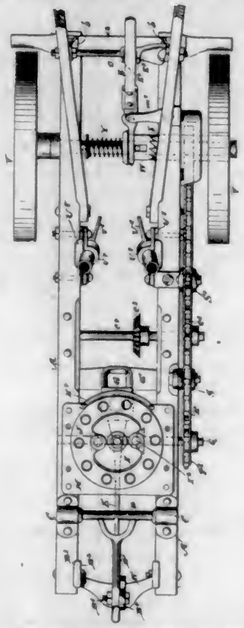
2. A wooden stirrup narrower at one end than at the other, composed of a bent strip provided with saw-kerfs B and B', converging toward the narrower end, in combination with the grooved block D and the wire link C, substantially as and for the purpose described.



295,130. NECKBAND-SHAPING DEVICE FOR BOSOM-BOARDS. DANIEL G. NORRIS, 2d, Glen's Falls, N. Y., assignor to Julia Norris, same place, and George E. Norris, Troy, N. Y. Filed June 30, 1883. (No model.)

Claim.—1. In a neckband-shaping device, the combination of the exterior U-form sheet-metal spring, S', the interior bottom plates, F' F', the exterior bottom flanges, F² F², and the supporting-blocks B B, constructed and arranged to operate as shown and described.

2. In a neckband-shaping device, the combination of the exterior U-form sheet-metal spring, S', the interior bottom plates, F' F', the exterior bottom flanges, F² F², the interior supporting-blocks, B B, and a slotted plate and set-screw to connect the blocks, in the manner and for the purposes set forth.



295,131.

295,131. CUT-OFF GOVERNOR FOR ENGINES. PHILIP PINTOR, Philadelphia, Pa., assignor to the Southwark Foundry and Machine Company, same place. Filed Nov. 26, 1883. (No model.)

Claim.—A cut-off governor in which the following elements are combined, namely: first, an attachment to the crank-shaft of a steam-engine; second, a lever, D, pivoted to the said attachment and carrying the valve-pin *f*; third, a lever, B, also pivoted to the said attachment; fourth, the toggle-joint connection between the two levers, and, fifth, a spring for acting on the said lever B, all substantially as set forth.

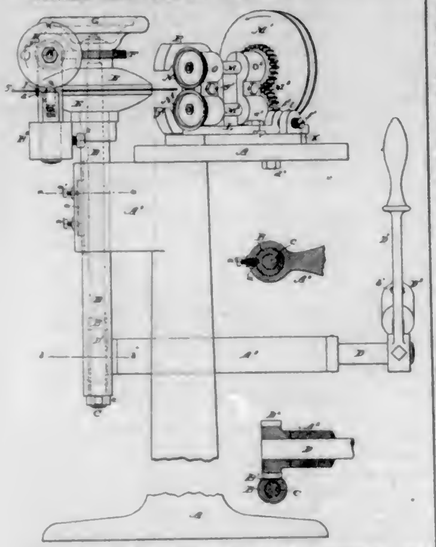
295,132. WALKING CORN-PLANTER AND FERTILIZER-DISTRIBUTER. ANDREW REMSTETLER, Dayton, Ohio, assignor to the Farmers Friend Manufacturing Company, same place. Filed Aug. 30, 1883. (No model.)

Claim.—1. The seed-hopper L, composed of a metal casting having at its upper edge an attachable inwardly-projecting top rim, for reducing the size of the lid-opening and supporting the lid, substantially as described.

2. The cast-iron or metallic hopper L, having flanges l^3 at its upper edge and an inward-projecting top rim, N, bolted to said flanges, for reducing the size of the lid-opening and supporting the lid, substantially as described.

3. The combination of a detachable seed-hopper, a stationary apertured plate forming the bottom thereof, and having an attached bridge-piece provided with a stationary journal or bearing, a crown-wheel having a hub mounted on the journal or bearing and provided with vertical studs on its upper side, a seed-dropping disk extending through the hopper and having a central aperture, perforations at the sides thereof, through which the hub and studs of the crown-wheel pass, and a plate covering the hub of the crown-wheel and its journal, substantially as described.

4. The combination of a detachable seed-hopper, a stationary apertured plate forming the bottom thereof, and having an attached bridge-piece provided with a stationary journal or bearing, a crown-wheel having a hub mounted on the journal or bearing, a seed-dropping disk mounted on the hub of the crown-wheel, devices rigidly but detachably connecting the disk with the crown-wheel, outside the hub thereof, and a plate having a hollow cap receiving the hub of the crown-wheel and its journal or bearing, substantially as described.



5. The combination of a seed-hopper having corner-lugs at its bottom, a plate detachably arranged on said lugs and constructed with a hollow closed cap, a curved slot, and flanges bounding the sides of the slot, a cap-plate, a spring cut-off pivoted in the cap-plate, an apertured plate forming the bottom of the seed-hopper and supporting a stationary journal or bearing, a crown-wheel having a hub mounted on said journal, and a seed-dropping disk detachably mounted on the crown-wheel, said

journal or bearing and crown-wheel hub projecting upward through the hopper-bottom plate into the hollow cap of the cut-off-carrying plate, substantially as described.

6. In a seed-hopper, the combination of the front casting, consisting of transverse bar having vertical end plates, upwardly-projecting arms, and downwardly-extending ears, with a draft-arm, furrow-opener, and parallel beams, substantially as described.

7. In a seed-planter, the combination of the pillow-blocks, the transverse shaft fitted therein, and the draft-arm forming part of said transverse shaft, with the parallel beams and a front support for the draft-arm, substantially as described.

295,133. SAW-FILING MACHINE. WILLIAM TUCKER, East Brookfield, Mass. Filed June 20, 1883. (No model.)

Claim.—1. The combination, in a saw-filing machine, of a vertical spindle furnished with a saw-clamp, devices by means of which the operator may raise and lower said spindle, and rotary files having horizontal axes and located with reference to the path of the saw-plate as carried by said spindle, substantially as herein specified.

2. The combination, in a saw-filing machine, of a vertical spindle furnished with a saw-clamp, devices by means of which the operator may raise and lower said spindle, a pair of rotary files having horizontal axes and arranged one above the other, and a device, substantially as described, for supporting the saw-plate by means of said spindle between and out of contact with the files.

3. The combination, in a saw-filing machine, of a vertical spindle furnished with a clamp for circular-saw plates, and with an index-gear, a horizontal shaft carrying at its inner end a worm meshing with said index-gear, and furnished at its outer end with a hand-wheel having stop-notches in its periphery, and a spring-detent coacting with said notches, substantially as herein described, for supporting and intermittently rotating the saw-plate in the manner set forth.

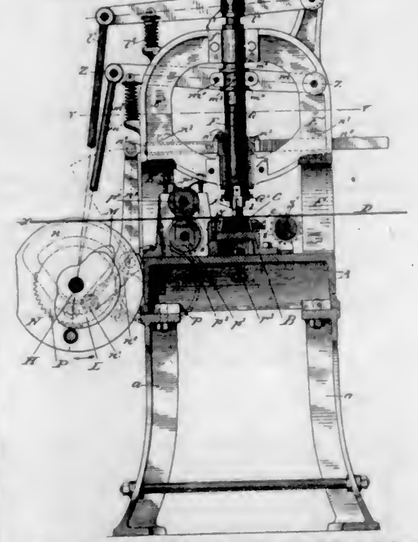
4. The combination, in a saw-filing machine, of a pair of rotary files having beveled cutting-peripheries and carried by parallel arbors, means for moving a circular-saw plate sidewise into contact with the respective files alternately, and means for turning the saw-plate in its plane of rotation between its successive contacts with the files, substantially as herein described, for filing the teeth of circular saws fleaming, with the fleam confined to the fronts of the teeth, and formed on opposite sides of alternate teeth, as set forth.

5. The combination, in a saw-filing machine, of a pair of rotary files having beveled cutting-peripheries, and carried by parallel arbors driven in opposite directions, means for moving a circular-saw plate sidewise into contact with the respective files alternately, and means for turning the saw-plate in its plane of rotation between its successive contacts with the files, substantially as herein described, for filing the teeth of circular saws fleaming, without "stubbing," in the manner set forth.

6. In a saw-filing machine, the combination, substantially as herein specified, of a vertical spindle carrying the saw-clamp, devices by means of which the operator may raise and lower said spindle, a pair of rotary files carried by horizontal arbors above and below the normal plane of the saw-plate, and stop-gages which limit the movements of the saw-plate away from said normal plane for determining the angle of the front of each saw-tooth in the manner set forth.

7. In a saw-filing machine, a pair of pivoted stop-gages having clamp-screws as their pivots, and constructed with intermeshing spur-teeth concentric with said pivots, substantially as herein described, for the purpose set forth.

8. The combination, in a saw-filing machine, of the horizontal pedestal-top A^4, having a longitudinal slot, and a horizontal plate, K, supported thereon, and adjustable by means of a vertical pivot, and a clamping-screw occupying said slot, substantially as herein specified.



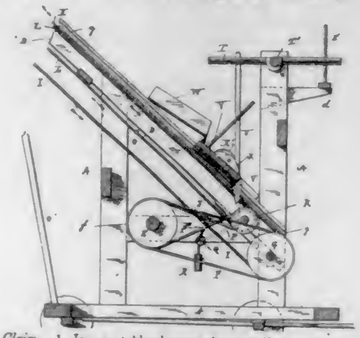
9. The combination, in a saw-filing machine, of the horizontal pedestal-top A^4, having a longitudinal slot, a horizontal plate, K, supported thereon, and adjustable by means of a vertical pivot, and a clamping-screw occupying said slot, with a slot in said plate concentric with said pivot, and a sliding nut within a depression in its upper surface to receive said clamping-screw, substantially as herein specified.

10. The combination, in a saw-filing machine, of the horizontal pedestal-top A^4, having the slot *s*, the horizontal plate K, having the pivotal stud-pin *p* on its lower surface occupying said slot, the slot s^3, concentric with said pivot, the drepression d^3 and screw-hole *h* in its upper surface, and the rib *r* and lug *l* upon the same, the head-frame L, having a grooved sole fitted to said plate K, and provided with the lug l^3 and slot s^2, the sliding nut n^2, occupying said depression d^3, and the clamping-screws *d'* *d'*, and gage-screw *f'*, substantially as shown, for the purpose set forth.

11. The combination, in a saw-filing machine, of a pair of rotary files carried by horizontal arbors and arranged one above the other, and means for adjusting one of said arbors longitudinally to render the cutting-points of the respective files in absolute line with each other in a vertical plane, substantially as herein specified.

295,134. MACHINE FOR MAKING BARBED FENCE-WIRE. ANDREW J. UPHAM, Sycamore, Ill., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Nov. 7, 1883. (No model.)

Brief.—The barb-wire is fed under the main wire, is cut, is bent into staple form, its ends are twisted across the main wire, and it is then compressed upon the main wire.



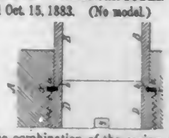
Claim.—1. The grooved die C, in combination with the die F', having wings for the purpose of coiling the barb around the strand-wire, substantially as set forth.

2. The die C, having the groove c^3, in combination with the die F', having wings for the purpose of bending and coiling the barb, substantially as set forth.

3. The grooved die C, the die F', having wings, and the die G', all in combination, for the purpose of coiling and clamping the barb, substantially as set forth.

4. The die C, having the groove c^3, the die F', having wings, and the die G', all in combination, for the purpose of bending, coiling, and clamping the barb, substantially as set forth.

295,135. ELEVATOR. THOMAS WILLIAMS, ALFRED MAUCK, and HENRY A. WILLIAMS, Princeton, Ind. Filed Aug. 9, 1883. (No model.)

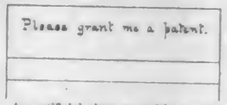


Claim.—1. In a portable elevator, the ascending dumping-rack V, provided with an apron, W, and cross-heads *h h*, in combination with the inclined grooved beams D, the knotted or balled wires, ropes, or chains, the pawls X and their springs, the projecting slotted arm *a*, the transverse bar Y, having an upright, Y', arbor *c*, and rod Z, substantially as described.

2. In a portable elevator, the arm P, slotted arm P', and a weighted shaft, Q, in combination with the knotted or balled wire, rope, or chain I, the connecting-rod U, and the dumping-rack T, substantially as described.

3. In a portable elevator, the combination of the knotted or balled wires, ropes, or chains, the pulleys, driving mechanism, the projecting slotted arms P' and *a* and their connections, and the dumping-racks operated thereby, substantially as specified.

295,136. PACKING CONDENSER-TUBES. JAMES WILSON, Philadelphia, Pa. Filed Oct. 15, 1883. (No model.)



Claim.—1. The combination of the casing A, tube B, and adjustable follower D of a surface-condenser with a packing-ring, *x*, confined directly between the outer end of the tube and the inner end of the follower, as set forth.

2. The combination of the casing A, having a shoulder, *a*, the tube B, the adjustable follower D, and the packing-ring *x*, interposed between the end of the tube and the follower, as set forth.

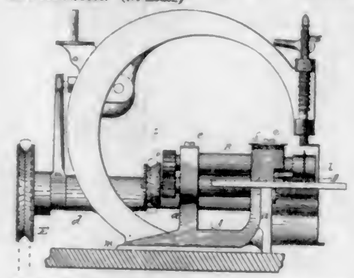
3. The combination of the casing A, the tube B, having a beveled end, the adjustable follower D, having a tongue, *b*, and the packing-ring *x*, interposed between the follower and the end of the tube, as set forth.

295,137. WRITING-TABLET. RUDOLF C. WITTMANN, New York, N. Y., assignor to himself and Charles Nelson, same place. Filed July 18, 1883. (Modal.)

Claim.—1. An artificial slate or writing-tablet composed of two layers of cement—such as magnesia-cement—and an intermediate layer of wood, pasteboard, or equivalent material, substantially as described.

2. An artificial slate or writing-tablet made of white cement, and having imprinted on its face or faces lines or copies, or both, in a color different from that of the cement, substantially as described.

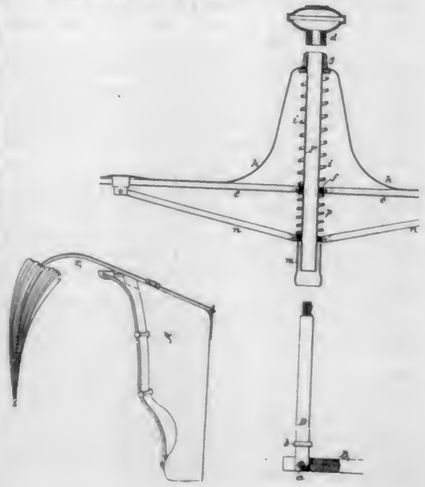
295,138. TOY. J. WARREN WORCESTER, New York, N. Y., assignor of one-half to Alfred W. Storm and Edwin R. Storm, both of same place. Filed Jan. 19, 1884. (No model.)



Claim.—1. A toy consisting of a case or box, a vibrating slat supported intermediate its ends, a toothed wheel or disk arranged to engage and release one end of the slat, and a diaphragm against which the other end of the slat is violently thrown when engaged and released by the wheel or disk, substantially as described.

2. A toy combining in its structure a case or box, a twisted cord or equivalent device supported thereby, a slat sustained intermediate its ends by the cord, a toothed wheel for engaging and releasing one end of the slat, and a diaphragm against which the other end of the slat is violently thrown when released by the teeth of the wheel, substantially as described.

3. A toy consisting of a case or box, a vibrating slat, a toothed wheel for engaging and releasing the slats of the diaphragm, and a quill or tube for producing a whistling sound in harmony with the sounds of the slat produced by violently striking the diaphragm, substantially as described.

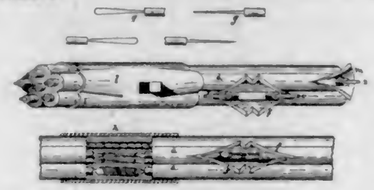


4. A toy consisting, essentially, of a slat supported intermediate its ends by a device held under tension, a diaphragm supported adjacent to one end of the slat, and means for acting on the other end of the slat to violently strike the diaphragm at short intervals, substantially as described.

295,139. DEVICE FOR TRIMMING FABRICS. AARON WRIGHT, Phœnix Mills, N. Y., assignor of one-half to Edwin Groat, same place. Filed Oct. 24, 1883. (No model.)

Claim.—As an improvement in devices for trimming fabrics simultaneously with their passage through a sewing-machine, the combination which consists of the frame A, having the upright bifurcated standards *a a*, the spring bearing-boxes located therein, and the forward standard having an overhang projection, in which is cut the recess *o*, for the passage of the fabric, the rollers B and C, journaled in the said spring-boxes, the upper roller being provided near its forward end with a rotary cutter, *k*, the lower roller having a grooved head, D, the rollers, respectively, being provided at their rear ends with intermeshing gear-wheels *b*, and the lower roller having a pulley, *c*, by means of which the working parts of the device may receive motion through the medium of a suitable band or belt from the drive-shaft of a sewing-machine, substantially as specified.

295,140. CARRIAGE-UMBRELLA. EDMUND WRIGHT, Philadelphia, Pa. Filed Dec. 26, 1883. (No model.)

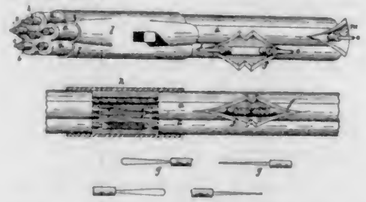


Claim.—1. The combination of the standard B of the carriage, the rod D, pivoted thereto, and having a collar, *b*, the tube F, adapted to the rod D, and carrying the parts of the umbrella, and a cap or retainer, *d*, whereby the tube is secured to the rod, as set forth.

2. The combination of the standard B, the rod D, pivoted thereto, the runner *m* of the umbrella adapted to bear upon the top of the standard, and a spring, *p*, bearing on the runner, as set forth.

REISSUES.

10,458. UNITING ELECTRIC CABLES. RICHARD S. WARING, Pittsburg, Pa. Filed Dec. 28, 1883. Original No. 268,159, dated Nov. 28, 1882. Division A.

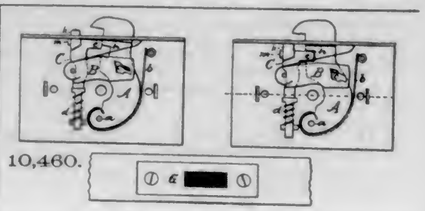


Claim.—1. The method herein described of connecting two or more sections of a lead-armored cable, which consists in electrically uniting the ends of the conductors, covering them with insulating material, covering the insulated joint and conductors from one section of lead armor to the other with lead, and finally securely connecting the two sections of the armor, substantially as set forth.

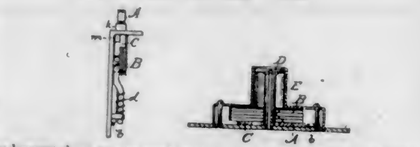
2. The method herein described of connecting two or more sections of a lead-armored cable, which consists in electrically uniting the ends of the conductors, covering them with insulating material, wrapping the insulated joint and conductors from one section of the lead armor to the other with lead, securely connecting the two sections of armor by a leaden sleeve, and finally filling the sleeve with insulating material, substantially as set forth.

3. The method herein described of connecting two or more sections of a lead-armored cable, which consists in first flattening the ends of the wires to a tapering form, then lapping and soldering them, then wrapping them with wire, then insulating them and inclosing the insulated joint of each wire with a wrapping of thin lead extending from one section of the lead armor to the other, then placing an outer leaden sleeve over the ends of the two cable-sections and soldering the same, and finally filling the space within the joint with insulating material, substantially as described.

10,459. BRANCHING ELECTRIC CABLES. RICHARD S. WARING, Pittsburg, Pa. Filed Dec. 28, 1883. Original No. 268,159, dated Nov. 28, 1882. Division B.



Claim.—1. The method of providing for branch connections with one or more of the conductors of a lead-armored cable, which consists in removing the lead armor from around the conductor to be branched, severing said conductor, and bending the severed ends outward, substantially as described.



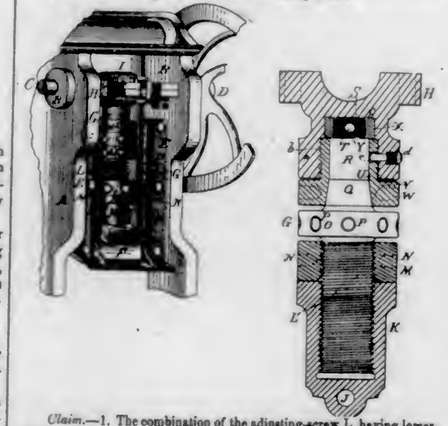
2. The method of providing for branch connections with one or more of the conductors of a lead-armored cable, which consists in cutting through the armor transversely and longitudinally a suitable distance, opening the divided parts out, severing the conductor, and bending each of the ends outward, and finally closing the parts of the armor, substantially as set forth.

10,460. CABINET-LOCK. FRANK W. MIX, New Britain, Conn., assignor to Corbin Cabinet Lock Company, same place. Filed Dec. 31, 1883. Original No. 286,327, dated Oct. 9, 1883.

Claim.—1. The combination of the swinging and hooked lock-bolt having a talon or edge face for being acted upon by the key for throwing the bolt backward out of engagement with the keeper, and also having its hooked end projecting from the face of the lock-case, the swinging tumblers and fence for holding said bolt in its position for locking,

10,460.

and mounted so as to be acted upon by the same key which acts upon said lock-bolt, suitable springs for pressing upon said bolt, and tumblers to force them into position for locking, and the spring-pressed bolt C or equivalent mechanism for snapping into engagement with the lock-bolt at a point inside of its hooked end and holding said bolt back when unlocked, said mechanism also having the projection in the face of the lock-case for being acted upon at a point outside of the case, to disengage the hooked lock-bolt, substantially as described, and for the purpose specified.



2. The combination of the spring-pressed swinging lock-bolt A, having a talon or edge face for being acted upon by the key, spring-pressed sliding bolt C, having projection *k*, and the laterally-extending arm *e*, for engagement with the keeper and lock-bolt, respectively, and a stop to limit the distance which the end *k* projects, substantially as described, and for the purpose specified.

3. The combination of the spring-pressed swinging lock-bolt A, having a talon or edge face for being acted upon by the key, tumblers B, pivoted as described, for being acted upon by the same key that moves the bolt backward, spring-pressed sliding bolt C, having projection *k*, and the laterally-extending arm *e*, for engagement with the lock-bolt and keeper, respectively, and a stop to limit the distance which the end *k* projects, substantially as described, and for the purpose specified.

4. The combination of a lock having bolts A and C projecting outside of the lock-face, and also operatively connected upon the inside of the lock-case, as described, and a keeper-plate, G, to engage the bolt A and actuate the bolt C, substantially as described, and for the purpose specified.

5. The combination of the spring-pressed and hooked lock-bolt having its hooked end projecting from the face of the lock-case, the spring-pressed sliding bolt C, having the end *k* projecting from the face of the lock-case and the arm *e* upon the inside of the lock-case for acting upon the said hooked lock-bolt, substantially as described, and for the purpose specified.

10,461. DIE-PRESS. GEORGE E. MERRIMAN, Terryville, Conn. Filed Aug. 25, 1883. Original No. 282,747, dated Aug. 7, 1883.

Claim.—1. The combination of the adjusting-screw L, having lower screw-threaded portion and upper smooth portion, Q R, and annular head or nut X at its upper end, the part having the socket K, socket *a*, female-screw-threaded at its lower portion, *b*, and forming upper cylin-

drical recess, *c*, and locking-sleeve U, fitting upon the upper portion of the adjusting-screw, screw-threaded on the outside, and turning in the screw-threaded part of socket *a*, and bearing with its upper edge against nut or head X, as and for the purpose shown and set forth.

2. The combination of the lower part having the screw-threaded socket K, adjusting-screw L, having head O, conical portion Q, cylindrical portion R, and screw-threaded end S, having perforation T, cylindrical nut or head X, having perforation-pin Y, locking-nut M, cross-head H, forming socket *a*, having female-threaded portion *b* and cylindrical recess *c*, male-threaded locking-sleeve U, having flange V and slot *e*, and screw *d*, as and for the purpose shown and set forth.

3. The combination of the part having the socket K, the adjusting-screw L, having one end threaded to correspond with the threaded socket, and its opposite end provided with the annular head or nut X, the locking-nut M, adapted to bear against the end of the part having the threaded socket K, the part having the smooth recess, which receives the nut X of the screw L, and the threaded sleeve for acting upon said annular head or nut X, substantially as described, and for the purpose specified.

4. In a pitman, the combination of the adjusting-screw L, the annular head or nut X, the part having the smooth recess, whose top forms a bearing-surface for the upper face of the nut X of the screw L, and the threaded sleeve for acting upon the under side of said annular head or nut X, substantially as described, and for the purpose specified.

PHOTO-LITHO. NORRIS PETERS WASHINGTON, D.C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of Iowa.

ANDREWS *et al. v.* HOVEY.

Decided May 9, 1883.

What the causes were that led to a long silence on the part of the patentee are not so material as the fact itself that he made public the knowledge and use of his invention, and then for four years remained wholly silent and took no action for the procurement of a patent. *Held*, that under the circumstances the invention must be regarded as dedicated or abandoned to the public.

Patent No. 73,425, January 14, 1868, and Reissue No. 4,372, May 9, 1871, granted to Nelson W. Green, construed, compared, and the reissue held to cover an invention different from that embraced in the original patent, and to be therefore void.

It being true that in 1849 and 1850 wells were driven at Milwaukee by a process not distinguishable from that devised by the patentee in 1861, and these wells were driven, not as mere experiments, nor for the purpose of exhibition, but for public and continuous use, it is held that the defense of want of novelty is sustained.

STATEMENT OF THE CASE.

This suit, with a large number of others against other defendants now pending in this court, is based upon Reissue Letters Patent No. 4,372, granted to Nelson W. Green, one of the complainants, under date of May 9, 1871, the original patent, No. 73,425, bearing date January 14, 1868, and having been issued for an improved method of constructing Artesian wells.

The bill alleges an infringement on part of the defendant, and prays for an injunction, accounting damages, and further relief.

The answer, in substance, denies that Green was the original inventor of the alleged improvement; avers that the alleged invention was known and in public use for more than two years prior to the date of the original letters patent; that Green, if he was an original inventor, abandoned his invention and knowingly permitted its public use for more than two years before applying for a patent; that the reissue is a departure from the original letters patent and embraces different and more extensive claims than are covered by the original, and also denies that defendant has infringed upon the rights and invention held and owned by the complainants.

As already stated, there are pending in this court a large number of causes brought by the complainants for alleged infringements upon their rights, and in the district of Minnesota similar suits are pending, in which the issues are substantially the same.

For convenience' sake it was agreed that these causes should be heard at one and the same time before the judges of the district of Minnesota and the districts of Iowa, and accordingly at the October term, 1882, of this court such hearing was had and the questions at issue were very fully and ably presented both in print and by oral argument before the court. At that time there was pending before the Supreme Court at Washington the case of *Wahl* v. *Hine*, on appeal from the district of Indiana, in which cause this same patent was involved, and it was hoped the decision of that case would give us a final and authoritative decision upon the more important questions discussed in this court.

When the judgment in *Wahl* v. *Hine* was announced, however, it appeared that the judges were equally divided in opinion therein, eight only of the members of that Court having sat in the case, and hence no opinion upon the merits was reached or announced in that cause.

It became, therefore, the duty of this court to consider the questions submitted, unaided by the decision in *Wahl* v. *Hine*, and we have endeavored to give them the consideration which their importance demands. Upon many of the questions involved a very large amount of evidence has been adduced, and the questions of law and fact have been ably argued and presented by the counsel in the cause.

Messrs. Stoneman, Rickel & Eastman, Messrs. Hubbard, Clark & Dawley, Mr. A. R. West, and *Messrs. Rogers & Rogers*, for the complainants.

Messrs. Lake & Harman and *Messrs. Wilson & Gale* for the defendants.

SHIRAS, *D. J.*:

Assuming for the present that Nelson W. Green is entitled to the credit of being the inventor of what is commonly known as the "driven well," we shall first consider the defense of abandonment—that is to say, the averment that he allowed the use of his invention to become part of the property of the public without asserting his right to a patent for the protection of his rights as an inventor.

In the case of *Shaw* v. *Cooper* (7 Peters, 292) it was held that—

> Vigilance is necessary to entitle an individual to the privileges secured under the patent law. It is not enough that he should show his right by invention, but he must secure it in the mode required by law; and if the invention, through fraudulent means, should be made known to the public, he should assert his right immediately and take the necessary steps to legalize it.
>
> The patent law was designed for the public benefit as well as for the benefit of inventors. * * * No matter by what means an invention may be communicated to the public before a patent is obtained, any acquiescence in the public use by an inventor will be an abandonment of his right. If the right were asserted by him who fraudulently obtained it, perhaps no lapse of time could give it validity; but the public stand in an entirely different relation to the inventor. The invention passes into the possession of innocent persons, who have no knowledge of the fraud, and, at a considerable expense, perhaps, they appropriate it to their own use. A strict construction of the act, as it regards the public use of an invention before it is patented, is not only required by its letter and spirit, but also by sound policy. * * * The doctrine of presumed acquiescence, where the public use is known or might be known to the inventor, is the only safe rule which can be adopted on this subject. * * * Whatever may be the intention of the inventor, if he suffers the invention to go into public use through any means whatever without an immediate assertion of his right, he is not entitled to a patent, nor will a patent obtained under such circumstances protect his right.

In the case of the *Consolidated Fruit Jar Company* v. *Wright* (94 U. S., 96) it is said that—

> The inventor must comply with the conditions prescribed by law. If he fails to do this he acquires no title, and his invention or discovery, no matter what it may be, is lost to him, and is henceforward no more his than if he had never been in anywise connected with it. It is made therenpon, as it were, by accretion irrevocably a part of the domain which belongs to the community at large.

From the evidence in the cause it appears that in the summer of 1861 Nelson W. Green was a resident of Cortland, New York; that he was engaged in drilling and organizing volunteers for the army, and especially in connection with the 76th regiment of New York infantry, of which regiment he was appointed colonel. That while thus employed his attention was called to the subject of procuring pure water for the use of his men, and that he set about to devise a means by which water could be readily procured from beneath the surface of the earth, thus avoiding danger from poisoned wells and springs, and also from the risk of being cut off from access to the ordinary sources of supply when in the presence of the enemy.

The patentee himself testifies that in the summer of 1861 he had devised in his own mind a method of accomplishing this result, which he explained first to his drill squad, and then to the officers of his regiment, and which consisted in driving a rod sharpened at the end into the ground, and into the water-bearing stratum, than withdrawing the same and inserting a tube, through which the water could be drawn by any ordinary style of pump. As a test of the method proposed, under the direction of Colonel Green, an experiment of driving a rod down to the water was made near his house, and this experiment was followed by driving a well at the fair-grounds at Cortland, at the expense and for the use of one Graham, who had the contract for furnishing food and other supplies at the camp on the fair grounds. This well was driven between the 1st and 15th of October, 1861, and was used generally by the men in camp, as well as by Graham and his employés.

We further find in the testimony of Colonel Green the following:

Question 60. After this experiment at the house, and the making and use of the well at the fair grounds, what was your opinion as to the practicability of making wells by that process, either for general use or for the purposes of the army, as you had originally intended? Answer. The result of the two experiments referred to had upon my mind the effect to convince me of the entire practicability and feasibility of the process for all the purposes named in the question.

Q. 61. Did you take any steps, give any orders or directions for the procurement of material to be taken with your regiment into the field for the purpose of making wells to supply that regiment with water, wherever it might be situated? A. I gave Lieutenant Mudge orders to procure such material for the purposes named, and gave Adjutant Robinson orders to furnish him with transportation for the same, and when at Albany made arrangements with the quartermaster-general for the transportation of that material with the regiment when it went to the front.

By the testimony of the patentee himself it is shown that the invention claimed by him was perfected in conception in the summer of 1861, was demonstrated to be a success by practical use in October, 1861; that the patentee caused the necessary apparatus to be procured to be taken with the regiment for its use when it moved to the seat of war, and arranged with the authorities at Albany for the transportation needed therefor. The testimony of the patentee shows beyond the possibility of a doubt that his object and purpose in 1861 was to provide a means of supplying the men under his care with pure water and protecting them from the danger to be apprehended from the polluted or poisoned springs and wells, or from being cut off by the enemy from access to the usual sources of supply, and to this end he caused the apparatus to be used in driving wells to be procured and transportation therefor to be provided. The sinking of the well at the fair-grounds at Cortland, and the providing the means for driving these wells whenever and wherever they might be needed by the regiment, establishes beyond question the intent on part of Colonel Green that this invention should be publicly and commonly used by his regiment at any and all times and places. His own testimony shows that he explained his invention and the means of carrying it into effect, first to his drill-squad, and then to the officers of his regiment, and subsequently consented to the sinking and public use of the well at the camp-ground, and yet he never cautioned any one to keep the method a secret, nor is it shown that in 1861 he ever mentioned to any one the idea of obtaining a patent, or that he purposed doing so, or that he took any action looking to that end. All that he did tended to spread the knowledge of the mode of making these wells and of the success attending their use, and nothing whatever is shown indicating an intent to restrict the right to make and use the same to himself as a patentee.

It is an admitted fact that Colonel Green was a man of intelligence and education, and he must have known what the law required of him in case he desired to secure his rights as an inventor under the provisions of the patent laws. He knew then that to secure his rights, if he desired to procure a patent, he must apply therefor before permitting his invention to pass into general or public use. His own testimony conclusively shows that he gave publicity to his invention, and consented to, nay, aided in, making the use thereof common and public. There is nothing in the evidence showing that he purposed or intended to make further or different experiments with a view to perfecting his discovery. He himself expressly testified that the experiment at his house, and the driving and use of this well at the camp-ground convinced him of the feasibility of the process in making wells either for general or army use: or as counsel for complainants in their brief upon the facts, pages 17 and 18, state it:

The two experiments fully and satisfactorily demonstrated the general practicability of the process where no rock intervenes.

The evidence shows conclusively, therefore, that the invention was thought out and was put into satisfactory use, the use being an open and public one, while Colonel Green's regiment was in camp at Cortland, and the necessary machinery and tools with transportation therefor were provided for continuing the construction and the open and public use of other wells, and yet no step was taken by Colonel Green for the procurement of a patent, nor was there at that time any act done or statement made indicating a purpose or intent upon his part to apply for a patent in the future. It is urged, however, that the reason why an application for a patent was not made at that time was because Colonel Green had become involved in serious difficulties on account of the shooting of Captain McNett, one of the officers of his regiment, on the 6th of December, 1861. If it appeared from the evidence that Colonel Green had in the fall of 1861 taken the initiatory steps for the procurement of a patent, or had even unmistakably announced his intention so to do, and it appeared that the accomplishment of such purpose was interrupted by the complications and difficulties arising out of the shooting of Captain McNett, it might then be claimed that these difficulties formed an excuse for the long delay in applying for a patent on part of Colonel Green. But it will be borne in mind that the idea of this mode of constructing a well was thought out in the summer of 1861, and the well at the camp-ground

was sunk before the 15th of October, and the shooting of McNett was not until December 6. It is also shown by Colonel Green himself that he gave the proper orders for the construction of the apparatus necessary to be used in sinking wells, and that, when in Albany, he arranged for the transportation thereof with the regiment when it moved to the seat of war. If he thus had time and opportunity enough to provide the means necessary to furnish these wells for the common and public use of his regiment, can it be fairly claimed that he did not have time and opportunity to at least announce his purpose of procuring a patent, if such was then his intent? It would seem that the utmost that can be said of the effect of the difficulties resulting to Colonel Green from the shooting of Captain McNett is that thereafter his attention was so fully occupied thereby that he gave no further thought to the subject of driven wells at that time, and hence did not, in his own mind, reach the conclusion that he would apply for a patent until several years had elapsed, and these difficulties had begun to pass away, and until it was brought to his attention that through the use of this mode of driving wells other parties had reaped large pecuniary benefits. But during this delay, extending to May, 1866, a period of over four years, the public had acquired rights through the open and uninterrupted use of the discovery. What the causes were that led to this long silence on the part of Colonel Green are not so material as the fact itself that he made public the knowledge and use of his invention, and then for over four years remained wholly silent, and took no action for the procurement of a patent. Can there be any question that Colonel Green did permit his invention to go into public use without an immediate assertion of his rights?

In *Egbert* v. *Lippman* (104 U. S., 333) it was held that "to constitute the public use of an invention it is not necessary that more than one of the patented articles should be publicly used," it being also held in the same case, that—

If an inventor, having made his device, gives or sells it to another, to be used by the donee or vendee, without limitation or restriction, or injunction of secrecy, and it is so used, such use is public, even though the use and knowledge of the use may be confined to one person.

It is not questioned that the well at the camp-ground was made with the knowledge and consent of Colonel Green. It was for a public use, being constructed at the expense of the sutler, Graham, for the purpose of supplying water for use in the cook-rooms, as well as for general use by all connected with the regiment. There was no effort made to keep the mode of its construction secret, but rather the contrary. When the regiment left Cortland, New York, Colonel Green exercised no control over this well, nor did he cause it to be taken up, or otherwise kept from public use or knowledge. If he was the inventor of that description of well, he certainly gave to Graham the full right to construct and use the well and to permit its use by others, without any limitation whatever, or any injunction of secrecy, thus bringing the case within the rule laid down in *Egbert* v. *Lippman*, even if there were no further facts showing acquiescence in the public use of the invention. But these facts are not wanting, for it is proven by Colonel Green himself that he caused the necessary tools and pipes to be procured for the use of the regiment when it went to the front, showing clearly that he proposed and intended to permit any number of wells to be sunk and used that might be needed by the regiment, thus showing that he contemplated a continuous public use of the invention without restriction or limitation. Again the evidence shows that a large number of driven wells were made and used in and about Cortland and neighboring places during the years 1862, 1863, 1864, and 1865. It is now claimed that Colonel Green had not actual knowledge of the existence of these wells; but was he not bound to know that the natural result of what he himself had done, and had caused to be done, in the way of giving publicity to the success which attended this mode of making wells, would be to spread their use by the public, unless he promptly prevented such result by procuring a patent, and can he now be heard to say that he did not know nor have reason to know that the use of these wells was becoming common in his own neighborhood, when the facts show that such use was the natural result of his own acts? But we are not left to mere inference upon this question, as there is testimony showing satisfactorily that he had knowledge of the existence of a portion at least of these wells, and despite his own testimony, wherein he endeavors to destroy the weight of this testimony, either by direct denial, or by claiming that he did not in fact recognize certain wells which came under his notice to be driven wells, yet we think the preponderance of evidence is against him on this proposition, and that it must be held that he knew that such wells were being made and used.

We find, therefore, as conclusions of fact—

1. That in 1861 Colonel Green's purpose in devising his method of driving wells was to furnish a ready means whereby the men of his regiment could procure a supply of pure water, and that he did not at that time contemplate procuring a patent therefor, and that he put his method of driving wells into public use in 1861, for the benefit of his regiment, and thereby dedicated or abandoned his invention to the public.

2. That his invention was in open and public use, with his knowledge and acquiescence, for more than four years before he applied for a patent thereon.

From these conclusions of fact it necessarily follows that the letters patent originally granted, and the reissued letters based thereon, must be held invalid and void.

It is also urged on behalf of defendants that the reissued patent enlarges the scope of the original patent, is broader in its terms, including improvements and principles not contained in the original specifications, and is therefore void.

This defense demands an examination and determination of what Colonel Green's original invention consisted, and of what is embraced within and covered by the reissued patent. We will consider the latter proposition before proceeding to the former.

William D. Andrews, one of the complainants, in giving his testimony, is asked whether he has read and understands the reissued patent, and if so to describe it, which he does in the following language:

The invention is for a method of procuring water from the earth by means of a tube inserted into the earth down to and into a water-bearing stratum, and attaching to such tube, in cases where the water does not flow naturally, a pump by an air-tight connection, and by the operation of the pump producing a vacuum within the tube which forms the body of the well and its lining, thereby causing the water in the surrounding earth, under the pressure of

the atmosphere, to rush into the well formed by the tube, and furnishing a practically inexhaustible supply of water by the means as stated and described.

In the opinion of Judge Benedict in the Carman case, cited at length by complainants, it is stated that—

The novelty consists in making the well-pit to consist of the tube of a pump connected tightly with the earth. This is accomplished by driving into the earth the tube to be used as a tube of a pump and at the same time as the pit of the well. This manner of inserting the tube renders it possible, by means of a pump attached to the tube, to create a vacuum in the pit of the well and at the same time in the water-bearing stratum of the earth.

In the printed argument of counsel for complainants it is said that—

The drive-well invented by Colonel Green left no open space between the lining and the suction-pipe, and is based upon the principle that if a vacuum is formed in the earth at the ordinary depths by the action of the suction-pump, the atmospheric pressure communicated through the earth to the water will cause it to respond to the vacuum produced within the well, whose lining is itself the suction-pipe of the well and perfectly air-tight, the earth serving as a filter.

It is not necessary to extend these quotations to show that the principle which it is claimed constitutes the discovery or invention of Colonel Green, as described in the reissued patent, is that the production of a vacuum in the earth by means of an air-tight tube driven into the earth to which is attached a suction-pump will greatly increase the supply of water. To produce this vacuum it is necessary that the tube forming the lining of the well should be in such close contact with the surrounding earth as to be air-tight, and it is claimed that driving the tube into the ground, whether with or without originally perforating the earth with a rod, constitutes a mode of constructing a well which practically results in producing a well whose lining—to-wit, the tube—is in air-tight connection with the earth. In other words, in order to successfully apply the principle it is absolutely essential that the tube forming the lining of the well should be in such close contact with the earth that the air cannot pass down around the ontside of the tube, and the pump used in drawing up the water must also be attached to the end of the tube by an air-tight connection. Unless both of these conditions are fulfilled it is impossible to create a vacuum in the tube and about the portion of it inserted in the water-bearing stratum; and as the creation of this vacuum is the essential and only means of applying the principle which it is claimed constitutes the chief merit of Colonel Green's invention or discovery, it follows that in order to protect such a discovery by a patent it must be included within the specifications. This may be done by either a proper description of the result to be obtained or by the means employed to accomplish the result—that is to say, it would be sufficient if it was stated that by the use of certain prescribed means a vacuum in and about the tube would be created, and thereby the supply of water would be increased, or if it was stated that the tubing of the well was so driven as to be made air-tight by contact with the surrounding earth and the pump to be used was affixed to the tube by an air-tight connection. In the latter case the result reached or the principle put into operation would not be described; but as the means described must necessarily produce the result or apply the principle, it is held sufficient to describe the means employed without specifying the principle which is thereby brought into play. Indeed, it is not necessary that the inventor, to be entitled to a patent, should himself understand the abstract principle which his invention brings into use. It is sufficient if he is the inventor of a means whereby a new and useful application of the abstract principle is brought about. Still, as already remarked, it is necessary that in the patent and specification the new and useful application of the principle must be described, either by setting forth the result obtained, with the means of its accomplishment, or else by such a description of the means employed as will, if followed, necessarily produce a result which embodies the practical application of the principle involved.

Let us now examine the specifications originally filed by Colonel Green, and see whether there is embraced therein the application of the principle of utilizing atmospheric pressure through the creation of a vacuum in the tube and the earth surrounding it, where it penetrates the water-bearing stratum.

The description of the invention is set forth in the following language:

My invention consists in driving or forcing an iron or a wooden rod with a steel or iron point into the earth until it is projected to or into the water, and then withdrawing the said rod and inserting in its place a tube of metal or wood to the same depth, through which and from which the water may be drawn by any of the usual well-known forms of pumps.

Finally, in setting forth his claim he does so in the following terms:

Having thus fully described my invention, what I claim, and desire to secure by Letters Patent, in the herein described process of sinking wells where no rock is to be penetrated, viz:

By driving or forcing down a rod to and into the water under ground, and withdrawing it and inserting a tube in its place to draw the water through, substantially as herein described.

It certainly cannot be successfully claimed that in these statements it is set forth in express terms that the principle to be utilized is the atmospheric pressure forcing the water to and into the tube through the agency of a vacuum created in the tube, and in the earth at the lower end of the tube, where it penetrates the water-bearing stratum. There is not to be found in any part of the specifications any reference to a vacuum either in or ont of the tube, nor any mention of atmospheric pressure created thereby. If the application of this principle formed the material and all important part of Colonel Green's invention in 1861, and is now claimed in argument, he certainly failed to set it forth in express terms in his specifications forming part of the original patent, nor can it be inferred from the description of the means to be employed that he then proposed to create a vacuum by making the well-lining air tight and by attaching a pump thereto by an air-tight connection. He describes a driving-rod having a swell thereon, which is to be driven into the ground and then withdrawn, and a tube of a diameter somewhat smaller than the diameter of the swell of the drill-rod is to be inserted in the hole thus made. In no part of the description is it said, either expressly or by fair implication, that the tube when inserted must fit so closely into the opening made by the rod that no air can pass down on the outside of the tube to the water, nor is it stated that the pump must be attached by an air-tight connection to the top of the tube. A person can follow with exactness all the instructions therein given, and yet it would not necessarily follow that he had excluded the air from the lining of the well, or from the water-bearing stratum at the place where the tube penetrated the same. In other words, the description of the means to be employed, as set forth in these specifications, does not show that one of the results arrived at is to render the lining of the well air-tight, and to have attached thereto a pump by an air-tight connection. The description of the means to be em-

ployed can be carried out in practice without making an air-tight lining or tube, and hence without forming a vacuum around the bottom of the tube or in it. This being true, it follows that it cannot, from the description of the means employed, be inferred that Colonel Green then intended to claim as part of his discovery or invention the application of the principle that, by creating a vacuum in and about the tube, the same having been made air-tight, the flow of water would be largely increased. He did not claim it in express words, and the description of his invention, and the means to be used in carrying the same into practical use, fail to show that such was the main or even a necessary part of his invention.

In our judgment his invention or discovery is fully and fairly described in the language of his own claim, to wit:

What I claim and desire to secure by Letters Patent, in the herein-described process of sinking wells where no rock is to be penetrated, viz:

By driving or forcing down a rod to and into the water under ground, and withdrawing it and inserting a tube in its place to draw the water through.

What he sought to accomplish was to devise a rapid, easy, and feasible means of reaching an underground supply of water in such a mode that any ordinary pump could be applied to bring it to the surface, and his plan was to drive down a rod into the water, withdraw it, and then insert a tube, through which the water could be drawn by any ordinary kind of pump. In our judgment the evidence introduced by complainants shows that this was all that Colonel Green sought to do in 1861, and that in making his experiments at that time he did not contemplate or conceive of the idea that the tube should be made air-tight, so as to create a vacuum in it and about it, and thereby utilize the atmospheric pressure. Hence it is that in the specifications attached to the original patent no mention is made of atmospheric pressure, or of a vacuum in and about the tube, nor is it stated, in describing the means to be employed in making the wells, that the tube must be air-tight in its connection with the surrounding earth, or that the pump must be attached thereto. It is inexplicable, if it was intended to embrace in the original patent the operation of atmospheric pressure in the earth through the creation of a vacuum, which is now claimed to constitute the chief features and merit of the driven well, that the specifications contain no reference thereto, either expressly or even by fair implication. We conclude, therefore, that the original patent cannot be so construed as to embrace the application of this principle.

Turning, now, to the specifications of the reissued patents, what do we find? In the first place it is stated—

That the hole or opening is made by the mere displacement of the earth, which is packed around the instrument, and not removed upward from the hole, as it is in boring.

And it is further said that—

I prefer to employ a pointed rod, which, after having been driven or forced down until it reaches the water, I withdraw and replace with a tube made air-tight throughout its length, except at or near its lower end.

And further—

I attach to the tube by an air-tight connection any known form of pump.

In these portions of the specifications we find it provided that the earth must be packed around the tube forming the lining of the well; that this tube must be air-tight throughout its length, except at or near the lower end, which penetrates the water, and the pump used therewith must have an air-tight connection with the tube. Under these specifications it is claimed by complainants that the main feature of the discovery consists in the utilization of the atmospheric pressure through the creation of the vacuum in and about the tube. (See questions 11 and 12, testimony of William D. Andrew, pages 210 and 211, volume 1, of complainant's record.) Giving these specifications the construction which complainants put thereon, it follows that the reissued patent covers—

1. The process of sinking wells by forcing down a rod or tube to the water-bearing stratum without removing the earth upward, as in boring or digging.

2. Creating a vacuum in the tube forming the lining of the well by making the tube air-tight except at the lower end, compacting the earth around the tube, and by attaching a pump with an air-tight connection to the tube.

In the argument of counsel, as well as in the testimony of complainants, it is urged that the great merit of Colonel Green's invention consists of the discovery of the effect of the vacuum thus created. According to the view we take of the original patent, it did not cover or describe the application of this principle. It follows, therefore, that the reissue embraces the application of an important and material principle not found in the original. The rule is well settled that a reissue can be validly granted only for the same invention which was originally patented. If the reissue goes beyond this and covers other and different inventions or improvements suggested by the use of the orginal invention, it will be void. (See *Bun* v. *Durgee*, 1 Wallace, 531; *Manufacturing Co.* v. *Ladd*, 102 U. S., 408; *Miller* v. *Brass Co.*, 104 U. S., 350; *James* v. *Campbell*, 104 U. S., 356; *Manufacturing Co.* v. *Corbin*, 103 U. S., 780.)

As we view the evidence in this case we find that Colonel Green in his original invention did not embrace the idea of creating a vacuum in the lining of the well for the purpose of utilizing the pressure of the atmosphere, nor did his original patent, either expressly or impliedly, cover or describe the application of this principle; that this idea of utilizing the atmospheric pressure was an after thought on the part of complainants; that to protect it as a part of Colonel Green's invention it was evidently necessary that the specifications should be enlarged; that the reissue was obtained for the purpose of covering thereby this idea of atmospheric pressure caused by a vacuum in an air-tight tube; that the complainant now claims that the chief merit of the invention consists in creating a vacuum in the tube and the earth surrounding it where it penetrates the water-bearing stratum, and through the pressure of the atmosphere, forcing a larger and more continuous supply of water into the tube forming the lining of the well, and that the application of this principle is provided for and embraced within the specifications of the reissued letters patent. Giving these specifications the construction claimed therefor by complainants, it follows, in our judgment, that the reissue departs widely from the original, and embraces the application of a principle not covered by the original invention of Colonel Green, and consequently that the reissued patent must be held void.

In determining this question of the validity of the reissued letters patent we have assumed that the construction put thereon by complainants and their coun-

sel is legally correct, to wit: that there is embraced therein the principle of utilizing atmospheric pressure by creating a vacuum in the tube and about the same where it penetrates the water-bearing stratum.

We have also assumed, without questioning it, that the theory of complainants in regard to the creation of a vacuum about the tube, and its effect in increasing the flow of water into the tube through the pressure of the atmosphere upon the other portions of the water-bearing stratum, is correct. In the view we have taken of the case it has not been necessary to investigate fully the scientific points involved in the latter proposition, but we will only say that the experiments made before the court and the evidence adduced on this question in physical science have not fully demonstrated to our satisfaction the correctness of the theory relied upon by complainants.

Upon the issue of originality of invention by Colonel Green a large amount of evidence has been adduced with a view of showing that this method of sinking wells had been substantially described in various publications antedating Colonel Green's discovery, and also that wells had been sunken by this method at different times and places. We do not deem it necessary to specially mention more than two of these alleged prior discoveries. While it cannot well be questioned that it is shown that in some of the other instances a near approach was made to the method subsequently adopted by Colonel Green, yet we do not think it can be said that these isolated instances were anything more than mere experiments, not developed to an extent sufficient to enable the court to say that they clearly anticipated Colonel Green's discovery. There are two instances, however, which cannot be so summarily disposed of, these being, first, the well at Independence, Iowa, and, second, the wells driven at Milwaukee, Wisconsin, by E. W. Purdy.

In regard to the well at Independence, the query is, whether it was in fact constructed in 1861, as claimed by defendants, or in 1866, as averred by complainants. The defendants claim that there were two wells driven at Independence—one in the early summer of 1861, the other in 1866; while the complainants aver that there was but one well—*i. e.*, the one driven in 1866, and that the witnesses who place it in 1861 are simply mistaken in the date.

In several of the cases heretofore heard touching the validity of Colonel Green's patent the question in regard to this Independence well has been presented, and it has been therein held that the conflict in the testimony was to be reconciled by holding that the witnesses for the defendants, while testifying truthfully to the existence and character of this well, had mistaken the date and placed an event in 1861 which really took place in 1866. If the evidence submitted to us was substantially the same as that submitted in the cases referred to, we should not feel disposed to re-examine the question at issue; but we have had presented to us much additional evidence largely intended to prove the date of the driving of the well in question by proving the date of other facts which are so connected with the existence of the well that proof of the date of the former unmistakably fixes the time when this well was driven and in use. Thus a number of witnesses who probably could not by a mere effort of memory fix the month or the year when they saw and used the well, testify to facts which corroborate their recollection—that they saw and used this well when the soldiers were enlisting at Independence and forming companies commanded by Captains Lee and Hord for the purpose of entering the Union army. That these companies were organized at Independence is a fact beyond dispute. So with other facts, the date of which is not open to question, such as the time when Sherwood and Kimball kept the hotel at Independence, the date of Colonel Lake's marriage, the use of the well by the cricket club, who played cricket upon the grounds adjoining the lot where the well was driven, and which club was broken up by a number of its members entering the army in 1861. By such facts as these the defendants have greatly strengthened their position in regard to this well at Independence, and while it cannot be doubted that there is much plausibility in the argument urged against the reliability of this evidence, still it seems to us that the preponderance of the evidence upon this question is with the defendant, and that it must be held as a conclusion of fact—

1. That in the early part of the summer of 1861 there was constructed at Independence, Iowa, a driven well which proved a success.

2. That this well was constructed by driving a tube down into the water-bearing stratum and attaching to the tube a pump, by which the water was drawn up through the tube in apparently an inexhaustible quantity.

It does not appear, however, that any other wells came into use by reason of the driving of the one under consideration, and if the decision of the court depended solely upon the effect to be given to the driving of this one well, we might well doubt whether it would not be proper to treat it as a mere isolated experiment, which would not be held to defeat the rights of an independent inventor.

In regard to what may be called the "Milwaukee wells," it is shown by the testimony of E. W. Purdy that in 1849 and 1850 he was in the business of making wells at Milwaukee, Wisconsin; that he used iron rods about two inches in diameter, and made so they could be coupled together. The first rod was about sixteen feet long, the lower end being in shape of a drill. This rod was worked up and down by a rope running over a gin-pole, the rod being raised up and down, and in that way the earth was displaced by the rod as it went down. Tubing of about four inches in diameter was driven down as the rod progressed. This tube formed the lining of the well. No earth was removed upward, except in case of striking quicksand, when a long sheet-iron bucket with a valve in the bottom was used to bring up the quicksand. When the tube had been forced down into the water, if the water did not come to the surface, a pump was used, the tube to which the pump was attached being placed inside the tube first forced down, the latter forming the lining of the well. It is shown by the testimony of Purdy that he drove a large number of these wells, and the places where and the parties for whom they were driven are given in several instances. In some cases the wells were driven to the depth of sixty and one hundred feet. In these wells thus driven there was used, first, a rod for puncturing the earth, which was driven down to the water-bearing stratum; second, into the aperture thus made a tube was forced, which was in close contact with the

earth, and which formed the lining of the well, and through which the water either flowed naturally or was drawn by the aid of a pump inserted therein.

Comparing this method of driving wells and its results with that adopted by Colonel Green in 1861, and described in the specification attached to the original letters patent, we confess our inability to see any substantial difference. What he expressly claimed in his original specifications was the process of sinking wells by driving or forcing down a rod to and into the water under ground, and withdrawing it and inserting a tube in its place to draw the water through; and it is just this process in substance that was employed in Milwaukee. These wells driven at Milwaukee cannot be set aside as abandoned experiments. Purdy testifies that he was engaged in sinking them as a regular business. Numbers were put into practical use. This testimony remains uncontradicted, and it is not claimed that these wells are a myth. If, then, it be true that in 1849 and 1850 wells were driven at Milwaukee by a process not distinguishable from that devised by Colonel Green in 1861, and these wells were driven not as mere experiments, nor for the purpose of exhibition, but for public and continuous use, and, from aught now shown, may be in use to-day, can any other conclusion be reached than that Colonel Green was not the original or first inventor of the process of driving wells described in his specification? In our judgment, the method pursued in sinking these wells at Milwaukee is the same in substance as that devised by Colonel Green, differing only in minor particulars, and hence it follows that Colonel Green's process for driving wells was only a reproduction of a method which had been devised and put to practical public use fully ten years before Colonel Green hit upon the same expedient. If this be true, then it necessarily results that the defense of want of novelty must be sustained.

The conclusions we have reached upon the points already discussed render it unnecessary to consider the other questions, including that of infringement, which are presented in the record.

Under the view we have taken of the case it follows that complainants' bill must be dismissed, with costs, and it is so ordered.

LOVE, *D. J.*, concurs.

NELSON, *D. J.*, dissents.

—

OPINION OF JUDGE LOVE.

The two years' limitation was intended in the act of 1839, as it unquestionably is in section 4886 Revised Statutes, to be general, and it applies to all cases in which the invention has been in public use or on sale for more than two years prior to the application, whether with or without the consent or allowance of the inventor.

LOVE, *J.*:

I concur fully in the opinion just delivered by my brother SHIRAS, and I can add nothing to what he has said touching the points which he has considered. I purpose, however, to give my own views upon one question which has not been discussed in the opinion. The respondent sets up the defense, among others, that the alleged invention of Colonel Green was in public use for more than two years prior to his application for a patent, and after the time when, as Colonel Green claims, his invention was perfected. But the complainants insist that this defense cannot be maintained because one of its essential conditions is that the public use for two years must have been with Green's knowledge and consent, and the complainant contends that the defendant has failed to establish the fact of Green's knowledge and consent. If it were necessary, in my view, to the decision of this point, I would be compelled to find the fact to be that Green did know of the use of the invention for more than two years prior to his application. In my judgment, the preponderance of evidence, both direct and circumstantial, shows that Green did know the fact that driven wells substantially the same as his were in public use for a period of more than two years before he made his application. Several witnesses, apparently credible, against Green alone testify to facts showing directly Green's knowledge and acquiescence in the use of his invention for the time mentioned. Besides, it appears that quite a number of driven wells were put down and used in the town of Cortland, New York, where Green lived for more than three years before he filed his application, and it is difficult to see how Green could have been ignorant of such a fact, considering the deep interest he must have felt in its results. But in my judgment, it is unnecessary to this defense to find that Green knew of and assented to the use of his invention for the period in question. Green's original patent was issued when the act of 1839 was in force, and it is clear to my mind that according to the true construction of that act a public use of an invention for two years prior to the application, with or without the consent of the inventor, is sufficient to invalidate the patent.

The seventh section of the act of 1839 (5 Stat. at Large, 353) provides that—

> Every person or corporation who has or shall have purchased or constructed any newly-invented machine, manufacture, or composition of matter, prior to the application of the inventor or discoverer, for a patent, shall be held to possess the right to use and vend to others to be used the specific machine, manufacture, or composition of matter so made or purchased, without liability therefor to the inventor or any person interested in such invention, and no patent shall be held to be invalid by reason of such purchase, sale, or use prior to the application for a patent as aforesaid, except on proof of abandonment of such invention to the public, or that such purchase, sale, or prior use has been for more than two years prior to such application for a patent.

The section just quoted was no doubt intended as an amendment of the sixth section of the act of 1836, as follows:

> That any person or persons having discovered or invented any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement on any art, machine, manufacture, or composition of matter, not known or used by others before his or their discovery or invention thereof, and not at the time of his application for a patent in public use or on sale with his consent or allowance as the inventor or discoverer, and shall desire to obtain an exclusive property therein, may make application in writing to the Commissioner of Patents expressive of such desire, and the Commissioner, on due proceedings had, may grant a patent therefor.

What is the true construction of the seventh section of the act of 1839, just quoted? Is it essential to a defense set up under that section that the "sale or prior use" of the invention for more than two years before the application for a patent should be with the inventor's "consent or allowance?"

In the case of *Egbert* v. *Lippman* Judge Blatchford said:

> The effect of the act of 1839 is to require that an inventor shall not permit his invention to be used in public at a period earlier than two years prior to his application for a patent under the penalty of having his patent rendered void by such use. Consent and allowance by the inventor are not necessary to such invalidity.

The decree in this case was affirmed by the Supreme Court of the United States, (104 U. S., 333.) Mr. Justice Woods, in delivering the opinion, says that—

Since the passage of the act of 1839 it has been strenuously contended that the public use of an invention for more than two years before such application, even without his (the inventor's) consent and allowance, renders the letters patent therefor void. It is unnecessary in this case to decide this question, for the alleged use of the invention covered by the letters patent to Barnes is conceded to have been with his express consent.

It is, therefore, to say the least, an open question whether or not the consent of the patentee to the public use is a condition essential to the defense in question. For my own part I must say that, but for the doubt thus cast upon the construction of the seventh section of the act of 1839, I could not possibly entertain a question about it.

Upon what principle of construction may we attempt to interpolate the significant words "consent or allowance" into the statute? These words do not appear in the statute. No such condition is expressed as these words imply. The plain, simple, and unqualified provision is that—

No patent shall be held to be invalid by reason of such purchase, sale, or use prior to the application, except on proof of abandonment of such invention to the public; or that such purchase, sale, or prior use has been for more than two years prior to such application for a patent.

Not a word is here used to the effect that such prior use or sale shall be with the "allowance or consent" of the patentee. If we get such a condition into the section, we must do it either by construction or interpolation. Now, the interpolation of material words into a statute is ordinarily an act of simple violence. It is a settled rule in the interpretation of contracts and statutes that their meaning and intent must be ascertained from all and not from a part of the words of the act or instrument. It would do violence to this rule in the construction of a statute to cast out certain words and consider only what remained; and surely we may with much stronger reason say that it would be wholly inadmissible to incorporate into a statute words not found in it, and thereby give the act a meaning and construction wholly different from that which it would bear without such interpolation.

It may not be amiss here to note what a celebrated writer upon the law of nations says upon the interpretation of treaties:

The first general maxim of interpretation is that it is not permitted to interpret what has no need of interpretation. When an act is conceived in clear and precise terms, when the sense is manifest and leads to nothing absurd, then there can be no need to refuse the sense which a treaty naturally presents. To go elsewhere in search of conjections in order to restrain or extinguish it is to endeavor to elude it. If this dangerous method be once admitted, there will be no act which it will not render useless. (Vattel, Law of Nations, book 2d, chapter 17, page 368.)

Now, what is there in the clause in question that needs interpretation? It is plain and unambiguous. It is free from obscurity. Does the language of the clause, when received in its obvious sense, lead to any absurd result? Would it when so taken work such gross and palpable injustice as to lead the mind to conclude that the legislature intended it to be received in some other and different sense? On the contrary, a legislature had, in my opinion, a wise purpose in fixing a period of limitation which should not depend upon the uncertain question of the patentee's consent. Its purpose was to require some degree of diligence from the inventor in the assertion of his rights, and to give him full protection when he exercised that diligence; and at the same time to protect the public in the exercise of rights examined where the patentee should, by reason of his own negligence, fail even to file his application for a patent for a period of two years. The legislature may justly have considered a period of two years from the completion of the invention quite a sufficient time to enable the inventor to make his application. No injustice could possibly arise to him from such a rule except as a consequence of his own negligence. What but negligence could lead an inventor to delay the assertions of his claims for more than two years from the maturity of his right? And was it the intention of Congress to protect him against the consequences of his own negligence? If the complainants' construction is to prevail, there is no time whatever prescribed within which, without the inventor's own consent to the use, he is required to make his application for a patent. The inventor could, under this construction, by simply refusing his consent, safely withhold his invention from public use for an unlimited period of time after bringing it to perfection. He might, after the lapse of many years, and after his invention should be in general use, by simply denying his consent, or by mere silence, obtain a patent, and thus override and prejudice intervening investments and industries unless, indeed, a case of abandonment could be made out. This, it is easy to see, would be against sound policy as well as private justice. The public interest would be prejudiced and individuals injured without real benefit to the inventor, since his true interest would certainly not be promoted by the delay. Congress did, indeed, in the act of 1836, give to the inventors and discoverers the right to apply for a patent without limit as to time after they were in public use or sale, unless the public use or sale was with their own consent or allowance. But the unwisdom of the provision becoming apparent, Congress, in the act of 1839, changed the law by prescribing a fixed period of limitation and omitting the words requiring the inventor's "consent or allowance" to the use or sale of his invention. The intention of Congress in the act of 1839 is further illustrated by section 4886 of the Revised Statutes. It will appear by inspection of this section that it embodies so much of the seventh section of the act of 1839 and the sixth section of the act of 1836 as it was the purpose of Congress to preserve; and that while the two years' limitation is in express terms re-enacted in section 4886 of the revision, the qualifying words requiring the consent or allowance of the inventor used in the act of 1836 are entirely omitted. The section is as follows:

Section 4886. Any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the fees required by law and other due proceedings had, obtain patent therefor.

It will not, I suppose, be doubted that the two years' limitation clause in the seventh section of the act of 1839 must receive precisely the same construction as the two years' limitation clause in section 4886 of the Revised Statutes. The language of this clause in the two sections being substantially the same, and the purpose of the legislature the same, it follows that the construction must be the same. Now, does any one for a moment suppose that the words "and not in public use or on sale for more than two years prior to his application," in section 4886 of the revisions, will bear the construction that the two years' public use, in order to invalidate the patent, must be with the "assent or allowance" of the inventor? Will any court ever interpolate the words "assent or allowance" into section 4886, thus: And not in public use or on sale "with the assent or allowance of the inventor" for more than two years prior to his application? What possible reason could have moved Congress to provide that the public use, in order to defeat the patent and vest a right to use the invention in the public, should continue for two years if that public use was to be with the consent and allowance of the inventor?

The act of 1839 must, I think, have been specially intended to apply to a class of persons who should make, use, and vend the "machine, manufacture, or composition of matter" before the application, without the allowance or consent of the patentee. The seventh section of that act, it will be observed, provides, substantially, that any person who has or shall have constructed or purchased such newly-invented thing prior to the inventor's application shall have the right to use and vend to others such specific thing without liability to the inventor or other person interested in the same. Now, this must surely refer to persons who should construct or purchase the newly-invented thing without the inventor's consent or allowance, because if it were constructed or purchased with the inventor's allowance and consent, he could not on general principles make them liable as infringers. This particular provision of the seventh section was, therefore, wholly unnecessary and nugatory except as a protection to those who should invade the inventor's right without his "consent or allowance" before the application; and can it be doubted that the words which immediately follow in the same section refer, in part at least, to the same class of persons—namely, those who should purchase or make the inventor's "machine, manufacture, or composition of matter," without his consent or allowance? Can it be questioned that the provision that "no patent shall be held to be invalid by reason of such purchase, sale, or use prior to the application for a patent, &c., except on proof that such purchase, sale, or prior use has been for more than two years prior to such application," was intended to embrace at least the class of cases referred to in the immediately-preceding part of the section? In my opinion, this two years' limitation was intended in the act of 1839, as it unquestionably is in section 4886 of the Revised Statutes, to be general, and that it applies to all cases in which the invention has been in public use or on sale for more than two years prior to the application, whether with or without the consent or allowance of the inventor.

It is obvious from the plain reading of the act of 1836 that under its provisions an inventor who permitted or allowed the public use or sale of his invention up to the time of his application was not entitled to protection, for the unavoidable implication from the language is that he should not be entitled to a patent. The law would not permit him to call to account as infringers persons whom he had allowed to use his invention, and perhaps invest their money in it, before he gave notice of his intention to claim it by making his application. The class of persons, therefore, who used or sold the "art, machine, manufacture, or composition of matter" with the consent of the inventor were fully provided for and protected by the act of 1836. But there was another class not provided for by that act—namely, those who should use, purchase, or sell the thing invented without the inventor's consent before his application. The public use and sale of the inventor did not under the statute of 1836 preclude the inventor from his right to a patent and his right to call infringers to account where his invention was used before the application without his allowance or consent. Yet it is obvious that the latter class of persons might have a certain equity which the law ought to protect, and the primary object of the seventh section of the act of 1839 seems to have been the protection of those who might before the application, without the inventor's consent, use his invention and perhaps invest money in it. Hence the seventh section of that act provides that—

Any person or corporation who shall or shall have purchased or constructed any newly-invented machine, manufacture, or composition of matter prior to the application by the inventor or discoverer for a patent, shall be held to possess the right to use and vend to others to be used the specific machine, manufacture, or composition of matter so made or purchased without liability therefor to the inventor or any other person interested in such invention.

If the statute had stopped here a possible inference might have arisen that a patent issued to an inventor, where his invention had been on sale or in use, even without his consent, would be held invalid. This would have been unjust to the inventor. It was his own fault or negligence if his invention came into public use with his own consent or allowance, and the act of 1836 denied him relief against the consequence of his own fault or negligence. But it was the manifest purpose of the act of 1839 to guard carefully against any possible implication that the sale or use of the invention without the inventor's consent or allowance should deprive him of his right to a valid patent. Hence it is further provided in the same clause of section 7, following the words just quoted, that "no patent shall be held to be invalid by reason of such purchase, sale, or use, prior to the application for a patent," except what? Except on proof of abandonment, or on proof that such purchase, sale, or prior use has been for more than two years prior to such application for a patent.

Now, what follows from this analysis of the two statutes? Is not the inference plain and irresistible that the purchase, sale, or prior use of the things invented for two years before the application without the assent and allowance of the inventor would invalidate the patent? Can we here interpolate the words "with the assent and allowance" of the inventor, seeing that the very object of the thirty-ninth section was to provide for a class of cases in which the invention should be used without the inventor's consent or allowance? The clause of the act of 1839 in question here is, I think, a statute of limitation, and all such statutes are founded rather upon considerations of public policy than private justice; and where no exceptions are made in the statute itself, it is not competent for the courts to introduce them. If married women, infants, and other persons under disability were not excepted from the provisions of a statute of limitations, no court could incorporate into the statute a saving clause in their favor.

Standing upon the broad grounds of public policy, it matters not that a statute of limitations may work injustice in particular cases. If my construction of the seventh section of the act of 1839 be correct, it is decisive of the present case, since it is established by the evidence beyond doubt that Green's invention was in public use for more than two years prior to his application for a patent.

U. S. Circuit Court—District of Rhode Island.

SMITH v. HALKYARD *et al.*

Decided February 9, 1884.

INJUNCTIONS—MOTIONS FOR CONTEMPT.

Motions for contempt for violation of injunctions are not granted unless the violation of the injunction is plain and free from doubt. Doubted in this case whether there is a violation.

MOTION for contempt.

Mr. John L. S. Roberts and *Mr. George L. Roberts* for the complainant.

Mr. Wilmarth H. Thurston and *Mr. Benj. F. Thurston* for the defendants.

BEFORE LOWELL AND COLT, JUDGES.

COLT, *J.:*

The defendants contend that they are not violating the injunction recently granted by this court by reason of certain changes made in their machine. The plaintiff claims that the defendants still infringe the first and seventh claims of the lacing-hook patent as well as the patent for lacing-hook stock. The lacing-hook patent is for a combination. One of the elements of the feeding device mentioned in the first and seventh claims is a spring inserted in the groove along which the stock is fed, which operates to raise the stock and clear it from the dies. In their present machine the defendants use no spring. The inclines in the groove of the feeding mechanism are not, in our opinion, the equivalents of the spring, and do not perform the same function, and, as shown in the affidavit of Mr. Renwick, may be dispensed with altogether. By leaving out one element of the combination a serious doubt is raised as to the defendants' infringement.

As to the lacing-hook-stock patent, the position is strongly urged by the defendants that the patent is for stock with a series of alternate necks and indentations, and that in their present machine they only use a single neck and indentation at the end of the stock-strip, and not a series. The plaintiff contends that, while at no moment of time a series exists, this is due to the fact that each neck and indentation is cut out as soon as formed, and that a series does exist in order of time or successively, as is shown by the successive holes in the waste-strip. It is clear from the specification and drawings that the patentee contemplated the co-existence of a series of alternate necks and indentations. It is from stock so specially prepared in a series from which the blanks for the formation of lacing-hooks were to be cut. It may well be doubted whether, in view of the terms of the patent and the prior state of the art, the patent can be held to extend to a single neck and indentation.

Motions of this character are not granted unless the violation of the injunction is plain and free from doubt. (Walker Patents, 481; *Birdsall* v. *Hagerstown Mfg. Co.*, 2 Bann. & Ard., 519; *Liddle* v. *Cory*, 7 Blatch., 1; *Welling* v. *Trimming Co.*, 2 Bann. & Ard., 1; *Bate Refrigerating Co.* v. *Eastman*, 11 Fed. Rep., 902.)

Motion denied.

U. S. Circuit Court—District of Rhode Island.

TAFT v. STEERE *et al.*

Decided February 9, 1884.

1. PARTICULAR PATENTS.

The second and third claims of Patent No. 63,853, granted March 26, 1867, to James J. Walworth and Gustavus E. Buschick, assignees of Caspar Zwicki, construed, and held not to have been infringed by the defendants.

2. UTILITY OF INVENTION.

Doubted whether there is any utility in the cam mentioned in the third claim, supposing the nose-piece to be attached to the cam exactly as shown in the model, and it not appearing that any looms embodying the improvements claimed have ever been put in operation.

BEFORE LOWELL AND COLT, JUDGES.

Mr. A. K. P. Joy for the complainant.

Mr. Eugene F. Warner and *Mr. Walter B. Vincent* for the defendants.

COLT, *J.:*

The complainant in his bill charges the defendants with the infringement of certain letters patent for improvements in looms, dated March 26, 1867, No. 63,853, issued to James J. Walworth and Gustavus E. Buschick, assignees of Caspar Zwicki, the inventor. By subsequent assignments the plaintiff became the owner of the patent. The alleged infringements relate to the second and third claims.

The second claim is as follows:

2. In combination with the shuttle-race, the springs H, at either end, arranged over the top of the shuttle-path, and provided with means for vertical adjustment, substantially as described.

The specification says:

Above each end of the shuttle-race E are springs H, each fastened to holding-pieces e on the side of the race, so that they can be adjusted in a vertical direction, and provided with a set or thumb screw at *f*, for the purpose of further adjustment of the free end of said spring H in a vertical direction. The function of these springs H is to stop the shuttle gradually and without recoil, and to keep it in its proper position on the shuttle-race to receive the blows of the picker-staffs T.

The essence of this claim is a spring capable of vertical adjustment over each end of the shuttle-race, to check the flight of the shuttle and keep it in its place. The defendants do not use this. Their looms have no spring over the top of the shuttle-race and no means of vertical adjustment. They use a piece of wood screwed onto the top of the shuttle-race, or a narrow piece of wood screwed onto the inside of the top, and the evidence goes to show that these have been in use for a period of thirty-five years. The side of the shuttle-box in the defendants' looms is of such shape that it operates to check the flight of the shuttle, and it also appears to be adjustable; but the important element in the plaintiff's claim is a spring on the top of the shuttle-box capable of vertical adjustment, and this we do not find, nor any equivalent therefor, in the defendants' machine, and so there is no infringement.

The third claim is as follows:

3. In combination with the picker-staff of a loom, the cam N when provided with the adjustable piece *o*, substantially as described.

It is not contended that Zwicki was the first to make a cam with a nose in two pieces, instead of being solid; but the adjustable character of the nose-piece upon the cam is claimed as an improvement.

After carefully examining the evidence and exhibits, we are satisfied that the cams used by the defendants are not adjustable for any practicable purpose; that such adjustment is not attempted in their use, and that it is doubtful at least whether there is any utility in this feature of the patent, supposing the nose-piece to be attached to the cam exactly as shown in the model. It does not appear that any looms embodying the improvements claimed in this patent have ever been put in operation. These conclusions dispose of the two main questions raised in this case, and we therefore deem it unnecessary to consider any others.

The bill should be dismissed.

DESIGNS.

14,883.—STEAM-RADIATOR PIPE.—*Juan B. Arci* and *John Chapman*, Brooklyn, N. Y. Application filed January 29, 1884. Term of patent 7 years.

14,884.—ORNAMENTATION OF BUILDERS' HARDWARE.—*Charles H. Beebe*, Norwich, Conn. Application filed January 23, 1884. Term of patent 7 years.

14,885.—FONT OF PRINTING-TYPE.—*George Giesecke*, Leipsic, Saxony, Germany. Application filed October 15, 1883. Term of patent 7 years.

14,886.—CLOCK-FRONT.—*William M. House*, New York, N. Y. Application filed December 12, 1883. Term of patent 7 years.

14,887.—CARPET.—*Henry Hunt*, Greenville, N. J., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed January 22, 1884. Term of patent 3½ years.

14,888.—ORNAMENTATION OF BUILDERS' HARDWARE.—*Arthur Langerfeld*, New Britain, Conn., assignor to *P. & F. Corbin*, same place. Application filed December 8, 1883. Term of patent 14 years.

14,889.—SLIDING-DOOR HANGER.—*Edward F. Moore*, Chicago, Ill. Application filed January 26, 1884. Term of patent 14 years.

14,890.—LADY'S COSTUME.—*John Quincy Reed*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed February 13, 1884. Term of patent 3½ years.

14,891.—FONT OF PRINTING-TYPE.—*Edwin C. Ruthven*, Philadelphia, Pa., assignor to *MacKellar, Smiths & Jordan*, same place. Application filed January 31, 1884. Term of patent 7 years.

14,892.—MISS'S COSTUME.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed February 13, 1884. Term of patent 3½ years.

11,893.—MOLDING.—*William Smith*, Philadelphia, Pa. Application filed February 11, 1884. Term of patent 7 years.

11,894.—LADY'S COSTUME.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed February 13, 1884. Term of patent 3½ years.

11,895.—LADY'S COSTUME.—*Mary Turner*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed February 13, 1884. Term of patent 3½ years.

11,896.—PACKING-CASE.—*Houghton Wardelle Wilson*, Kingston, Ontario, Canada. Application filed August 28, 1883. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upwards are registered under the act of March 3, 1881.]

11,010.—DRILLING AND SHEETING.—*Adolph Bernheimer*, New York, N. Y. Application filed January 21, 1884.
"The figure of a bear."

11,011.—TELEGRAPHIC CALL-BOXES.—*Augustus G. Daris*, Baltimore, Md. Application filed January 18, 1884.
"The arbitrary symbol of a Maltese cross."

11,012.—COFFEE AND COFFEE-EXTRACT PREPARATIONS.—*George W. Earhart*, Columbus, Ohio. Application filed January 30, 1884.
"The symbol of a twig or branch of a coffee-plant with its leaves, blossoms, and ripening berries arranged across an elliptical figure."

11,013.—PLAYING-CARDS.—*John Gang*, New York, N. Y. Application filed February 4, 1884.
"The arbitrary word-symbol 'EDGE.'"

11,014.—BUTTON-FASTENERS.—*J. K. Krieg & Co.*, New York, N. Y. Application filed February 14, 1884.
"The word 'BOSS.'"

11,015.—PRESSED CLOVER-BLOSSOMS AND FLUID AND SOLID EXTRACTS THEREFROM.—*D. Needham's Sons*, Chicago, Ill. Application filed December 26, 1883.
"A representation or illustration of a clover-blossom."

11,016.—FERTILIZER.—*James D. Simmons*, Hagerstown, Md. Application filed December 22, 1883.
"A figure representing the bust of the registrant, in connection with the words and letters 'THE WHEAT AND CLOVER PRODUCER.'"

11,017.—SAFETY-MATCHES.—*C. C. Abel & Co.*, New York, N. Y. Application filed January 15, 1884.
"The word 'WASHINGTON,' the representation of the head of Washington, a shield, an eagle, and a scroll in any arrangement."

11,018.—FILES, STRAW-KNIVES, GRASS-HOOKS, SAWS, SICKLES, AND SCYTHES.—*William Kirkby Peace* and *Hugh Kirkby Peace*, Sheffield, England. Application filed January 5, 1884.
"The word 'EAGLE' or the pictorial representation of an eagle."

11,019.—TUNING-PINS.—*Wilhelm Wagner, Jr.*, Plettenberg, Prussia. Application filed February 21, 1884.
"The representation of a bee with spread wings, with the letters 'W W' imprinted upon said wings."

11,020.—WRITING AND CARD PAPER AND ENVELOPES.—*Whiting Paper Company*, Holyoke, Mass. Application filed February 2, 1884.
"The letter 'W' and the representation of an acorn within it."

11,021.—CANNED FRUIT AND VEGETABLES.—*Knowles & Anderson*, Camden, N. J. Application filed February 15, 1884.
"The word-symbol 'ANDERSON'S.'"

11,022.—GLASS BOTTLES.—*Henry Martin*, Pittsburg, Pa. Application filed February 5, 1884.
"The letter 'G,' words 'UNION,' 'SEAL,' and letter 'W,' placed one above the other in the order named."

11,023.—RUBBER BUTTONS.—*Novelty Rubber Company*, New Brunswick, N. J. Application filed December 1, 1883.
"The representation of a winged animal figure with a button in its claws, which has on its face the letters 'N R C' in monogram."

11,024.—KID GLOVES.—*Oberteuffer, Abegg & Daeniker*, New York, N. Y. Application filed February 9, 1884.
"A picture, image, engraving, or cut representing a woman holding a sword in her right hand, which rests upon her knee, her left hand resting upon a shield, and in front of her a cock with one claw resting upon a globe, and adjoining said picture is the word 'GALLIA.'"

11,025.—PLOWS.—*Arabella G. Starke*, Richmond, Va. Application filed February 12, 1884.
"The word 'DIXIE.'"

11,026.—LAUNDRY AND TOILET SOAP.—*C. L. Jones & Co.*, Boston, Mass. Application filed February 18, 1884.
"The phrase 'KNIFE AND FORK.'"

11,027.—BOOT-POLISH.—*Theodore Young Kelley*, London, England, and New York, N. Y. Application filed January 4, 1884.
"The word 'PET.'"

11,028.—HAIR-BLEACHING COMPOUND.—*Albert Simonson*, New York, N. Y. Application filed February 8, 1884.
"The word 'MESSALINA.'"

LABELS.

3,990.—Title: "CURA REUMATICO."—*Harry Hibben Ballard*, Washington, Ohio. Application filed February 21, 1884.

3,991.—Title: "BUCHU GIN" (FOR A MEDICAL PREPARATION.)—*Walter Wm. Crawford*, New York, N. Y. Application filed February 23, 1884.

3,992.—Title: "PENNYPACKER" (FOR HORSE-COLLARS.)—*A. F. Dunavan & Son*, Dayton, Ill. Application filed February 23, 1884.

3,993.—Title: "B. F. DURVIN'S EUREKA SALVE."—*Benjamin Franklin Durvin*, Richmond, Va. Application filed February 25, 1884.

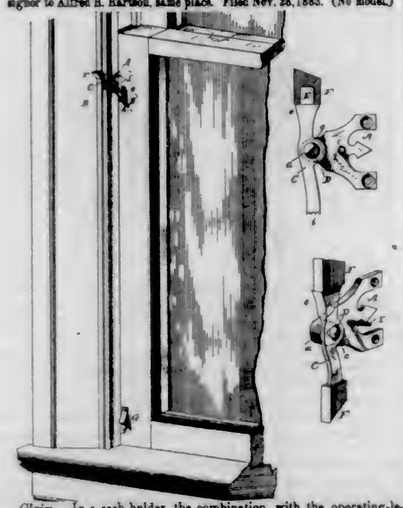
4,006.—Title: "ACME RUBBER PAINT."—*Sullivan & Ravekes*, San Francisco, Cal. Application filed February 20, 1884.

4,007.—Title: "HIGH FLYER." (FOR CIGARS AND TOBACCO.)—*Frederick Wambach*, Philadelphia, Pa. Application filed February 20, 1884.

PATENTS



GRANTED MAR. 18, 1884.

295,141. PROTECTOR FOR BOOK-LEAVES. JOHN AKINS, Buffalo, N. Y., assignor to Orville A. Crandall, same place. Filed May 14, 1883. (No model.)

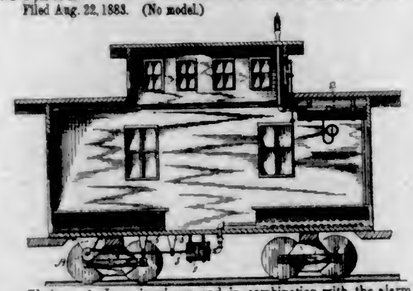
Claim.—The corner-protector for leaves, consisting of the blank A, with the projection *c* on one side and the other side cut away from *d* to the bottom, the part A' turned over from *d* to *b'*, forming a triangular receptacle or pocket, *a*, for the corners of leaves, the part *c* making one closed side, and the part from *d* up the other closed side of the pocket, substantially as specified.

295,142. SASH-FASTENER. HENRY H. ASHDOWN, Duluth, Minn., assignor to Alfred H. Harton, same place. Filed Nov. 28, 1883. (No model.)

Claim.—In a sash-holder, the combination, with the operating-lever formed with heads at each end, the upper head having a block, F, and the lower head being formed with serrations *i*, of the plates G H, the block F being adapted to bear against the corner *g* of plate G, and the serrated lower end of the lever engaging with serrations on the inclined face of plate H, as set forth.

295,143. BUGGY-SEAT. WILLIAM W. BALL, Indianapolis, Ind., assignor of one-half to Addison W. Ball, same place. Filed Jan. 9, 1884. (No model.)

Claim.—1. The combination, with the bottom, sides, and back of a buggy-seat, of corner-pieces C, which cover the corners of said sides and back and extend under the same over the corners of said bottom, and thus secure the parts of the seat together and protect the corners of the same, substantially as set forth.



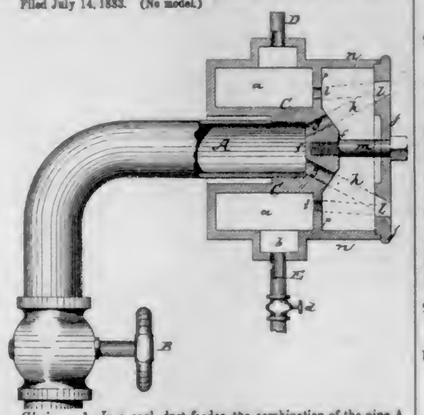
2. The combination, with the bottom, sides, and back of a buggy-seat, of corner-pieces widened at the lower end and formed to cover the corners of said bottom and be secured thereto, and extend thence up over the outside of the corners of the back and sides, substantially as described, and for the purposes specified.

3. In a buggy-seat, a corner-piece, C, having ears *c'*, formed into hooks to support the shifting-rail, in combination with said rail, substantially as set forth.

4. The combination of the usual seat parts, the shifting-rail, and a series of hooks on the seat as supports for said rail, parts of said hooks being curved to pass under said rail and a part over it, thus securing it firmly in position without the use of other fastenings, except at the ends, substantially as set forth.

5. The combination of the ordinary seat parts, A B, the corner-pieces thereon, provided with hooks, and the shifting-rail mounted in said hooks, and thus secured in position, substantially as set forth.

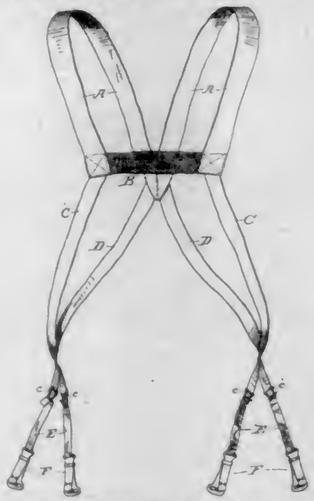
295,144. CAR-SIGNAL. WILLIAM D. BEATY, Mannington, W. Va. Filed Aug. 22, 1883. (No model.)



Claim.—1. In a signal-car, and in combination with the alarm thereof, the shaft A, secured beneath the car, provided with friction-wheel B, adapted to bear on the axle, and having a crank-turn, to which is secured the piston-rod of an air-pump, 1, which forces air into a reservoir, where it is held under pressure for subsequent use, the lever O, pivoted within the car, and connected to the end of the shaft A by the link *b*, and held in any desired position by the serrated plate *c*, substantially as described.

2. In a car-signal, and in combination with the alarm thereof, the shaft A, secured beneath the car, provided with friction-wheel B, adapted to bear on the axle, and having a crank-turn, to which is secured the jointed piston-rod of an air-pump having valved piston-head, said air-pump being secured to the bottom of a car, and adapted to force air through connecting-pipes into a reservoir, 2, and means for raising, lowering, and holding in place the shaft A, consisting of the lever O, pivoted inside the car, and connected to the end of the shaft A by link *b* and plate *c*, for holding the lever in any desired position, substantially as described.

3. In a car-signal, the combination of the shaft A, secured beneath the car by the hangers *a a'*, the latter of which is slotted, as described, having the crank-turn, to which is secured the jointed piston-rod supported by the hangers 5, the air-pump 1, secured beneath the car, reservoir 2, whistle, connecting-pipes, and the lever O, pivoted within the car, and connected to the shaft A by link *b*, and held in place by serrated plate *c*, all substantially as described.

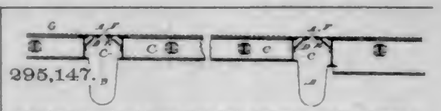


295,145. COAL-DUST FEEDER. HENRY A. BRADLEY, New York, N.Y. Filed July 14, 1883. (No model.)

Claim.—1. In a coal-dust feeder, the combination of the pipe A, with the cylindrical piece C, chamber *a*, having apertures *i*, pipe D, head *f*, having apertures *g*, chamber *h*, cap *j*, having apertures *l*, all arranged with reference to each other, substantially as herein shown and described.

2. The coal-dust feeder constructed with chamber *a*, and steam-supply pipe D, leading thereto, and with the chamber *h*, having apertures *g* for receiving coal-dust, apertures *i* for receiving steam, and apertures *l* for the discharge of the mixed steam and coal-dust, substantially as herein shown and described.

295,146. STOCKING-SUPPORTER. GERTRUDE CAMPBELL, Chicago, Ill. Filed Sept. 1, 1883. (No model.)



Claim.—1. The combination of the shoulder-straps connected at the point shown in the back, an elastic breast-strap connecting the front ends of the said shoulder-straps, the straps C, secured at an angle to the front ends of the same, and the straps D, connected to the back ends thereof, substantially as set forth.

2. The combination, with the strap A, straps C and D, straps E, and clasps F, of the elastic front cross-strap, B.

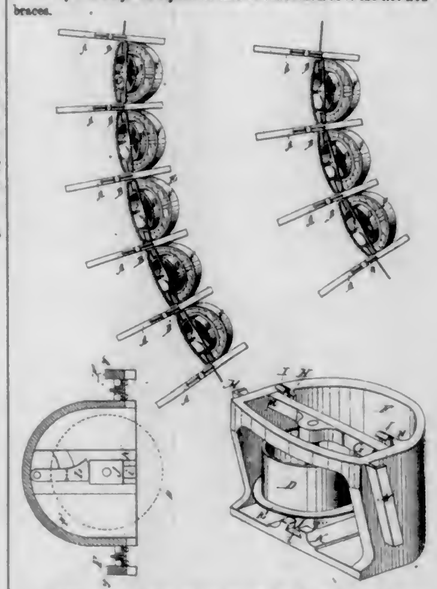
295,147. CABLE RAILWAY. JOHNATHAN B. CASEBOLT, San Francisco, Cal. Filed June 30, 1883. (No model.)

Brief.—The upper portion of the tunnel is formed of I-beams, inclined plates secured to the webs thereof, and top horizontal plates which form the grip-slot. The top plates are grooved where lines cross to permit passage of wheel-flanges.

Claim.—1. In a street cable railway, the cable tube or tunnel having its upper portion composed of iron beams C, with the angular plates

295,147.

extending upward and inward from their sides, substantially as herein described.



2. In a street cable railway, the cable tube or tunnel composed of the flanged iron beams C and the angular plates D, in combination with the covering-plates G, substantially as herein described.

3. In a street cable railway, the cable tube or tunnel composed of the beams C and the iron plates D, with the covering-plates G, said beams and plates being united at points of intersection to form a single rigid structure, substantially as herein described.

4. In a cable railway having the cable tube or tunnel formed of beams C, angular iron plates D, and covering-plates G, the grooves or slots H, formed in these plates in line with the inside line of the rails, substantially as herein described.

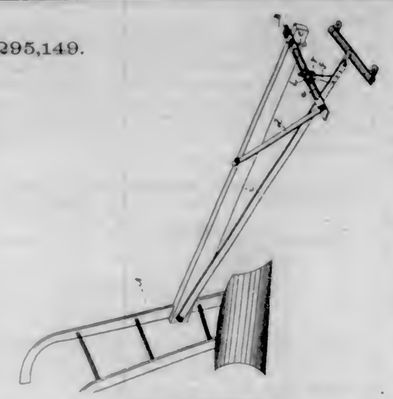
295,148. CABLE RAILWAY. JOHNATHAN B. CASEBOLT, San Francisco, Cal. Filed June 30, 1883. (No model.)

Brief.—Pulleys on adjustable axes in boxes secured to the slot-iron braces.

Claim.—1. In a cable railway having the ribs and slot-iron braces, as shown, the pulleys D, flanged at their lower ends and turning upon vertical axes, in combination with the cases or boxes F, bolted to the ribs, substantially as herein described.

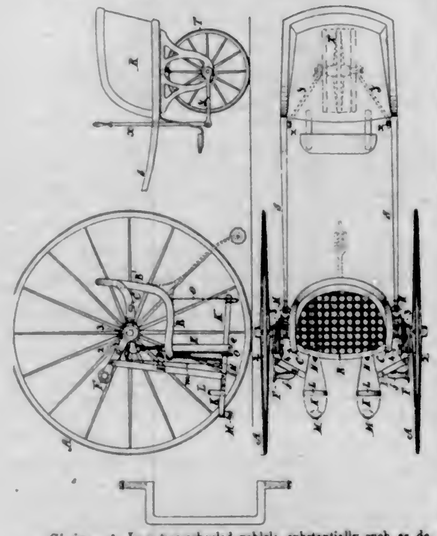
2. In a cable railway, and in combination with the ribs and slot-iron braces, the flanged pulleys D, mounted in the cases F, and having their vertical shaft-journals adjustable at top or bottom, substantially as herein described.

3. The flanged pulleys D, turning upon the vertical shafts within the exterior cases, F, in combination with the bars G, supporting-lugs H, and slotted adjusting keys or wedges, substantially as herein described.



4. The flanged pulleys D, turning upon the vertical shafts within the exterior cases, F, in combination with the boxes or steps J, moving in guides K, and the cam or cam-shaped lever-arm L, substantially as herein described.

5. The case F, containing the pulley D, with its vertical shaft turning in boxes at G and J, in combination with the adjusting-keys at the top, and the box or step-guide K at the bottom, having the open slot *i*, substantially as herein described.



295,149. PLOW ATTACHMENT. JULES COMEAUX, Plaquemine, La. Filed June 16, 1883. (No model.)

Claim.—In combination with a plow, an attachment consisting of the slotted bar B, hanger *f*, arranged adjustably on bar B, draft-rod *i*, stirrup *e*, and brace *d*, substantially as and for the purpose specified.

295,149.

295,150. VELOCIPEDE. DANIEL CROWLEY, Boston, Mass. Filed Mar. 9, 1883. (No model.)

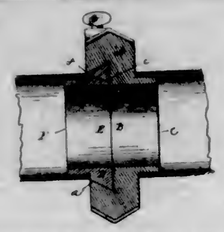
Claim.—1. In a two-wheeled vehicle, substantially such as described, the combination of the seat B, back B', the bars D, and the arms C C, supported directly upon the axles of the wheels A A, substantially as and for the purpose set forth.

2. The combination of the swinging seat B, the bars E, and the independently-acting treadles K, connecting-rods I I, levers F F, and the pawls and ratchets 2 3, attached, respectively, to the levers F and hubs of the wheels, as set forth.

3. The chains or cords O O, in combination with the treadles K K and the seat B, as set forth.

4. The rollers M M, in combination with treadles K K, substantially as and for the purpose set forth.

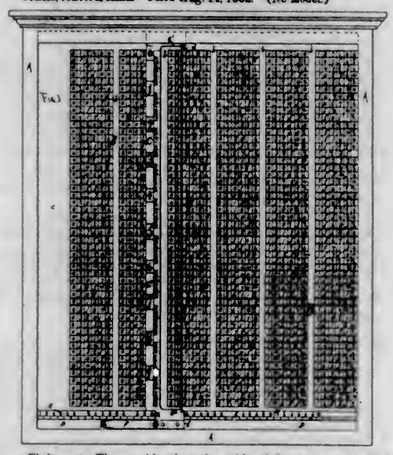
5. The brakes H, partially encircling the hubs, in combination with the rod or cord *m*, provided with a loop at its lower end, as and for the purpose set forth.



6. The combination of the annex R, caster-wheel T, rods *y*, and levers *x*, substantially as and for the purpose set forth.

7. A chair or seat, B B', having arms C C, with axles affixed thereto, substantially as set forth.

295,151. HOSE-COUPLING. JAMES CUMMINS, Janesville, Minn. Filed July 27, 1883. (No model.)

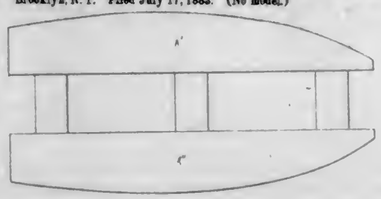


Claim.—1. In a hose-coupling, the section A, formed with a dovetailed slot, *a*, in combination with the other section, D, of a dovetail form, so as to fit entirely within the said slot, and a packing-ring fitted in a depression of the slot *a* in section A, as set forth.

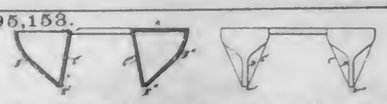
295,151.

2. In a hose-coupling, the section A, formed with a dovetailed slot, *a*, in combination with the other section, D, of a dovetail form, so as to fit entirely within the said slot, a thumb-screw working through one side of section A and engaging with the other section, and a packing-ring fitted in a depression, *c*, of the slot *a* of said section A, as set forth.

295,152. INSTRUMENT FOR CALCULATING INTEREST, &c. URIAH CURTIS, Concord, Minn. Filed Aug. 14, 1882. (No model.)



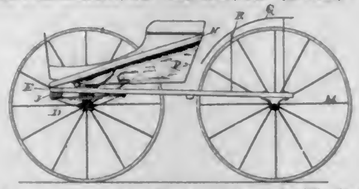
Claim.—1. The combination of a table of figures computed to denote the progressive amounts of interest or taxation at a given rate, arranged in columns, which are divided into blocks by suitable means of indication, substantially as described, a key-scale divided, numbered, and arranged to correspond with the table, as set forth, and a sliding gage graduated with prominent figures in the order of the digits, and with intermediate figures, as specified, and provided with a decimal index-wire, all for the purposes herein set forth.



2. A table of figures computed to denote the progressive amounts of interest or taxation from a given rate, arranged in columns and divided into blocks, as described, in combination with a key-scale divided and numbered to correspond with the columns of figures, as set forth, a series of sliding gages, graduated as specified, and provided with decimal-pointers, whereby the several parts will operate as and for the purposes set forth.

3. The combination of a table of figures computed to denote the progressive amounts of interest or taxation from a given rate, a key, and a movable gage divided and numbered to indicate the valuations on which the computation is to be made, a decimal-pointing wire connected to the gage, and an adjustable plate for increasing or decreasing the rate, the several parts being arranged to operate substantially as set forth.

295,153. VESSEL HAVING DIVIDED HULL. JACOB DAVID, Brooklyn, N.Y. Filed July 17, 1883. (No model.)

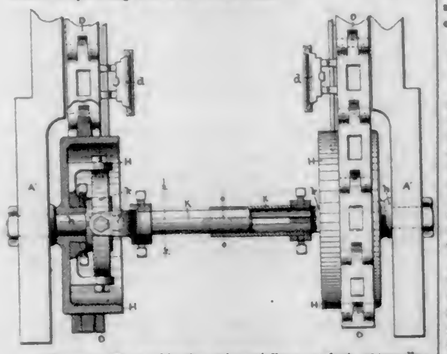


295,153.

Claim.—The hull of a vessel constructed in any of the usual general forms on the outer sides and divided into two parts, having the plane of division longitudinally through the center, the approximating or inner sides diverging downward from the deck at an acute angle toward the keel or bottom of each section, each approximating or inner side of each section being in parallel planes to each other throughout, except at the run or counter, which is cut away and narrowed at the stern of each section to form a rudder-post, thus making the approximating sides farther apart at the stern and having the deck of each section on a horizontal plane, substantially as shown and described.

295,154. THREE-WHEELED VEHICLE. WALTER S. DILATUSH and JOHN R. DRAKE, Lebanon, Ohio. Filed Dec. 31, 1883. (No model.)

Claim.—1. In an animal-tricycle or road-cart, the fifth-wheel arranged at an angle, as described, substantially as herein set forth.

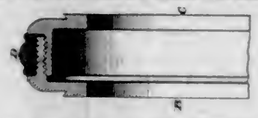


2. In an animal-tricycle, the arrangement of a rear trailing or wheel centrally located, in combination with the reaches, arranged as specified, substantially as herein set forth.

3. In an animal-tricycle or road-cart, the combination of the fifth-wheel, arranged at the angle specified, whereby the bed and the hind wheel are inclined at an angle when the axle is turned, with the axle, for the purpose specified, substantially as herein set forth.

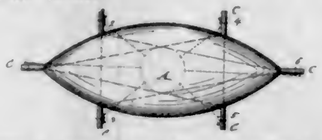
4. The combination of the fifth-wheel, arranged as specified, so that the bed and hind wheel may be inclined to one side in turning, with the reaches and hind wheel, substantially as herein set forth.

295,155. TENTERING-MACHINE. OTIS E. DROWN, Lincoln, R. I., assignor to Ann Maria Drown, same place, and William F. Sayles and Frederic C. Sayles, both of Pawtucket, R. I. Filed Apr. 21, 1883. (No model.)



Brief.—The side rails which support the chains are mounted so that they may be adjusted toward and from each other by means of adjusting-screws pivotally mounted at their centers to enable the machine to tenter fabrics of different widths, and at the receiving end are so pivoted that they may be made to diverge, and thereby stretch the fabric. Said rails are also arranged so as to have a longitudinal reciprocating motion, to give to the fabric a certain peculiarly desirable finish. Sprocket-wheels are employed at both ends of the machine, and to the hubs of those at the receiving end are attached gimbal or universal joints connected together by a shaft, thus connecting said wheels, so that they may revolve together at the same speed without interfering with the longitudinal reciprocating motion of the side rails.

Claim.—1. The combination, substantially as set forth, of traveling chains carrying tenter-hooks or equivalent devices, side rails for supporting the chains, mechanism for alternately longitudinally reciprocating said side rails, sprocket-wheels for each chain at each end of the machine and engaging with said chains, and a shaft uniting the sprocket-wheels at the receiving end of the machine, and devices for joint-connecting said shafts to said wheels.



2. The combination, substantially as before set forth, of traveling chains carrying tenter-hooks or equivalent devices, side rails for supporting said chains, and devices for adjusting them relatively to each other, and mechanism for alternately longitudinally reciprocating the same, sprocket-wheels for each chain at each end of the machine, engaging with said chains, a telescopic shaft uniting the sprocket-wheels at the receiving end of the machine, and devices for joint-connecting said shafts to said wheels.

295,156. PROCESS OF MAKING WATCH-CASE CENTERS. JOHN C. DUBBER, Newport, Ky. Filed Nov. 15, 1883. (No model.)

Claim.—The within-described process of making watch-case centers, which process consists in forming said center of a ring and a pair of "halves," and then screwing together these three component members, substantially as herein described and set forth.

295,157. AIR-SHIP. CHARLES P. FITT, Philadelphia, Pa. Filed Jan. 27, 1883. (No model.)

Claim.—1. An air-ship having the lower part of its body conically-tapered toward its bottom, and provided above the tapered part with horizontally-projecting valved pipes for the discharge and regulation of heated air, whereby the air-ship may be propelled and steered in either direction, substantially as described.

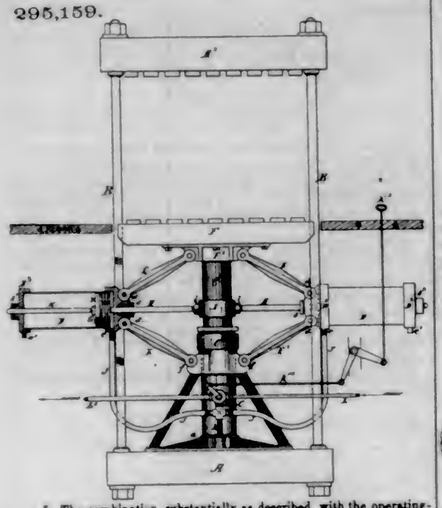
2. An air-ship the body of which is provided with valved horizontally-projecting discharge-pipes, and with means for regulating the valves, and at its lower part with a downwardly-extending conically-tapering part, having valved air-inlet openings, substantially as specified.

295,158. SPLIT RING. WM. M. FISHER, Attleborough, Mass. Filed Dec. 17, 1883. (No model.)

Claim.—1. As an improved article of manufacture, an oval-shaped split ring, as and for the purposes set forth.

2. As an improved article of manufacture, the herein-described oval split ring having its free ends terminating on opposite sides at one end of the ring, all substantially as shown, and for the purpose set forth.

295,159. PRESS. ABRAHAM FITTS, HERBERT M. REED, and ALONZO E. BLANCHARD, Worcester, Mass. Filed May 16, 1883. (No model.)



Claim.—1. In a knuckle-joint press, the combination, substantially as described, with the operating-arms, of two cylinders arranged in connection with the knuckle-joints, and respectively provided with pistons that are connected one with the other, as specified, and means for producing pressure within said cylinders for effecting the operation of the arms and press-follower by the movement of said cylinders, in the manner set forth.

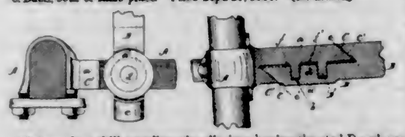
2. The combination, substantially as described, of the operating-arms, the cylinders arranged in connection with the knuckle-joints of said arms and movable therewith, and the piston supported at stationary position in relation to the press, for the purposes set forth.

3. The combination, substantially as described, of the operating-arms, the cylinders arranged on the knuckle-joints of said arms, the pistons attached to rods passing through the respective cylinders and rigidly connecting said pistons to a ring or slide-piece supported on a central guide, and means for producing pressure within said cylinders for effecting movement of the parts, as set forth.

4. The combination, substantially as described, of the pressing-follower, the operating-arms, the cylinders supported on the knuckle-joint plates, the pistons in the respective cylinders joined to each other by a rigid connecting-rod, the flexible pipes communicating with the interior of said cylinders, and a valve for directing the flow to or from said cylinders, as set forth.

295,159.

5. The combination, substantially as described, with the operating-arms, of the knuckle-joint plates provided with joints or seats *d* for the arms, stuffing-boxes *s*, and connecting-flanges for attaching cylinders thereto, the cylinders D, and pistons G, as and for the purpose set forth.



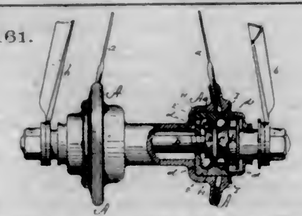
6. In a knuckle-joint press having operating-arms that fold together in the manner set forth, the combination, with the pressing-follower, the knuckle-jointed operating-arms, and an actuating mechanism for effecting pressure through said arms, of a hydraulic elevating-cylinder and piston-column arranged between the press-bed and follower, and means for producing pressure within said cylinder, substantially as and for the purpose set forth.

7. The combination, substantially as described, of the pressing-follower, the hydraulic elevating-cylinder and column arranged beneath said follower, the operating-arms, the hydraulic cylinders arranged upon the knuckle-joints of said arms, the pistons of said cylinders rigidly interconnected by the coupled rods guided by a ring upon the elevating-column, the pipes for delivering water to the respective cylinders, and a directing-valve for regulating the flow thereto, as set forth.

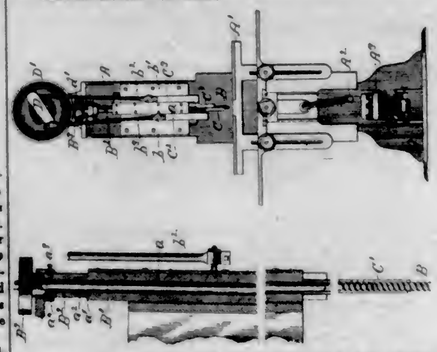
8. The combination, substantially as described, with the operating-arms in a knuckle-joint press, of the joint-plates or cylinder-heads having screw-threaded flanges, stuffing-boxes and ports, as shown, and the cylinder-shell externally screw-threaded and screwed into the flanges of said joint-plates.

9. A press the follower in which is operated by knuckle-jointed arms, in combination with hydrostatic presses mounted upon or acting directly in connection with the knuckle-joints of said arms, and means for connecting together said hydrostatic presses, whereby they are adapted for exerting their resistant forces one against the other, as set forth.

295,160. THILL-COUPLING. HENRY E. GAMBLE, Evanston, Ill., assignor, by direct and mesne assignments, to Oscar H. Mann and Augustine C. Buell, both of same place. Filed Sept. 29, 1883. (No model.)



Claim.—In a thill-coupling, the clip-iron having the stud D and surfaces *c c'*, and the thill-iron B, having the recess to admit the stud, closed at its outer side, and the surfaces *e e'*, in combination with an intermediate washer, *f*, of rubber or equivalent elastic material, encircling the journal, as described, whereby the washer is caused to prevent noise, compensate for wear, and exclude dust from the wearing-surfaces.

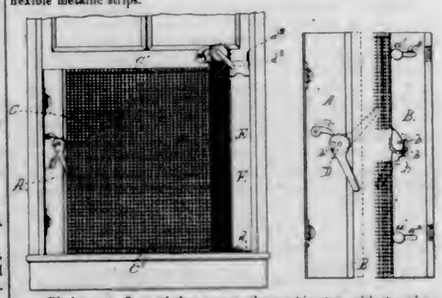


295,161. BEARING FOR VELOCIPEDES. JOHN C. GARROOD, Boston, Mass. Filed Dec. 24, 1883. (No model.)

Claim.—A double-ball bearing for bicycles and other velocipedes, consisting, essentially, of an external annular box or surface provided with two internal annular grooves, H I, the groove H being nearly semicircular in cross-section, and the groove I being an end groove and nearly quadrantal in cross-section, an internal bearing provided with the similar grooves C D, the nearly-semicircular groove C being situated opposite the nearly-quadrantal groove I, and the nearly-quadrantal groove I opposite the nearly-semicircular groove H, and the two rows of balls *d d*, all constructed and arranged substantially as and for the purpose herein set forth.

295,161.

295,162. MORTISING-MACHINE. WILLIAM W. OREEN, Chicago, Ill. Filed Nov. 20, 1883. (No model.)



Claim.—1. In a mortising-machine, the combination, with a boring-auger, of the chisels C C', arranged on each side of said auger and adapted to have an alternate reciprocating movement, substantially as and for the purpose set forth.

2. In a mortising-machine, the combination of the auger-stem, the socket-piece *a*, provided on the upper end with the shoulder a' and the neck a^2, and the sleeve B, resting upon the shoulder a' and neck a^2, and having band-pulley B^2, substantially as described.

3. In a mortising-machine, the combination of a boring-auger having a socket-piece, *a*, and chisels C and C', having reciprocating cross-heads C^2 and C^2 on each side of the socket-piece *a*, substantially as described.

295,163. WINDOW-SCREEN. JOHN A. GROVE, Bluffton, Ind. Filed June 21, 1883. (No model.)

Brief.—A vertically-placed spring-roller window-screen, one edge being secured between adjustable strips placed one upon the other, and the other edge secured to the roller. One of the plates has an eccentric-lever and ratchet, and so attached and operating with the other strip as to make taut the window-screen. The roller is supported in suitable brackets to one side of window-frame, and is provided with operating mechanism. The free edges of the window-screen are re-enforced by flexible metallic strips.

Claim.—1. In a window-screen, the combination, with the wire-cloth, of the plates or strips adjustable one upon the other, and means

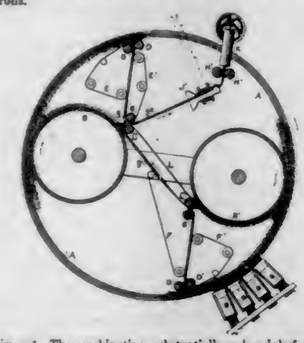
for the retention of the opposite edge of the cloth, substantially as and for the purpose set forth.

2. In a window-screen, the combination, with the screen proper, of the cylinder and its operating mechanism, and the plates or strips, one having an eccentric-lever and ratchet, and the other having slots, one of which receives a pin or projection of the eccentric-lever, and the others receiving headed projections or rivets of the former plate, substantially as and for the purpose set forth.

3. In a window-screen, the combination, with the wire-cloth cylinder, of the bracket having the end flange projected upward therefrom, the lower bearing-plate having a socket and slot, and the slat or bar arranged between the bracket and said plate, substantially as and for the purpose set forth.

4. In a window-screen, the combination, substantially as described, of the wire-cloth, the adjustable plates A B, connecting one end of said cloth to the window at one side of the latter, the roller E, made fast to the other end of the cloth, and journaled in suitable supports secured in the opposite side of the window, the bevel-pinion *g*, secured on the said roller, and the bevel-gear wheel *f*, provided with pinion *g'* and meshed with pinion *g*, all arranged and operating substantially as set forth.

5. In a window-screen, the wire-cloth having its free edges re-enforced by flexible metallic strips suitably woven upon or into the cloth, substantially as and for the purposes specified.

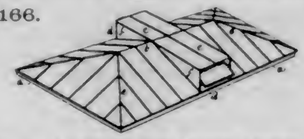


295,164. HOSE ATTACHMENT FOR STREET-WASHERS. CHAS. GUMLICH, Jr., Cleveland, Ohio. Filed May 17, 1883. (No model.)

Claim.—The combination of the pipe A with the neck C, provided with the flange *c*, the spring *s*, and the nut B, whereby a swivel-joint is formed, substantially as described.

295,165. MACHINE FOR COMBING FIBROUS MATERIAL. WILLIAM HALL and JOHN MIDGLEY, Pawtucket, R. I., assignors of one-half to William F. Sayles and Frederic C. Sayles, both of same place. Filed Apr. 21, 1883. (No model.)

Brief.—The two slivers, produced on opposite sides of the machine, are prevented from winding about the rolls which deliver them, and are joined by an endless apron passing around one of each of the set of said delivery-rolls.

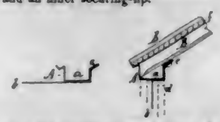


Claim.—1. The combination, substantially as hereinbefore set forth, of the revolving combing-cylinders B B', delivery-rolls C *c* and C' *c'*, appropriate thereto, and an endless traveling apron or conveyer arranged to embrace the rolls C and C' of the two sets of delivery-rolls pertaining to the combing-cylinders, respectively, substantially as described.

2. The combination, substantially as hereinbefore set forth, of the revolving combing-cylinder A, the revolving combing-cylinders B B', delivery-rolls C *c* and C' *c'*, appropriate, respectively, to the latter combs, means, substantially as described, for conveying the combed slivers from the comb A to the said rolls, and an endless traveling apron or conveyer directly connecting the rolls C and C' of the two sets of delivery-rolls, whereby the combed product is conducted so as to be united in a single sliver, as set forth.

295,166. SKYLIGHT. GEORGE HAYES, New York, N. Y. Filed Nov. 7, 1881. (No model.)

Brief.—Provides a superstructure for a skylight, consisting of a skeleton frame having vertical glazed sides and top, and a vertical open face with a valve.

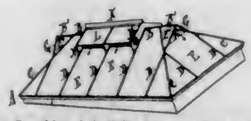


Claim.—1. In comomation with a skylight, a skeleton frame with sides *f* and top or roof *s*, constituting a superstructure raised above the plane of the glass plates of the skylight, and having a vertical face, *d*, as a ventilator, the ventilating-face *d* provided with valve or louver, essentially as shown, for excluding rain, hail, or snow, substantially as described.

2. In combination with the base-frame *a*, and ridge *b* and sloping bars *c*, a boxing having glazed sides *f* and top or roof *s*, and having a ventilating-face *d*, the said boxing open below to the interior of the structure below the skylight, to which it constitutes a superstructure for ventilation, substantially as described and shown.

295,167. SKYLIGHT. GEORGE HAYES, New York, N. Y. Filed July 5, 1883. (No model.)

Brief.—The base-frame of a skylight constructed with an extended adjustable flange and an inner securing-lip.



Claim.—1. As a new article of manufacture, the base-frame of a skylight formed with an extended adjustable flange attached to or a part thereof, adapted to be bent to curbs of varying widths and lengths, substantially as shown and described.

2. In combination with the base-frame of a skylight, a plate or flange, *b*, formed into several rabbets, *d*, adjusting the frame to suit openings of varying dimensions, substantially as shown and described.

3. In combination with the base-frame of a skylight and adjustable plate *b*, the necking, flange, or lip *a*, substantially as and for the purpose described and shown.

295,168. VENTILATING-SKYLIGHT. GEORGE HAYES, New York, N. Y. Filed July 17, 1883. (No model.)

Brief.—Provides ventilator-apertures in the skylight-glass, located adjacent to the ridge and covered with a hood formed with vertical and inclined top bars, the top and side being glazed. The ridge-bar is extended horizontally, and has gable-bars sloping to the hipped bars of the skylight, the parts being glazed and forming a ventilator-opening. The upper edge of the glass, which is cut away, has a supporting rabbeted cross-bar and gutter. The ridge-bar has a vertical extension with rabbets supporting glass plates. The ventilator-openings have louver-slats.

Claim.—1. In a hipped skylight, the ventilator-aperture F, located adjacent to the ridge, as shown, and provided with a hood or raised roof of metal frame and glass, essentially as shown and described.

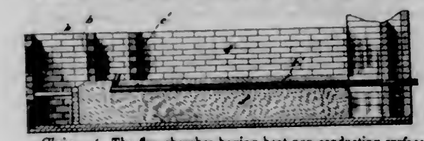
2. In a hipped skylight, the combination of extension ridge-bar B' and gable or sloping bars G, with hipped bars C, to form frame for a ventilator-hood, substantially as shown and described.

3. In a hipped skylight, the ventilator consisting of opening F, chamber F', extension-ridge B', sloping or gable bars G, and glass sheets E', in combination with hip-bars C, substantially as shown and described.

4. In combination with gable-bars G, hip-bars C, and glass E, the cross-bar H, provided with rabbet *a* and gutter *b*, substantially as shown and described.

5. In combination with ridge-bar B' and gable-bars G, one or more movable or stationary louver slats or valves, I, substantially as shown and described.

6. In a hipped skylight, the combination of two or more ventilators located at bot below the apex of the skylight, each constructed as herein set forth, and adapted to operate simultaneously or individually, as and for the purpose described and set forth.

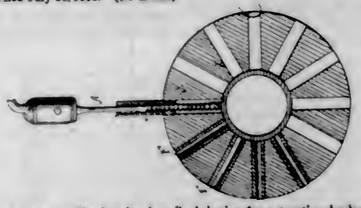


7. The vertical extension K or superaddition to the ridge-bar, provided with rabbets *c*, to form supports for sheets of glass L, essentially as shown and described.

8. In combination with super ridge or extension K, the frame-bars M and N, with glass L, and sides O, constituting a hood to an opening

F, substantially as shown and described.

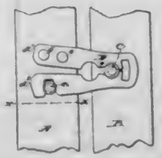
9. In a double-pitch skylight, two apertures, F, provided with a hood, K, having two slopes, each slope glazed, as at L, the glasses supported by frame-work of bent sheet metal resting upon the ridge, and sloping bars of the skylight, substantially as shown and described.



295,169. EVAPORATING APPARATUS. MARTIN PETER HAYES, Benforth, Ontario, Canada. Filed June 26, 1883. (No model.)

Claim.—1. The flue-chamber having heat non-conducting surface, consisting of the double thickness of boards and coal or wood ashes with salt, substantially as and for the purpose set forth.

2. The combination of the evaporating-pan of the inclosure or block, having the longitudinal flues, with a heat non-conducting surface or floor, the furnace combustion-chamber, the chimney having an air-space surrounding its flue, and the hot-air pipes, substantially as and for the purpose set forth.

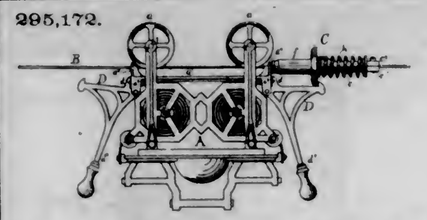


295,170. TENON-EXTRACTOR. OBADIAH HENDRIX, Macon, Miss. Filed July 21, 1883. (No model.)

Claim.—1. The herein-described device for extracting broken-off tenons from the hubs of vehicle-wheels, the same consisting of a stem or shank squared at its upper end for insertion into a brace, and having at its lower end a cylindrical bit with a smooth blunt point, and provided with a spiral flange or thread, the upper edge of which is square, or at right angles to the vertical axis of the bit, substantially as and for the purpose herein shown and specified.

2. The herein-described process of extracting broken-off tenons from the hubs of vehicle-wheels, the same consisting in first boring through the said tenon a hole extending to the axle-box, and next driving into the said hole a screw-threaded or spirally-flanged bit of slightly larger diameter than the said hole, and continuing the revolution of the said bit when it reaches and presses against the axle-box, whereby the counter-pressure thus generated shall serve to drive the tenon out of the mortise, substantially as set forth.

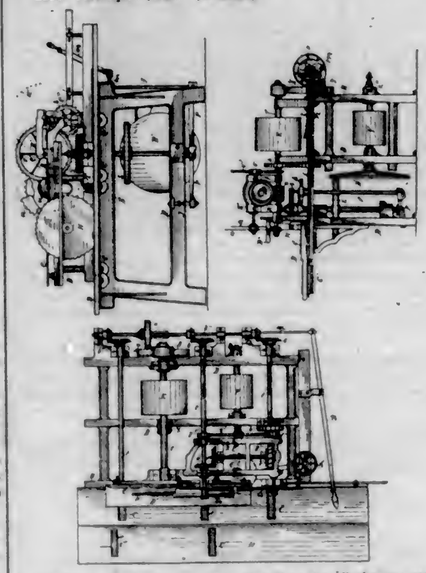
295,171. CORSET-STEEL FASTENING. LUCIAN HILL, North Brookfield, Mass., assignor to Theodore C. Bates, same place. Filed Sept. 8, 1883. (No model.)



Claim.—The steel B and its headed stud, combined with the steel A and its attached clasp D, one end of the said clasp being connected loosely with the said steel, whereby the clasp is permitted to expand laterally as the stud passes from the larger into the smaller part of the eye of the clasp, and then springs back of and locks the said stud in the smaller part S of the clasp, all substantially as set forth.

295,172. CASH AND PARCEL CARRYING SYSTEM. WARREN S. HILL, Boston, Mass. Filed Feb. 6, 1884. (No model.)

Claim.—1. In a cash and parcel carrying system, a car provided with a pivoted booked arm held against a stop by a spring, and a buffer disposed axially on the wire way, consisting of a fixed part secured to the wire, and a yielding part moving against a spring, and having a retaining-flange to engage with the pivoted booked arm, substantially as set forth.



295,172.

2. In a buffer for a cash-carrying system, the combination of the fixed part *e* with lug *e'*, strap *e²*, screws *e³*, and pin *e⁴*, and the movable part *f*, with retaining-flange *f'*, slot *f²*, washer *f³*, and the spring *h*, substantially as shown and described.

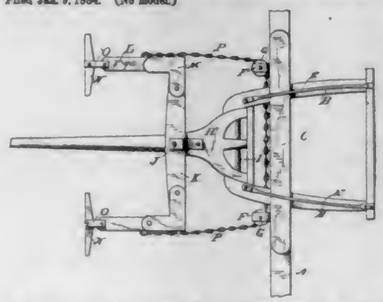
3. In a cash-carrying car, the combination of the handle *d²*, made integral with the pivoted hooked arm D, the stop *d*, spring *g*, and frame *e'*, substantially as shown and described.

295,173. LATH-SAWING MACHINE. WILLIAM E. HILL, Kalamazoo, Mich. Filed Apr. 27, 1883. (No model.)

Claim.—1. In a lath-sawing machine, the perpendicular saw and the horizontal saws, in combination with the feed-rollers, the carrier-rollers, and the perpendicular serrated feed-disks, all arranged and adapted to operate substantially as described.

2. In a lath-sawing machine, the combination, with the perpendicular lath-saw, the horizontal lath-saws secured to a vertically-adjustable shaft, and the hinged support to said shaft, of the serrated feed-disks and the feed and carrier rollers, all substantially as set forth.

3. The combination, with the perpendicular saw, the horizontal lath-saws supported by a vertical shaft, and the hinged support to said shaft, of the feed and carrier rollers and the automatically-yielding feed-disks, substantially as shown.



4. In a lath-machine, the combination, with the perpendicular and horizontal lath-saws, of the feed-disks and the feed-rollers, the latter provided with gear at the rear ends, the shaft having the bevel-gear meshing with the gear of said feed-roller shafts, the laterally-adjustable friction-wheel, the disk having the center depression connected with a power-shaft, and the bar and pivoted lever adapted for operating said friction-wheel, all located and adapted substantially as set forth.

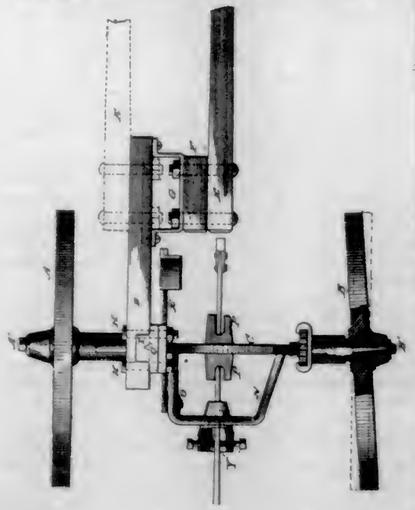
5. The perpendicular lath-saw, feed-disks, and feed-rollers, in combination with a series of horizontal lath-saws mounted upon a vertical shaft which is vertically adjustable, a hinged support to the lower end of said shaft, and means for operating said hinged support, substantially as described.

6. The perpendicular lath-saw, means shown for feeding the slab, the series of horizontal lath and picket saws secured to a vertically-ad-

justable shaft, said shaft provided with the horizontal friction-wheel, the power-shaft having the friction-disk adapted to engage said friction-wheel, and means for adjusting said vertical saw-shaft, substantially as set forth.

295,174. DRAFT-EQUALIZER. WILLIAM B. HUBBARD, Greenville, Ill. Filed Jan. 9, 1884. (No model.)

Claim.—1. In a draft-equalizer, the combination, with the front axle, having pulleys attached thereto, of the whiffletrees secured to poles having a jointed connection with the double-tree, and chains passing through the pulleys and connecting the poles, as set forth.



2. In a draft-equalizer, the combination, with the front axle, having pulleys or rollers attached thereto, of a chain passing through the pulleys or rollers, and whiffletrees connecting with the ends of the chain and having a jointed connection with the double-tree, as and for the purpose set forth.

3. In a draft-equalizer, the combination, with the front axle, having pulleys or rollers attached to the front face thereof, of the chain passing through the pulleys or rollers, a double-tree secured to the tongue, poles having joint-plates connecting with the ends of the double-tree, and whiffletrees attached to the poles, as set forth.

4. In a draft-equalizer, the combination, with the front axle, having pulleys or rollers attached to the front thereof, of the chain passing through the pulleys, poles provided with elbow-joint plates secured to the double-tree and connecting with the ends of the chain, and whiffletrees having a link-connection with the poles, as set forth.

5. In a draft equalizer, the combination, with the front axle and hounds, and pulleys or rollers attached to the axle, of the tongue pivoted to the front ends of the hounds, a chain passing through the pulleys, poles having a jointed connection with the double-tree, secured to the tongue, and whiffletrees attached to the poles, as set forth.

295,175. SULKY-PLOW. FRANKLIN B. HUNT, Richmond, Ind., assignor to the Richmond Sulky Plow Company, same place. Filed Jan. 26, 1884. (No model.)

Claim.—1. In a side-spring vehicle, the combination, with the head-block or like rigid transverse bar, of two side springs shackled thereto and a semi-elliptic spring arranged with its concavity forward, clipped near its middle to the rear axle, and connected by its ends with the side springs, substantially as and for the purposes specified.

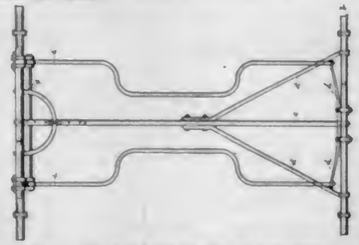
2. In a side-spring vehicle, the combination, with the bed and running-gear, of two side springs, a rigid transverse bar to which the side springs are connected at one end, and a semi-elliptic spring or spring-bar to which the side springs are connected at their opposite ends, substantially as and for the purposes specified.

Claim.—1. The land-wheel B, placed obliquely to the furrow, in combination with the beam-holder Y', provided with a wedge-shaped hole and set-screws for the oblique adjustment of the plow in relation to the wheel B, substantially as set forth.

2. The beam-holder Y', provided with a wedge-shaped hole and set-screws, and a pivot, T, for swiveling the plow-beam to the crank or bail, substantially as set forth.

3. The pivoting devices X W, provided with the recess Y, in combination with the reversible cap V, whereby the plow may be loosely pivoted or made stationary laterally, as may be desired, substantially as set forth.

4. The beam-holder Y', provided with the integral pivot T, having the recess U, in combination with the cap V, provided with a projection to fit into the recess U, substantially as set forth.



5. The combination of the axle-section C, having the vertical portion F' and the recessed plate *c*, with the axle-section C', having the projection J, spindle A', and pivot M, substantially as described.

6. The combination of the axle-section C, having plates P, and recessed plate *c*, with the axle-section C', having the projection J, and the rib I, the bar D, and the bolts H H, substantially as set forth.

7. The vertical arch-section F', having hollow stud *f* on one side and the hollow stud H' on its other side, the sector G', having a circular half-recess, the spindle-slide L', loop K', and lever I', substantially as set forth.

8. In combination with axle A', having the extension M, hand-lever L, and bail N, the foot-lever K, centrally pivoted to the axle, and its rear end resting beneath the bail N, substantially as set forth.

295,176. VEHICLE-SPRING. RUDOLPH S. HUNSICKER, Pittsburg, Pa., assignor to himself and William A. Herron, same place. Filed Aug. 9, 1883. (No model.)

Claim.—1. In a side-spring vehicle, the combination, with the head-block or like rigid transverse bar, of two side springs shackled thereto and a semi-elliptic spring arranged with its concavity forward, clipped near its middle to the rear axle, and connected by its ends with the side springs, substantially as and for the purposes specified.

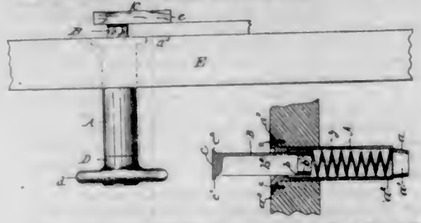
2. In a side-spring vehicle, the combination, with the bed and running-gear, of two side springs, a rigid transverse bar to which the side springs are connected at one end, and a semi-elliptic spring or spring-bar to which the side springs are connected at their opposite ends, substantially as and for the purposes specified.

295,177. VEHICLE-SPRING. RUDOLPH S. HUNSICKER, Pittsburg, Pa., assignor to himself and William A. Herron, same place. Filed Aug. 10, 1883. (No model.)

Claim.—1. A spring having two or more spirals parallel with each other and united by a cross-piece at their upper ends, the spirals being arranged to act by extension in lines on or approximating the same vertical plane, substantially as and for the purpose specified.

2. In a wagon or other vehicle, a double spiral spring having two or more spirals joined or connected at their upper ends, the spirals acting by extension, the body of the vehicle being suspended from the lower ends thereof, substantially as and for the purpose specified.

3. In a vehicle having side bars and springs extending transversely between the same, the combination, with the side bars and transverse springs, of interposed extensible spiral springs arranged to suspend the transverse springs from the side bars, substantially as and for the purposes specified.



295,178. COMBINED BENCH DOG AND CLAMP. CHAS. C. JOHNSON, Springfield, Vt., assignor to the Miller's Falls Company, Miller's Falls, Mass. Filed Dec. 19, 1883. (No model.)

Claim.—1. The bench-dog herein described, consisting of the removable head C, fixed head *c*, with hollow shank B, socket A, and screw-spindle *z*, the said shank, spring, and spindle inclosed in socket A, and all arranged, adapted, and combined as and for the purposes specified.

2. A bench-dog provided with a removable head, adapted to be used as a bench-clamp, and arranged to be at all times vertically movable in relation to the face of the bench, irrespective of the actuating mechanism, for operating the said head as a clamp, substantially as and for the purposes set forth.

3. In a bench hook and dog, a head provided with a hollow shank having a threaded orifice near the bottom, the said shank fitted to a hollow socket and supported by a spring, and adapted to be actuated vertically by a screw-spindle, substantially as and for the purposes set forth.

4. A bench hook or dog provided with a hollow socket and hollow shank, the sides externally interchangeably fitted to said socket, and having an independent actuating screw-spindle adapted to be operated from the bottom to adjust the said shank and its attachments vertically, the said shank and its adjusting mechanism supported by a spring, all combined substantially as and for the purposes set forth.

5. In a bench hook or dog, the combination of the hollow socket A, with shoulder a^2, the hollow shank B, provided with the threaded orifice b', and with head *c*, adapted to be inserted in said socket A, so that either side of head *c* may be presented to the work, and the spring *y* and independent screw-spindle inclosed in socket A, for adjusting the head *c* and shank B vertically, all substantially as and for the purposes set forth.

6. In a bench hook or dog, the head *c*, formed square, with undercut bevel c' upon all sides, in combination with the removable head C, provided with the opening c^2 and overlapping shoulders c^3 c^3, adapted to fit the head *c*, substantially as and for the purposes set forth.

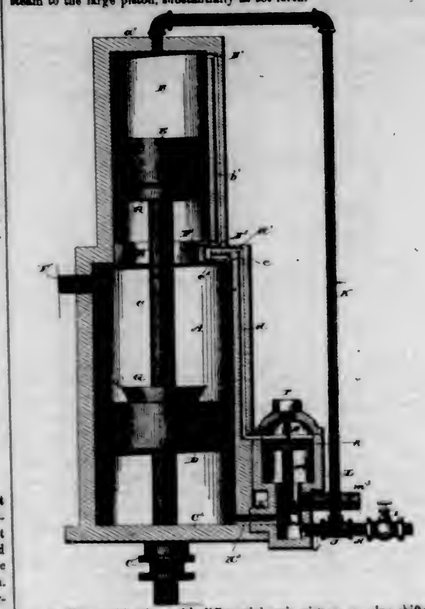
7. In a bench hook or dog, a removable head, in combination with a fixed head attached to a shank fitted to a socket, and adapted to be depressed to the surface of the bench by means of pressure upon the said removable fixed head, and adapted to resume its former vertical elevation upon the removal of said pressure, substantially as and for the purposes set forth.

8. The combination of the bench E with the head of a bench-dog adapted to act as a clamp, and be used in either direction, the said bench-dog and head being actuated vertically by suitable mechanism, substantially as and for the purposes specified.

9. The removable head C, formed oblong in shape, with the V-shaped opening at one end, the sides of said V being beveled under from the top face to the bottom, and having suitable provision for readily securing and removing the same from the fixed head *c*, substantially as and for the purposes set forth.

10. In a bench dog or clamp, a head provided with a square hollow shank, the sides of said shank interchangeably and removably fitted to a socket, said shank supported by a spring, and adapted to be actuated vertically by means of a nut and a screw-spindle, operated from below the socket, said spindle and nut being inclosed and protected from injury and dirt by the said socket, substantially as specified and described.

11. In a bench dog or clamp, the heads C *c*, the latter provided with the shank B, spring *y*, the said shank and spring inclosed in the socket A, the said heads and shank adapted to be actuated vertically from beneath the bench by an independent screw-spindle and nut, said spindle and nut inclosed in socket A, in combination with the bench E, substantially as and for the purposes set forth.



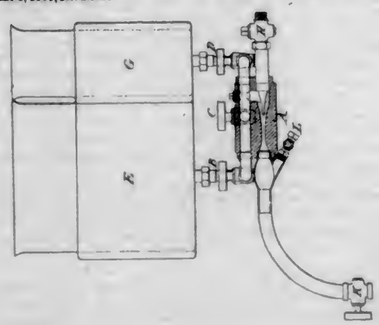
12. A removable head arranged to be attached to a bench-dog, and operated vertically in relation to the surface of the bench as a clamp by suitable mechanical means applied to the bench-dog, substantially as specified and set forth.

295,179. MOTOR. CHAS. H. KUHNS, Butler, Pa. Filed Aug. 4, 1883. (No model.)

Claim.—1. The combination, with differential main pistons and a valve shifted by said pistons, of a differential valve for regulating the exhaust, substantially as set forth.

2. The combination, with differential main pistons, a valve shifted by said pistons, and pipes for admitting steam to both pistons, of a differential valve for regulating the exhaust and cutting off the supply of steam to the main piston, substantially as set forth.

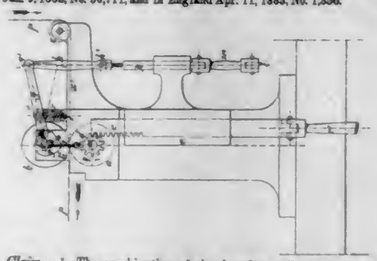
3. The combination, with differential main pistons, a valve shifted by said pistons, and pipes for admitting steam to both pistons, of a differential valve connected with the pipe which supplies steam to the larger piston, and adapted to regulate the exhaust and cut off the supply of steam to the large piston, substantially as set forth.



4. The combination, with differential main pistons, a valve shifted by said pistons, and pipes for supplying steam to both pistons, of a differential valve connected with the pipe which supplies steam to the large or main piston and adapted to regulate the exhaust and cut off the supply of steam in the large piston, and a throttle-valve situated beyond or outside of the two supply-pipes, substantially as set forth.

5. The combination, with differential cylinders and pistons, a sliding valve, and rings or washers for moving the valve, of a differential valve for cutting off the supply of steam in the large piston and regulating the exhaust of both cylinders, substantially as set forth.

6. The combination, with differential cylinders and pistons, the latter being provided with suitable rings or washers, the sliding valve, the steam-supply pipe, exhaust-passage F', the ports B', B, d', e^2, *e*, d^2, and d^3, and steam-passages b' *d*, of the differential valve provided with the exhaust-pipe m^3, and adapted to cut off the supply of steam in the main piston and regulate the exhaust of both cylinders, substantially as set forth.



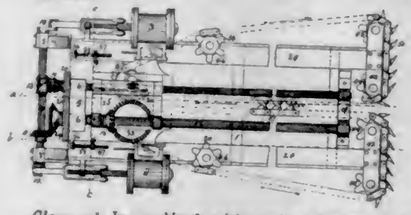
7. The combination, with the pistons and cylinders, constructed as described, and the steam-supply pipes, of the differential valve connected with the cylinders, as described, and adapted to cut off the supply of steam in the large or main piston and regulate the exhaust of both cylinders, substantially as set forth.

295,180. PROCESS OF TREATING MILK. GEORGE LAWRENCE, London, England. Filed Oct. 15, 1883. (No model.) Patented in England June 8, 1883, No. 2,869.

Claim.—The process of treating milk with fatty and other matters by passing it and them, mingled with gases, through one or more steam-ejectors, for separating and mixing the particles, substantially as described, and for the purposes set forth.

295,181. APPARATUS FOR FEEDING PAPER IN CIGARETTE MACHINES. EUGENE F. LEBLOND, Paris, France. Filed May 29, 1883. (No model.) Patented in France June 22, 1881, No. 143,549; in Belgium Jan. 9, 1882, No. 56,711, and in England Apr. 11, 1883, No. 1,830.

Claim.—1. The combination of the drawing-roller *a*, its pinion *d*, and drawing-roller *b*, with the rack *c*, mechanism, substantially as described, for reciprocating said rack, levers *g*, presser *q*, springs *r t*, and mechanism, substantially as described, for oscillating the levers *g*, all as and for the purpose specified.



2. The combination of the drawing-rollers *a b*, and mechanism, substantially as described, for turning them and holding them together, with the presser *q*, mechanism for moving it up and down, as described, and platform *x'*, all arranged so that when the drawing-rollers are held together the presser is lifted, and when the drawing-rollers are moved apart the presser is lowered upon the platform, substantially as specified

295,182. CHRISTMAS-TREE CANDLE-HOLDER. FREDERIK LEHLER, Cleveland, Ohio. Filed Aug. 25, 1883. (No model.)

Claim.—The combination of the coiled-wire spring and candle-holder C and the leaves A A and pintle *b*, substantially as and for the purpose specified.

295,183. MINING-MACHINE. VAN AMBURGH LECHNER, Columbus, Ohio, assignor to himself and Francis M. Lechner. Filed Mar. 31, 1883. (No model.)

Claim.—1. In a machine for mining coal and like purposes, the combination of two chains provided with cutters and arranged to move in opposite directions in a plane or planes at right angles to the line of advance of the machine, substantially as and for the purposes specified.

2. The combination, in a machine for mining coal and similar substances, of two revolving chains provided with cutters mounted on suitable wheels to communicate motion to them, and moving side by side to the point of cut and then outward in opposite directions, substantially as and for the purposes described.

3. In a machine for mining coal and similar substances, two chains provided with cutters and mounted on suitable wheels for driving them side by side to the point of cut and then outward in opposite directions, in combination with a sliding carriage carrying said chains, and the mechanism for actuating the same, substantially as and for the purposes described.

4. In a machine for mining coal and similar substances, two revolving chains provided with cutters, and mechanism for moving the chains in opposite directions and at right angles to the line of advance of the machine, in combination with a sliding carriage for sustaining the chains and operating mechanism, a nut mounted on said frame, and a screw-shaft coacting with said nut to move said frame, substantially as and for the purposes described.

5. In a machine for mining coal or similar substances, two revolving chains provided with cutters, and mechanism for causing the chains to travel in reverse directions, in straight lines, and in planes at right angles to the line of advance of the machine, in combination with a stationary power-shaft, and a feather-keyed sliding pinion on said shaft, connected with and actuating the mechanism which operates the chains, substantially as and for the purposes described.

6. In a machine for mining coal and like purposes, the combination of two cutters, and mechanism, substantially as specified, for causing the cutters to move in right lines in opposite directions at right angles to the path of the machine while cutting, substantially as and for the purposes set forth.

7. The combination, in a machine for mining coal and similar substances, of a traveling carriage carrying two cutter-chains, and mechanism for causing said chains to move in a right line in opposite directions while cutting, a stationary shaft having a sliding key-seated pinion for actuating the chain-revolving mechanism, a nut on said carriage, a screw-shaft coacting with said nut to move the carriage, in order to feed the cutters to their work, and a power-shaft connected with and driving the other two shafts, substantially as and for the purposes described.

8. The two sliding bars, each provided with two loose sprocket-wheels or chain-sheaves secured at their outer ends in a cross-frame, and arranged parallel with each other, in combination with the two cutter-chains and mechanism to move the latter in opposite directions after reaching the end of the bars, substantially as and for the purposes described.

9. The cutter-chain for mining-machines, composed of a series of cutter-links arranged with the lapping ends, and support-plates arranged on the sides of the chain parallel with and opposite to each cutter-link, whereby the cutters are placed zigzag in the chain, and the sprocket-holes are in line with the cutters, substantially as and for the purposes set forth.

10. The combination, in a machine for mining coal and similar substances, of a pair of cutter-chains moving side by side to the point of impact against the rock, having projecting cutters arranged opposite to each other or at corresponding points on the two chains, substantially as and for the purposes described.

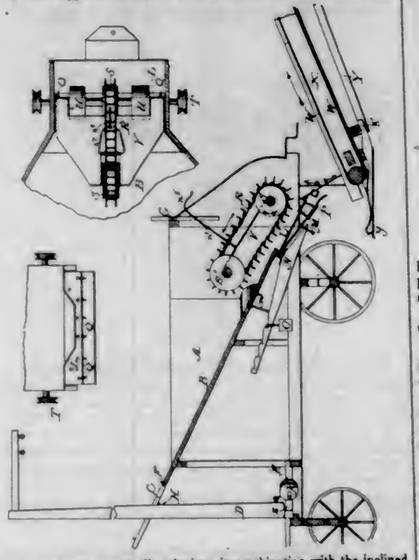
11. The combination, in a machine for mining coal and similar substances, of a pair of cutter-chains moving side by side to the point of impact, and then passing outward in opposite directions, having supporting-blocks placed on the adjacent sides of opposite links, substantially as and for the purposes described.

295,184. PROCESS OF EXTRACTING AND MELTING TALLOW AT A LOW TEMPERATURE. HENRI LESAGARAY and HIPPOLYTE LEPLAY, Paris, France. Filed July 9, 1883. (No specimens.) Patented in France Sept. 4, 1882, No. 150,936, and in England Nov. 23, 1882, No. 5,575.

Claim.—The herein-described process for extracting tallow and fats, which consists in first cutting the said tallow or fat fine and shredding it, then subjecting it to a pugging process without water and under the influence of heat to about 68° to 86° Fahrenheit, then subjecting the pugged mass to a churning operation while mixed with water and steam at a temperature of about 136° Fahrenheit, and then subjecting it to a final churning and straining operation, substantially as described, whereby the mixture of water and fat is separated from the nitrogenous substances, substantially as herein described.

295,185. FEED-REGULATING DEVICE FOR THRASHING-MACHINES. ALEXANDER WASHINGTON LOCKHART, Sacramento, Cal. Filed Apr. 23, 1883. (No model.)

Claim.—1. In a feeder for thrashing-machines, the receiving-hopper A, provided with the inclined slotted bottom B, the slotted step, and the supporting-frame, in combination with the derrick-mast D, having a semicircular fulcrum-plate, H, and the rod F, upon which it turns, substantially as described.



2. The receiving-hopper A, the frame provided with supporting-wheels, and a derrick-mast fulcrumed upon the front edge of the hopper, in combination with the winding-drum I upon one of the wheel-axles, and the rope J, attached to the foot of the mast and passing around the drum, substantially as shown and described.

3. The hopper A, having the inclined bottom B, the hinged adjustable extension L, and weighted lever-arm N, in combination with the bar or plate P, provided with the upwardly-projecting teeth Q, substantially as described.

4. The receiving-hopper A, having an inclined bottom, B, and the hinged adjustable extension L, in combination with the toothed feeding-belt R, the fixed rotary pulley S, the vertically-movable pulley S', and the movable frame V, substantially as described.

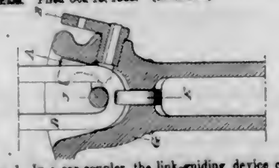
5. In combination with the hopper A, having an inclined bottom, B, hinged adjustable extension L, and toothed plate P beneath, the toothed chain belt R, adapted at its upper end to rise or fall with the supply of the straw beneath it, and the toothed rollers U, substantially as described.

6. The hopper A, having an inclined bottom, B, the hinged adjust-

able extension L, and feeding devices, in combination with the inclined carrying-belt W, its rollers, the frame X, the pulley *f*, the belt *e*, and the pulley T, substantially as shown and described.

7. The carrying-belt W, the pivoted frame X, and the wheel-carriage Y, provided with a shaft, *c*, having cams *b*, a crank, *d*, and the holding pawl and ratchet, in combination with the thrashing-cylinder casing having slots to receive the ends of the upper roller of the belt W, substantially as shown and described.

8. In combination with the hopper A, the feed mechanism, and the inclined carrying-belt W, the thrashing-machine having the upper part of the cylinder-case open to receive the straw from the belt W, and the movable hinged plates h and i, as and for the purpose herein described.

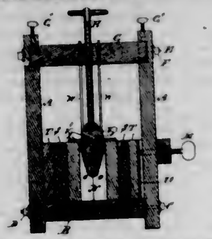


9. The hinged plates h and i, and the vibrating suspending-arm *j*, and the spring *j''*, in combination with the cranked shaft *l*, connected with the plate *h* near the hinge, substantially as herein described.

10. The hinged plates h and i, and means for imparting thereto a vibratory movement, in combination with the inclined hinged bottom *o* and the weighted lever-arm *p*, substantially as herein described.

11. The hinged and movable plates h and i, the inclined hinged floor *o*, and the weighted lever-arm *p*, in combination with the belt-shifting arm *q* and the driving-belt *n*, substantially as herein described.

12. In combination with the thrashing-machine Z, hopper A, feeding-belts R and W, pulleys T-*f*, and belt *e*, of the pulleys *t*, *w*, *v*, and *v'*, arranged with relation to each other as shown and described, the single belt *u*, passing around said last-named pulleys, substantially as herein described.



295,186. COUPLING FOR RAILWAY-CARS. ALBERT K. MANSFIELD, Boston, Mass. Filed Oct. 15, 1883. (No model.)

Claim.—1. In a car-coupler, the link-guiding device consisting of the arm G inside the mouth of the draw-bar, and the horizontal arm B outside the same, both secured together to form a single lever pivoted on one side or cheek of the draw-bar, and so arranged that lifting vertically the free end of the arm B causes the free end of the coupling-link to rise, all substantially as described.

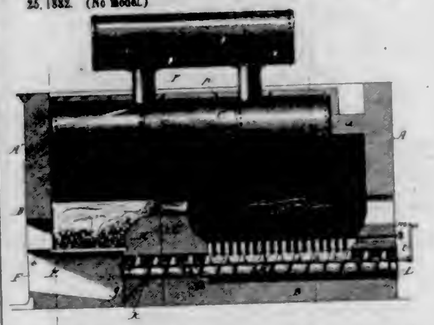
2. In the link-guiding device of a car-coupler, the combination of the arm G inside the bar, the horizontal arm B outside the same, the trip-tongue E, and the lifting-shaft H, having an arm near its center, all as set forth.

295,187. BOOT OR SHOE CRIMPING MACHINE. THOMAS TENNOCK MARSHALL, Jarvis, Ontario, Canada. Filed Nov. 6, 1883. (No model.) Patented in Canada Oct. 12, 1882, No. 15,514.

Claim.—1. The combination, in a crimping-machine provided with pressure-screw H, of the clamp-screws M M, halved block N, rubber plates S, filling-plates T, plate U, last-block P, and plate Y, substantially as set forth.

2. In combination with the halved block N, the inserted heel-plate Q, and toe-cushion R, as and for the purpose set forth.

3. The combination, with the notched sides A A, of the adjustable gate L, provided with block Z', pin L', and wedge 2, for holding down one end of plate Y, as set forth.



4. In combination with the halved block N, having recesses O, the correspondingly-apertured plate Y, covering said block, and removably secured to hold down the leather over the block-orifice in crimping, as set forth.

5. The combination, in a crimping-machine having pressure-screw H, of the last-block P, apertured plate Y, and halved block N, substantially as set forth.

6. The combination, with the sides A A, of the bridge G, pressure-screw H, braces W W, grooved bed V, and last-block P, as set forth, for the purpose described.

7. The combination, in a crimping-machine provided with pressure-screw H, of the clamping-screws M M, halved block N, and rubber plates S, to yield to the enforced pressure of the last-block P, whereby leather of different thicknesses may be crimped, as set forth.

295,188. FURNACE. CHARLES MCMILLAN, Chicago, Ill. Filed Oct. 25, 1882. (No model.)

Claim.—1. The combination, in a furnace, of a bridge-wall and a combustion-chamber arranged in the rear of and extending in a plane below the top of said bridge-wall, said combustion-chamber having the masonry of its longitudinal sides and bottom concaved or inclined to a uniform depth, so that the longitudinal line thereof shall be in a horizontal plane, and provided with means of access for the removal of accumulations without interrupting the operation of the furnace, substantially as described.

2. The combination, in a furnace, of a bridge-wall and a combustion-chamber arranged in the rear of and extending in a plane below the top of said bridge-wall, said combustion-chamber having the masonry of both sides and ends and its bottom concaved or inclined to a uniform depth, so that the longitudinal lines of the sides and bottom shall be in a horizontal plane, and provided with means of access for the removal of accumulations without interrupting the operation of the furnace, substantially as described.

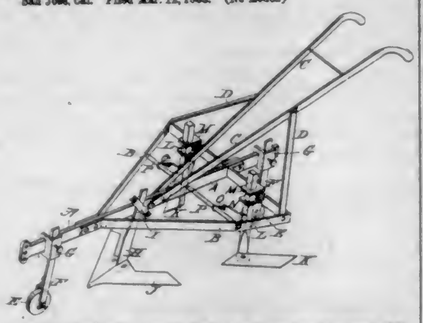
3. The combination, in a furnace, of a bridge-wall, a combustion-chamber in the rear thereof, and a conveyer arranged in the masonry forming the bottom of said combustion-chamber, and adapted to remove the accumulations in said chamber, substantially as described.

4. The combination, in a furnace, of a combustion-chamber arranged in the rear of the fire-chamber, and a conveyer arranged within and in a plane below the bottom of said combustion-chamber, and adapted to remove the accumulations therein, substantially as described.

5. The combination of the combustion-chamber, the bottom of which is a contiguous part of the masonry of the side walls of the boiler-setting, and is grooved to receive accumulations, and means for removing such accumulations, substantially as described.

6. The combination, with the combustion-chamber, of the series of pivoted and hollow bars forming air-inlets, and means for operating said bars, substantially as described.

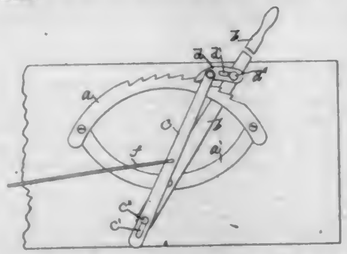
7. The combination, with the combustion-chamber, and with the receptacle for the accumulations, of the intermediate swinging bars and means for operating the same, substantially as described.



8. The combination, in a furnace, of a combustion-chamber constructed in the masonry thereof and arranged in the rear of the fire-chamber, the accumulation-receptacle in the bottom of the combustion-chamber, an air-chamber surrounding the receptacle, and air-inlets opening into said air and combustion chambers, substantially as described.

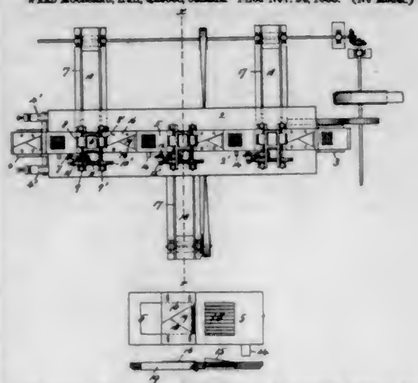
9. The combination, with a furnace, of a bridge-wall the front face of which is convex and its extremities joining the sides of the furnace concaved, as at *i*, substantially as and for the purpose described.

10. In a steam-boiler furnace, the combination, with the boiler, of a covering conforming in shape to the upper portion of and supported by the boiler, and detached from the walls of the furnace, between which the boiler is suspended, substantially as described.



11. The combination, with the boiler, the supporting-lugs, and the side walls of the furnace, of bars supported by and connecting said lugs, and an arched covering resting on the bars, all substantially as described.

295,189. CULTIVATOR AND HORSE-HOE. CHARLES W. MEADOR, San José, Cal. Filed Mar. 12, 1883. (No model.)



Claim.—The combination of the beam A, angular side pieces, B B, transverse rod P, the adjustable guide-rollers E E, connected to each end of the beam, the adjustable share or cutter J, carried by said beam, the adjustable shares or cutters K K, carried by the transverse portions of the side pieces, and the rods N N and links O O, for bracing the standards of the rear cutters, substantially as shown and described.

295,190. WAGON-BRAKE LEVER. EDWD. J. MILES, Kellogg, Iowa, assignor of one-half to H. M. COX, same place. Filed Nov. 24, 1883. (No model.)

Claim.—The improved wagon-brake lever and automatic lever-locking device, composed of a frame having ratchet-teeth in an arc and section of its edge, a lever of the first order, a lever of the second order, having a sliding connection with the short arm of the lever of the first order, a combined pawl, link, or bridle flexibly connected with the long arms of the two levers, and a rod connected with the central portion of the lever of the second order, to operate in the manner set forth.

295,191. MATCH-SPLINT MACHINE. GEORGE H. MILLER and EDWARD MOUSSEAU, Hull, Quebec, Canada. Filed Nov. 24, 1883. (No model.)

Claim.—1. The endless apron composed of apertured plates 5, or rectangular links hinged together having scoring-knives 15 and slicing-knives 16, alternatingly, in combination with frame 1, having rails 2 2′, wheels 3 4, and feed-boxes 6, as set forth, for the purpose described.

2. The combination, with frame 1, having parallel rails 2 2′, of the endless apron composed of plates or links 5, hinged together, having scoring-knives 15 and slicing-knives 16, alternately arranged, a series or row of feed-boxes, 6, having feed-rollers 8 8′, and ratchet-wheel and pawl intermittently operated by cams 14 on the apron, to automatically feed the splint-block to the scoring-knives, and subsequently slice the splints, as set forth.

3. The endless apron composed of apertured plates or links 5, hinged together, having alternately scoring and slicing knives, the plates having the scoring-knives provided with cams 14, in combination with feed-boxes 6 and intermediate ratchet-gear and rollers, to feed the splint-blocks by the movement of the apron, as set forth.

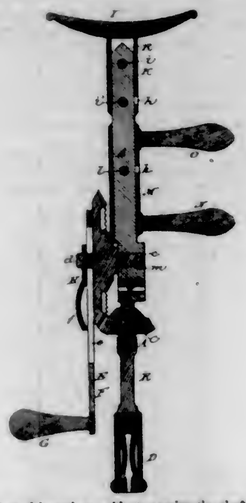
4. The combination, with frame 1, having rails 2 2′ and polygonal wheels 3 4, of the endless apron composed of apertured plates or links 5, hinged together, alternately having slicing-knives 16 and scoring-knives 15, feed-boxes 6, having an automatic feed-gear operated by cams 14 on the apron, and troughs 17, having an inclined end and endless-belt bottom 18, whereby the splint-blocks are automatically fed and successively scored and sliced by knives moving in a continuous plane, and the splints collected at the end of the troughs, substantially as described and set forth.

295,192. CRUPPER-COUPLING. CHAS. H. ORTS, Silver Creek, N.Y. Filed Jan. 12, 1884. (No model.)

Claim.—A crupper-coupling consisting of the flat tubular body *a*, having the flat strap-connecting portion a^2, and a plate and catch jointed thereto, and provided with a spring, a^3, in combination with the connecting-piece *c*, having the flat strap-connecting portion c^2, and a tongue, c', having a hole, c^3, substantially as and for the purposes described.

295,193. BREAST-DRILL. OBED PIKE, Rowe, Mass. Filed Oct. 5, 1881. (No model.)

Claim.—1. The breast-bearing I, combined with and attached to the frame A, and adjustable on said frame at different distances from the bearing *c* or *c′* of the gear-wheel B therein, combined with the wheel B, and a crank, E, attached to said wheel, which crank has its handle G adjustable, as described, at different distances from the axis about which it rotates.



2. The breast-bearing I, combined with the frame A, and adjustable thereto in positions which form one or more radial angles with each other, as described, for the purposes described.

3. In a breast-drill, the hand-hold N, combined with the frame A, and adjustable thereto at different radial angles, as described, for the purposes described.

4. The frame of a breast-drill, having a hand-hold, N, attached, and a breast-bearing, I, and a hand-rest, O, located on and attached to said frame at a point between the hand-hold and the breast-bearing.

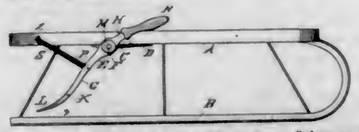
5. The crank E, attached to the driving-wheel B, and having its handle G adjustable, as described, at different distances from its axis of rotation, said driving-wheel having the gears *a a′*, and combined with the bevel-gear wheel C, shaft R, chuck D, and the frame A, having the

295,193.

bearings *c c′*, adapted interchangeably to receive the shaft of the wheel B in positions to bring the gear *a* or *a′* into engagement with the gear-wheel C.

295,194. ROPE OR LINE CLASP. ALBERT L. PITNEY, Washington, D.C. Filed Dec. 11, 1883. (No model.)

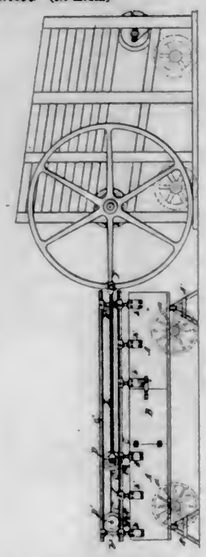
Claim.—1. The combination, in a bag-fastener, of an exterior casing having inclined interior sides or surfaces, with an interior wedge, and means, substantially as described, whereby the wedge is forced inward by the lateral strain of the rope upon the wedge, for the purposes shown and described.



2. The combination, in a bag-fastener, of a casing, a wedge having a flange at its enlarged end, provided with perforations to receive the rope, whereby the wedge is forced into the case by lateral strain upon the rope, substantially as set forth.

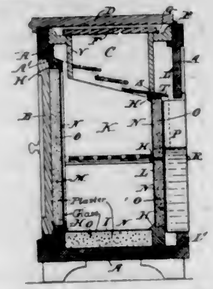
3. The combination, in a bag-fastener, of a casing, with a wedge extending beyond both ends of the casing, and provided with a stop at its smaller end, substantially as set forth.

4. The combination, in a bag-fastener, of a casing with a wedge having a perforated flange at its head, and provided with a stop, substantially as set forth.



5. The combination, in a bag-fastener, of a casing having means, substantially as described, for grasping it to release the wedge, with a wedge having a flange at its head, and provided with a stop, substantially as set forth.

295,195. SLED-BRAKE. JOHN GODFREY PERCOCK, Raigelsville, N. J. Filed Dec. 9, 1882. (No model.)



Claim.—In a hand-sled, the lateral brake-levers G, having oblique tapering spindle-form arms K, extending downward and rearward, and terminating in under convex rear extensions, L, formed without shoulder or obstruction, the forward arms, H, covered with wooden handle-sleeves N, and having the perforations P, in combination with the braced brackets C and springs S, connected each by one end to a brake-lever below its pivotal point, and by its other end to side of the body or rave in rear, all constructed and adapted to operate substantially as specified.

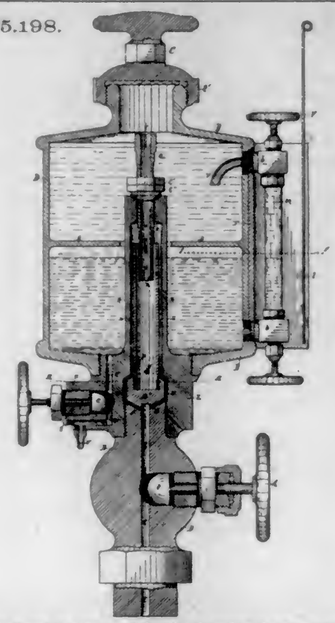
295,196. MORTAR-MIXER. WILHELM PROCHNOW, Milwaukee, Wis. Filed Jan. 29, 1884. (No model.)

Claim.—In a mortar-mixing machine, the box A, having the hinged door B, supports *b b′ b′ b′* for the rails *c c*, and extensions b^2 b^2 for the guard-rails *c′ c′*, in combination with the wheels C C and C′ C′, axles D and D′, bearing the knives *e e e′ e′ e′*, bars or rods *f f*, and pitmen E E of the driving mechanism, substantially as shown and described, and for the purpose set forth.

295,197. REFRIGERATOR. GEORGE ROGER PROWSE, Montreal, Quebec, Canada. Filed Nov. 23, 1883. (No model.)

Claim.—1. As a new article of manufacture, a refrigerator formed of an outer casing and inner lining or casing, said inner lining or casing consisting of sash-work, glass, and plaster or plastic compound, constructed and arranged, as described, so that when the plaster or plastic compound has set and hardened, the sash-work, glass, and plaster or plastic compound form practically one solid piece, the whole substantially as described.

2. The inner lining of a refrigerator, formed in one piece by the combination of sash-work, glass, and plaster or plastic compound, substantially as described.



3. The combination of the outer casing, A, inner casing composed of sash-work, glass, and plaster or a plastic compound, ice-box C, and removable tank P, the whole substantially as described and shown.

295,198. LUBRICATOR. JOSEPH W. REED, Kalamazoo, Mich. Filed Dec. 11, 1883. (No model.)

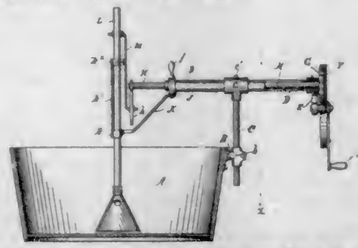
Claim.—1. The combination, with a stop-cock and an oil-tube support having the integral base detachably connected with said stop-cock, of an oil-reservoir surrounding the tube-support and detachably connected with the base thereof, all substantially as set forth.

2. The combination, with an oil-reservoir having a horizontal partition, the latter adapted to admit the location of a vertical oil-tube

295,198.

through it, and the passage of the oil and condensed steam as well, of a stop-cock and an oil-tube, substantially as described.

3. The combination, with a stop-cock, vertical oil-tube, and an oil-reservoir, of the tube-support having the integral base, said base provided with the integral side extension for the location and reception of the water-passage and cock, substantially as specified and shown.



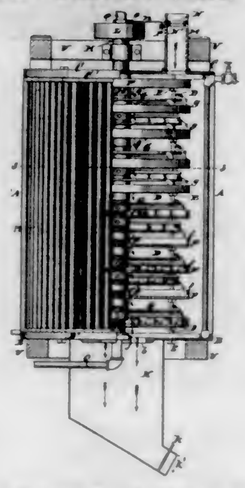
4. The combination, with a stop-cock and oil-reservoir, of an oil-tube support having the central chamber and an oil-tube located therein, substantially as specified.

5. A lubricator consisting of an oil-reservoir, a stop-cock provided with the upper small end, passages leading from the periphery of said small end into the central passage of the stop-cock, an oil-tube support having the central chamber, and oil and water passages shown, a stationary oil-tube having the perforations through the wall of its lower end, and the adjustable oil-tube having the perforations to receive the steam, all substantially as set forth.

6. The combination, with an oil-reservoir, of a gage having its upper passage which leads from the reservoir into the gage extended inward and downward for the object stated, substantially as set forth.

7. The combination, with the oil-reservoir and the gage-casing having the sliding door, of the gage provided with the screw-lugs securing the gage and the casing to the reservoir by passing through the wall of said casing, substantially as set forth.

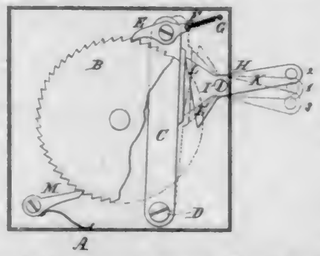
295,199. POUNDER WASHING-MACHINE. FRANCIS T. ROUTS, Connersville, Ind. Filed June 5, 1883. (Model.)



Claim.—1. The combination, substantially as specified, of the standard C, provided with a cross-head, *c*, sleeve D, movably mounted in the cross-head, and provided with guides, reciprocating plunger L, adapted to slide in said guides, pitman M, crank-shaft H, and means for rotating said shaft.

2. The combination of standard and cross-head C *c*, slotted sliding tube or sleeve D, bracket B *b*, screw *d'*, and bracket K *k' k²* with crank-shaft H, cog F, pinion G, plunger-rod L, and pitman M, arranged substantially as and for the purpose specified.

3. The combination, substantially as specified, of the bracket B *b*, the standard C *c*, adjustably secured therein, the sleeve D, adjustably secured in the cross-head *c* of the standard, and provided at one end with plunger-guides and at the other end with driving mechanism, crank-shaft H, the plunger, and means for connecting the shaft with the plunger.

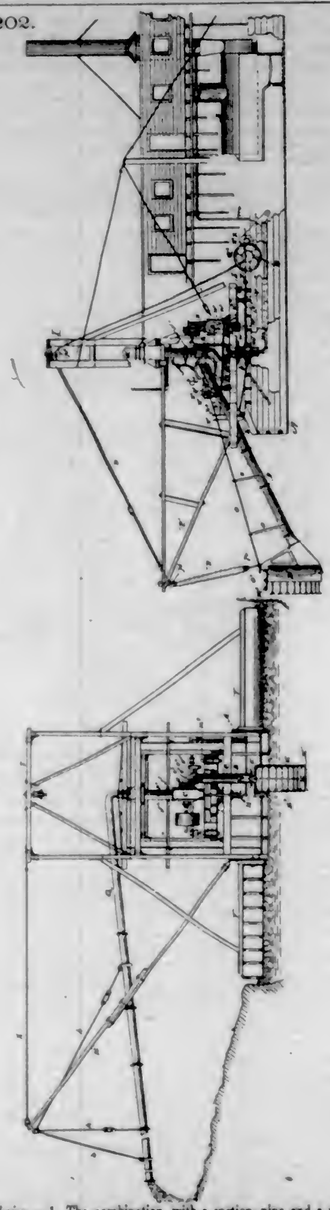


295,200. MACHINE FOR ROASTING COFFEE. ALFRED W. KOPER, St. Louis, Mo., assignor of one-half to George F. Durant and James Campbell, same place. Filed June 16, 1883. (No model.)

Claim.—1. The combination of fixed shelves or plates F G and revolving flight-rakes carried on a tubular shaft surrounding a fixed steam-pipe.

2. The combination of fixed shelves F G, rotating rakes with flights I' I², central steam-pipe, Q, outer steam-pipes, E, and inclosing-case A B C, with induction and eduction openings M K, substantially as set forth.

295,201. FARE-REGISTER. JOHN H. ROSE, Norwalk, Conn., assignor to W. Jennings Demorest, New York, N. Y. Filed Oct. 13, 1883. (No model.)



Claim.—In a fare-register, the ratchet-wheel B, rigid lever C, pivoted within the casing A and extending along the side of the said ratchet-wheel, the pawl E, spring F, and the T-headed actuating-lever K, having its pivot I wholly within the casing A, all combined and arranged as herein specified.

295,202. DREDGE. REUBEN E. ROSE, Kissimmee, Fla., assignor of three-fourths to Hamilton Disston, James M. Kreamer, and Samuel H. Grey, all of Philadelphia, Pa. Filed Oct. 5, 1883. (No model.)

Brief.—To a pump mounted on a turn-table is swiveled for vertical play a suction-pipe (with chains to a derrick) terminating below in a vertical semi-cylindrical chamber with cross-bars, between which play the knives on a revolving vertical cutter-shaft. A valve in discharge-pipe holds it charged during inaction of the pump. Propelling-capstans are controlled from the turn-table. A scow is secured on each side of the dredge, to guide and support it.

295,202.

Claim.—1. The combination, with a suction-pipe and a vertical shell or earth guide secured thereto, one side or face of said shell being open, of a vertical shaft journaled in said shell, and horizontal knives or cutters secured to the shaft, substantially as set forth.

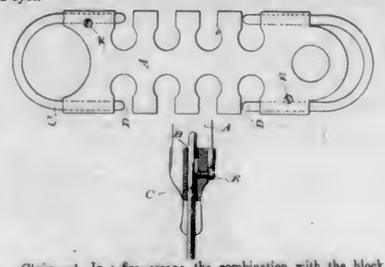
2. The combination, with a suction-pipe and a vertical semi-cylindrical shell secured thereto, of a vertical shaft journaled to the shell, horizontal cutters secured to the shaft, and devices for imparting a rotary motion to the shaft.

3. The combination, with a semi-cylindrical earth guide or shell, and a suction-pipe connected to the lower end thereof, of revolving knives and the bars *e'*, rigidly secured to the shield between the knives, substantially as set forth.

4. In a hydraulic dredging-machine, the combination of a pump, a suction-pipe swiveled to the pump, and devices for elevating and moving the outer end of the suction-pipe laterally, substantially as set forth.

5. The combination of a turn-table, a pump mounted thereon, a suction-pipe swiveled to the pump, a discharge-pipe connected to the pump, and a valve located in the discharge-pipe, substantially as set forth.

6. The combination, with the boat and its turn-table, of the capstan-pulleys, means for turning the same, and means for controlling said capstan-pulleys from the turn-table in any position, substantially as described.

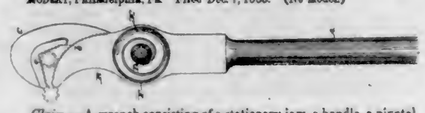


7. The combination of a turn-table, a pump mounted thereon, a derrick, P', a suction-pipe swiveled to the pump, and chains or ropes connecting the induction end of the suction-pipe with the derrick, substantially as set forth.

8. The combination of a turn-table, a pump mounted thereon, a suction-pipe swiveled to the pump and adapted to be moved laterally by turning the table, a steam-engine mounted on the table, a steam-generator independent of the turn-table, and a steam-pipe connecting the generator and engine, the said steam-pipe having a swiveled joint, substantially as and for the purpose set forth.

9. In a dredging or excavating machine, the combination, with a central hull supporting the machinery, of the pontons or scows secured to the sides of said central hull, substantially as described, and for the purpose set forth.

295,203. FIRE-ESCAPE. MICHAEL SCHOLL, San Francisco, Cal. Filed Dec. 19, 1883. (No model.)



Brief.—An improvement on Letters Patent No. 284,763, dated September 11, 1883. At both ends of the friction-block adjustable spring-staples are placed, to prevent the rope from slipping from the end eyes.

Claim.—1. In a fire-escape, the combination, with the block A, having dead-eyes and transverse cuts, as shown, of the adjustable spring-staples C C, attached to the opposite ends of said block, substantially as described.

2. In a fire-escape, the combination, with the block A, having dead-eyes and transverse cuts, of the spring-staples C C and set-screws F E, substantially as shown and described.

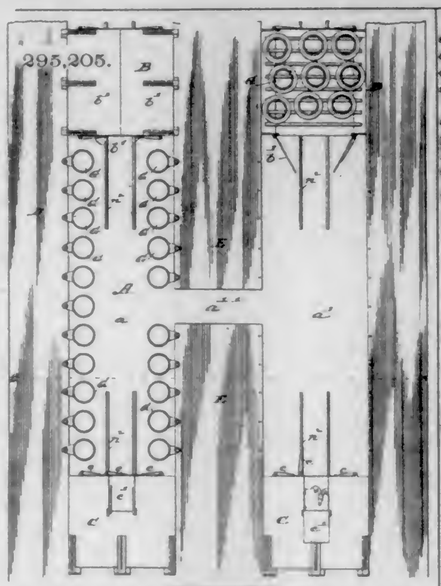
295,204. PIPE-WRENCH. FRANZ A. SCHRAMM and AMBROSIUS MODERY, Philadelphia, Pa. Filed Dec. 7, 1883. (No model.)

Claim.—A wrench consisting of a stationary jaw, a handle, a pivotal jaw, coiled springs, and caps, the axial bolt of the pivotal jaw being extended beyond the sides of the stationary jaw, and having said caps attached to its ends, the space between the caps and stationary jaw receiving said springs, which are secured to the stationary jaw and the axial bolt, substantially as and for the purpose set forth.

295,205. PIPE-MOLDING APPARATUS. FREDERICK SEICKLE, St. Louis, Mo. Filed June 25, 1883. (No model.)

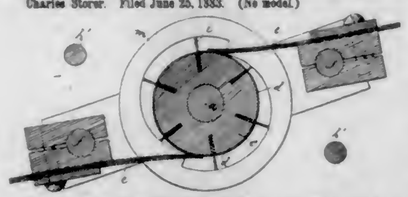
Claim.—1. The combination, in a molding-pit, of the beam H and the posts I I I, said posts being suitably braced laterally, for the purpose described.

2. The combination of the beams H L J J', the posts I I I, and the wall F, as described.



3. The combination of the pit A, the posts I' I' I', and the beams H' L' J' J², as described.

4. The combination of the beam L, the flask G, having the shoulder g^3, and the hook M, as described.



5. The oven C, having the vertically-arranged doors *c c* and the vertically-arranged reel Q, as and for the purpose described.

6. The combination of the top g^2, having the slot g^3, the core P, and the bar g^4, as and for the purpose described.

295,205.

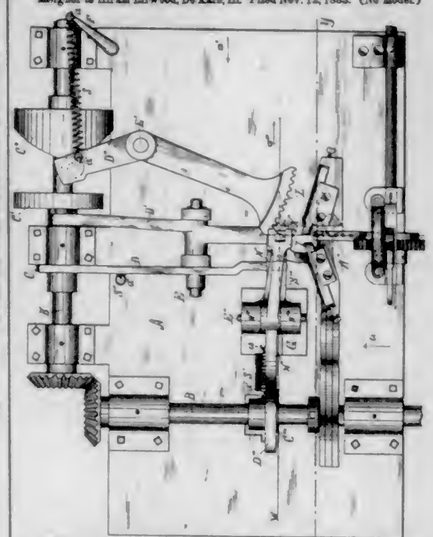
295,206. COMMUTATOR FOR ELECTRIC GENERATORS. HENRY M. STEVENS, Boston, Mass., assignor to Wm. Greene Howe, same place, and Charles Storer. Filed June 25, 1883. (No model.)

Claim.—1. In an electric generator, the combination, with the revolving commutator having a series of insulated contact-pieces, of a series of movable pieces of insulating material interposed between the said contact-pieces, and adapted to project beyond their contact-surface, substantially as and for the purpose described.

2. The commutator-drum having insulated electric contact-pieces at its peripbery, and the contact-brushes or collectors, combined with movable wings of insulating material between the said contact-pieces, normally projecting beyond the periphery of the commutator, and means to depress them to the level of the said periphery at the point where they pass beneath the brushes, substantially as described.

295,207. ELECTRICAL CONDUCTOR. ROSS C. STONE, New York, N. Y. Filed Aug. 9, 1883. (No model.)

Claim.—1. The method herein described of constructing an electrical wire or conductor, which consists in twisting together two galvanized wires, then coating and uniting the two by a galvanized coating, substantially as stated.



2. The method herein described of constructing an electrical wire or conductor, which consists in twisting together two galvanized wires, covering the same with a galvanic coating, then covering the whole with a coating of lead or similar metal, substantially as described.

3. The electrical wire or conductor herein described, consisting of wire A, of great strength, and wire B, of great conductivity, each wire having a separate coating, and the two stranded together and covered by a second coating of metal, substantially as described.

4. The electrical wire or conductor herein described, consisting of steel wire, as A, and copper wire, as B, both wires having a metallic coating, and the two stranded together, and having a galvanic coating over said strand, and the lead covering for the wires and their coatings, as set forth.

5. The combination, in an electric wire or conductor, of galvanized steel wire A and galvanized copper wire B, the two being twisted together and covered by a galvanic coating, and having a lead covering, E, and tin coating F, all being arranged with relation to each other, substantially as shown and described.

295,208. WIRE-BARBING MACHINE. DANIEL C. STOVER, Freeport, assignor to Hiram Ellwood, De Kalb, Ill. Filed Nov. 12, 1883. (No model.)

Claim.—1. In a wire-barbing machine, the combination of means for supporting a main wire, means for feeding a barb-wire across said main wire, means for severing the barb-wire between the barb-feeding mechanism and the main wire, and means for wrapping the severed barb about the main wire and intertwisting its ends, substantially as shown and described.

2. In a wire-barbing machine, the combination of means for supporting a main wire, means for feeding a barb-wire across said main wire, means for severing the barb-wire between the barb-feeding mechanism and the main wire, means for bending the severed barb into a staple having its legs on opposite sides of the main wire, and means for crossing and intertwisting said legs, substantially as shown and described.

3. In a wire-barbing machine, the combination of means for supporting a main wire, means for forming a barbing-staple with its middle in contact with the main wire, and its legs on opposite sides thereof, and means for crossing said legs over the main wire and intertwisting them in a flat coil from which the points of the barb project, substantially as shown and described.

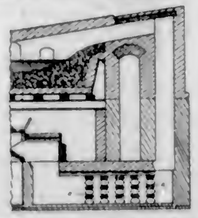
4. In a wire-barbing machine, the combination of means for supporting a main wire, means for feeding a barb-wire across said main wire, means for severing the barb-wire between the feeding mechanism and the main wire, means for pressing the main wire against the middle of the severed barb, and bending it into a staple whose legs are on opposite sides of the main wire, and means for crossing and intertwisting the legs of the staple, substantially as shown and described.

5. In a wire-barbing machine, the combination of means for supporting a main wire, means for feeding a barb-wire across said main wire, means for severing the barb-wire between the feeding mechanism and the main wire, means for pressing the main wire against the middle of the severed barb and bending it into a staple having its legs on opposite sides of the main wire, a twisting-cylinder at right angles to the main wire, and provided with opposite longitudinal notches or recesses in its periphery adapted to receive the legs of the staple so formed, and means for rotating said twisting-cylinder, whereby the legs of the staple may be crossed and intertwisted, substantially as shown and described.

6. In a wire-barbing machine, the combination of means for supporting a main wire, means for feeding a barb-wire across the main wire and severing the same, a longitudinally-reciprocating punch at right angles

to the main wire, adapted to press the main wire against the middle of the severed barb and bend it into a staple having its legs on opposite sides of the main wire, a twisting-sleeve rotating freely about said punch, and provided with opposite notches in its periphery adapted to receive the legs of said staple, and means for rotating said sleeve, whereby said legs are crossed and intertwisted, substantially as shown and described.

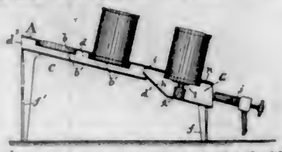
7. The combination, with means for supporting a main wire, and means for forming a barbing-staple having its middle in contact with the main wire and its legs on opposite sides thereof, of the rotating cylinder M, provided with notches Q Q, having lips R R', formed substantially as described, whereby the rotation of the cylinder crosses the legs of the staple, and at the same time brings them into the same plane, substantially as shown and described.



8. The combination of means for supporting a main wire, means for forming a barbing-staple having its middle in contact with the main wire, and its legs on either side thereof, a twisting-cylinder, M, provided with notches Q Q in its periphery, and two pins, i, projecting below the lower face of said twisting-cylinder, said notches being adapted to receive the legs of the staple, partly intertwist them, and bring them into the same plane, and said wrapping-pins to complete the intertwisting of said legs, substantially as shown and described.

9. The combination of the sleeve M, punch O, moving freely within said sleeve, and pivoted lever D''' and cam C''', adapted to impart reciprocal motion to said punch, substantially as shown and described, and for the purpose set forth.

10. The combination of the levers D D', supporting-spindle e, attached to the lever D, the grooved face P, attached to the lever D', and means, substantially as described, for imparting reciprocal vertical motion to said levers.

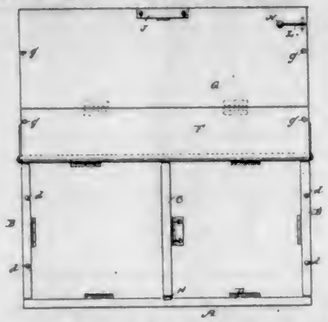


11. The combination of the punch O, sleeve M, reciprocating lever D''', reciprocating segment L, pivoted reciprocating levers D D', and means, substantially as described, for imparting reciprocal motion to said levers and segments.

295,209. REGENERATOR-FURNACE. WILLIAM SWINDELL, Allegheny, Pa. Filed Oct. 21, 1882. (No model.)

Claim.—A regenerator-chamber having a checker-work composed of a series of layers or courses of double-pointed refractory bricks, substantially as and for the purpose specified.

295,210. CAN-SOLDERING MACHINE. JOHN A. TILLERY, Baltimore, Md., assignor of two-thirds to John H. Brandt and Robert B. Carswell, both of same place. Filed Aug. 9, 1883. (No model.)



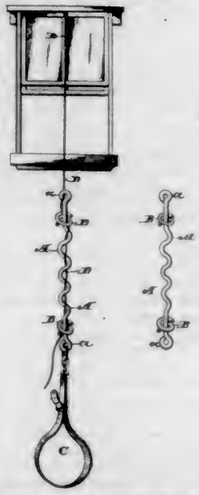
Claim.—1. A can-soldering machine embracing the following construction, to wit: an inclined top and bottom plate, with a flame-passage, d, between the two plates, a flame-receiving chamber, G, at the lower part of the top plate, having an upward-sloping rear wall, h, and a narrow horizontal opening, i, at the top of the wall, and a rotary seat, l, the plane or top of which is below the top plate and on a line direct with the narrow horizontal opening, as set forth.

2. A can-soldering machine having an inclined top and bottom plate, with a flame-passage, d, between the two plates, a flame-receiving chamber at the lower part of the top plate, having an upward-sloping rear wall, h, and an opening, i, at the top of the wall, and a separate air-opening, d', into the flame-passage at each side of the flame-receiving chamber, as set forth.

3. A can-soldering machine having an inclined top plate provided with circular recesses b, depending below the lower surface, a bottom plate with a flame-passage, d, between the two plates, a flame-receiving chamber at the lower part of the top plate, having an upward-sloping rear wall, h, and an opening, i, at the top of the wall, and a separate air-opening, d', into the flame-passage at each side of the flame-receiving chamber, as set forth.

4. A can-soldering machine having an inclined top and bottom plate, with a flame-passage, d, between the two plates, a flame-receiving chamber at the lower part of the top plate, provided with a rotary seat, l, and a detachable cover, n, for the chamber, having a circular opening, as set forth.

295,211. FOLDING EGG-CASE. SAMUEL M. TOAY and EDWARD HARRIS, Cambria, Wis. Filed July 23, 1883. (Model.)



Claim.—1. The combination, with the pivoted lever-latch L, having head N at its free end, of the cover G, front board, D, and rear board, E, each provided with a transverse notch, as and for the purpose specified.

2. In a folding egg-case, the combination, with the box A, of the front and rear boards, D E, and the cover-section G, each provided with a notch, a, on the end, the latch-lever L, the cover-section, F, and the end boards, B, substantially as herein shown and described, and for the purpose set forth.

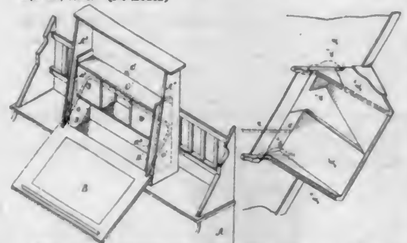
295,212. FIRE-ESCAPE. CORNELIUS A. VAN WAGENEN, Ellenville, N. Y. Filed Apr. 26, 1883. (No model.)

Brief.—A friction device consisting of a spiral provided at both ends with open loops and rings for attaching the body-strap.

Claim.—1. In a fire-escape, the combination, with the rope or wire, of a friction-holder having a spiral body, around and through which the rope or wire is wound, and provided at each end with a ring and an open loop, the ends of which latter pass each other, and a belt removably secured to the lower ring and the holder, substantially as set forth.

2. The combination, with a rope or wire, of a friction device around which the rope or wire is wound, provided at or near its opposite ends with open loops, the ends of which latter pass each other, and a belt removably secured to the lower end of the friction device.

295,213. STREET POUNDER OR RAMMER. F. AUGUST VOIGT, St. Louis, Mo. Filed Dec. 31, 1883. (No model.)



295,213.

Claim.—1. A street rammer or pounder having an iron body and steel or chilled face and cross-handle C, for the purpose set forth.

2. A street rammer or pounder having an iron body, A B, a steel or chilled face, B′, and adjustable handle C, substantially as set forth.

295,214. ORGAN-CASE. JOSEPH A. WARREN, Detroit, Mich. Filed Apr. 27, 1883. (No model.)

Claim.—1. The combination, with an organ-case and self-closing pedals, of a sealing-flange secured to said pedals, adapted to suitably close the space between said pedals and said case, substantially as described.

2. The combination, with an organ-case and self-closing pedals, of a sealing-flange secured to said pedals and suitable blocks, a^3, secured to said case, said flange and blocks adapted to suitably close the space between said pedals and said case, substantially as described.

3. The combination, with an organ-case, of a sliding panel and a rock-shaft connected with said panel, whereby the panel may be slid downward for use as a writing-desk or be slid upward out of the way, substantially as described.

4. The combination, with an organ-case and a rock-shaft having its bearings therein, and provided with arms *c* and *c′*, of a sliding panel secured at its upper end to the extremities of the said arms, and adapted to be slid upward against the case or be slid downward for use as a writing-desk, substantially as described.

5. The combination, with an organ-case provided with the side pieces, A^3 A^4, of a rock-shaft, having end bearings therein and provided with arms *c c′*, and a sliding panel secured at its upper end to the extremities of the said arms, and adapted to be slid downward for use as a writing-desk or slid upward against the case, substantially as described.

6. The combination, with an organ-case having an inclosure, C, of a rock-shaft and a sliding panel connected therewith, and adapted to slide upward to cover the inclosure, and thus serve as a book-rack, or slide downward for use as a writing-desk, one surface only of the panel being exposed to view in either adjusted position, substantially as described.

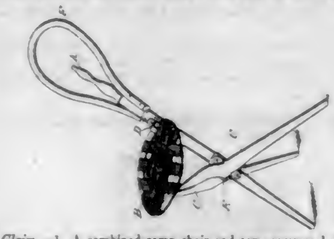
295,215. FLY-WHEEL. RUEL W. WHITNEY, Cleveland, Ohio, assignor to the Leader Sewing Machine Company, same place. Filed Jan. 4, 1884. (No model.)

Claim.—1. The combination of a fly-wheel provided with a rim or shoulder, a disk having a belt-groove, and an interior circumferential groove, with a binding device, substantially as specified.

2. The combination of a fly-wheel having a sleeve and a rim or shoulder, a disk having a belt-groove, and a sleeve adapted to rotate and to move longitudinally upon the sleeve of the wheel, with a binding device, substantially as specified.

295,215.

3. The combination of a belt-disk having a circumferential groove, and a binding device projecting into said groove and through the hub of a fly-wheel, substantially as specified.



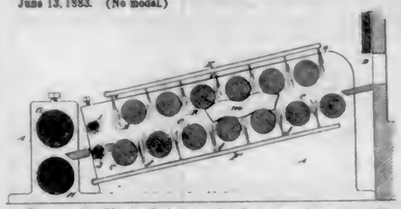
4. The disk D, having the belt-groove D′, the sleeve D^2, and the groove D^3, substantially as shown and described.

5. The combination of the disk D, having the belt-groove D′ and the groove D^3, with the bolt E, having the head E′ cut away, as at *e*, substantially as shown and described.

6. The combination of the wheel B, provided with the rim or shoulder B^3 and sleeve B′, the disk D, having the groove D^3, bolt E, having the head E′, the weight C, and nut E^2, substantially as shown and described.

7. The combination of the wheel B, having the rim or shoulder B^3 and sleeve B′, with the disk D, having the belt-groove D′, sleeve D^2, and groove D^3, and with the bolt E, having the head E′, weight C, and nut E^2, substantially as specified.

295,216. COMBINED CAMP-CHAIR AND CANE. THOMAS WRIGHT, South Norwich, County of Oxford, assignor to the Otto Sweeper Company, (Limited,) Otterville, Ontario, Canada. Filed May 10, 1882. (No model.)



Claim.—1. A combined camp-chair and cane composed of the following elements, namely: central staff, A, loop D, clamp E, pivoted legs C C, seat B, and bow-handle F, constructed and arranged substantially as shown and described.

2. In a combined chair and cane composed, essentially, of a central staff and movable legs, the bow-handle B, also forming a back for the chair, substantially as described.

3. In a combined chair and cane, the seat B, hinged to the central staff by means of a loop, D, substantially as described.

295,217. MODE OF AND MECHANISM FOR PRODUCING SURFACES ON IRON OR STEEL. LEVI D. YORK, Portsmouth, Ohio. Filed June 13, 1883. (No model.)

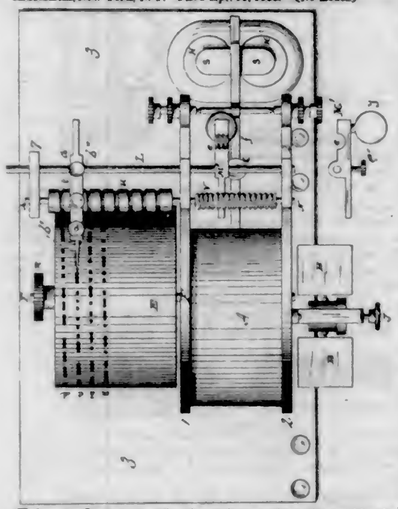
Claim.—1. The method of treating iron or steel—to wit, subjecting a highly-heated mass of metal to streams of water and simultaneously bending said mass alternately in opposite directions, and then immediately reducing the thickness by reducing-rolls, as herein specified.

2. The two series of bending-rolls B C, and the two series of water-pipes E F, with their nozzles *e f*, combined and arranged to serve as herein specified.

3. The furnace D, bending-rolls B C, water pipes and nozzles E *e* F *f*, and reducing-rollers G H, combined and arranged to serve as herein specified.

4. The revolving brushes I J, in combination with the bending-rollers B C, water pipes and nozzles E *e* F *f*, and reducing-rollers G H, substantially as herein specified.

295,218. AQUARIUM. FORTONATO CLEMENTE ZANETTI, Bryan, Tex. Filed Feb. 10, 1883. (No model.)



Claim.—The herein-described improved aquarium, consisting of the vase or jar with a base support, and provided at its upper edge with the thickened perforated enlargements for the suspending-chains, and having

295,218.

a re-enforced bottom provided with an aperture, and a plug inserted from within the jar and provided with an interior enlarged ornamental head, as set forth.

295,219. AUTOMATIC AND FAC-SIMILE TELEGRAPH. JOHN AMSTERDAM, New York, N. Y. Filed Apr. 18, 1883. (No model.)

Claim.—1. In an automatic-telegraph transmitter, the combination of a drum or cylinder having symbols thereon in non-conducting matter in a spiral line, and representing a telegraphic code or signals, a stylus, and means, substantially as described, for causing the stylus to contact with the drum or cylinder when in operation and take upon the drum and the lines of non-conducting symbols, substantially as set forth.

2. In an automatic-telegraph transmitter, the combination of a pen or stylus, a drum or cylinder having thereon symbols of non-conducting material in a spiral line therearound, and means for rotating such drum or cylinder, and means for causing the pen or stylus to traverse the drum or cylinder in a spiral line, substantially as set forth.

3. In an automatic-telegraph transmitter, a drum or cylinder having a series or number of symbols representing a telegraphic code or alphabet imprinted thereon in non-conducting matter, and in a spiral line therearound, to automatically control the transmission of the electrical impulses necessary for a message, substantially as set forth.

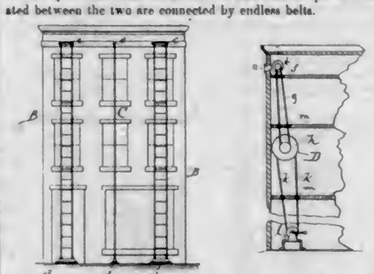
4. In an automatic-telegraph transmitter, the combination of a drum or cylinder, a stylus or pen, and a shaft provided with two different screw-threads and a guide, so that the path of travel of the stylus over the face of the drum or cylinder may be changed, substantially as set forth.

5. In an automatic-telegraphic transmitter having a drum or cylinder prepared in spiral lines of conducting and non-conducting material, to control the transmitting-circuit, the combination, with the drum or cylinder, of a motor giving motion thereto, a vibrating or governing fan for controlling the speed thereof, and means for simultaneously adjusting the position or angles of the vanes of the fan relatively to each other, and locking them positively in such position or relation, so as to readily control and regulate the speed of the motor and of rotation of the drum or cylinder, substantially as set forth.

6. A stencil-plate or series of stencil-plates, each representing an arbitrary telegraph-symbol, and provided with hooked ends adapting them to be joined together to form a message, substantially as set forth.

7. The means for holding the stencil in position upon the face of the drum or cylinder while in use, consisting of an upright and its right-angled arm and an adjustable annulus supported thereby, substantially as set forth.

8. The method of automatic transmission herein described, consisting in causing telegraphic symbols to be recorded upon a drum or cylinder in conducting and non-conducting spaces in a spiral line by transferring or stenceling thereon a suitable ink, paint, or pigment, and then using the record so made to automatically control the transmitting or line circuit, substantially as set forth.

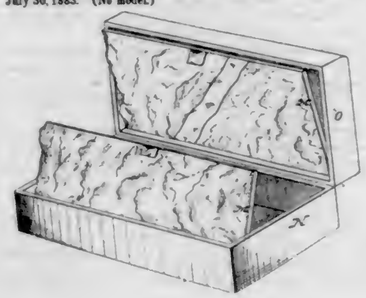


295,220. MANUFACTURE OF FLY-PAPER. EDWARD F. BAKER, Chicago, Ill., assignor to Margaret M. Baker, same place. Filed Aug. 17, 1883. (Specimens.)

Claim.—1. As an improvement in the art of manufacturing fly-paper, the method herein described, which consists of fusing the composition by means of the application of steam or other indirect heat, so as to maintain the composition at a regular degree of temperature, and finally applying the composition to the surface of the paper by means of a roller, substantially as and for the purpose set forth.

2. As a new article of manufacture, fly-paper, when prepared in the manner herein set forth.

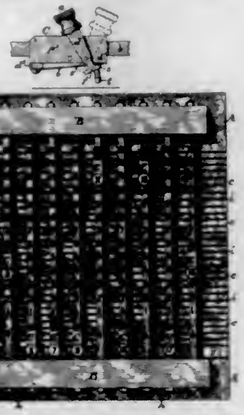
295,221. FIRE-ESCAPE. BENJAMIN F. BENNETT, Lockport, N. Y. Filed Apr. 9, 1883. (No model.)



Brief.—The ladder-shaft and windlass and the power-wheel situated between the two are connected by endless belts.

Claim.—1. In combination with the ladder-shaft A, the pulley *f* thereon, the belt *g*, the power-wheel D, with its two divisions and ropes, or belts *k k′* therein, its pulley *h*, and a double windlass, *l*, all arranged and operating substantially as and for the purpose specified.

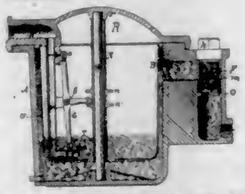
2. A fire-escape consisting of a ladder provided with a weight at the outer end, and a reel to which the ladder is attached at the inner end, and upon which it is wound, in combination with a shaft on which the reel is placed, a power-wheel, D, and windlass *l*, with belts or connections *g m*, whereby the ladder is operated.



295,222. TOILET-CASE. HART O. BERG, New York, N. Y. Filed July 30, 1883. (No model.)

Claim.—1 A toilet-case provided on its interior with frames attached to one side of the body and cover, and covered with satin or any other suitable material, and removable panels inserted between the frames and the bottom of the body and cover of the case, having on their surfaces the requisite projections for holding and securing toilet articles, substantially as described.

2. In a toilet-case, the combination of the frames M, the body N, the cover O, and the removable panels K and P, substantially as described and set forth.



295,223. SWITCH-BOARD. FRANCIS BLAKE, Weston, Mass. Filed Aug. 6, 1883. (No model.)

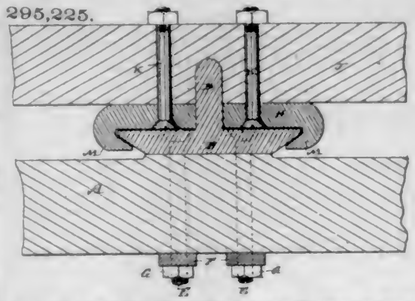
Claim.—1. The combination, with two series of conducting-rods in a switch-board, one series crossing the other, of contact-pins sliding and tilting, one on each of the rods of one of the series, substantially as described, for the purpose specified.

2. The combination of two series of conducting-rods in a switch-board, one series hinged to the other, substantially as described.

295,224. STEAM-TRAP. JAMES H. BLESSING, Albany, N. Y. Filed Oct. 17, 1883. (No model.)

Claim.—1. In a steam-trap, the combination, with a floating bucket adapted to reciprocate vertically, as herein set forth, of the mechanism, substantially as described, for operating a slide-valve, so as to alternately cover and uncover a discharge-opening through which the water contained in said bucket is discharged, in the manner herein specified.

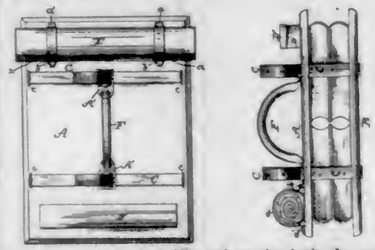
2. In a steam-trap, the combination, with a floating bucket arranged to reciprocate, as herein described, of a slide-valve adapted to cover and uncover a discharge-opening for the escape of the water contained in said bucket, and mechanism, substantially as described, for effecting the movements of said slide-valve by means of the reciprocations of the floating bucket, substantially in the manner herein specified.



3. In a steam-trap, the combination, with a floating bucket adapted to reciprocate vertically, as herein set forth, of the mechanism, substantially as described, for the purpose of imparting alternate reciprocatory motions to a sliding valve and a loose piston, in the manner and for the purpose herein specified.

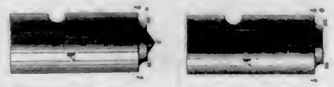
4. In a steam-trap, the combination, with a floating bucket, B, and a lever, G, connected with and vibrated by said bucket, as herein set forth, of a movable piston, *d*, adapted to reciprocate in an air-vent hole, *b*, as and for the purpose specified.

295,225. BOLSTER-PLATE FOR WAGONS. LEROY J. BRANDOW, Starkville, N. Y. Filed Aug. 25, 1883. (No model.)



Claim.—The combination of the axle A, having a plate, B, provided with an upwardly-projecting pintle, D, secured to said axle by means of transverse bolts having interposed washers F, said plate being

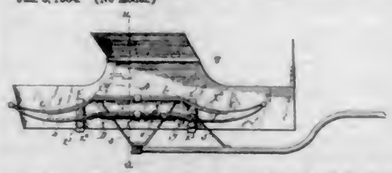
295,225.



also provided with oblong recesses C, and a plate, H, secured to the under side of the bolster J by means of bolts K, said plate H having jaws M, to engage the edges of the plate B, said plate H being also provided with a transverse opening, L, through which passes the pintle D, the end of which is seated in an opening formed upon the under side of the bolster, substantially as and for the purpose set forth.

295,226. BOOK-CARRIER. PETER NAPOLEON BERTON, Montreal, Quebec, Canada. Filed Oct. 10, 1883. (No model.) Patented in Canada Sept. 10, 1883, No. 17,801.

Claim.—A device for holding and carrying books, &c., composed of two side boards or sections, A B, having slots *c* in their outer edges, securing-straps C C, handle F, box or compartment D, and short straps *a a*, adapted for holding a water-proof cover or roll when folded, said cover being constructed substantially as described, and having a slot in its top portion to receive the carrying-handle F, and adapted to be applied to cover the entire device, substantially as and for the purposes described.

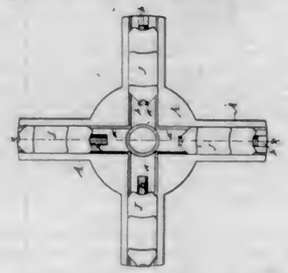


295,227. PUNCH. EDWARD W. ENGOS, Brooklyn, and JOHN D. WALTON, New York, N. Y. Filed MAR. 30, 1883. (No model.)

Claim.—1. That improvement in metal-punches which consists in forming the body with successive annular punching-edges *a b*, joined by an outwardly inclined or curved wall, *c*, as described, for the purpose set forth.

2. The metal-punch herein shown and described, having the successive annular punching-edges *a b*, joined by a curved wall, *c*, and a cone projection, *e*, having the described relation to the cutting-edge of least diameter, for the purposes specified.

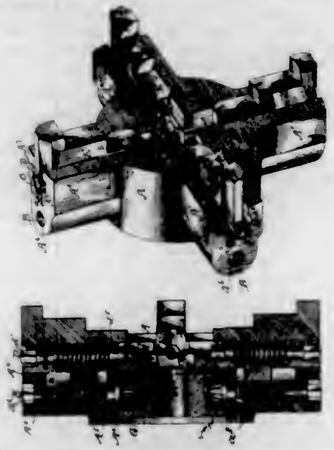
295,228. VEHICLE-SPRING. JOHN P. CALLAN, Aurora, Ill. Filed Jan. 8, 1884. (No model.)



Claim.—1. The vehicle-spring constructed as described—that is, of the two parts or halves A and D, each having a central part substantially straight, terminating at each end in a curve, these parts being jointed

at their extremities, the upper half having leaves on its under side, and the lower half having leaves on its upper side—the springs being applied to the vehicle with the body or weight connected directly underneath to the lower half, D, and with the additional springs underneath the lower half, as shown and described.

2. In combination, the described spring, consisting of the parts A and D, constructed as set forth, the braces 3 and 4, connecting the upper part, A, to the axle, the braces 5, connecting the same part to the shafts, and the body supported by or upon or underneath the lower half, D, of the spring.



295,229. LATHE-CHUCK. GEORGE A. COLTON, Syracuse, N. Y., assignor of one-half to Henry C. Hooker, same place. Filed Mar. 21, 1883. (No model.)

Claim.—1. The jaw J and screw *b*, in combination with the carrier B, having integral with it the nut *a*, the screw *c*, pinion *d*, secured to the inner end of the screw *c*, and the gear *r*, arranged around the center of the chuck, all combined substantially in the manner described and shown.

2. In combination with the carrier B, provided with the nut *a*, screw *c*, provided at its inner end with the pinion *d*, and the rack *r*, arranged near the center of the chuck, as shown, the way *e*, extended to the periphery of the chuck, and the shoulder *s* against the back of the pinion, substantially in the manner described and shown, for the purpose set forth.

295,230. LATHE-CHUCK. GEORGE A. COLTON, Syracuse, N. Y., assignor of one-half to Henry C. Hooker, same place. Filed Jan. 25, 1884. (No model.)

Claim.—1. A chuck body or case comprising a hub and radial arms, the latter provided with ways for jaws or jaws and jaw-carriers, substantially as specified.

2. A chuck body or case comprising a hub and projecting radial jaw-supporting arms, the whole being cast in one piece, substantially as specified.

3. A chuck body or case comprising a hub, and hollow radial arms having internal bearings, as A^4 A^5, the whole being formed in one piece, substantially as specified.

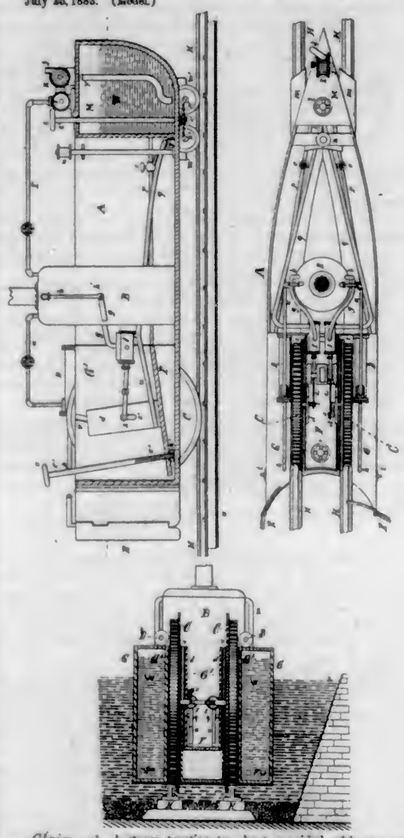
4. A chuck body or case comprising in a single casting a hub, and hollow radial arms projecting therefrom and having an outer bearing, as A^4, and an inner enlarged bearing, as A^5, in combination with a jaw or jaw-carrier-operating screw having an enlarged bearing portion, as b^3, substantially as specified.

5. A chuck body or case comprising in a single casting a hub, hollow radial arms, a diaphragm or floor, jaw-ways, and thrust seats or shoulders, substantially as specified.

6. The screw B, comprising the body *b*, thread b^2, bearing b^3, gear b^4, and thrusts or shoulders b^4 b^5, substantially as shown and described.

7. The screw D, comprising the body *d*, bearing d^4, and thrusts d^6 d^7 d^8, substantially as shown and described.

8. The combination of the jaw E and screw D, having thrusts d^6 d^7 d^8, with the carrier having the bearings *c c' c²*, substantially as shown and described.



9. The combination of the arm A', having the bearings A^4 A^5, and formed as a part of the hub A, having seat A^6, the screw B, having the body *b*, enlarged portions b^3 b^4, and a jaw or a jaw-carrier, substantially as specified.

10. The combination, with the chuck-body having the hollow radial arms provided with ways, and a diaphragm or floor, A^7, of jaws or jaw-carriers adapted to said ways, and a core, as F, arranged against said diaphragm or floor, substantially as specified.

11. The screw D, having the enlarged portion d^4, forming the thrusts or shoulders d^7 d^8 at its inner end, substantially as specified.

12. The hub A, having bearings A^4 and floor A^5, in combination with the core F, having flange *f'*, and with geared ring G and bevel-gears b^3, substantially as specified.

295,231. STEAM TRACTION TUG-BOAT. DAVID W. COOKE, Franklin, Tenn. Filed Aug. 2, 1879. Renewed July 29, 1881. Again renewed July 25, 1883. (Model.)

Claim.—1. A steam traction tug-boat provided with two well-spaces open at their stern ends, and with traction-wheels therein, in combination with a vertically-swinging horizontal platform, with motor or motors thereon for driving said traction-wheels, substantially as described.

2. A steam traction tug-boat provided with a water-compartment at or near the bow end thereof, in combination with the aligning guide-trucks beneath said bow and water-compartment, as described, and for the purpose herein set forth.

3. A steam traction tug-boat provided with traction-driving wheels and aligning guide-trucks thereto, the two water traction-compartments and bow-tank therein, in combination with connecting and circulating pipes and valves thereto, substantially as described, and for the purposes herein set forth.

4. In combination with the swinging platform F, with supporting-standards *d d*, and traction-wheels C C, supported thereon and driven by engines *f f*, connected thereto and supported upon and swinging with said platform, the vertical shaft *c*, with screw *c'* thereon for elevating and depressing said traction-wheels and parts connected therewith and thereto, as and for the purpose specified.

5. The two traction water-compartments filled or partly filled with water as a means for affording additional weight and traction force, in combination with the elevating-shaft *c* and screw *c'*, swinging platform F, engines *f f*, and traction-wheels C C, connected thereto and therewith, whereby the accumulated weight derived from the water in said tanks and increased weight due to the elevation of said boat is transferred to the said traction-wheels, as described, and for the purpose herein set forth.

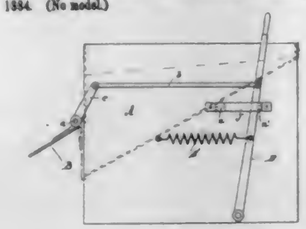
6. In combination with the supporting-rods *b b*, attached to boiler B, rod or bars *g g*, and jointed connection *h' h'*, in combination with the engines *f f* and platform F, substantially as arranged, and for the purpose specified.

7. In combination with the bow end of a steam traction tug-boat provided with a water-ballast compartment therein, the aligning guide-trucks *m' m'*, provided with the vertical shaft *l'*, with hand-wheel *l* thereon for elevating and depressing the bow end of said boat when more or less traction is required upon the submerged rails.

8. In combination with a steam tug-boat provided with well-spaces and traction-wheels therein, and water traction and ballast compartments within said boat, and connecting pipes therewith and valves thereto, constructed and arranged as shown and described, the pump *k*, with induction and eduction pipes *g* and *j*, and external valve, K, for opening and filling said tanks, as arranged, and for the purpose herein set forth.

9. In a steam traction tug-boat having a concave stern, the water-ballast compartments, and well-spaces with traction-wheels therein, all located at the stern end of said boat, in combination with the track on which said traction-wheels roll.

10. In a steam traction tug-boat having a concave stern and well-spaces opening through said stern, said well-spaces and traction-wheels therein, in combination with the water-ballast compartment and submerged track, for the purposes specified.



11. In a steam traction tug-boat, a frame horizontally located, or nearly so, and swinging about a pivotal point at or near one of its ends, while at or near its opposite end a traction wheel or wheels are located and caused to rise and fall with said frame by means of a screw or its equivalent, and the packed slides, which are caused to rise and fall by means of the traction-wheel axles, or by some other equivalent devices, in combination with the motive or transmitting power located upon and swinging with said frame and traction wheel or wheels.

295,232. MANUFACTURE OF ELECTRIC CONDUCTORS. ALFRED A. COWLES, New York, N. Y., assignor to the Ansonia Brass and Copper Company, Ansonia, Conn. Filed Dec. 20, 1883. (No model.)

Claim.—The method herein specified of preparing flexible adhesive water-proof tape and applying it to the conductor, consisting in rolling the tape after the same has been impregnated with such waterproofing material, and afterward heating the roll of tape to expel moisture and soften the adhesive waterproofing material, and applying such tape, while in the hot condition, to the conductor, substantially as and for the purposes set forth.

295,233. COAL-BUNK. JOHN DALL, New York, N. Y. Filed Jan. 25, 1884. (No model.)

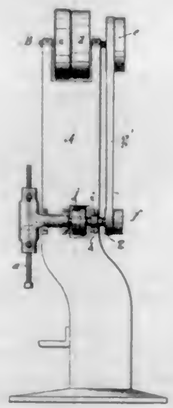
Claim.—A receptacle, A, the sides and back of which are made slanting toward the front, closed by a hinged door, B, in combination with crank *c*, rod *b*, lever D, spring S, and guide-frame J, provided with recesses *n n'*, arranged to operate in the manner and for the purpose substantially as described.

295,234. RETAINER FOR GUN-WADS. JAMES W. DENNIS, Cincinnati, Ohio, assignor of one-half to William Hamilton, same place. Filed Oct. 3, 1883. (No model.)

Claim.—1. A metal cartridge-wad holder concaved or arched, and expansible by flattening with one or more downwardly-projecting spurs at or within its peripheral boundary, adapted to be forced into or around the wad in the flattening process, to secure the metal holder to the wad, and the latter within the shell, substantially as set forth.

2. As a new article of manufacture, an arched or concave sheet-metal wad-holder having spurs or projections upon its under surface, formed by cutting and turning down the metal within the peripheral boundary, and adapted to sink into or around the paper or felt wad in the flattening process, to engage and hold the parts in place, substantially as set forth.

295,235. GUN-WAD. JAMES W. DENNIS, Cincinnati, Ohio, assignor of one-half to William Hamilton, same place. Filed Nov. 5, 1883. (No model.)



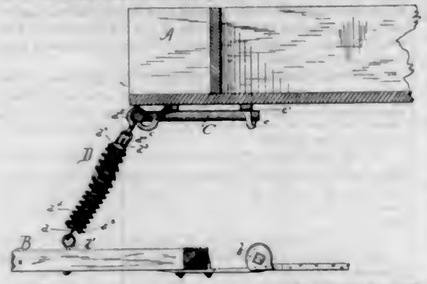
Claim.—1. A holder for gun-wads, consisting of a flat sheet-metal disk having an annular groove at or near the margin, and adapted to be secured to the wad in using, and expanded by flattening, substantially as set forth.

2. A combined gun-wad and holder, consisting of a wad of paper or soft material having united therewith a flat metal disk provided with an annular groove adapted to be expanded by the ramming process against or into the wall of the cartridge or barrel, substantially as set forth.

3. The improved gun-wad, consisting of a paper or felt wad perforated centrally or marginally, and provided with a sheet-metal disk united therewith at one of its outer surfaces, substantially as set forth.

295,236. BORING ATTACHMENT FOR MORTISING-MACHINES. WILLIAM H. DOANE and GEORGE W. BOOBER, Cincinnati, Ohio. Filed Aug. 9, 1883. (No model.)

Brief.—A boring-spindle is placed upon each side of the mortising-machine, either one of which may be driven by a belt from the main shaft. This belt runs over a pulley on the counter-shaft which drives the main boring-spindle, or over an adjacent pulley on a sleeve on this counter-shaft, which is belted to the counter-shaft of the auxiliary boring-spindle.



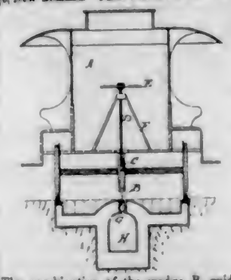
Claim.—1. In a mortising and boring machine, the main and auxiliary boring attachment arranged relatively to each other, substantially as described, driving mechanism leading from the main counter-shaft to one of the boring-shafts, and driving mechanism, substantially as described, leading therefrom to the other boring-shaft, and mechanism for throwing the latter into or out of operation, all in combination, substantially as set forth.

2. In a mortising and boring machine, the main and auxiliary boring attachments at opposite sides of the supporting-column, a belt connecting the same, means for throwing said belt into or out of operation, a counter-shaft on the main frame, and a belt connecting this with one of the boring-shafts, all combined and arranged to operate as set forth.

3. In combination, in a mortising-machine having boring attachments, a counter-shaft journaled on the main frame and connected to the main boring-spindle, a fixed pulley on said counter-shaft, an adjacent pulley secured to a loose sleeve, the auxiliary boring-tool and its counter-shaft driven from said pulley on the sleeve, and the driving-belts, all combined substantially as stated.

4. In a mortising-machine, the combination of the boring counter-shaft C, having thereon a fixed pulley, *f*, and a loose sleeve, A, carrying pulleys *g* and *j*, with a second boring counter-shaft, C', provided with fast and loose pulleys *m n*, substantially as and for the purpose specified.

295,237. WAGON-TONGUE SUPPORT. JAMES T. DOUGHS, Chicago, Ill. Filed Nov. 3, 1883. (No model.)

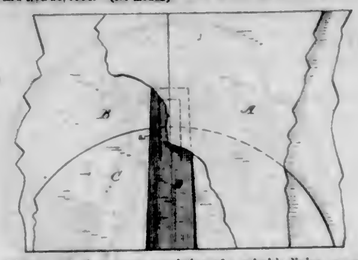


Claim.—1. In a vehicle-tongue supporter, the combination, with a curved rod or guide-rail secured to the vehicle box or body, of a connecting device suspended therefrom to the tongue, said connecting device being adapted to slide around on said curved rod as the tongue is turned, substantially as specified.

2. The combination, with a curved rod secured to the vehicle box or body, of a spring-connection to the tongue suspended from said curved rod and adapted to slide around on the same as the tongue is turned, substantially as specified.

3. The vehicle-tongue supporter, consisting of a rod secured to the vehicle, and a spring-connecting device attached to the tongue, and adapted to slide around on said rod as the tongue is turned, substantially as specified.

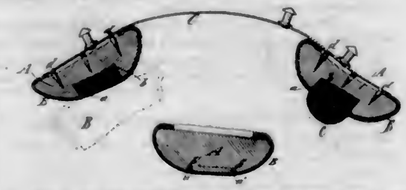
295,238. BRAKE FOR CABLE-RAILWAY CARS. GEORGE DUNCAN, Dunedin, Otago, New Zealand. Filed Dec. 22, 1883. (No model.)



Claim.—1. The combination of the wedge B, guide C, screw D, hand-wheel E, and stand F, with the car A and the slot-irons G of an underground slotted-tube endless-cable railway, substantially as shown and described.

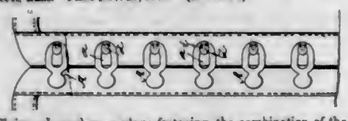
2. The combination of the wedge B, guide C, stand F, screw D, and hand-wheel E, with the car A.

3. The wedge B and guide C, in combination with the car A and slot-irons G.



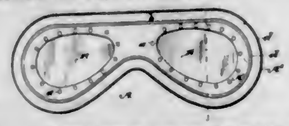
4. In an endless cable underground slotted-tube railway, the combination of a car, A, a wedge, B, and the slot-irons G of the tube, substantially as shown and described, and for the purpose set forth.

295,239. SHOE-UPPER. JAMES HENRY BOAK, Jr., St. Johnsville, N. Y. Filed Dec. 28, 1881. (No model.)



Claim.—A shoe-upper consisting of a suitable lining, an upper-leather and a stiffening-leather, and a back stay skived across its entire width and in a direction of its length, and held between them by a horizontal row of stitches across its upper end and two longitudinal rows of stitches, said stitches extending down only a portion of the length of the stay, to fasten it to the upper portion only of the stiffening-leather, substantially as and for the purposes specified.

295,240. TRUSS. JOHANNES FENERSTEIN, New York, N. Y. Filed Nov. 14, 1883. (No model.)

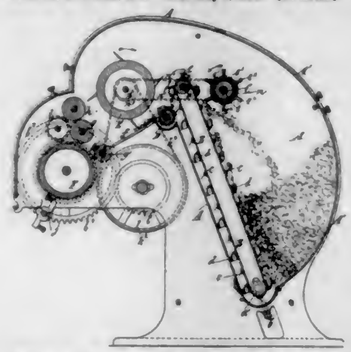


Claim.—The truss-pad consisting of a solid body or block, A, and the flexible india-rubber sheath or covering B, centered upon said body by means of a recess and projection, as herein described, the said sheath or covering conforming in shape to the face of the body or block A, fitting in contact therewith at all points and secured thereon by its elasticity, substantially as set forth.

295,241. SHOE OR GLOVE FASTENING. MATTHEW S. FOX, Fort Scott, Kans. Filed Nov. 26, 1883. (No model.)

Claim.—In a shoe or glove fastening, the combination of the plate A, having the slot *a*, notch *b*, and securing-flange *c*, button *d*, having the head notched, as at *i*, and projecting prongs *f*, the whole adapted to operate as shown, described, and for the purpose specified.

295,242. FLEXIBLE AIR-TIGHT EYE-GUARD. DAVID GENESE, Baltimore, Md. Filed July 10, 1883. (Model.)



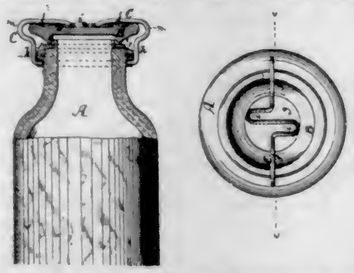
Claim.—1. A flexible air-tight eye-guard consisting of a frame of flexible metal completely surrounding the orbital space, and having plane lenses of mica or other transparent and flexible substance, and an elastic marginal body secured to said frame, in the manner and for the purpose substantially as described.

2. The combination, with the frame composed of two flexible metallic plates, A and A', of the mica lenses B, the raw rubber *a'*, and the rivets *a*, substantially as described.

3. The combination, with the frame composed of two plates lying one upon the other with the lenses interposed, as described, of an elastic margin secured to a strip which is attached to the frame by bending the edges of the plates over the margins of the strip, substantially as described.

4. The combination, with the frame composed of the plates A' A², having flanged edges *d d*, of the elastic tube C, mounted upon a strip, D, the parts being united, substantially as described.

295,243. SELF-FEEDER FOR CARDING-MACHINES. CALVIN L. GODDARD, New York, N. Y. Filed May 3, 1883. (No model.)



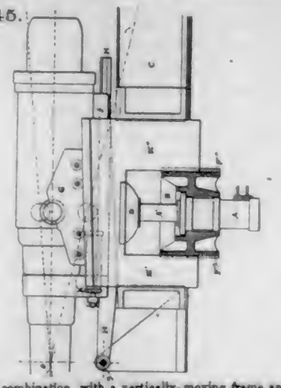
Claim.—1. The combination, with a bin for stock, of a lifting-apron provided with rows of teeth, and receptacles or buckets interposed between the teeth, and mechanism for operating said apron and for delivering the material raised by the lifting-apron to a carding-engine or other machine, substantially as specified.

2. The combination, with a bin for stock, of a lifting-apron provided with buckets or receptacles, a beater or other stripping device near the top of the apron, mechanism for operating said apron and beater or stripping device, and mechanism whereby the material raised by the lifting-apron may be delivered to a carding-engine or other machine, substantially as described.

3. The combination, with a bin for stock, of a lifting-apron provided with buckets or receptacles, and with rows of teeth independent of said buckets or receptacles, a beater or other stripping device near the top of the apron, mechanism for operating said apron and beater or stripping device, and mechanism whereby the material raised by the lifting-apron may be delivered to a carding-engine or other machine, substantially as described.

4. The combination, with a bin for stock, of a lifting-apron provided with buckets or receptacles having serrated or toothed edges, a beater or other stripping device near the top of the apron, mechanism for operating said apron and beater or stripping device, and mechanism whereby the material raised by the lifting-apron may be delivered to a carding-engine or analogous machine, substantially as described.

295,244. FRUIT-JAR. GEO. W. GOSHEN, Sybertsville, Pa., assignor to Henry W. Putnam, Bennington, Vt. Filed Dec. 31, 1883. (No model.)



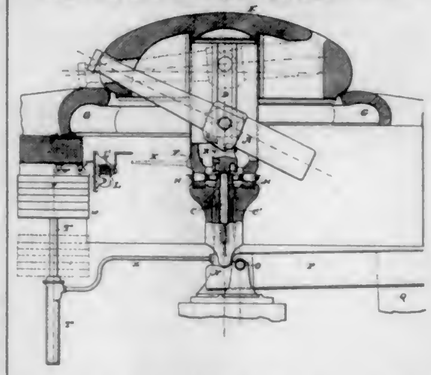
Claim.—1. The jar-fastener C, made with central springing enlargement, with spring-arms *j*, having curved portions *m*, and downwardly-extending hooks *h h*, substantially as described.

2. The combination of the lid B, having depression *g*, with the holder C, swiveled by spring enlargements *i i* in said depression, said holder having spring-arms *j*, with curved portions *m*, and hooks *h*, substantially as and for the purpose herein shown and described.

295,245. GUN-CARRIAGE. HERMANN GRUSON, Buckau, near Magdeburg, Prussia, Germany. Filed Sept. 12, 1883. (No model.) Patented in Belgium Mar. 24, 1883, No. 60,670; in France Apr. 3, 1883, No. 154,638, and in Italy June 30, 1883, XVII, 15,425.

Claim.—1. The combination, with a vertically-moving gun-carriage, of a barrel whose trunnions have bearings therein, said barrel having through intermediate connections a fixed pivotal point distant from the vertical plane of the axis of said trunnions on which it turns, as set forth.

295,245.



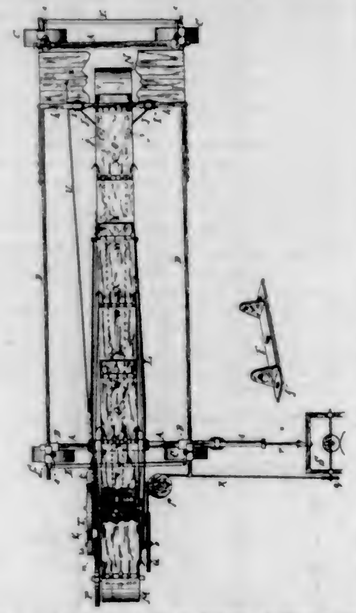
2. The combination, with a vertically-moving frame and a sliding gun-carriage mounted thereon and supporting the trunnions, of the barrel pivoted through intermediate connections to a part of the frame distant from the vertical plane of the axis of said trunnions, which is stationary as regards vertical and independent horizontal movement, as and for the purpose set forth.

3. The combination, with a vertically-moving gun-carriage affording bearings in which the trunnions work, and the barrel having through intermediate connections a fixed pivotal point distant from the vertical plane of the axis of said trunnions, of a hydraulic press for operating said carriage, as set forth.

4. The combination, with the vertically-moving frame E and carriage G, of the barrel pivotally connected to a part of the frame through the medium of the buffer K and rod H, sliding in a suitable groove in a block fixed to the under side of the barrel, as and for the purpose set forth.

5. The combination, with the vertically-moving frame E, carriage G, and the barrel, having through the medium of suitable intermediate connections a fixed pivotal point distant from the vertical plane of the axis of the trunnions, of a hydraulic press, A, as and for the purpose set forth.

295,246. ARMOR-PLATED GUN-CARRIAGE. HERMANN GRUSON, Buckau, near Magdeburg, and MAX SCHUMANN, Magdeburg, Prussia, Germany. Filed Apr. 19, 1883. (No model.) Patented in Belgium Feb. 23, 1883, No. 60,476; in England Mar. 10, 1883, No. 1,288; in Italy May 16, 1883, XXX, 434, and in France July 6, 1883, No. 154,131.



Claim.—1. The armor-plated gun-carriage adapted to be raised by hydraulic pressure and to be lowered by a winch, as described, and provided with a piston, C, to serve as a pivot-point for rotating the gun-carriage, and to rest upon the fluid of the cylinder C' when the said carriage is elevated.

2. In combination with the armor-plated gun-carriage adapted to be raised by hydraulic pressure, as described, a lowering device consisting of a winch, L L', having a cord, *v*, moving over pulleys *v'* and *v''*, for raising the weight *w* and withdrawing the hydraulic pressure and permitting the gun-carriage to descend, substantially as described.

3. The combination of the armor-plated shield having a minimum embrasure, as described, with a gun-carriage adapted to be elevated and supported by a piston, C, and to be rotated in a horizontal plane with the piston C as a pivot-point, or upon the roller-track, when the carriage has been slightly raised, in combination with the cylinder C', the connecting-pipe *x*, the cylinder T', piston T, and the superimposed weight *w*, controlled by a winch, substantially as set forth.

295,247. DITCHING AND GRADING MACHINE. ISAAC B. HAMMOND, Chicago, Ill. Filed Dec. 28, 1882. (No model.)

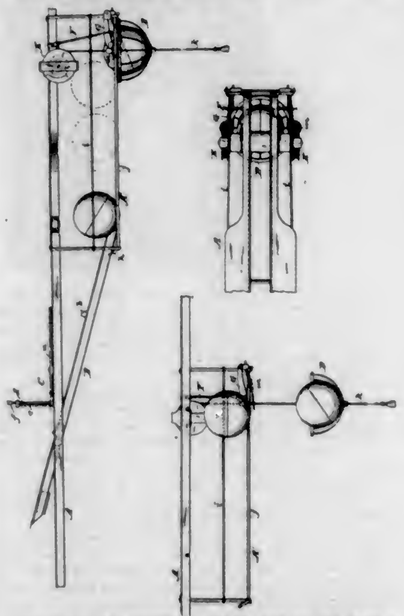
Brief.—A frame carrying an endless belt, having alternative claws and buckets secured (the latter by twisted straps) to cross-strips, is pivoted in the bent-up ends of a plate perforated for a king-bolt passing through an under bearing-plate secured to one of two axle-beams. These beams, with two beams connected thereto and to caster-wheel spindles (connected in pairs) by socketed sleeves, form the main frame. The upper belt-roller is geared with a pulley-shaft driven by cords running around suitable pulleys, and from an engine-truck adjusted in attachment to main frame by a sleeve and slide-rod. On a bridge transverse to the frame run two rollers, to which are secured ropes passing therefrom under pulleys on belt-frame to a drum thereon, having slide-boxes enabling it to be thrown into gear with the pulley-shaft by a lever and rod.

Claim.—1. In a ditching and grading machine, the scoops Y, rigidly connected by straps *x* to bars W, which are secured upon an endless belt, O, that is stretched over pulleys M and N, all constructed and arranged as and for the purpose set forth.

2. In a ditching and grading machine, the combination of the supporting-frame, composed of axle-trees A A' and longitudinal beams D, independently swiveled upon mandrels *b*, and the wheels C, pivoted in the bifurcated shanks of mandrel *b*, substantially as and for the purpose set forth.

3. In a ditching and grading machine, the endless belt O, stretched over pulleys M and N of swinging frame G, and having alternate plow-hooks X and scoops Y, each pulley M being driven by a gear-wheel, P, pinion *n*, and pulley Q, and from the engine S by an endless rope, R, that is guided over sheaves *p*, all constructed and arranged substantially as described, to operate as specified.

4. In a ditching and grading machine, the axle-trees A A' and longitudinal beams D, pivotally connected each to the other by mandrels *b* that have wheels C and cranks *c*, connected by bars E, all substantially as and for the purpose described and shown.



5. In a ditching and grading machine, the combination of main frame, composed of axle-trees A A' and longitudinal beam D, wheels C, pivoted in the bifurcated shanks of mandrel *b*, frame G, pivotally supported on bolt *g* upon plate F and plate *f*, all substantially as and for the purpose set forth.

6. In a ditching and grading machine, the main frame, consisting of axle-trees A and A' and longitudinal beams D, having uprights H, with bridge-tree A, and supported on wheels C, in combination with swinging frame G, pivotally supported at one end on axle-tree A, and suspended at its opposite end by ropes J, that are coupled to hangers *i* of rollers I, passed over sheaves *j*, and thence wound upon drum K, all substantially as and for the purpose set forth.

7. In a ditching and grading machine, the combination, with the main frame having axle-trees A A', longitudinal beams D, and bridge-tree A, with rollers I and hangers *i*, of swinging frame G, having sheaves *j*, drum K, having its shaft journaled in sliding boxes, with pulley T, driving-shaft o, with friction-wheel *u*, brake-shoe *t*, shifting-lever *k*, with rod U and ropes J, coupled to hangers *i*, passed over sheaves *j*, and thence winding upon drum K, all constructed and arranged to operate substantially as described, for the purpose specified.

8. In a ditching and grading machine, the combination, with frame G, of driving-pulley Q and sheaves *p*, rope or belt R, main frame having axle-tree A, having tube *s*, portable engine S, having rod *r*, adapted to enter tube *s* and be adjustably secured therein by a set-screw, all substantially as and for the purpose set forth.

295,248. STORE-SERVICE APPARATUS. HARRY H. HAYDEN, New York, N. Y. Filed Dec. 27, 1883. (No model.)

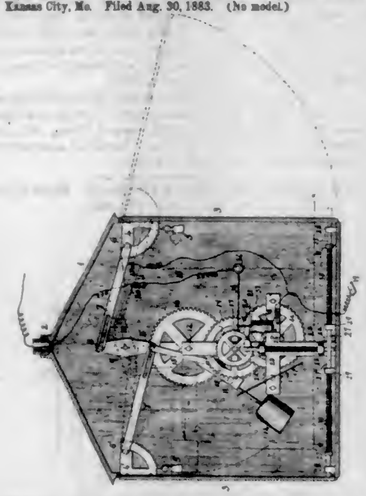
Claim.—1. The combination, with the main way and switch of a store-service apparatus, of a supplemental receiving-way and a movable receptacle arranged below the receiving-way to receive the carriers passing from the latter, substantially as set forth.

2. The combination of the main way and switch and a receiving-way having an opening whereby the carriers may descend vertically, a vertically-moving receptacle below the receiving-way, and a detent whereby the carriers are retained on the receiving-way until the receptacle is at its highest point, substantially as described.

3. The combination of the main track and switch, receiving-way having the tracks spread at the delivery end, detent, and receptacle or basket arranged below the opening in the track, and connected to cords and counterbalanced, substantially as specified.

4. The combination, with the main way and switch of a store-service apparatus, of a receiving-way arranged below the main way, and a movable receptacle arranged below the receiving-way to receive the carriers passing vertically from the latter, substantially as set forth.

5. The combination of the main track and switch, receiving-way, basket, suspension-cords, and one or more spring-drums, upon which said cords are wound, substantially as described.



6. The combination of the main track, switch, and receiving-way, consisting of wires arranged below the main way and provided with a detent, substantially as described.

7. The combination of the receiving-way, receptacle, detent, and

locking device, whereby the detent is locked in place until the receptacle is at its highest point, substantially as described.

8. In a store-service system, a return-way provided with a series of switches and appliances whereby each switch is unlocked at its proper station, and a receiving-way adjacent to each switch, and a movable receptacle and appliances whereby the carriers on the receiving-ways may be successively carried downward to the operator's station, substantially as specified.

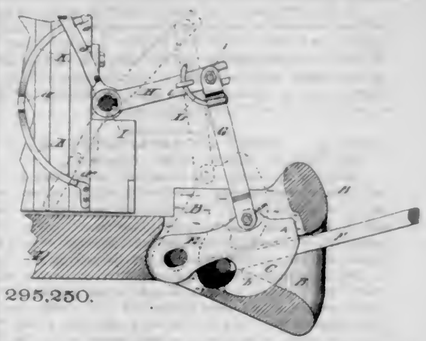
295,249. COMBINED FIRE AND POLICE ALARM. JOHN C. HENRY, Kansas City, Mo. Filed Aug. 30, 1883. (No model.)

Claim.—1. In a signal-box having suitable line and ground connections, and with a make-and-break device for giving the prescribed call from said box, a supplemental make and break for giving signals additional to the main call, and duplicate mechanism, both adapted to operate the main circuit-breaker, and one the supplemental circuit-breaker in addition, as set forth.

2. In a signaling apparatus, the combination, with a signal-box having means of sending, in addition to the regular call, a preliminary or subsequent impulse of some duration, of the indicator and alarm, the latter being adapted to be operated only by the supplemental call, as set forth.

3. An electric signal-box provided with two independently-hinged doors or levers, each connected with and adapted to operate the regular call through the medium of intermediate mechanism, and one of said doors or levers having a separate make-and-break device for sending additional impulse or impulses to line, substantially as set forth.

4. In a signal-box, the combination, with a weighted arm or spring and a train adapted to be driven thereby to transmit the call, of two independently-movable levers or doors so connected with such weighted arm or spring as by being lifted to set the same in position for driving the train, substantially as set forth.



5. The combination of door or doors having means of connection to the call mechanism, with segment rack or racks fixed to such door or doors, and pawl or pawls adapted to engage with such segment-racks until the door has reached its extreme position, substantially as set forth.

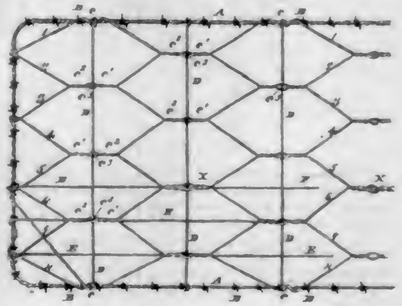
6. The combination, with one or more doors or levers, 3 3', of slotted connecting-rods 7 7', rocking lever 9, connecting-rod 13, and weighted arm 11, substantially as and for the purpose set forth.

7. In combination with door or doors 3 3', the train 16 18 19, and weighted arm 11, adapted to drive such train when set by the opening of one or other of the doors, and the stop mechanism adapted to be moved by the closure of such door, and thus release the train, for the purpose set forth.

8. In combination with a make-and-break wheel having suitable means for rotating the same, and stop or pin 20, the spring-rod 22, having stop-lug 21 and plate or arm 26, and the spring rod or rods 27, adapted to release the stop mechanism when the door is closed, substantially as set forth.

295,250. CAR-COUPLING. ROBERT HITCHCOCK, Springfield, Mass. Filed Feb. 9, 1884. (No model.)

295,250.



Claim.—1. The within-described improved car-coupling, consisting of a draw-head, B, having a vertical slot bisecting its mouth, a depression, *h*, in the front wall of said slot and immediately above the upper mouth-surface, a shoulder, *b*, in the lower surface of the mouth, a hook, C, hinged at its rear end within the slot of the draw-head, within an elongated opening, having an inclined front end and a hook-depression adapted to hold the link, and means, substantially as shown, for suspending the hook upon its hinge to have its front upper corner bear in the depression *h*, the upper surface of its hook-depression coincide with the upper wall of the draw-head mouth, and for swinging the hook upward and downward from said position, while permitting it an independent upward swing, all operating as shown and described.

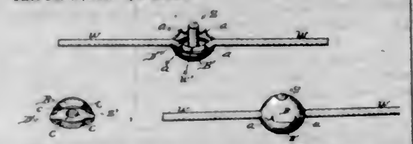
2. In a car-coupling, the combination, with a draw-head, B, and self-coupling hook C, adapted to swing in both directions from a self-coupling position, of a shaft, I, hung in bearings across the end of the car, provided with handles, as J, upon its ends, arranged to swing upon the sides of the car, a track, K, arranged upon the side of the car and provided with stops *d d' d''*, and adapted to form a friction-surface with handle J, a toggle, G, hinged to the hook C, a crank-arm, H, hinged at one end to the toggle G and sleeved upon its other to shaft I, and a clutch formed upon the sleeve of arm H and shaft I, and adapted to permit an upward movement to hook C, to self-couple, while becoming operative to raise or depress the hook through the rotation of shaft I.

3. The combination and relative arrangement of a swinging operating-handle, J, and friction-track having stops of a car-coupling, with the end ladder of a car, whereby from the ladder the handle upon the side of the car is adapted to be operated either by one hand or one foot.

4. In a car-coupling, the release-joint consisting of the segment L and staple or eye *l*, arranged and combined with the hinged ends of toggle G and arm H, one of which is provided with a forked end, all as shown and described.

295,251. WIRE-NETTING. ARTHUR G. HULBERT, St. Louis, Mo. Filed May 3, 1883. (No model.)

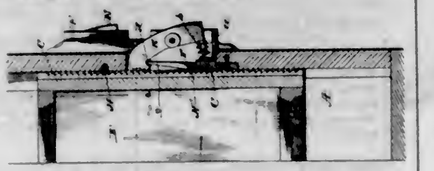
Claim.—1. A wire-netting formed from continuous wires connected to the nearest wire on each side alternately by right and left twists to form elongated hexagonal meshes, as set forth.



2. A wire-netting formed from continuous wires connected to the adjacent wire on each side alternately by right and left twists to form hexagonal meshes, and selvage-wires connected thereto by the outer wires passed bodily around the selvage-wires, as set forth.

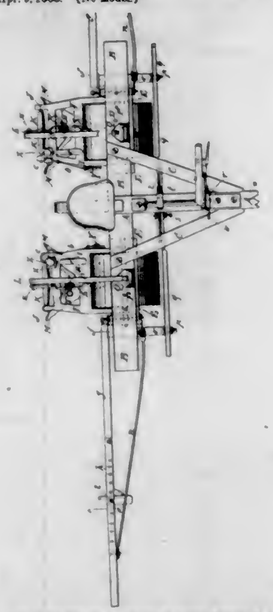
3. The combination of body-wires C, connected by right and left twists c' c^2, and vertical wire D, passing through eyes c^3 in the twist.

4. The combination, in wire-netting, of body-wires C, connected by right and left twists with eyes c^3 therein, and longitudinal wires or strips passing through said eyes or twists.



5. The combination of body-wires C, connected by right and left twists forming eyes c^3, and the vertical and longitudinal wires passing through the eyes, as set forth.

295,252. STOP FOR CHECK-ROW WIRES. THOMAS H. HUTCHINS, Joliet, Ill., assignor to the Illinois Manufacturing Company, same place. Filed Dec. 26, 1883. (No model.)

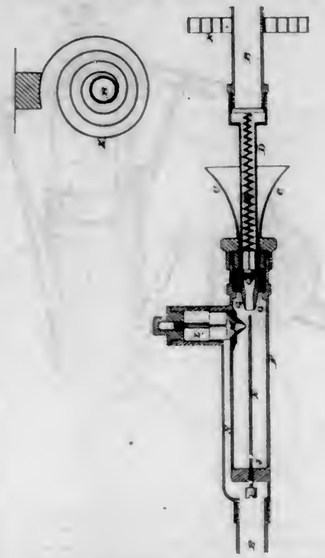


Claim.—The check-row stop described, consisting of the two semi-spheres having the cavities D', and having their meeting edges serrated or provided with the teeth *a* and corresponding notches, *c*, and the rivet S, for uniting the two halves or semi-spheres, substantially as set forth.

295,253. SASH-HOLDER. THOMAS BROWN JONES, Hiawatha, Kans., assignor of one-half to Nathan S. Grover and Delbert T. Grover, both of same place. Filed July 25, 1883. (Model.)

Claim.—The combination, with a window-sash provided with a serrated bar, of a casing secured within the window-frame, the dog E, centrally pivoted within the casing, and provided with the groove *d* and finger *a*, the spring for forcing the upper end of the dog outwardly, and an independent key, shaped substantially as shown, for disengaging the dog from the serrated bar, substantially as set forth.

295,254. LAND-MARKER. WILLIAM HANFORD KING, Little Silver, N.J. Filed Apr. 9, 1883. (No model.)

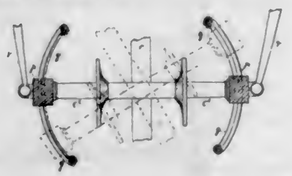


Claim.—1. The combination of the roller-plate flanges F, the frame I, pivoted to the roller-axle and carrying the plow M, whose standard is pivoted to said frame, said frame also having a spring-hook, Y, the bar O, pivoted to the plow-standard, and with its free end adapted to rest on a roller, P, of the beam B, and the hand-lever X, pivoted upon the frame I, and connected to the bar O, said lever having a supplementary lever, *a*, having means for operating the spring-hook Y, substantially as and for the purpose set forth.

2. The combination of the roller-plate flanges F, the frame I, pivoted to the roller-axle and carrying the plow M, whose standard is pivoted to said frame, said frame also having a spring-hook, Y, the bar O, pivoted to the plow-standard, and with its free end adapted to rest on a roller, P, the brace R, connected to the bar O, and having a slot, U, in its end connected to the plow-standard, and the hand-lever X, pivoted to the frame I, and provided with means for operating the spring-hook Y, substantially as and for the purpose set forth.

3. The combination of the roller-plate flanges F, the foot-plate *f*, pivoted to the latter, and having the fixed forwardly-projecting arm *o*, in turn provided with an upwardly-projecting flange having a bolt, *p*, upon which is pivoted the slotted bar *q*, the rods *g h*, and foot *k*, curved bar *r*, shaft *t*, and lever *w*, having a pawl, *v*, and catch-bar *w*, substantially as and for the purpose set forth.

295,255. COUPLING FOR CAR-HEATING APPARATUS. JOHN J. LACEY, San Francisco, assignor to the Lacey Automatic Coupling Company, Oakland, Cal. Filed Feb. 24, 1883. Renewed Feb. 13, 1884. (No model.)



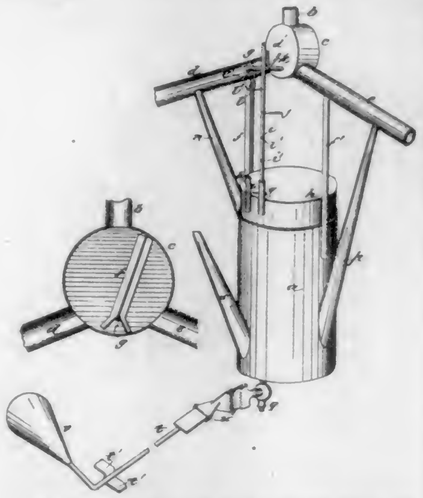
Claim.—1. The pipes B, by which steam or hot air may be conveyed beneath the cars, in combination with the tubes D and F, the bell-shaped guiding-mouth C and the coiled supporting-spring E, substantially as herein described.

2. The tube F, with the partition J, passage N, chamber L, valve M, and the stem or rod K, in combination with the tube D, the valve H, spring I, and the bell-shaped guiding-mouth C and stuffing-box G, substantially as herein described.

295,256. COMPOUND FOR COATING METAL. JOSIAH H. LEGGE, Pittsburg, assignor of one-fourth to A. A. McCarty, Allegheny, Pa. Filed Oct. 22, 1883. (No specimens.)

Claim.—The herein-described compound for coating metals, composed of lead, zinc, tin, and borax, the borax being in the proportion of one-half of one per cent. to five per cent. of the lead and zinc employed, substantially as and for the purposes set forth.

295,257. TRICYCLE. WALTER JOHN LLOYD, Harborne, Birmingham, County of Stafford, England. Filed Jan. 2, 1884. (No model.) Patented in England Aug. 31, 1882, No. 4,157.

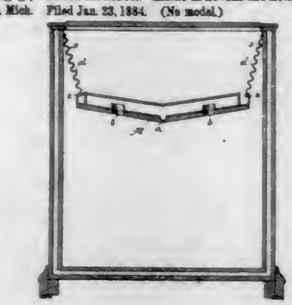


Claim.—1. In a tricycle, the steering-wheel having an elongated axle and bearings near the ends thereof, as described, in combination with the frame *d*, having two curved guide-bars at each end thereof, said guide-bars arranged to embrace the sliding bearings, as described, and connected at the ends by screw-bolts, substantially as shown and set forth.

2. The combination of the steering-rod and its pinion, a draw-bar with which said pinion engages, a lever operated by said draw-bar, and suitable connections, substantially as described, from the ends of said lever to the bearings of the steering-wheel axle, said bearings being adapted to move in curved guideways, all substantially as described.

3. The steering-wheel having elongated axle c^3, the bearings *p* of said axle having side grooves, and the curved guides *q q'*, having edge projections, which extend into said grooves, all arranged and combined to operate substantially as shown and set forth.

295,258. AUTOMATIC RAIN-WATER REGULATOR FOR CISTERNS. FREDERICK E. LORD, St. Louis, Mo. Filed Aug. 10, 1883. (No model.)



Claim.—1. The tank *a*, having upwardly-extending pipe *n*, in combination with a superposed case having water-inlet pipe *b*, waste-pipe *d*, connected with pipe *n* by a wire-gauze-covered hole, *m*, and the cistern-pipe *c*, placed on the opposite side to pipe *d*, whereby as the water passes through the waste-pipe some will pass through hole *m* and pipe *n* into the tank, to raise the float, as and for the purpose described.

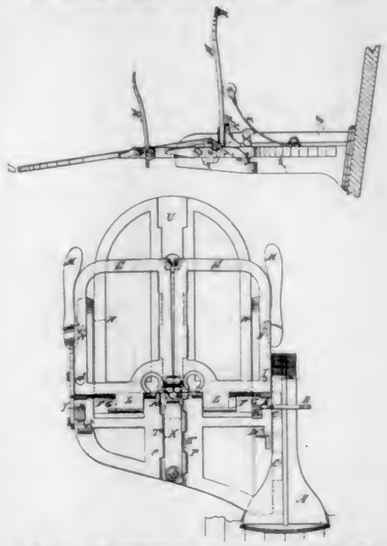
2. The combination, with the tank *a*, having upwardly-projecting pipes *p s*, of the superposed case having a cistern-pipe, *c*, connected with pipe *p*, whereby the float will be maintained in a position to retain the valve tilted at its upper end on the side of pipe *b* opposite to that on which the cistern-pipe is situated, so that as long as the rain continues the water will be poured uninterruptedly into the cistern.

3. The combination, with the valve-pivot *g* and the float-stem *i*, of the arms *j k l l'*, whereby the valve will be automatically operated, as described.

295,259. REFRIGERATOR. HENRY H. LOVELL and HOMER T. LOVELL, Ionia, Mich. Filed Jan. 23, 1884. (No model.)

Claim.—1. In a refrigerator, and in combination, an ice-box bottom fitted tightly to the sides of the refrigerator, with a space at the ends for the passage of air, and with air-passages in the bottom, and hinged end pieces perforated and connected loosely with the bottom, substantially as described.

2. The wooden bottom A, made in one piece with the groove *a*, wherein it is bent or sprung, whereby it is inclined from the ends to the grooved center, said groove also serving as a drip-trough, the whole being provided with a sheet-metal covering and combined in a refrigerator, substantially as described.



295,260. TUMBLER FOR LOCKS. CHARLES A. LUDLOW, Bridgeport, Conn., assignor of one-half to Walter Lips, New York, N. Y. Filed Jan. 18, 1884. (No model.)

Claim.—1. The lock-tumbler herein described, consisting of the hollow journals *a a'*, the journal *a* being closed at its outer end, and the journal *a'* having in it the key-socket *c*, and the wrist or connecting portion a^2, all formed integral with each other from sheet or plate metal, substantially as herein specified.

2. The method of producing a lock-tumbler from sheet or plate metal, consisting in first producing a blank having the cupped or drawn portions *a a'* and the connecting neck or portion a^2, in forming a key-socket, *c*, in one or both of said cupped or drawn portions, and in bending the said blank to bring the said portions *a a'* into line with each other and at right angles to the portion a^2, all substantially as herein described.

295,261. FOLDING CHAIR. JAMES STEELE MACKAYE, New York, N. Y. Filed May 10, 1882. (No model.)

Claim.—1. The combination, substantially as before set forth, of a single post-like standard, substantially such as described, a pair of chair-frames, both hinged at their adjacent rear corners by vertical hinges to said standard, and a folding seat for each chair-frame.

2. The combination, substantially as before set forth, of the post-like standard, substantially such as described, the chair-frame, hinged at one of its rear corners by a vertical hinge to said standard, the pivoted seat, and a spring for automatically folding the seat.

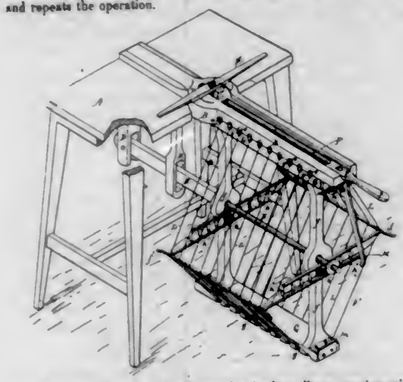
3. A chair-standard constructed substantially as described, provided with double hinge-sockets, double seat-supporting catches B B, and double chair-fastening catches D D, whereby two chairs may be supported by, folded upon, and secured to a single standard.

4. In a folding chair, bracket P, made in three parts, with hinges, admitting the folding of one section thereof upon another, and forming a support for the back and seat of the chair, substantially as described.

5. The duplex seat E, provided with free hinge H, counter-weights L L, catch-pin I, socket J, spring K, supporting-rods F F, closing-springs G G, and separator O, operating together substantially as described.

6. The combination, substantially as before set forth, of the self-folding seat and the pivoted arms, the outer ends of which are curved inward and also reach over the edges of the seat, whereby the folding of the seat causes the folding of the arms.

7. The combination of arm M on the outer section of the back, lever Y, and latch X, pivoted to such section, and catch D on the standard, all operating together substantially as set forth.



8. The combination, substantially as before set forth, of the swinging back U, provided with hinges V V, and supporting-bolts W W, and the folding seat constructed with rearward projections or weights, whereby the back is automatically inclined on turning the seat down.

9. In a folding chair, seat-separator and back-supporter O on the bracket P, constructed and operating substantially as described.

10. The combination of a standard, two supporting bars or frames pivoted vertically and independently thereto, and two folding chairs hinged to said supporting bars or frames, substantially as described, whereby said chairs may, when folded, be turned back to back and leave a passage-way between adjacent rows of double seats.

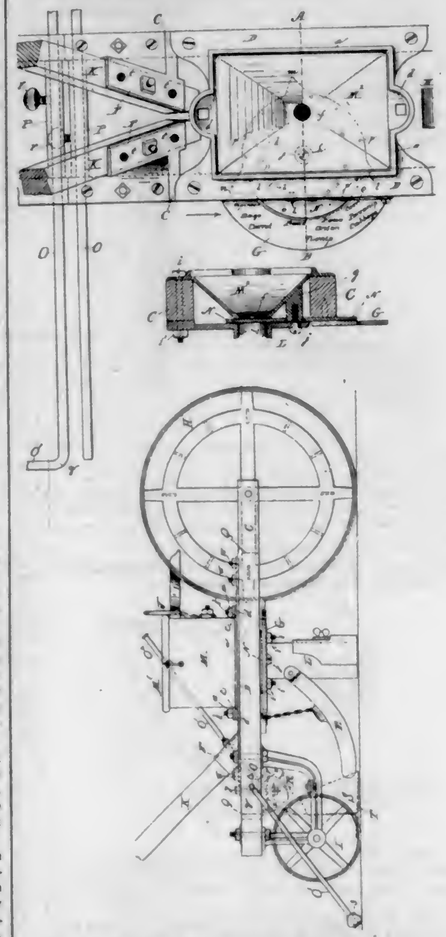
295,262. MACHINE FOR CASTING LEADS ON FISH-NET LINES. ERIK MANULA, Astoria, Oreg. Filed Dec. 4, 1883. (No model.)

Brief.—Winds the line on and tightens it on an expansible reel, each of whose bars constitutes an under part of the mold, turns the reel until one of its mold-bars comes upward and under the stationary upper part of the mold, and then clamps it at each end to that upper part, pours the metal, slides the cut-off, unclamps the under part of the mold, and repeats the operation.

Claim.—1. In a machine for casting leads on lines, a reel or winch upon which the line is wound, said reel having grooves in its circumference, in which the line lies, and forming one half the matrix, in combination with a stationary piece having corresponding grooves, forming the other half of the matrix, substantially as herein described.

2. In a machine for casting leads on lines, a reel or winch upon which the line is wound, said reel having grooves in its circumference, in which the line lied, and forming one half the matrix, in combination with a stationary piece having corresponding grooves, forming the other half of the matrix, and a means for clamping the reel and stationary piece together to form the matrix around the line, substantially as herein described.

3. In a machine for casting leads on lines, the revolving reel F, having cross-pieces G on its circumference, provided with grooves *g*, in combination with the perforated arm B, under which the reel revolves, and provided with corresponding grooves, *c*, communicating with the perforations in the arm, and forming with grooves *g* the complete matrix around the line, substantially as herein described.



4. In a machine for casting leads on lines, the reel F, mounted on a shaft adapted to have a vertical adjustment, said reel having cross-arms G on its circumference, provided with grooves *g*, in combination with the superposed perforated arm B, having grooves *c*, and means for clamping the reel up to the arm, to bring and hold the pieces G in connection with the arm B, substantially as and for the purpose herein described.

5. In a machine for casting leads on lines, the table A, arms D, pivoted reel-shaft E, and reel F, mounted thereon, having the grooved cross-pieces G, with slotted inner ends on its circumference, in combination with the perforated arm B, having grooves *c*, and the means for clamping the reel up to the arm, consisting of the pin J, passing down through an elongated slot, *i*, in arm B, and having a head, *k*, on its lower end, and a cross-lever, H, on its upper end, adapted to move upon a cam, *j*, on said arm to vertically adjust the pin, substantially as herein described.

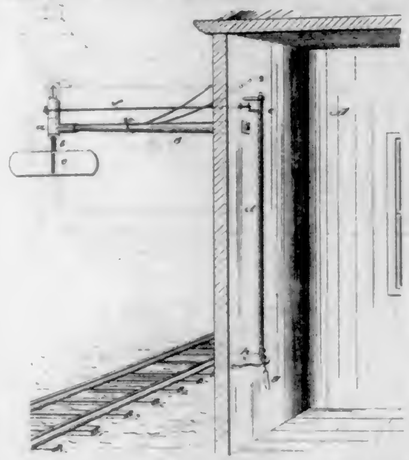
6. In a machine for casting leads on lines, the vertically-adjustable reel F, having the grooved cross-pieces G, with slotted inner ends in its circumference, in combination with the perforated arm B, having grooves *c*, and the means for clamping the reel up to the arm at both ends, consisting of the vertically-adjustable pin J, engaging with the inner ends of the cross-pieces, and the forked lever M, engaging with their outer ends, substantially as and for the purpose herein described.

7. In a machine for casting leads on lines, the revolving reel F, having the transversely-grooved cross-pieces G, in combination with the perforated grooved arm B, having transverse grooves *c* on its lower side, and the sliding perforated trough P, all arranged and operating substantially as herein described.

295,263. COMBINED SEED-DRILL AND CULTIVATOR. ALBERT B. MATTHEWS, Oakham, and JOSIAH B. SMALL, Somerville, Mass. Filed Oct. 17, 1883. (No model.)

Claim.—1. In a seed-drill, a horizontal perforated seed-gage plate, N, having indicator-points formed upon the edges thereof, substantially as and for the purposes set forth.

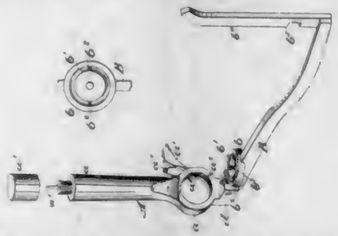
2. In a seed-drill, the combination, with the perforated gage-plate N, provided with indicator-points and hook-holes, of the seed-indicator plate G and hook *o*, substantially as shown and described.



3. In a seed-drill, the combination, with side frames, C C, bottomless seed box or hopper M, and concave bed-plate D M', of seed-gage plate N, seed-indicator plate G, and holding-hook *o*, all constructed and arranged to operate substantially as shown and described.

4. In a seed-drill, the combination, with the frame parts C C, of the tubular sleeves or cylinders P P, provided with thumb-screws *r r*, and

the supporting-arms O O and markers O' O', made in one piece, as described, and adjustable laterally, and held in place in said tubular sleeves P P by the thumb-screws r r, and being also adjustable in any elevated position as to angle, and adapted to be held in any desired elevated position by the said thumb-screws r r, in the manner substantially as shown and described.



295,264. RAILROAD-SIGNAL. JOHN MAYNE, Atchison, KANS. Filed June 13, 1883. (No model.)

Brief.—This device embraces a signal supported near the track by a bracket fixed to the outside of the station-building, and means, as described, for operating the same from a hand-lever arranged within the building.

Claim.—In a railroad-signal, the combination, with the support B, having an upright box, *a*, at its outer end, and the vertical shaft *d*, bearing in a notched plate, *h*, at its lower end, and having a pivoted handle, *g*, of the shaft *b*, passing through and supported upon the box *a*, and carrying the board *c* and a lamp, and the rod *f*, connected to the shaft *b* and to a crank, *e*, of the shaft *d*, substantially as and for the purpose set forth.

295,265. CARTRIDGE IMPLEMENT. JAMES HENRY MCCABE, Jacksonville, Fla. Filed Sept. 28, 1883. (Model.)

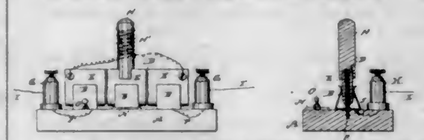
Claim.—1. The combination of the ring *a* and die-block *b*, hinged together, the latter having annular groove *b'*, and one or more pins, *b²*, arranged in said groove, as described, whereby the cartridge may be crimped.

2. The combination, with the ring *a*, of the lever *a'*, pivoted at *a²* in a slot of the ring, having the bit *a³* on the inner edge, and supported at the rear by a spring, *a⁴*, whereby the cartridge may be creased, as described.

3. In a cartridge-reloading tool consisting of the rammer-rod A and lever B, jointed together and arranged for holding the cartridges, as described, the rod A having the cap-expelling point *a⁴*, in combination with the lever *b⁴*, jointed to lever B, and also having a removable cap, *a⁵*, forming the end of the rammer-rod and protecting the cap-expelling point, substantially as set forth.

295,266. BLANK-BOOK. JOSEPH P. MCCANDLESS, New York, N. Y. Filed July 5, 1876.

Claim.—1. The combination of the open sheets E and the short



sheets C and D, provided with the recess F, substantially in the manner described and set forth.

2. In a book, the combination of the cover A, having attached to its flexible joint or back B the U-shaped wire H, constructed as described, the open sheets E, and the short sheets C and D, arranged and operating all in the manner described, and for the purposes set forth.

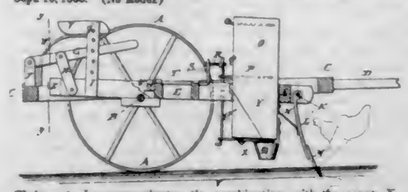
3. In a book, the combination of the cover A with the U-shaped wire H, constructed substantially as described and set forth.

295,267. LIGHTNING-ARRESTER FOR ELECTRIC LINES. CHAS. W. MCDANIEL, Carthage, Mo. Filed Nov. 1, 1883. (No model.)

Claim.—1. In a lightning-arrester, the combination, with clamps on an insulating-base, of an insulating-strip on which as many metal plates are secured as there are clamps on the base, which strip is adapted to be passed into the clamps, and has its end plates connected with the line-wires and to each other, and the intermediate plate or plates connected with the ground-wire, substantially as herein shown and described.

2. In a lightning-arrester, the combination, with an insulating-base, A, of the clamps B, the strip, D, of insulating material, the U-shaped metal plates E on the strip D, of which plates E those at the ends are connected with a coil, H', on the handle H of the strip D, and the strip D and the intermediate plate or plates connected with the ground-wire, substantially as herein shown and described.

3. In a lightning-arrester, the combination, with the base, A, of insulating material, of the strip D, of insulating material, the metal plates E on the same, of which those at the ends are connected with a coil, H', on the handle H of the strip D, the clamps B, the wires F, the posts G, with which posts the line-wires are connected, and a normally-open shunt connected with the posts G, substantially as herein shown and described.



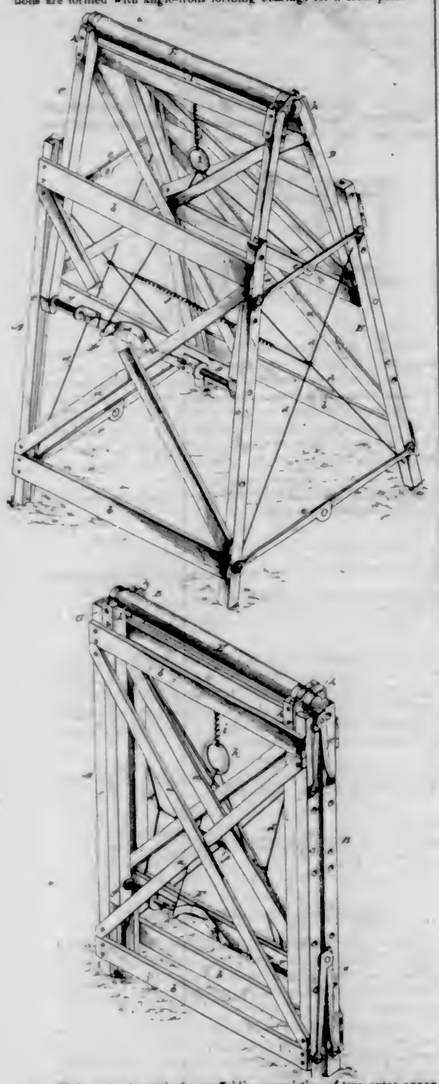
4. In a lightning-arrester, the combination, with the base A, of the clamps B, the strip D, the metal plates E on the same, the wires F, connecting the end clamps B with the binding-posts G, a wire connecting the intermediate clamp B with the ground-wire, the wires M, the plates N, and the plug O, substantially as herein shown and described.

5. The combination, with a base, A, of a series of clamps, B, a metal strip, R, connecting the middle clamps B, the ground-wire L, the insulating-strip D, and the plates E on the strip D, substantially as herein shown and described.

6. The combination, with a base, A, of the clamps B, the insulating-strip D, the U-shaped plates E on the strip D, and wires F, for connecting the end post G with the end clamps B, and a wire, J, for connecting the ground-posts K with the intermediate clamp B, substantially as and for the purpose set forth.

7. The combination, with the base A, of the clamps B and the plate Q, provided with hooks adapted to be passed between the clamps B, substantially as herein shown and described.

295,268. CORN-PLANTER. CHAS. J. MIKESH, Rathven, Iowa. Filed Sept. 10, 1883. (No model.)



Claim.—1. In a corn-planter, the combination, with the spouts Y, the seed-dropping slides P, and the arms Q', of the inverted approximately U-shaped rod Q of the seed-dropping slides X, and the funnels Z, substantially as herein shown and described.

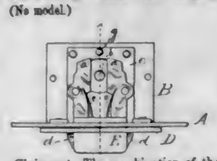
2. In a corn-planter, the rock-shaft T, having arm S and cross-bar U, inverted approximately U-shaped rod Q, having arms Q', and the slides P of the seed-spouts Y, in combination with the slides X and the funnels Z, substantially as and for the purpose set forth.

3. In a corn-planter, the rock-shaft T, having the upwardly-projecting arms S, link R, inverted approximately U-shaped rod Q, having downwardly-projecting arms Q', the slides P of the seed-spouts Y, the slides X, and the funnels Z, substantially as and for the purpose set forth.

295,269. TRESTLE FOR SCAFFOLDING. JOHN T. MILLER, Memphis, Mo. Filed Aug. 8, 1883. (No model.)

Brief.—Consists of two expansible outer and two hinged inner sections removably connected, the inner sliding section having spring-bolts and means for operating them simultaneously, engaging grooved and perforated standards. The outer section is braced by wire cords crossing diagonally, and is held apart by jointed spreaders. An elastic wire cord loosely connects the crossed-wire braces. The hinges of the inner sections are formed with angle-irons forming bearings for a cross-piece.

Claim.—1. A trestle for scaffolding, consisting of two outer expansible sections and two inner sections hinged together at their tops, these latter sections being removably connected to the outer sections and capable of extension in relation thereto, and when extended securely locked and supported in position by the means substantially as herein described, the entire device being adapted to fold together, as and for the purpose set forth.



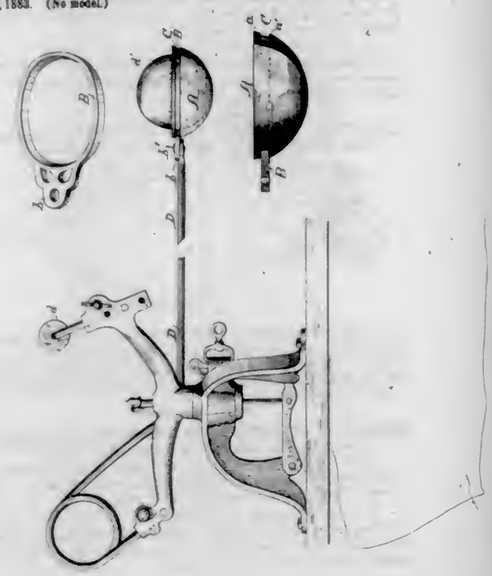
2. The two outer sections, constructed substantially as described, and provided with jointed spreaders pivotally secured at or near their upper and lower ends, said sections having their standards grooved and perforated to form guides and bearings for suitable bolts connected to the inner hinged sections, as and for the purpose specified.

3. The outer folding sections, constructed as herein described, and provided with wire cords adapted to cross each other in opposite directions, substantially as shown, to form braces when said sections are expanded and held apart by their spreaders, and a spiral spring or an elastic cord having its ends loosely secured around said wire cords at their point of crossing, as and for the purpose set forth.

4. The two inner sections, constructed substantially as described, and provided at their upper ends with suitable angle-irons which form bearings for a supporting cross-piece, and in connection therewith hinges for the sections, said sections having connected to their lower horizontal braces suitable bolts adapted to slide in grooves and engage with the perforations in the standards in the outer sections, and means for operating said bolts, substantially as and for the purpose specified.

5. The two outer sections, constructed substantially as described, having grooved and perforated standards, and provided with wire-cord braces and jointed spreaders, in combination with a spiral spring or elastic cord loosely secured to said wire braces, and the hinged inner sections having a suitable cross-piece, and provided with spring-bolts and means for operating the same, as and for the purpose set forth.

295,270. PIANO-LOCK. FRANK W. MIX, New Britain, Conn., assignor to the Corbin Cabinet Lock Company, same place. Filed Jan. 2, 1884. (No model.)

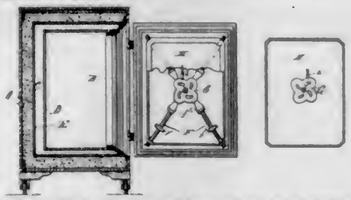


Claim.—1. The combination of the stationary hollow bolt and inclosed spring-pressed locking mechanism adapted to be operated by a key applied directly thereto, and having projections for projecting from the edges of said bolt, which are thrown outward in locking by means of the springs, substantially as described, and for the purpose specified.

2. A lock consisting of the stationary hollow bolt having the plate *e*, formed by an extension of one of its sides, the locking mechanism secured to said plate *e*, the face-plate, and lock-plate B, with the plate *e* secured to said plate B, substantially as described, and for the purpose specified.

3. A self-locking lock having a stationary hollow bolt projecting from the face-plate, and the locking mechanism partially inclosed within said projecting end, substantially as described, and for the purpose specified.

295,271. FLYING TARGET. JOHN G. MOLE, Batavia, Ill. Filed Nov. 20, 1883. (No model.)



Claim.—1. A target holder or cup of a semi-globular form composed of rubber or other material of an elastic nature, and provided near the top with an annular exterior groove, substantially as and for the purpose set forth.

2. A target holder or cup of an elastic nature, the inclosing-walls whereof are thin at the bottom, and gradually increase in thickness upward, and are provided near the top with an exterior annular groove, substantially as and for the purpose set forth.

3. The combination, with a target-holding cup composed of flexible material, and provided near the top with an annular groove, of an encircling band or bracket adapted to engage with said groove, and be retained in place by means of the flange *a* and the bead *a'*, formed on said holder, substantially as set forth.

4. The combination, with a cup-shaped target-holder of an elastic nature, thin at the bottom and gradually increasing in thickness upward, and provided near the top or edge with an annular groove, of the encircling-band B, adapted to fit into said groove, and provided with the attaching projection *b* and the spring-arm D, substantially as and for the purpose set forth.

295,272. FIRE-PROOF SAFE. MAX MOSLER, Cincinnati, Ohio. Filed Oct. 30, 1883. (No model.)

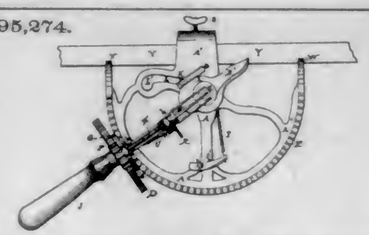
Claim.—1. The combination, in a fire-proof safe, of air-chamber C, surrounding the inner receptacle, D, and the safe-door, having an inner air-chamber, which is also the receptacle for the bolt-work, with tubular bolts to communicate with the chamber C and the chamber in the door when the safe is closed.

2. The combination, in a fire-proof safe, of the safe-body A and stepped door and door-frame with the inner receptacle, D, secured upon the inner flange or step of the door-frame, and the box E upon one of its intermediate steps or flanges, so as to form two chambers within the safe-body, the outer one for the reception of a fire-proof filling, and the inner one being an air-chamber, substantially as specified.

3. The combination, with a safe having an air-chamber, and a door-frame the corners of the inner step of which are beveled and perforated opposite said air-space, of the door provided with an air-chamber, and having its inner step similarly beveled and perforated, the tubular bolts radiating from the center of the door, and adapted to be projected through the beveled corners of the door and door-frame, and means for simultaneously projecting and retracting the bolts.

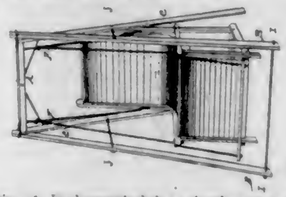
4. The combination, with the safe-door having a chamber, and the bolt-work arranged within said chamber, of the inner door or plate, constructed to close said chamber, and provided with lugs adapted to be engaged by the bolt-work when the bolts are shot.

295,273. CONVERTIBLE BRIDLE AND HALTER. JOHN ADAMS NESBIT, Charlottesville, Ind. Filed Dec. 29, 1883. (No model.)



Claim.—The combination, with the ring *f* of a bridle, of the halter attachment C, consisting of rings *i k* and the strap A, the strap being secured at the middle of its length to the ring *i*, passed through ring *k*, and the ends passed through the rings *f* of the bridle and secured to the ring *k*, substantially as described.

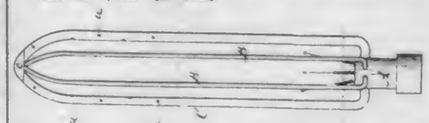
295,274. APPLE-PARER. WM. A. C. OAKS, Antrim, N. H., assignor to the Goodell Company, same place. Filed Sept. 3, 1883. (Model.)



Claim.—1. In an apple-parer, the combination of the reciprocating frame B, the pivoted doffer R, the spring U, the cam-dog S, pivot *b*, stud or stop S', and spring T, substantially as set forth.

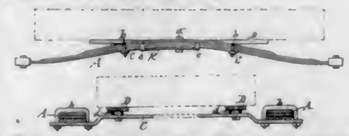
2. In an apple-parer, the combination of a reciprocating frame vibrating upon a pivot, with a doffer pivoted to said reciprocating frame, and a pivoted cam-dog attached to the main frame of the machine and retained in its normal position by a spring.

295,274.



295,275. STAND OR FRAME FOR SUSPENSION OF SWINGS AND HAMMOCKS. WM. A. C. OAKS, Antrim, N. H., assignor to the Goodell Company, same place. Filed Sept. 3, 1883. (No model.)

Claim.—1. In a hammock-chair, passing the upper ends of the supporting-ropes F F together vertically through holes E E in the top bar, A, of the frame, and then hooking the looped ends over the upward extension of the forward legs, B B, substantially as shown and described.



2. In a hammock-chair, the iron rods D, having their upper ends fastened to the cross-bar A, forming top of frame, and having their lower ends bent into hooks, which are hooked into staples at H on the inner or back legs, C, of the frame, for the purpose of giving stiffness.

295,276. VAGINAL IRRIGATOR. AARON PALMER, Rochester, N. Y. Filed Jan. 15, 1883. (No model.)

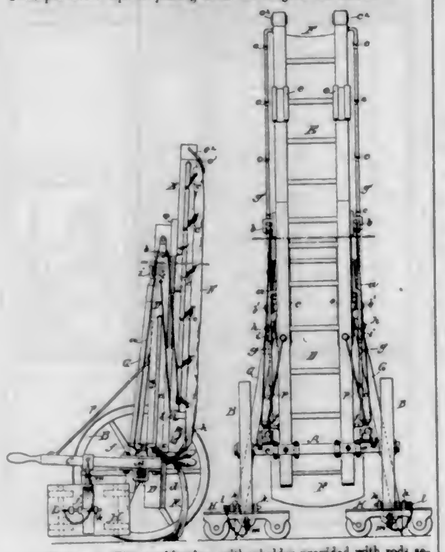
Claim.—A vaginal syringe consisting of the hollow nozzle A, the tubes C C', and non-heat-conducting wires B B, the wires offsetting the tubes, as described, the top of the nozzle entering the bottom of the cage, and provided with perforations *g g*, which allow the liquid to be injected up vertically the whole length of the cage, the whole arranged to operate in the manner and for the purpose specified.

295,277. SIDE SPRING FOR VEHICLES. HENRY W. PELL, Rome, N. Y. Filed Dec. 20, 1883. (No model.)

Claim.—1. In combination with side springs and cross-bars connected therewith intermediately between the ends of said springs, body-supporting plates connected to the cross-bars, and elastic cushions interposed between said plates and cross-bars, substantially as and for the purpose set forth.

2. In combination with the side springs, cross-bars connected therewith intermediately between the ends of said springs, and having their main portion raised to carry the body-supporting plates in the same plane as the top of the clip which fastens the cross-bar to the side spring, and an elastic cushion interposed between said supporting-plate and cross-bar, substantially as described and shown, and for the purpose set forth.

3. The combination of side springs having their component leaves tied together at the center only, round clips embracing the springs, cross-bars connected to the clips and having their main portion raised, longitudinal body-supporting bars mounted on the raised portion of the cross-bars, and elastic cushions interposed between said bars, all constructed and combined substantially in the manner and for the purpose shown and set forth.



4. In combination with the side spring, a rub-iron clamped on the

under side of said spring, and provided with projections engaging the edge of the spring, substantially as set forth.

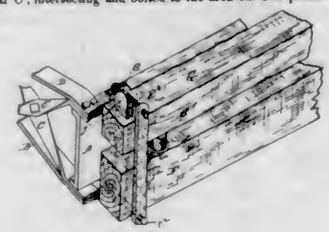
5. In combination with the side spring having a bolt passing vertically through the center thereof, a rub-iron clamped to the under side of the spring by its aforesaid bolt, and provided with lugs engaging the side of the spring to confine the rub-iron laterally in its position, substantially as described and shown.

295,278. FIRE-ESCAPE. HENRY POOLE, New York, N. Y. Filed June 1, 1883. (No model.)

Brief.—Rods are secured to the sides of the ladder-sections, and the chute is secured thereto by loops. Smaller four-wheeled trucks, grooved to receive the large truck-wheels, and provided with chains and pins for securing them therein, are attached to the main truck. The braces have U-shaped metal tops for passing under the rungs of the ladder.

Claim.—1. The combination, with a ladder provided with rods secured to its sides and staples at its upper end, of the chute F and the loops *c c'*, substantially as herein shown and described.

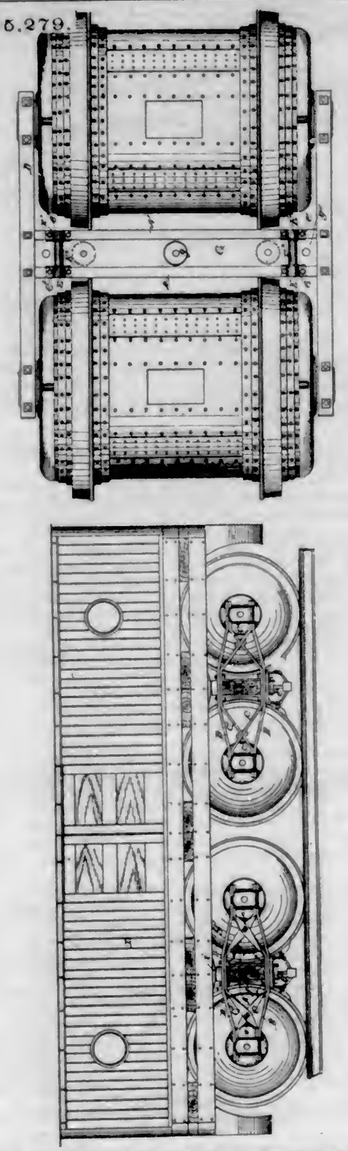
2. The combination, with a two-wheeled truck having a ladder secured to the axle thereof, of the four-wheeled trucks H-H, for shifting the truck and ladder sidewise, substantially as and for the purposes set forth.



3. The handles C C of the two-wheeled ladder-truck, provided with the hooks *o o*, in combination with the four-wheeled trucks H H, adapted to be hooked thereon to be carried by the main truck, and to serve as counter-weights to the ladder, substantially as described.

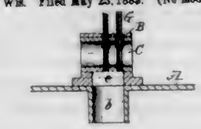
4. The combination, with the section D of a ladder, of the U-shaped irons having hooks *i'*, substantially as herein shown and described.

5. The trucks H, having the grooves *j* formed in them, and provided with the eye-plates *k k*, combined with the bolts *l l*, adapted to pass through the eye-plates, for holding the wheels of the main truck in place upon the small trucks, substantially as described.

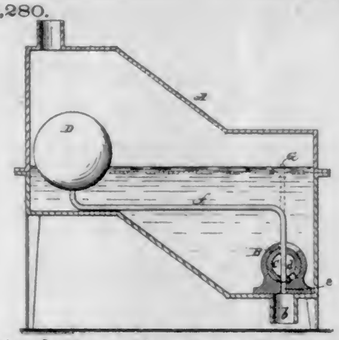


295,279. COMBINED BOX AND CYLINDER CAR. TREAT T. PROCTER, Chicago, Ill. Filed May 4, 1883. (No model.)

Claim.—1. In a car-truck, the combination, with the pedestal tie-bar B, the arch-bar D, and the inverted arch-bar C, of the supplementary arch-bar C', intersecting and bolted to the arch-bar C at points intermediate between the bolster and the axle-boxes, substantially as specified.

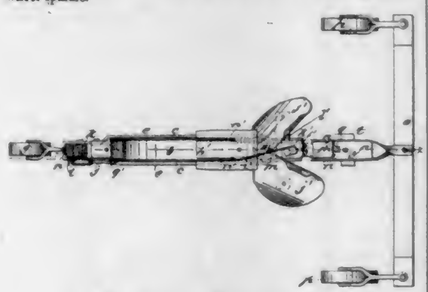


2. In a car-truck, the combination of the pedestal tie-bar B, the arch-bar D, and the inverted and supplementary arch-bars C C', each having a short section, the whole arranged substantially as specified.

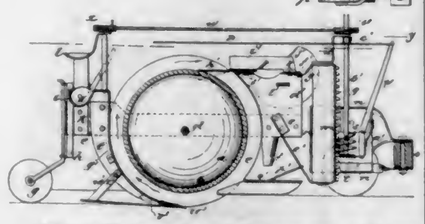


295,279.

295,280. STEAM-TRAP. WILLIAM PUFFER and WILLE D. PUFFER, Janesville, Wis. Filed May 23, 1883. (No model.)



295,280.



Claim.—In a steam-trap, the combination of the float D and its tubular arm *f* with the cylindrical valve C and seat B, provided with the port *e*, with which the tube *f* coincides in the normal position of the float, substantially as described.

295,281. DITCHING-MACHINE. ALONZO PURCELL, Monticello, Ill. Filed June 30, 1883. (No model.)

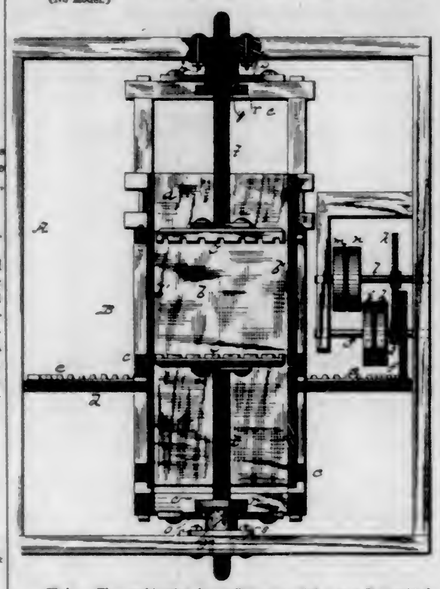
Brief.—A disk and rim ditching-wheel preceded by a sled-shaped guide bent out of sheet metal and provided with a plow having a lapping point detachably secured to the standard by bolts through ears is cleared by a shovel-plate delivering to a right or a left hand chute (the two connected by a bar) as a pivoted guide-board slides one or the other into position. The main frame has a front rack-bar engaging a screw (on a wheeled frame) for giving elevation, normally held in contact therewith by a spring. At the rear a sliding rod vertically adjusted by a cord and an eccentric lever pivoted on the driver's seat-standard carries a caster-wheel spindle.

Claim.—1. The combination, in a ditching-machine, of the wheel *a b c*, plow *g'*, shovel *h'*, and the shifting-board *i'*, substantially as described.

2. The combination, in a ditching-machine, of the wheel *a b c*, plow *g'*, shovel *h'*, adjusting-board *i'*, and the mold-board chutes *j''*, substantially as described.

3. The mold-board chutes *j''*, attached to bar *l'*, and connected to adjusting-board *i'* at *m'*, to shift bar *l'* with said board to discharge at either side of the ditch, substantially as described.

4. The combination of the point and shoe-plate *u'* with the plow *g'*, said plate being hooked onto the end of the plow *g'*, and secured to it detachably by the ear-points *v'*, braces *w'*, and the pin *x'*, substantially as described.

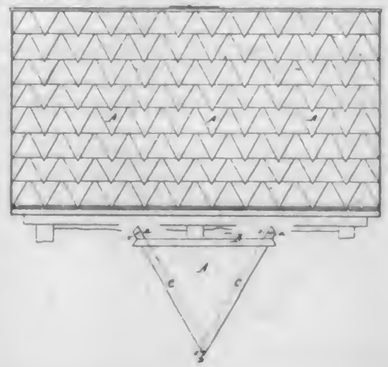


5. The combination of the guide *o'* with the plow-wheel, consisting of disks *a*, rim *b*, and the flanges *c*, substantially as described.

6. The combination, with the bars *e*, of the cord *i*, the eccentric lever *j*, the post *k* on said bars, the driver's seat L, and the vertical bar A, carrying a spindle with caster-wheel at the end, as shown and described.

7. The frame *n* of the wheel-beam *o*, having adjusting-screw *s*, in combination with the toothed post *m* of the ditching-machine frame, substantially as described.

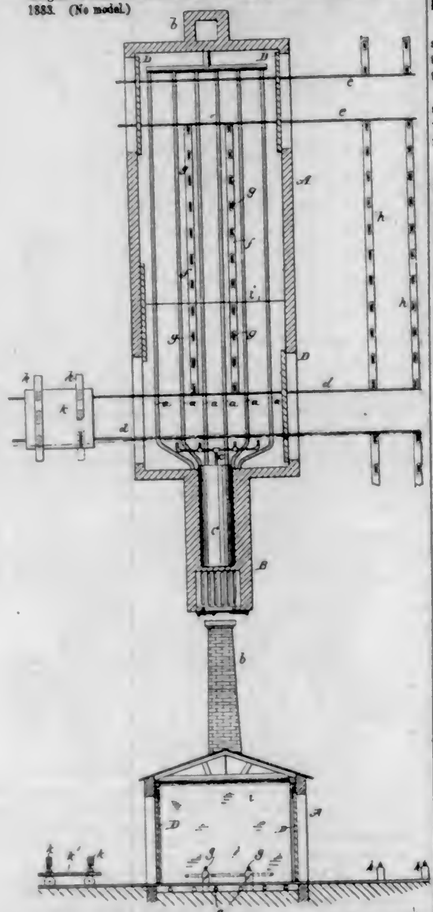
8. The worm *z* and frame *n*, in combination with rack *q m*, said worm being fitted adjustably with relation to rack *q*, and having lever *y* and spring *a'*, substantially as described.



295,282. BALING-PRESS. EDGAR U. G. REAGAN, La Grange, Tex., assignor of one-half to AUGUST WARNKEN, same place. Filed Jan. 10, 1884. (No model.)

Claim.—The combination, in a baling-press, of the press B, provided with the circular platform *d*, having the gear-wheel *e*, the centrally-perforated plates *o o*, right-hand and left-hand screws *t t*, secured to the follower-blocks C C, nuts *q q*, cog-wheel *f*, pinion *j*, pulleys *h i* on the shaft *g*, gear-wheel *k*, and pulleys *m n* on the shaft *l*, the whole constructed and arranged to operate in conjuction with one another, as herein shown and described.

295,283. METALLIC ROOFING-SHINGLE. EPHRAIM R. REPP, New Windsor, Md., assignor to the Anglo-American Roofing Company, New York, N. Y. Filed Oct. 8, 1881. Renewed July 26, 1883. Again renewed Feb. 23, 1883. Again renewed Feb. 20, 1884. (No model.)

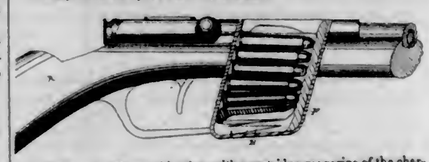


Brief.—A triangular-shaped shingle having a locking-flange on one side turned onto to the outside, and locking-flanges turned under on both of the other sides.

Claim.—1. The triangular-shaped or three-cornered shingles A, having the flanges B and C C and nail-holes *o* and *s s*, and adapted to be connected together and laid to form a roof, substantially as herein shown and specified.

2. The combination of the triangular-shaped or three-cornered shingles A, having flanges B and C C and nail-holes *o* and *s s*, with the diamond-shaped shingles E, having flanges F F and G G and nail-holes *p* and *i i*, substantially as described, for the purposes herein specified.

295,284. LUMBER-DRIER. LAFAYETTE ROLLINS, Mountain Creek, assignor to himself and Otto Stoelker, Montgomery, Ala. Filed May 14, 1883. (No model.)



Claim.—1. The house A, provided at one end with the projection B, containing a furnace and boiler, and at the other with a chimney, *b*, in combination with the heating-pipes *a*, extending longitudinally through the house from the furnace to the chimney, substantially as herein shown and described, whereby the furnace is entirely outside of the house, and consequently all danger of fire is avoided, as set forth.

2. The combination, with the house A, provided with the projection B, containing the furnace, the longitudinal heating-pipes *a*, and the steam-pipes *c*, of the curtain or partition *i*, substantially as herein shown and described, whereby provision is made for dividing the house into steaming and drying compartments, as set forth.

3. The combination, with the house A, provided at one end with the extension B, containing a furnace and boiler, and at the other with the chimney *b*, and the steam and hot-air pipes *a c*, of the tracks *d e*, passing transversely through the house at opposite ends thereof and on a level with the floor of the same, and the elevated tracks *s* A, arranged, respectively, within and without the house, substantially as herein shown and described.

295,285. MAGAZINE-GUN. ANDREW H. RUSSELL, United States Army. Filed July 26, 1883. (No model.)

Claim.—1. The combination, with a cartridge-magazine of the character described, of a follower adapted to force the cartridges sidewise in the magazine, and mechanism, substantially such as described, to adapt the magazine for the reception of short or long cartridges, as set forth.

2. A cartridge-magazine having a spring-follower, adapted, as described, to force the cartridges sidewise in the magazine, in combination with an inserted piece to reduce the length of the magazine and adapt it for shorter cartridges, substantially as shown.

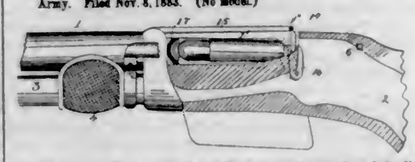
3. A cartridge-magazine having a spring-follower adapted to bear against the side of the cartridges, as described, one corner of the follower being cut away, as stated, in combination with an insertible piece to be placed in the magazine and occupy the space of the cut-away corner of the follower, for the purpose of reducing the length of the magazine, as set forth.

4. In combination with a magazine of the character described and its spring, the follower having a projection at its rear end extending some little distance down in the magazine parallel with the rear wall thereof, the follower and projection being of such length as to prevent the front end of the follower being pressed downward into inclined position, substantially as described.

5. The combination, with a magazine of the character described, of a spring-follower, having its side extending down parallel with the wall of the magazine, said side extension serving to close the opening into the receiver when the follower is elevated, and also serving to prevent the follower from tilting in the magazine, as stated.

6. The combination, with a magazine of the character described, of interior guide ribs or projections at one side thereof, and a follower having projections which engage with said ribs, substantially as set forth.

7. The combination, with a magazine of the character described, having a stop-bar at the top thereof, against which the cartridge rests when in position to be struck by the bolt, of the spring-gate, with offset, as *f''*, in its face, and spring-follower, all operating in combination, substantially as stated.



8. The combination, with a magazine of the character described, and its spring-follower, of the spring-gate having recess *t* in its face, which recess terminates in a projection, and the stop-bar *f**, recessed and beveled at *f**, substantially as described.

9. The spring composed of flat leaves, as described, the lower leaf being forked at the end, in combination with a magazine having a stud or stop at the bottom which is embraced by said fork, as shown and described.

10. The combination, with a magazine adapted, as described, to force a column of cartridges placed side by side in the direction of the receiver without the intervention of a carrier, of a bolt which reciprocates past the mouth of the magazine, and a stop mechanism, substantially as described, whereby the bolt may be stopped short of its rearmost position and serve to close the mouth of the magazine and prevent the escape of a cartridge therefrom, substantially as stated.

11. The combination, with a magazine adapted by spring-pressure to force a column of cartridges placed therein toward the receiver, and a bolt adapted to reciprocate past the mouth of the said magazine, of a pivoted stop, as D, in the receiver, adapted to engage with and stop the bolt when turned in one position and to permit a full movement of the bolt when turned in another position, as described and shown.

295,286. MAGAZINE-GUN. ANDREW H. RUSSELL, United States Army. Filed Nov. 8, 1883. (No model.)

Claim.—1. The combination, with the receiver of a breech-loading arm, of a breech-block pivoted at the rear and adapted to swing downward to open the breech of the arm, said breech-block being cut away at the side, as described, a side-push magazine arranged to feed a cartridge sidewise upon said block, and mechanism, substantially as described, for retaining the succeeding cartridges in the magazine, substantially as set forth.

2. The combination, with the receiver of a breech-loading arm, of a breech-block pivoted at the rear, so as to open the breech by swinging downward, a side-push magazine arranged to feed a cartridge upon said block, mechanism, substantially as described, for retaining the remaining cartridges in the magazine, and an inserter for carrying the cartridge into the barrel, substantially as set forth.

3. The combination, with the receiver of a breech-loading fire-arm, of a breech-block pivoted at the rear, so as to swing downward to open the breech, a side-push magazine arranged, as described, to feed a cartridge upon said block, mechanism, substantially as described, to retain the remaining cartridges in the magazine, a sliding inserter-bar, and an inserter and extractor carried by said bar, all substantially as described.

4. The combination, with the receiver of a breech-loading fire-arm, of a breech-block pivoted at the rear, so as to swing downward to open the breech, a side-push magazine arranged, as described, to feed a cartridge upon said block, mechanism, substantially as described, to retain the remaining cartridges in the magazine, an inserter and extractor carried by a reciprocating rod, and mechanism connecting the rod and operating-handle, substantially as described, whereby there is lost motion between the two, substantially as set forth.

5. The combination, with a side-push magazine having a side opening into a receiver, of a movable gate adapted, as described, to partially close said opening, and a cartridge-inserter arranged, as described, to operate said gate, substantially as stated.

6. The combination, with a side-push magazine having a side opening into the receiver, of a swinging notched gate pivoted near the rear end of said magazine, and a cartridge-inserter arranged to reciprocate, as described, and engage the notch in said gate, so as to swing the same in either direction, substantially as set forth.

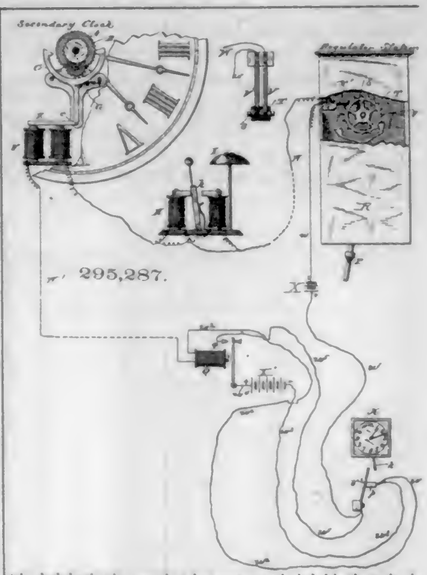
7. In a magazine fire-arm, a reciprocating bar, operative mechanism, substantially as described, to reciprocate the same, and a cartridge-inserter and an extractor carried by said bar, the latter arranged to be in front of the flange of a cartridge while the inserter is behind the same, substantially as set forth.

8. The combination, in a magazine fire-arm, of a reciprocating sleeve or handle, an inserter-bar having a notch therein, and a pivoted catch in the handle adapted, as described, to engage said notch, all substantially as stated.

9. The combination, in a magazine fire-arm, of an operating sleeve or handle arranged to reciprocate, as stated, a notched inserter-bar, a pivoted catch in the handle, arranged to engage said notch, and a lug on the barrel, arranged, as described, to operate said catch, all as and for the purpose hereinbefore set forth.

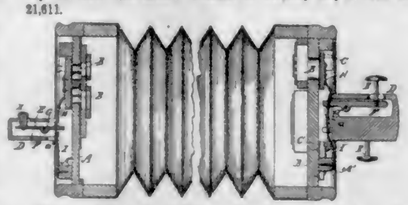
10. A side-push magazine of the character described, having projections (as a' a^2 b) near the top and inside thereof, to afford a seat for a cartridge-feed case.

11. A side-push magazine of the character described, having its end walls grooved and slotted, as described, combined with a side plate (as A) made to fit said grooves and cover the tops of the slots, and a gate, m, with end pivots extending into said slots, all in combination, substantially as set forth.



295,287. STRIKE SYSTEM FOR SECONDARY ELECTRIC CLOCKS. WILLIAM H. SAWYER, Providence, R. I. Filed Dec. 26, 1883. (No model.)

Claim.—1. In an electrical time system, the combination, with the main circuit and battery, a regulator arranged to close and break said circuit at predetermined intervals, and a secondary clock having its actuating electro-magnet included in said main circuit, of a striking device for said secondary clock, and a separate electro-magnet arranged in the main circuit for controlling said striking device, and requiring for its operation a variation of the current on the main circuit which will not operate the secondary-clock magnet, substantially as described.



2. In an electrical time system, the combination, with the main circuit and battery, a regulator at a central station arranged to close and break the main circuit at predetermined intervals, and a secondary electric clock having its actuating electro-magnet included in said main circuit, of a striking device for said secondary clock, an electro-magnet included in the main circuit for controlling said striking device, and requiring for its operation a variation of main-line current which will not affect the secondary-clock magnet, and devices at a central station arranged to act at predetermined intervals for producing the required variations of current on the main line, substantially as described.

3. In an electrical time system, the combination, with the main circuit and battery, a regulator at a central station arranged to close and break the main circuit at predetermined intervals, and a secondary electric clock having its actuating electro-magnet included in the main circuit, of a polarized electro-magnet included in the main circuit and arranged to control a striking device, and mechanism at a central station arranged to cause reversals of current on the main line at predetermined intervals for operating said polarized electro-magnet, substantially as described.

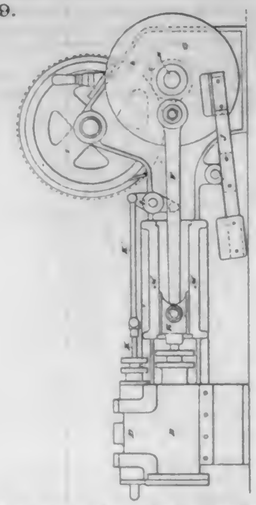
4. In an electrical time system, the combination, with the main circuit and battery, a regulator at a central station arranged to close and break the main circuit at predetermined intervals, and a secondary electric clock having its actuating electro-magnet included in the main circuit, of a striking device for said secondary clock, a polarized electro-magnet included in the main circuit and arranged to control said striking device, an extra battery of greater strength than the regular secondary clock-operating battery, and devices for connecting said extra battery in the main circuit in opposition to the main battery, at predetermined intervals during the closing of the main-battery circuit, substantially as described.

295,288. ACCORDION. AUGUST LEOPOLD SCHAAR, Chicago, Ill., assignor of one-half to the Root & Sons Music Company, same place. Filed Sept. 27, 1883. (No model.) Patented in Germany May 6, 1883, No. 21,611.

Claim.—1. The combination, substantially as specified, of the valves, the keys E E, the arms H H, connected rigidly to the said keys, and also connected to the valves, and the external springs, I I, all arranged substantially as shown and described with relation to each other and the key-board, for the purposes set forth.

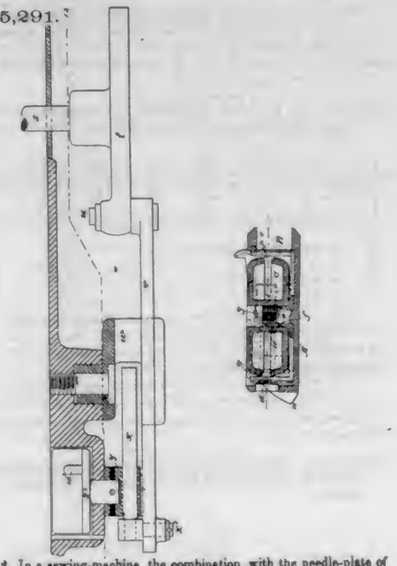
2. The combination of the valves C C, rigid angle-levers E H, connected to the valves, the parts H H passing through the parts E E and forming extensions *a a* upon the keys, the springs I I, bearing on the said extensions, and the key-board, substantially as and for the purposes set forth.

3. The combination of the top piece, A, the frame or molding A', the key-board D, valves C C, arms H H, keys E E, and springs I I, the said keys and arms forming rigid angle-levers connected to the valves, and the said springs being arranged horizontally outside of the key-board and bearing on the said levers, substantially as and for the purposes specified.



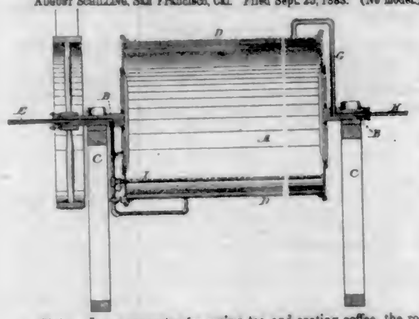
295,289. STEAM HOISTING-ENGINE. THEODORE SCHEFFLER, Paterson, N. J., assignor, by direct and mesne assignments, to Otto Flohr, Newark, N. J., and Francis M. Pierce, Brooklyn, N. Y. Filed Oct. 31, 1883. (No model.)

Claim.—1. The combination of steam-cylinder and cross-head guides, both cast in one piece, the cross-head guides being bored cylindrically from the same axis as the cylinder, substantially as and for the purposes set forth.



2. In a steam-engine, the combination of the engine-frame, the crank-shaft bearing, the steam-cylinder, and the cross-head guides, all cast in one piece, substantially as set forth.

3. In a steam-engine, the combination of the engine-frame, cylinder, and valve-chest, all cast in one piece, the valve-chest being tabular and having its axis parallel to the axis of the cylinder, substantially as set forth.



295,289.

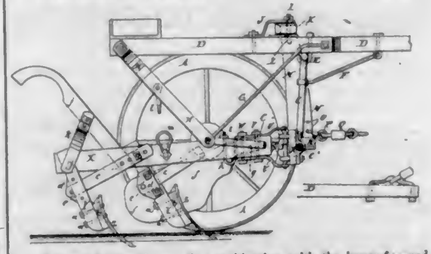
295,291.

295,290. APPARATUS FOR CURING TEA AND COATING COFFEE. AUGUST SCHILLING, San Francisco, Cal. Filed Sept. 25, 1883. (No model.)

Claim.—In an apparatus for curing tea and coating coffee, the rotating cylinder having a door-opening and a surrounding jacket, into which steam may be admitted through pipes connecting with one trunnion and be discharged through the other, in combination with a jet tube or pipe extending horizontally through the interior cylinder near its periphery, and cocks or valves through which steam may be admitted to either the jacket or cylinder, substantially as herein described.

295,291. SHUTTLE AND MECHANISM FOR OPERATING THE SAME. FERDINAND OTTO SCHMIDT, Berlin, Germany. Filed June 6, 1883. (No model.) Patented in England Nov. 13, 1882, No. 5,413; in France Nov. 14, 1882, No. 152,086, and in Germany Dec. 2, 1882, No. 23,556.

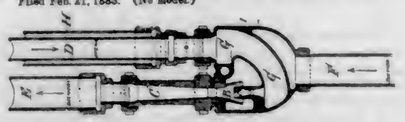
Brief.—The shuttle is given an oscillatory movement of more than a half-revolution by a connecting-rod sliding in a block pivoted to the under side of the bed-plate, and serving as a fulcrum for the connecting-rod or lever, said rod, by means of a pivoted sliding pin, engaging in a hole in another block which forms the lower extension of the shuttle-shaft, and giving said shaft the oscillatory movements. Various spring friction devices are used, the one on the thread-guide being provided with a V-shaped slide for adjusting the tension as desired.



Claim.—1. The combination of the cup-like shuttle A, provided with a recess, *b*, and spindle *c*, the thread-guide B, provided with a tubular spindle, *f*, with spring *i*, a thread-tension spring, and a spring, *o'*, to press against the shuttle-wall, and the bobbin C, all substantially as set forth.

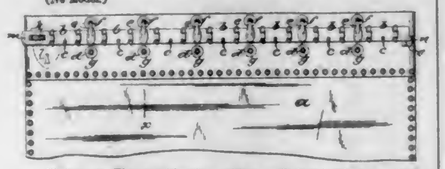
2. In a sewing-machine, the combination, with the needle-plate of a sewing-machine provided with a shoulder, *m*, of the cup-like shuttle A, provided with a recess, *b*, the thread-guide B, provided with a tension-spring, *n*, and its slide *q*, and a shoulder, *l*, to catch against the shoulder on the needle-plate, and mechanism, substantially as described, for imparting an oscillating movement to the shuttle, as described.

3. As a means for imparting an oscillatory movement to the shuttle of a sewing-machine, the combination of the shaft *s*, crank *t*, connecting-rod *v*, guide-block *w*, radially-mounted rod *x*, block *y*, and shuttle-bearing disk *y'*, provided with a shuttle-driving pin, *w'*, all arranged to operate substantially as set forth.



4. The combination, with a detached cup-like shuttle for a sewing-machine, of the thread-guide B, provided with a vertical ride or wall, A, a tension-spring, *n*, arranged in an opening in said wall, a ratchet, *r'*, a slide, *q*, and a spring, *r*, to engage the ratchet, all substantially as herein set forth.

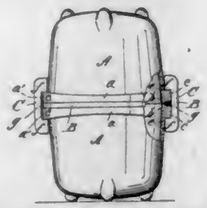
295,292. CULTIVATOR. ALVAH SCHOONOVER, Jr., Elliott, Iowa. Filed Dec. 28, 1883. (No model.)



Claim.—In a cultivator, the combination, with the lower forward part, C', of the axle C, and the plow-beams X, of the coupling-bearings R, and pins T, and the adjustable clevis-straps U, substantially as herein shown and described, whereby the rear ends of the said plow-beams can have a free vertical and lateral movement, and their forward ends can be adjusted inward or outward, as set forth.

295,293. STEAM-JET EJECTOR. LOUIS SCHUTTE, Philadelphia, Pa. Filed Feb. 21, 1883. (No model.)

Claim.—In a jet-ejector, the body I, having the passage G and nozzle A therein, combined with the suction-pipe F, applied centrally to the lower side, the steam and delivery pipes applied to the top near opposite sides thereof, and the pipe H, surrounding the steam-pipe and closed at the lower end, as described.



295,294. MAIL-BAG FASTENING. ROY B. SCOTT, Denton, Tex., assignor of one-fourth to John B. Nicholas, same place. Filed Oct. 18, 1883. (No model.)

Claim.—1. The combination, with a mail-bag having eyes in the upper margin of its mouth, of a chain hinged at its lower edge to the bag, and provided with fastening devices projecting through the said eyes, substantially as herein shown and described.

2. The chain *b*, pivoted to the part *a* of the bag, and having hooks *d*, in combination with the parts *a* and *i*, and with the chain A, attached to the part *i*, said parts *a* and *i* of the bag having eyes *f* and *g*, substantially as described.

295,295. BUTTER-PACKAGE. JAMES PATERSON SINCLAIR, Mottville, assignor of one-half to Birch Ellis, Moravia, N. Y. Filed Sept. 11, 1883. (Model.)

Claim.—1. The combination, with jars A A, having the cam-flanges undercut at top and bottom, of the two buttons C C, provided with correspondingly-shaped notches *f*, whereby the clamps are held in place, as described.

2. The jars A A, formed with the flanges *a a*, made rounding at their outer edges, as at *a' a'*, undercut, as at *c c*, and enlarged, as at *e e*, in combination with the buttons C C, formed with the undercut notches *f f*, and made rounding, as at *g*, substantially as and for the purposes set forth.

295,296. PENCIL-SHARPENER. ALBERT M. SMITH, Brooklyn, N. Y. Filed Oct. 24, 1883. (No model.)

Claim.—1. A pencil-sharpener, A, consisting of the cutting end C, for sharpening lead-pencils, the end D, for slate-pencils, and the intermediate file-surface, all substantially as shown and described.

2. A pencil-sharpener consisting of parts A and E, riveted together, having sharpening devices at each end, and an intermediate file-surface, all substantially as described.

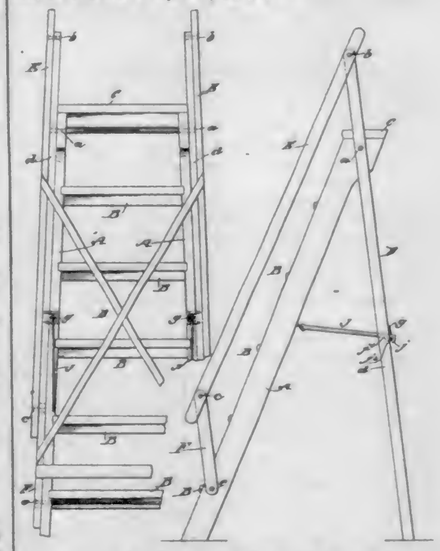
3. In a pencil-sharpener, the combination of the parts A, E, and B, all arranged and operating as shown and described.

295,297. SEED-PLANTER. ASAHEL SMITH, Chatham, Ontario, Canada. Filed Nov. 24, 1883. (No model.)

Claim.—1. In a seed-planter, the combination, with the drive-wheel A and the spring-held seed-dropping slide G, of the flanged wheel J, the cam-wheel L, having interior ratchet-teeth, O, and the springs and band P Q, whereby the said seed-dropping slide will be operated with certainty, and the cam-wheel can be readily adjusted, as set forth.

2. In a seed-planter, the cam-wheel L, provided on its inner periphery with ratchet-teeth and its inner face with serrated cams M, arranged, as shown, for operating the dropper-slide, and cams N between said cams M, for jarring the dropper-slide, substantially as set forth.

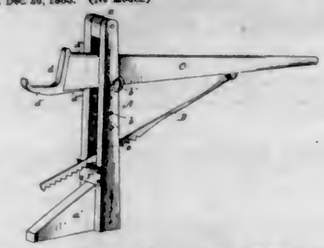
295,298. ART OF MAKING TILE, &c. JOHN S. SMITH, Jackson, Mich., assignor of one-half to Theodore G. Bennett, same place. Filed Jan. 23, 1884. (No model.)



Claim.—1. The process of balling damp clay by casting it upon a rapidly-traveling plane surface, by the action of which it is gathered into rounded masses, substantially as set forth.

2. First balling and then pugging the moistened clay, substantially as set forth.

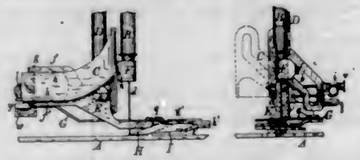
295,299. FOLDING STEP-LADDER. GEORGE ANTON SOMMER, Brooklyn, N. Y. Filed Jan. 23, 1884. (No model.)



Brief.—Ladders provided with hand-rails pivoted at one end to extensions of the legs or standards and at the other to links on the side rails, and brace-rods having sliding engaging-hooks.

Claim.—1. The bars *d d* of the standard D, pivoted to the side boards, A, of the ladder and reaching above the ladder, in combination with rails E and links F, pivoted to the side boards, A, and lower ends of the rails E, the rails E being pivoted to the upper ends of the bars *d d*, substantially as and for the purposes set forth.

2. The braces J, formed with the curved edges *j''* and offset *j'*, and hook *j*, in combination with the staples *g* and the simultaneously opening and closing standard and side rails, D E, substantially as and for the purposes set forth.



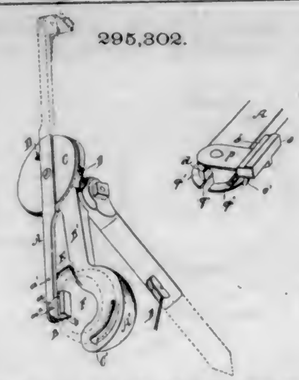
295,300. LIFTING-JACK. RALPH REED SPEARS, Wheeling, W. Va. Filed Dec. 26, 1883. (No model.)

Claim.—1. In a lifting-jack, the combination, with two uprights, of a lever pivoted between said uprights, said lever being provided with an angular bracket at one end, its other end being provided with a pivoted rack-bar to engage with a plate upon the said standards, substantially as set forth.

2. In a lifting-jack, the combination, with two uprights, of a lever pivoted between said uprights, said lever being provided with an angular bracket, *d*, having the extensions or arms d^2, to engage the ends of the lever at one end, and provided near its lower end with a pivoted rack-bar to engage a strip or plate secured to the sides of the standards or uprights, substantially as set forth.

295,301. RUFFLING ATTACHMENT FOR SEWING-MACHINES. GEORGE H. SPRING, Bath, assignor of one-half to Edward J. Sugrue, Rochester, N. Y. Filed June 23, 1883. (No model.)

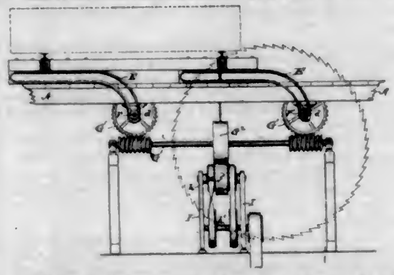
Claim.—1. The combination, with a sewing-machine needle-bar carrying stud or roller *n*, of the supporting-frame E, the sliding blade-carrier G, serrated ruffling-blade H, and the swinging lever C, pivoted to the frame behind the needle-bar, and arranged to vibrate horizontally across the line of feed, and provided with the arm *j*, and the slotted plate *p*, located between the needle-bar and the presser-bar, and a suitable adjustable pivotal connection between the arm *j* and the blade-carrier, substantially as described.



2. The combination, with a sewing-machine needle-bar carrying projection *n*, of the supporting-frame E, the sliding blade-carrier G, serrated ruffling-blade H, and the horizontally-swinging lever C, pivoted to the supporting-frame and provided with inclined slot *b*, having straight ends *o o'*, and a suitable connection between the lever and the sliding blade-carrier, substantially as and for the purposes set forth.

3. The combination, with a sewing-machine needle-bar carrying projection *n*, of the supporting-frame E, the horizontally-swinging lever C, pivoted to the supporting-frame and provided with inclined slot *b* and arm *j*, and the sliding blade-carrier G, serrated ruffling-blade H, and an adjustable pivotal connection between the lever and the blade-carrier, arranged to be adjusted at an angle with the line of feed, substantially as and for the purposes set forth.

4. The combination, with a sewing-machine needle-bar carrying projection *n*, of the supporting-frame E, the sliding blade-carrier G, provided with slot *x*, serrated ruffling-blade H, and the horizontally-swinging lever C, pivoted to the supporting-frame and provided with inclined slot *b*, adjusting-screw *i*, pivot *l*, and sliding block *w*, substantially as and for the purposes set forth.



295,302. BALL-TRAP. CHARLES F. STOCK, Peoria, Ill. Filed Dec. 28, 1883. (No model.)

Claim.—1. The combination, with the throwing-arm of a target-throwing device, of a clip for holding the target, arranged to automatically drop below the upper surface of the throwing-arm for releasing the target, substantially as described.

2. The target-holding clip, consisting of the pivoted plate *p*, having the plate *o*, provided with toe *o'*, hinged to it, in combination with the slotted plate *q*, all adapted to be operated substantially as described.

295,303. SAW-MILL. JOSEPH M. STORY, Spring City, Tenn. Filed Mar. 25, 1883. Renewed Jan. 24, 1884. (No model.)

Claim.—1. The combination, substantially as before set forth, of the log-carriage and mechanism, substantially such as described, for propelling the same, whereby in feeding the log to the saw the simple horizontal movement of said carriage is preceded by a compound vertical and horizontal movement thereof.

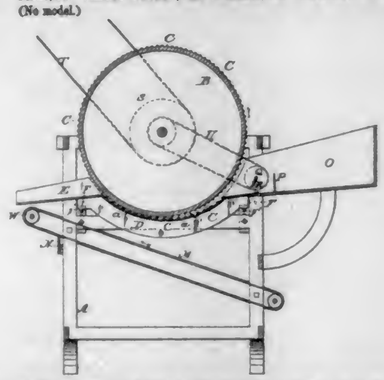
2. In a circular saw mill, a log-carriage provided with curved supporting-yokes, adapted to be propelled and guided upon fixed shafts to give the log both a vertical and horizontal movement in relation to the saw, substantially as set forth.

3. In combination with the carriage B, the curved supporting-yokes E, having the interior face at one or both sides formed as bearing-rails, and the depressed surface between the rails formed as a rack, and the supporting-shafts F F', provided with spur-pinions and friction-rollers, substantially as specified.

4. In combination with a log-carriage provided with guide-yokes and shafts, upon which the same are guided and driven, the reversible worm and friction gear, substantially such as described, for imparting reversible motion to the carriage, as set forth.

5. The construction and arrangement, in a saw-mill, of a circular saw journaled beneath the floor, and operating upward through the same, a carriage having both a vertical and horizontal movement in relation to the saw, and mechanism, such substantially as described, for supporting, guiding, and operating the carriage under control of the attendant, substantially as set forth.

295,304. ARROW. GEORGE E. SWAN, Beaver Dam, Wis. Filed Dec. 29, 1883. (No model.)



Claim.—1. As an improvement in arrows, darts, and similar projectiles, the combination, with a flexible or elastic point, of a coating of chalk or equivalent substance adapted to leave an impression upon the target, substantially as set forth.

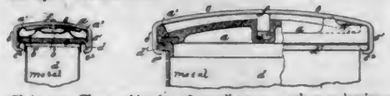
2. An arrow or other toy projectile embodying a rod or body and an elastic-pointed head having its point coated with chalk, substantially as set forth.

295,305. MACHINE FOR THRASHING AND SEPARATING GRAIN, PEAS, &c.

ALFRED SWINGLE, San Francisco, Cal. Filed Dec. 11, 1883. (No model.)

Claim.—1. In a machine for thrashing and separating peas or grains from the outer husk or envelope, the combination of a cylinder the surface of which has an elastic covering with protuberances, a corresponding concave surface in close proximity below with similar protuberances, and a mechanism by which the concave is caused to reciprocate in a line parallel with the axis while the cylinder is rotated, substantially as herein described.

2. In a machine for thrashing and separating seeds from the outer envelope or husk, the combination of a cylinder and a reciprocating concave surface, below and through which the substances pass, said cylinder and concave having their surfaces provided with projections or protuberances and covered with sheets of elastic material, substantially as herein described.



3. In a machine for thrashing and separating seeds from the outer envelope or husk, the combination of a reciprocating concave surface, into which the materials are fed, and a cylinder rotating above the concave and in close proximity thereto, the surfaces of both being provided with elastic protuberances, having rigid internal pins, *b*, substantially as herein described.

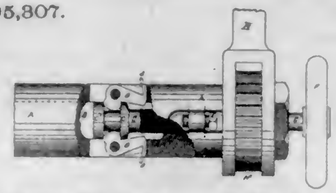
4. In a machine for thrashing and separating seeds from the outer pod or envelope, the combination of a reciprocating concave, into which the substances are fed, with elastic protuberances upon the surface and holes between them, a cylinder with similar protuberances rotating in close proximity to the concave, and an inclined upwardly-traveling belt below the concave, substantially as herein described.

5. The rotating cylinder and the reciprocating concave situated below, having surfaces provided with elastic protuberances, which move in close proximity, in combination with the supply-chute, the transverse rotating shaft Q, and radial arms R, substantially as herein described.

295,306. STOPPER FOR BOTTLES AND JARS.

NATHAN THOMPSON, Brooklyn, N. Y. Filed Nov. 1, 1883. (No model.) Patented in England Apr. 17, 1883, No. 1,943.

Claim.—1. The combination of a sealing-cap, such as *a*, having a central opening and two inclines on the outer edge of its top, a clip or strap, such as *c*, having legs *c'* and inturned ends *c²*, and a long pin occupying the central opening and securing the cap to the clip or strap in connection with the inturned ends, which project inwardly beneath the edge of the cap and limit its downward movement, as set forth.

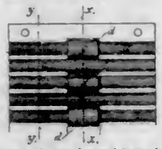


2. The combination of parts forming my improved stopper, and consisting of a sealing-cap, such as *a*, and clip or strap, such as *c*, with a stud or pin, such as *f* and a compression-plate, such as *b*, within the cap, the clip being permanently secured to the sealing-cap, substantially as herein shown and described, and for the purpose stated.

295,307. TUBE-CUTTER.

NATHAN P. TOWNE, Brooklyn, N. Y., assignor to WM. H. Moorhouse, same place. Filed Jan. 14, 1884. (No model.)

Claim.—1. The bored mandrel provided with screw-thread, the threaded rod in said mandrel having projections which engage the cutters at each side of their pivots, and the cutters pivoted in the mandrel, so as to be operated positively in either direction by means of the screw-rod engaging therewith, substantially as described.



2. The mandrel A, having screw-threaded axial aperture and cross-mortise, the two cutters in shape of bell-crank levers pivoted in said mortise, the screw-rod in the mandrel constructed, as described, to engage the

ends of said lever-cutters, and mechanism, as described, for advancing and retracting said screw, all combined and arranged substantially as shown and described.

295,308. ANTI-FRICTION JOURNAL-BOX.

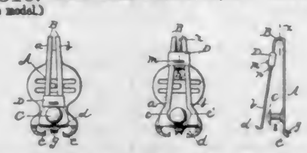
THOS. TRIPP, Stoughton, Mass. Filed Jan. 8, 1884. (No model.)

Claim.—1. In an anti-friction journal-box, the combination of the annular recessed journal-box and the annular recessed journal, with a series of rollers, which are unattached to one another, and consequently adapted to be independently introduced and removed, substantially as stated.

2. The combination, with the journal B and journal-box A, as herein described, of a series of separate rollers, *a a'*, &c., of diameter substantially as stated.

3. In an anti-friction journal-box, A, the combination of a series of rollers, *a a' a'*, of uniform diameter, maintained in their proper relative positions one to the other by every alternate roller *a' a'*, carrying rollers *g g*, which rotate in recesses *d e*, for the purpose hereinbefore described, and the spindle *j*, connecting the parts *a² a²* of their rollers *a' a'*, all substantially as and for purposes set forth.

4. The combination of the journal-box A, with its cap E and keyway F, for the purpose described, with the rollers *a a'*, &c., and the journal B, provided with the plate *l*, whereby end-thrusts are prevented from affecting the series of rollers, and the latter are free to rotate with said journal, substantially as stated.



295,309. INCRUSTATION PREVENTIVE.

FREDERIK TROXEL, Danville, Ill., assignor to Norval D. Crim, Anderson, Ind. Filed Aug. 31, 1883. (No specimens.)

Claim.—A preparation or compound for extracting lime from water and removing scale from boilers, composed of concentrated lye, rosin, and alum, in substantially the proportions above set forth.

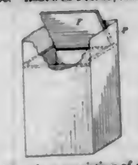
295,310. CLASP.

SIDNEY D. TUCKER, Troy, N. Y. Filed Dec. 21, 1883. (No model.)

Claim.—1. The combination, in a clasp, of a studded plate, and spring-arms provided with suitable means for spreading and closing said arms, substantially as described, and for the purposes set forth.

2. A clasp-plate provided at or near one end with hook-points *c e*, and at or near its middle portion with the inwardly-projecting arms *j k*, in combination with a mechanism, substantially as described, for attaching said plate to a garment.

3. A studded clasp-plate adapted to be secured to a piece of webbing, having that portion of the plate contiguous to the stud swaged up to occupy a plane higher than that of the general surface of the plate, in combination with a suitable clamping device, whereby a garment is secured to said stud, substantially as described, and for the purposes set forth.



4. A studded clasp-plate, in combination with clamping-arms, and slide provided with a spreading device, *n*, substantially as described, and for the purposes set forth.

5. A studded clasp-plate, in combination with a clamping-spring provided with a thumb-rest, *d*, integral therewith, and suitable means for operating said spring, substantially as described, and for the purposes set forth.

6. A studded clasp-plate, in combination with two clamping-arms provided with recesses *c c'* and projection *d*, attached to one prong and overlapping the other, and suitable means for opening and closing said arms, substantially as described, and for the purposes set forth.

295,311. FOLDING BOX.

H. CHANNING UNDERWOOD, Kalamazoo, Mich. Filed July 17, 1883. Renewed Feb. 21, 1884. (No model.)

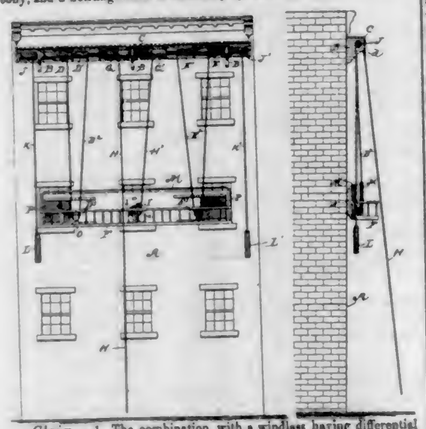
Claim.—1. A folding box consisting of separate pieces constituting the several inclosures of the box, all arranged in the relation to each other shown, and secured to a flexible wrapper, the engaging edges of said pieces forming joints with matched surfaces, substantially as set forth.

2. A folding box consisting of a flexible wrapper and separate pieces forming the several inclosures of the box, one end piece being adapted to brace the side inclosures, and the other end piece adapted to brace the top and bottom inclosures, substantially as described and shown.

295,312. FLYING TARGET.

HENRY VARWIG and ALBERT E. SPANGLER, Cincinnati, Ohio. Filed Aug. 9, 1883. (No model.)

Claim.—1. The target-body consisting of an inner cylindrical ring, an outer ring of easily-punctured material, and a partition arranged in a plane parallel to the edges of the inner ring, to steady the flight of the target.



2. In a flying target, the combination, substantially as specified, of cylindrical ring A and ring C, secured around the periphery of said ring A, with an explosive material interposed between said rings.

3. The ring A, ring C, secured around the periphery thereof, fulminate B, interposed between said rings, partition D, secured within and parallel to the edges of ring A, and lug E, the whole combined and arranged substantially as hereinbefore set forth.

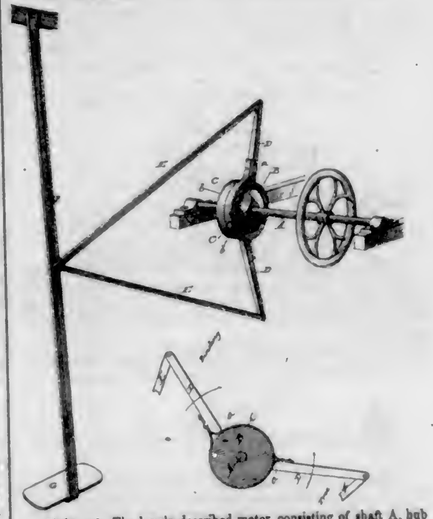
295,313. FIRE-ESCAPE.

AARON WALKER, Kokomo, Ind. Filed Jan. 24, 1884. (No model.)

Brief.—An improvement on Letters Patent No. 284,517, dated September 4, 1883. The balcony is suspended in the loops of the ropes, which are wound on the two differential windlasses near the top of the building, and is provided with counter-weights and their ropes and pulleys, guide-bars for the ropes, rubber buffers on the rear side of the balcony, and a hoisting-windlass stationary upon the balcony.

Claim.—1. The combination, with a windlass having differential drums, ropes attached to said drums, and a balcony hung in the bight or loop of the rope, of a counter-weight and rope, arranged as described, to oppose the unwinding of the larger drum, as and for the purpose described.

2. The combination, with the differential windlass having drums of different diameters, and one or more suspending-ropes for the balcony, of a drum, G', rigidly connected to the windlass, the rope H', the pulley I on the balcony, with crank *a*, ratchet-wheel *b*, and pawl *c*, as and for the purpose described.



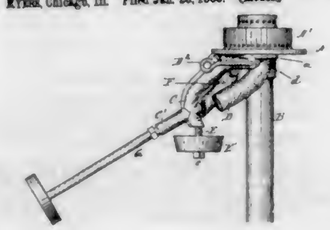
3. The combination, with the differential windlass having differential drums D D' and E E', and drums G G', arranged between them and working rigidly with the windlass, of the balcony having pulleys D² E², the two suspending-ropes D² E², and the two working-ropes H H', one of the same being extended to the ground, and the other wound about a crank-pulley on the balcony, as and for the purpose described.

4. The combination, with a windlass, a balcony, and suspending-ropes, of the two horizontal guide-rods M M', inclosing the ropes between them, and rendering the balcony stiff against tipping or rocking about its point of suspension, as described.

5. A fire-escape balcony provided with elastic cushions or buffers on its side next to the wall, in combination with hoisting-ropes and a windlass, as and for the purpose described.

295,314. MOTOR.

THOMAS WALL, Springfield, Ohio. Filed Jan. 14, 1884. (No model.)



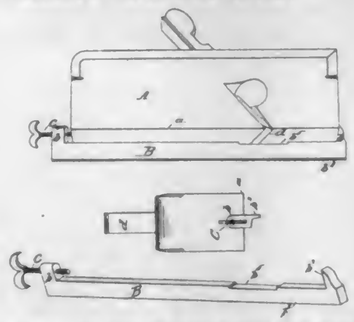
Claim.—1. The herein-described motor, consisting of shaft A, hub B, bands C C, levers D D, attached to the ends of the respective bands and extending in different directions from the hub, pitmen E E, connected with the ends of the levers D D, and a swinging lever, F, or its equivalent, connected with the pitmen, substantially as and for the purpose set forth.

2. In a motor, a clutch consisting of a hub, a flexible band encircling said hub, and a lever attached to the ends of the band and having its lower end curved, substantially as shown and described, whereby it is caused to tighten the band upon the hub when moved in one direction and to loosen it when moved in the reverse direction.

3. In a motor, a clutch consisting of a hub, a flexible band encircling the hub, and a lever, D, the ends of the band being secured to the side face of the lever, substantially as shown and described, whereby a movement of the lever in one direction is caused to bend or draw the band across its end, and thereby tighten it upon the hub, and a reverse movement of the lever is caused to loosen the band, substantially as set forth.

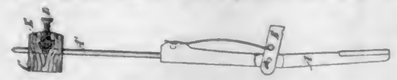
295,315. VAPOR-BURNER.

J. BRODETT WALLACE and GARSON MYERS, Chicago, Ill. Filed Jan. 25, 1883. (Model.)



Claim.—1. In a vapor-burner, the combination, with the base-plate and laterally-arranged needle-valve, of a bent mixing-tube having its upright portion mounted to rotate in the base-plate, whereby its lower and laterally-projecting part may be swung horizontally into and out of line with the needle-valve, substantially as described.

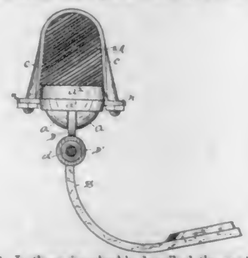
2. In a vapor-burner, the combination, with the base-plate and laterally-arranged needle-valve, of a bent mixing-tube having its upright portion mounted to rotate in the base-plate, and its laterally-projecting lower portion provided with an external deflecting-shield, substantially as described.



3. The combination of the base-plate A, provided with a circular aperture, the mixing-tube D, fitted to rotate therein, and the washer D', applied to the tube above the base-plate, substantially as and for the purpose set forth.

295,316. RABBET-PLANE ATTACHMENT. CHARLES A. WARFIELD, Philadelphia, Pa. Filed Sept. 18, 1883. (No model.)

Claim.—The rabbet attachment for planer herein described, consisting of bar B, having its upper or inner surface flat and transversely grooved, and provided with lugs *b b'* and a screw, C, or equivalent means for securing said attachment to the plane, substantially as shown and set forth.



295,317. PIANO-DAMPER. OTTO WENSELL, ADAM NICKEL, and RUDOLPH GROSS, New York, N. Y. Filed Aug. 21, 1883. (No model.)

Claim.—1. The combination, with a damper-lever and a block receiving said lever through it, of a nut inserted into the block, and a set-screw engaging with the nut and bearing against said lever, substantially as and for the purpose herein described.

2. The combination, with a damper-lever and a block receiving said lever through it in a direction transverse to the grain of the block, of a nut inserted in the block in a direction also transverse to the grain of the block, and a set-screw extending through the nut and bearing on said lever, substantially as and for the purpose herein described.

295,318. SHACKLE FOR CARRIAGE-SPRINGS. HENRY WESTPAL and EDWARD DISTERLA, Chicago, Ill. Filed July 31, 1883. (No model.)

Claim.—1. In the spring-shackle described, the combination of the ball *a*, seat *a'*, cover a^2, link D, pin B^2, spring S, and clip C, all attached to the bar A, as shown, and arranged to operate as and in the manner set forth.

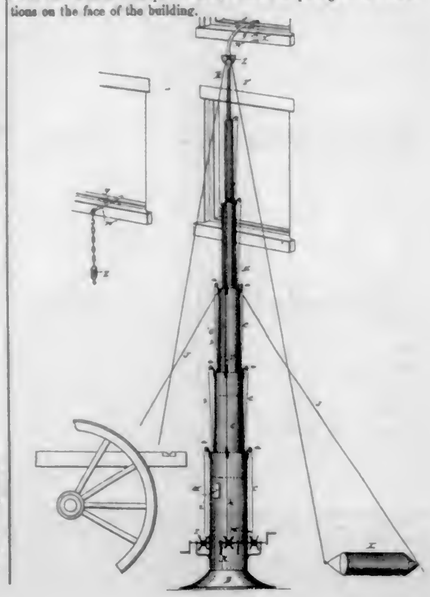
2. The combination of the spherical or semi-spherical body *a*, having the legs B', pin B^2, and seat *a'*, attached to the side bar, A, by the clip C, and adapted to support the body of the carriage on the springs S, in the manner and for the purpose set forth.

3. The combination of the ball *a*, seat *a'*, and link D, adapted to connect the body of the carriage to the running-gear, as and for the purpose set forth.

4. In the carriage-spring shackle described, the ball *a*, having the curved recesses B, in combination with the link D, having the legs B', and the seat or socket *a'*, as and for the purpose set forth.

295,319. BALE-TIE. LEWIS WILLIAMS, Johnstown, Pa. Filed Jan 30, 1884. (No model.)

Claim.—1. The described bale-tie, consisting of a link having one end formed as an oblong open loop for receiving and retaining one end of the baling-wire, and the opposite end thereof provided with an eye, of which the axis is substantially parallel with the plane of the said oblong loop, but lies transversely therewith, the walls of said eye constituting abutments or shoulders over which the other inserted end of the baling-wire is bent or cranked, substantially in the manner described, and for the purposes set forth.



2. A link for uniting and fastening the ends of wire bale-bands, having the described loop and eye, relatively arranged and disposed substantially as shown, made from wire bent into the form described, substantially as specified.

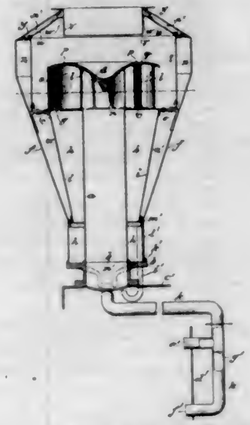
3. The method shown of fastening the ends of a wire bale-band, which consists in connecting one end of the band by means of a loop with the loop end of the described connecting-link, doubling said connecting-link back upon the loop of the band, inserting the other end of the band endwise through the loop end of the connecting-link, then through the eye thereof, and also through the loop at the other end of the bale-band, substantially as shown, and bending the protruding end of the wire so inserted back to about a right angle, as described, and finally distending the band, so as to cause the said connecting-link to turn over or reverse its position endwise, whereby said inserted end of the bale-wire is cranked, in the manner described, and for the purposes set forth.

4. The described bale-tie, consisting of a wire bale-band having one end thereof connected by a loop with the loop end of the described connecting-link, and its other end passed through the eye of said link and confined within the loop at the opposite end of the band, said band-wire being cranked or bent at a transverse angle upon itself at the point where it traverses the eye of the connecting-link, substantially as described and set forth.

295,320. FIRE-ESCAPE. WILLIAM WEBB, Medway, Ohio. Filed Mar. 12, 1883. (No model.)

Brief.—Added to the main extension-rope and windlass, which are connected to all the sections, are supplemental ropes and windlasses, to assist in raising the lower heavier sections. The hook at the top of the column is provided with a cross-bar, to prevent its turning. The sheet-metal car has a cone-shaped bottom, to allow its passage over obstructions on the face of the building.

Claim.—1. The combination, with a tubular mast having three or more telescoping sections, of a rope attached to the inner section, pulleys on all the other sections, over which said rope runs, and means for winding said rope, in combination with another rope attached to same section outside the inner one, pulleys over which the second rope runs on sections outside of the one to which this second rope is attached, and means for winding the second rope independent of the first, as described, whereby the mast may be fully raised by the first rope, or it may be partially raised by the first rope and then the pulley raised by the action of both ropes working together independent of each other.



2. A sheet-metal fire-escape car having a lid completely closing its top and a bottom in the shape of a complete cone inverted, substantially as shown and described.

3. The combination, with the mast and the arm or chain provided with a hook and pulley, as described, of a cross-bar secured thereto near the hook, as and for the purpose specified.

295,321. COMPOSITION FOR FIRE-PROOF POTTERY. EDWARD P. LYONS, Milwaukee, Wis. Filed Sept. 25, 1883. (No specimens.)

Claim.—The composition for pottery, &c., consisting of alumina, silica, magnesia, potter's clay, and graphite, in about the proportions stated, when mixed and treated substantially as and for the purposes set forth.

295,322. SPARK-ARRESTER. JOHN COLUMBUS ALBRIGHT, Columbus, Ga. Filed Nov. 3, 1883. (No model.)

Claim.—1. The combination of the volute partitions *l*, having branches *p* and scrolls *o*, and horizontal partitions *c*, having passages *g*, with the cone *d* and smoke-pipe *a*, substantially as described.

2. The volute partitions *l*, having branches *p* and scrolls *o*, arranged between plate *c* and cone *d*, with passages *s* for the smoke, and with passages *q* for the cinders, said passages *q* discharging through the openings *g* of the plate *c* into the space *h* below, and the smoke-passages *s* discharging upward for the escape of the smoke, substantially as described.

3. The combination of return-pipes *k*, leading into the fire-box through the front plate, with the smoke-pipe *a*, cone *d*, and the volute partitions *l p*, scrolls *o* and plate *c*, arranged to arrest the cinders and project them down into space *h* outside of pipe *a*, and into which said return-pipes connect, substantially as described.

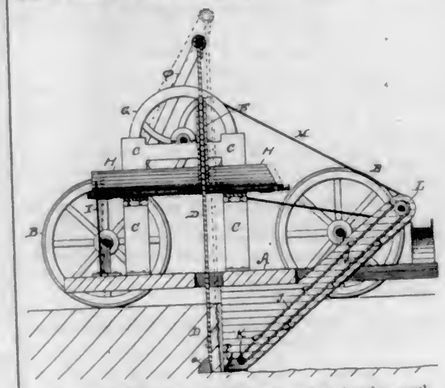
4. The pipe *t*, inner dome, *u*, drop-pipe *v*, and the inner flaring pipe, *i*, combined with the cone *d* and outer flaring pipe, *f*, substantially as described.

5. The pipe *t*, inner dome, *u*, drop-pipe *v*, and the inner flaring pipe, *i*, combined with the cone *d*, volute partitions *l p*, scrolls *o*, plate *c*, having passages *g*, smoke-pipe *a*, and the outer flaring pipes, *f* and *y*, substantially as described.

6. The pipe *t*, inner dome, *u*, having passages *w*, drop-pipe *v*, outer dome, *y*, and outer flaring pipe, *f*, combined with the cone *d*, said cone having means for mainly projecting the cinders down into the space *h*, substantially as described.

7. The combination of the blower-pipes *i'* with the smoke-pipe *a* and the cone *d*, and partitions arranged for causing a return-blast in the space *h*, said pipes *i'* connecting with said space *h* and returning into the smoke-pipe, substantially as described.

8. The return-pipes *k*, in combination with a smoke-stack having means for causing a return-blast in the space *h*, and being connected with the fire-box through the front plate by branches *e' f'*, and having a regulating-valve, *g'*, substantially as described.

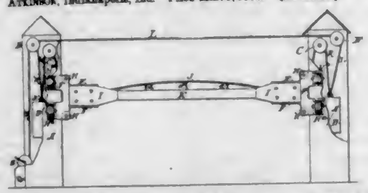


9. The saddle *b*, having the flange *k'*, supporting the base-pipe *l'*, of the pipe *i*, for inclosing an annular space, *h*, having connection with the return-pipes *k*, in combination with the return-blast pipes *i' i'*, adapted to conduct said blast from said space to the lower end of the smoke-pipe *a*, whereby the blast is utilized to accelerate the draft, substantially as set forth.

10. The saddle *b*, having the flange *k'*, supporting the base-pipe *l'* of the outer flaring pipe, *f*, also the inner flaring pipe, *i*, in combination with the smoke-pipe *a* and cone *d*, said cone *d* having means for projecting the cinders mainly into space *h* and partly into space *a'*, substantially as described.

11. The cone *d*, having partitions *l p* and scrolls *o*, in combination with smoke-pipe *a* and partition-plate *c*, and said plate having passages *g*, communicating with space *h* for the discharge of the cinders, and arranged with relation to pipe *t* for producing the space *a'*, for enabling the cinders escaping through passages *s* to fall into space *a'*, substantially as described.

295,323. TILE DITCHING-MACHINE. JOHN ARTHUR, Streator, Ill. Filed Oct. 15, 1883. (No model.)

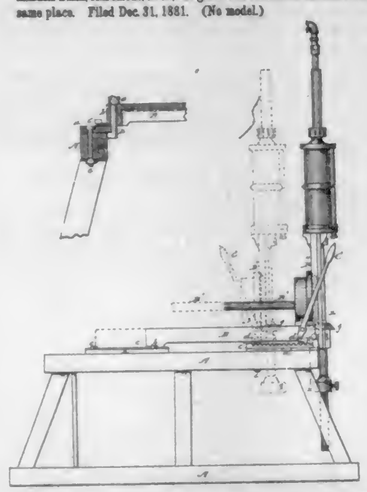


Brief.—Crank-wheels having belt-connection to drive the elevator have their cranks connected to a spade-shaft working in vertical ways which slide on longitudinal ways backward with the spade during its cut as the ditcher advances, and have a means (a spring) for returning them to advance the spade for a new cut.

Claim.—1. The combination, with a wheeled truck and an earth-elevator mounted thereon, of a spade, vertical ways for the spade, and means to reciprocate the spade therein, longitudinal ways for the spade-ways, and means for moving the spadeways forward thereon, substantially as and for the purpose specified.

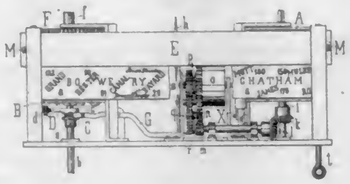
2. The combination, with a wheeled truck, an earth-elevator mounted thereon, a frame supporting longitudinal ways mounted on said truck, vertical ways mounted in said longitudinal ways, a spade fitted to said vertical ways, drive-wheels provided with cranks, rods connecting said cranks with said spade, and a belt connecting one of said drive-wheels with said elevator, substantially as shown and described.

295,324. SAFETY-GATE FOR RAILROAD-CROSSINGS. BENJAMIN ATKINSON, Indianapolis, Ind. Filed Mar. 9, 1883. (No model.)



Claim.—1. The combination, with the towers, of a gate, preponderating counterbalance-weights connected to each end of the gate, a windlass, and connections from the windlass to each weight, whereby upon operating the windlass both weights may be raised and the gate allowed to fall, substantially as described.

2. The combination of the towers A A, a vertically-moving gate, the cables R, attached to said gate, the cable M, attached to the weight and windlass, with suitable pulleys for such cables, and the cable L, connecting the operating mechanism in said towers, whereby both ends of the gate may be raised or lowered simultaneously, as set forth.



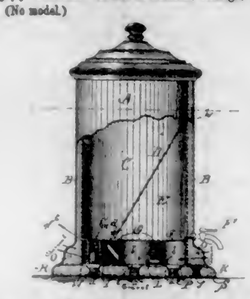
3. The combination, with the towers, of a gate provided with the end beams, G G, and having the braces J K, of the arms F, extending between said braces and the end beams, and the friction-rollers H and H, as set forth.

295,325. APPARATUS FOR SHIFTING DRILLING-MACHINES. ALBERT BALL, Claremont, N. H., assignor to the Sullivan Machine Company, same place. Filed Dec. 31, 1881. (No model.)

Claim.—In a drill-shifting apparatus, the combination, with the frame A and its guides, and rack *a a'*, supporting the drill mechanism, of the pawl *d*, and lever C, for shifting the drill, and clamp-bolt D, for adjustably securing the same, said bolt passing through the base of the drill mechanism and engaging at its lower bent end with the under side of one of the guides, substantially as described.

295,326. STATION-INDICATOR. SIMMY BALLIN, Hamburg, Germany. Filed Aug. 8, 1883. (No model.)

Claim.—1. In a station-indicator operated by a moving part of the vehicle, an indicator-apron, *a*, with the names of the stations, streets, &c., printed upon it in duplicate lines, commencing at opposite ends of the apron, in combination with drums A and B and shiftable screen E, which covers one line of names, substantially as and for the purpose set forth.



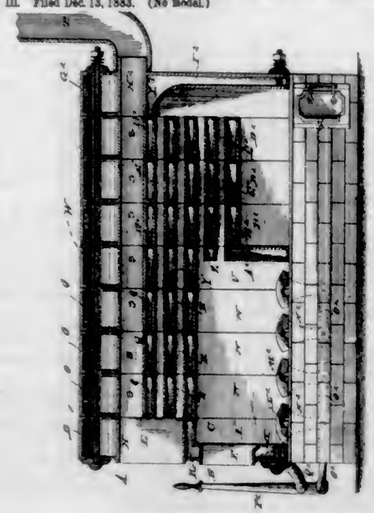
2. In a station-indicator operated by a moving part of the vehicle, an indicator-apron, *a*, with the names of the stations, streets, &c., printed upon it in duplicate lines, commencing at opposite ends of the apron, in combination with drums A and B, a coiled spring connected with the drum B, a shiftable screen, E, which covers one line of names, and a clutch device operated by a rod, *t*, which releases the drum A from its shaft and allows the apron to rewind on drum B at the end of the route, all operated and arranged substantially as and for the purpose set forth.

3. In a station-indicator, the combination, with the rollers A and B, indicator-apron *a*, and spring-drum C, suitably connected with roller A, of the crank D, carried by the collar C on the shaft of the roller B, and having a projection or spring-pin, *d*, which can engage with projections *e* on the roller B, the lever G, and the wheel *g*, having finger *r*, and geared into the pinion *p* on the spring-shaft, as described, whereby the roller B is automatically connected with its shaft when the apron has been rewound on the roller, A, substantially as set forth.

4. In a station-indicator having an indicator-band, *a*, a curtain, E, carried in front of the band by means of the arms M on the shaft L, said shaft having the lever K, in combination with the cam H and lever X, whereby the position of the screen in front of the apron can be shifted by means of any movement that may be given to the lever X, substantially as herein set forth.

5. In a station-indicator operated by a moving part of the vehicle, an indicator-apron, *a*, with the names of the stations, streets, &c., printed upon it in duplicate lines, commencing at opposite ends of the apron, in combination with drums A and B, a coiled spring connected with the drum B, an automatically-shiftable screen, E, which covers one line of names, and a clutch device and a screen-shifting device operated by a rod, *t*, which releases the drum A from its shaft and allows the apron to rewind on drum B at the end of the route, and also shifts the screen, all operated and arranged substantially as and for the purpose set forth.

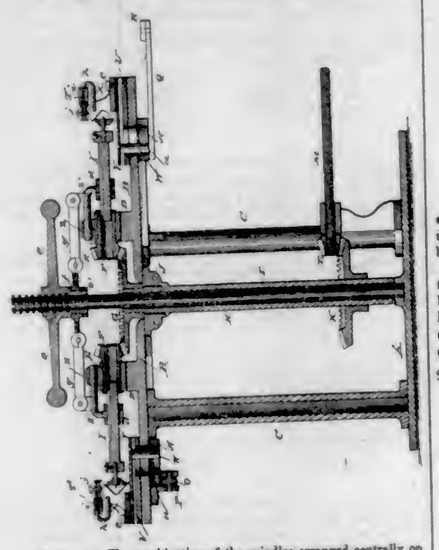
295,327. FILTER. EDWIN L. BARBER, Chicago, Ill. Filed Aug. 3, 1883. (No model.)



Claim.—1. A cylindrical water-vessel having a slanting partition extending from the bottom to one side thereof below the top, completely closing the chamber beneath the partition, a vent-tube in said partition extending to the top of the vessel, holes in the bottom of each compartment, one or more chambers to hold filling material connecting said holes, and a faucet entering the inclosed compartment near its bottom, substantially as and for the purpose specified.

2. The water-cooler A, the slanting partition D therein, the opening G, and a screen covering it, in combination with the tube H, having side openings near its lower end, a sponge or other filtering material in said tube, a chamber, I, surrounding the tube, filtering material in said chamber, an opening through said chamber I directly opposite the mouth of tube H, and means for conveying water from the side of chamber I to chamber E, substantially as specified.

3. The water-cooler A, the slanting partition D therein, and the openings G *g* in the bottom thereof, in combination with the filtering-chambers I J K L M N P, each having an opening in its bottom, and a removable cap therefor, and means, substantially as specified, for connecting said filtering-chambers with each other and with the openings G and *g*, as and for the purpose specified.



295,328. SECTIONAL STEAM-BOILER. HIRAM A. BARNARD, Moline, Ill. Filed Dec. 13, 1883. (No model.)

Claim.—1. In a sectional steam-boiler, the herein-described front sections forming the fire-box, the said sections being constructed with the rests or bearings L^2, in combination with the slotted grate-bars M^2, mounted pivotally upon the said rests, and having downwardly-extending arms N^2, the connecting-rods O^2, and the operating-lever P^2, pivoted to a bracket, Q^2, upon the front section of the boiler, as set forth.

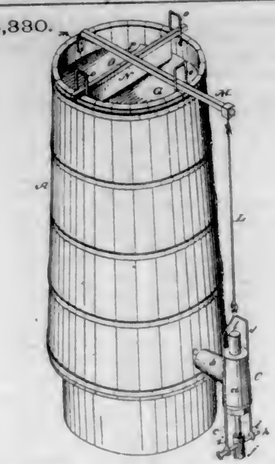
2. As an improvement in sectional steam-boilers, the combination of the herein-described front section having the steam-dome, combustion-chamber, transverse water-pipes, and front doors, the sections having steam-domes, water-legs, transverse pipes, and horizontal flues, the section comprising the water-back of the furnace, sections forming a continuation of the boiler, and a rear section having a water-back, a smoke-stack, and a soot-door, substantially as set forth.

295,329. DRILLING-MACHINE. JOHN BARRET, Lafayette, Ind. Filed June 8, 1883. (No model.)

Claim.—1. The combination of the spindles arranged centrally on a table, the adjustable vise-chucks, and the mechanism for rotating the spindles and moving them endwise, and the hand-wheel on the vertical shaft, whereby the movement of said mechanism is controlled, substantially as specified.

2. The combination of the drill-spindles, the adjustable chucks, the screw-shaft with its hand-wheel, the link-ring and push-rods connected to the spindles, and the links connecting these rods to the said link-ring, all constructed and adapted to operate substantially in the manner and for the purposes described.

3. The combination of the adjustable vise-chucks, the dovetail guides U on table B, and pins projecting from said chucks and entering slots in a circularly-movable ring, N, and drilling-spindles, which are adjustable endwise by means described, controlled by a hand-wheel, all constructed and adapted to operate substantially in the manner and for the purposes described.

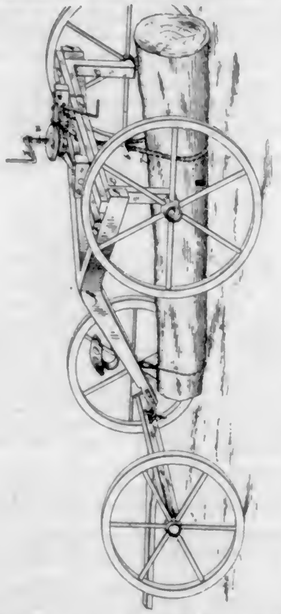


4. The combination of the endwise-adjustable spindles and adjustable chucks on a table, B, the centrally-fixed screw-shaft I, the hand screw-wheel *s*, and its connections with the spindles, the pinions F on sleeves, through which the spindles pass, and the bevel-gear on the sleeve which incloses the shaft I, all constructed and adapted to operate substantially in the manner and for the purposes described.

295,330. CISTERN. JAMES WESTFALL BARNUM, New Orleans, La. Filed Aug. 7, 1883. (No model.)

Claim.—1. The combination, with a tank and an overflow-valve at the lower end of the tank, of a float connected with said overflow-valve, and means, substantially as shown and described, for holding the float near the top of the tank when the water is below the same, as set forth.

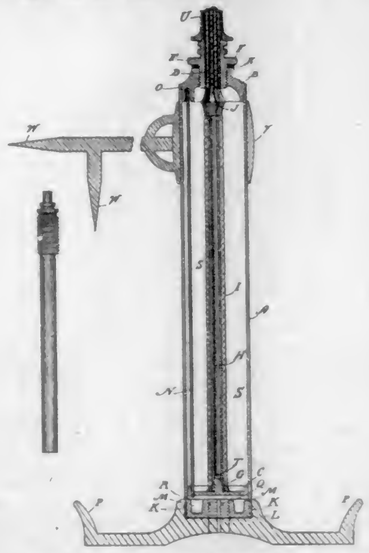
2. The body *a*, having the hollow externally-threaded extension *b*, the top cap, *f*, and the internally-threaded lower end, the externally screw-threaded plug *e*, made conical on the inside, and the conical stopper having an upper and lower stem, in combination with a cistern-valve and suitable mechanism to connect it with the stopper-stem, for the purpose specified.



295,330.

3. The combination, with the cock-stopper *f*, having a downward stem, K, and slotted head *j*, of the cross-rod *h*, the yoke J, having eyes *i*, the pivoted rod L, the lever M, hinged at *m*, the board N, the cross-bar O, and the float G, as and for the purpose specified.

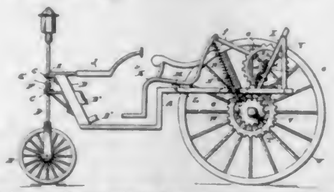
4. In a cistern, the combination, with the tank A, provided with the guides *c*, and the cock-stopper *f*, of the float G, provided with the bar O, for holding the same near the top of the tank, and the lever M, hinged to the tank, and having its free end connected to the said cock-stopper, substantially as herein shown and described, and for the purpose set forth.



295,331. WAGON FOR MOVING HEAVY OBJECTS. ANDREW BARTHOLOMEW, Springfield, Mass. Filed Sept. 17, 1883. (No model.)

Claim.—1. The combination, with a vehicle for transporting heavy objects, of the yoke *d*, hung on trunnions, the nut-case *v*, capable of rocking on said yoke, the nut *w*, having a geared border, the screw-rod *x*, provided with hook 6, the shaft 4, having pinion 3 and the collar 13 thereon, and the stop-lever 2, substantially as set forth.

2. In combination, the reach A, the yoke *d*, hung on trunnions, the nut-case *e*, capable of a rocking motion on said yoke, the nut *w*, having a geared border, the screw-rod *x*, provided with hook 6, and the shaft 4, having pinion 3 thereon; substantially as set forth.



295,332. PORTABLE LAMP. LEOPOLD RADICHTER, Bridgeport, Conn. Filed July 9, 1883. (No model.)

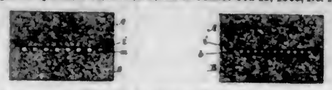
Claim.—1. In a lamp, the casing having at its top a cap recessed as described, and at the bottom a projection, in combination with the tube N, cap L, recessed and having communication with the outside air, and tube H, substantially as set forth.

2. The casing A, having cap B and bottom C, with recess O and projection G, respectively, in combination with the tube N, cap L, with annular recess M, grooves Q, tube H, wick I, burner D, and means for regulating the flame, substantially as set forth and described.

295,333. VELOCIPEDE. LOUIS BEAUPAIN, Springfield, Ohio. Filed Jan. 17, 1884. (No model.)

Claim.—1. In a velocipede, the combination, with the oscillating seat, the standards having two sets of bearings, and the main driving-shaft having driving gear-wheels of different diameters, of the auxiliary shaft carrying gear-wheels, and adapted to operate in either set of bearings and to recive motion from the seat.

2. In a velocipede, the combination, with the boxes having brackets and anti-friction rollers mounted therein, of the main driving-shaft, upon which the said rollers rest, the rollers forming a bearing for the shaft.



3. In a velocipede, the combination, with the oscillating seat, of the pivoted rods, and the springs which act to aid in throwing the seat upward or forward.

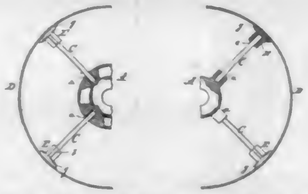
4. In a velocipede, the combination, with the oscillating seat, the pivoted rods, and the springs, which act to aid in throwing the seat upward or forward, of the heel and toe pieces adapted to receive the feet of the operator, whereby they are prevented from slipping, and he is enabled to exert the balance of power necessary to bring the seat forward.

5. In a velocipede, the combination, with the oscillating seat, of the transverse rock-shaft and the interposed springs, whereby the seat and shaft are yieldingly connected together.

6. In a velocipeda, the combination, with the main frame, of the standards having two sets of bearings, whereby the position of the auxiliary shaft relatively to the driving-shaft may be varied.

295,334. ARTIFICIAL PAVEMENT AND CONDUIT FOR ELECTRIC WIRES. WALTER BERRY and PETER STUART, Edinburgh, County of Mid-Lothian, Scotland. Filed Sept. 19, 1883. (No model.) Patented in England Apr. 14, 1883, No. 1,894, and in France Oct. 13, 1883, No. 156,018.

Claim.—1. Blocks or slabs of granolithic paving composition formed with conduits adapted to receive electric wires or cables.



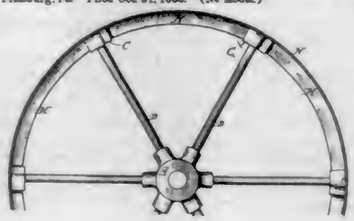
2. Blocks or slabs of granolithic paving composition having conduits beneath the surface and cemented together.

295,335. BUTTON. RICHARD B. BLACK, Experiment Mills, Pa. Filed Jan. 15, 1884. (No model.)

Claim.—An improvement in buttons, consisting of a metal shank composed of two strands bent toward each other to form a closed loop, with their ends overlapping in opposite directions, as shown, and adapted to be attached to or detached from the fastening-staple, all substantially as set forth.

295,336. MANUFACTURE OF PULLEYS, &c. HENRY H. BLAKE, Pittsburg, Pa. Filed Aug. 11, 1883. (No model.)

Claim.—1. In the manufacture of pulleys, wheels, and analogous articles, the method of securing independent arms or spokes to the hub, consisting in forming recesses in the hub larger than the spokes, and pockets beside said recesses, having overhanging walls and communicating therewith, then inserting the arms or spokes into said recesses, and pouring into said pockets and recesses a cement which shrinks in setting, substantially as described.

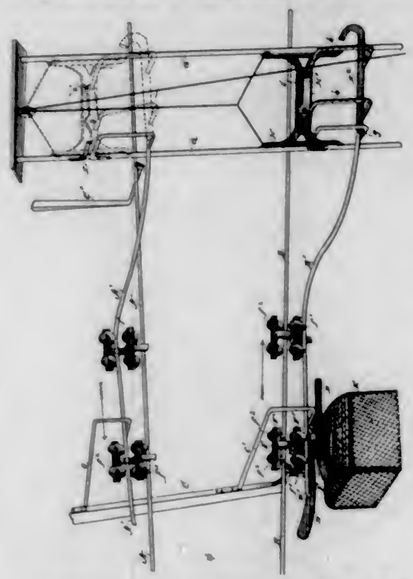


2. In a pulley, the cast hub A, having recesses *a* larger than the spokes, in combination with spokes C and cement filling the space between the spokes and recess-walls, substantially as set forth.

3. In a pulley, the cast hub A, having recesses *a* larger than the spokes, and pockets *b*, communicating therewith and having overhanging walls, in combination with the spokes C and cement filling in the space between the spokes and recess-walls and in the pockets, substantially as shown.

4. In the manufacture of pulleys, the plate I, having mandrel *p*, and adjustable centering-lugs *l*, having pockets or clamps *o*, adapted to receive and rigidly hold the independent hub and spokes of a pulley, substantially as described.

5. In a pulley, the combination of hub A, having recesses *a* and pockets *b*, spoked C, lugs E, having recesses *e* and pockets *b*, and cement filling for said recesses and pockets, substantially as described.



295,337. COMPOUND PULLEY OR WHEEL. HENRY H. BLAKE, Pittsburg, Pa. Filed Oct. 31, 1883. (No model.)

Claim.—1. In a compound pulley or wheel having spokes or spoke-lugs separately attachable, the combination of metallic lugs at the spoke ends, having sockets *a*, wooden rim-segments H, adapted to enter said sockets, and a metallic facing or band, N, secured outside said wooden segments, substantially as described.

2. In a compound pulley or wheel having spokes or spoke-lugs separately attachable, the combination therewith of the lugs C, having sockets *a*, wooden rim-segments fitting said sockets, and having recesses *i* and overlaps *m*, and the metallic facing-band N, secured outside said segments, substantially as described.

295,338. CONVEYER APPARATUS. GEORGE C. BLICKENDERFER and HERVEY SMITH, Erie, Pa. Filed Feb. 4, 1884. (No model.)

Claim.—1. In a conveyer apparatus, substantially as shown, the combination, with a track formed of a taut wire, of a hanger or support having thereon a clamp which grips the track below its face and holds it against vertical, lateral, and longitudinal movements, substantially as shown.

2. In a conveyer apparatus, substantially as shown, the combination, with the track, of a hanger or support having thereon the clamp formed of the parts c^2, c^3, and c^4, constructed and arranged to operate substantially as and for the purposes set forth.

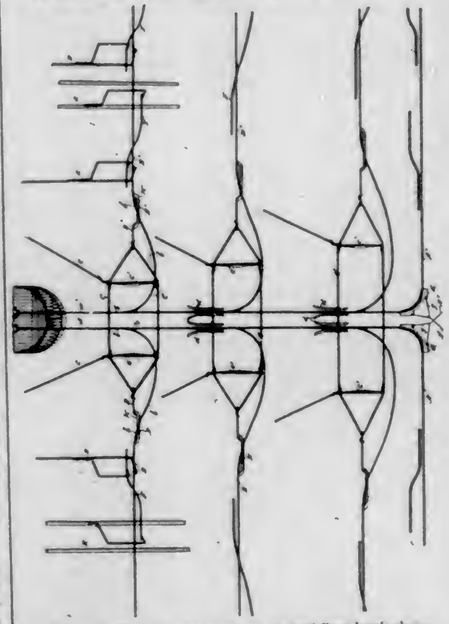
3. In a conveyer apparatus, substantially as shown, the combination, with a taut wire track which passes corners or curves by angular bends, of a curved track formed of a separate piece of metal, which is clamped upon said main track, substantially as shown, and has its face in a plane above the plane of the main track.

4. In a conveyer apparatus, substantially as shown, the combination, with a taut wire track which passes curves or corners by angular bends, of the curved track-iron J, cheek-pieces *j j*, and means, substantially as shown, for clamping said parts upon said main track.

5. In a conveyer apparatus, substantially as shown, the combination, with the main track and a car having two sets of wheels—one above the other—of a switch-track having its point lying in a vertical plane with the main track, and graded at an angle to the grade of the main track, and adjusted at a distance from the main track corresponding with the distance the said sets of wheels are apart on the car, whereby the car passing said point on one set of wheels on one of said tracks will be engaged by the other track on the other set of wheels, substantially as set forth.

6. In a conveyer apparatus, substantially as shown, the combination, with a main track and a car having two sets of wheels—one above the other—of a switch-track for taking cars off the main track, which has its point lying in a vertical plane with the main track at a distance therefrom corresponding to the distance apart of the sets of wheels on the car, and adjusted so as to receive the tread of the set of wheels not in use on the main track, and which is graded at such an angle to the grade of the main track as to raise the set of wheels used on the main track sufficiently above the same to clear it as the car runs onto the curve of the switch-track, substantially as shown and described.

7. In a conveyer apparatus, substantially as shown, the combination, with a main track and a car having two sets of wheels—one above the other—of a shipping-switch for shipping cars onto said main track, which has its point lying in a vertical plane with the main track, and is at a sufficient distance therefrom at a point near the curve of said switch to carry the set of wheels not in use thereon over the main track, and from thence toward its extreme point grades sufficiently toward the main track to bring the said wheels into tread upon said main track, substantially as shown and described.



8. In a conveyer apparatus, substantially as shown, the combination of the following elements: two main tracks, one grading from and the other to the stations; two switch-tracks at each station, one, A′, for shipping cars onto the track A, which grades from the station, has its point in a vertical plane with the track A, and graded more precipitously than said track A, and the other, B′, for receiving cars from the main track B, which grades toward the station, has its point in a vertical plane with said track B, and graded less precipitously than said track B; and, finally, a car to be received at and shipped from said station, which has two sets of wheels, one above the other and distanced from each other to correspond with the distance the said switches are adjusted in a vertical line from the said main tracks, substantially as shown and described.

9. In a conveyer apparatus, substantially as shown, the combination of the following elements: two main tracks, A and B, which grade in opposite directions, and arranged one above the other; two switches at each station, one, A′, for placing cars on the track A to ship them from the station, and the other, B′, to take cars off the track B, said switches being arranged one above the other; and, finally, an elevator having a section of track, B^3, which can be brought into line with either of said switch-tracks A′ or B′ by the movement of said elevator, substantially as shown and described.

10. In a conveyer apparatus, substantially as shown, the combination, with the shipping-switch A′, of the elevator H and tilting track-section B^3, connected with said elevator, and adapted to be operated substantially as and for the purposes set forth.

11. In a conveyer apparatus, substantially as shown, the combination, with the shipping-switch A′, of the elevator H, tilting-bar H′, track-section B^3, finger I, and stop *i*, as shown, and for the purposes mentioned.

295,339. CONVEYER APPARATUS. GEORGE C. BLICKENDERFER and HERVEY SMITH, Erie, Pa. Filed Feb. 15, 1884. (No model.)

Claim.—1. In a conveyer apparatus, substantially as herein shown, the combination, with a direct or main track, of branch tracks which are connected with frames, substantially as shown and described, which span

the main track and afford an opening for the uninterrupted passage of the cars along the main line, as set forth.

2. In a conveyer apparatus, substantially as herein shown, the combination, with a direct or main track, of branch tracks having frames thereon, which span the said main track for the purposes mentioned, and transfer tracks or switches which lead from said branch tracks and connect with said main track, substantially as shown and described.

3. In a conveyer apparatus, substantially as shown, the combination of the main track A, branch track B, spanning-frame C, transfer-track *b*, and connecting-iron H.

4. In a conveyer apparatus, substantially as shown, the combination, with two or more substantially parallel tracks, of a guy for holding one or more of said tracks at their curves, which is provided with a frame or frames for spanning such of said tracks as the said guy intersects, so that cars can pass along said intersected track or tracks uninterruptedly, as set forth.

5. In a conveyer apparatus, substantially as shown, the combination, with the tracks thereof, of a spanning-frame, substantially as herein shown and described, and for the purposes set forth.

6. In a conveyer apparatus, the combination, with a track formed of a taut wire, of the angle-iron G, properly curved, and adapted, substantially as shown, to hold the track from below and leave its upper portion free for the passage of cars.

7. In a conveyer apparatus the track of which is formed of a continuous taut wire, the combination, with said track at points where it changes its direction, of a supporting-iron which is properly curved, and provided along its curve with means, substantially as shown, for grasping the said taut-wire track and holding it at a proper curve without obstructing or interfering with the tread or face of said track.

8. In a conveyer apparatus, substantially as shown, a track running in various directions, formed of a continuous taut wire, which passes angles or corners by proper curves and without break, splices, or angular bends, and at all points has its upper surface exposed as a tread or face, as shown.

9. In a conveyer apparatus, substantially as shown, the combination, with a taut-wire track, of the angle-hanger G, properly curved, and having the flange g^2 and clips g^3, as shown, and for the purposes mentioned.

10. In a conveyer apparatus, substantially as shown, the combination, with a taut-wire track, of the angle-hanger G, curved properly, and the guys *g g*, attached to said angle-hanger.

11. In a conveyer apparatus, substantially as shown, the combination, with a main track and a car having two sets of wheels, arranged side by side, of a switch-track placed by the side of the main track, so as to engage the set of wheels on the car not used on the main track, substantially as herein shown.

12. In a conveyer apparatus, substantially as shown, the combination, with a main track and a series of switches having their points arranged by the side of said main track, and successively raised at different heights above the plane of the main track, of a car having two sets of wheels, arranged side by side, one for running on the main track and the other on the switch-tracks, which latter are adjustable vertically, so as to bring them at a desired height above the tread of the set which run on the main line, as and for the purposes mentioned.

13. In a conveyer apparatus, substantially as herein shown, the combination, with a main track and switch-tracks arranged by the side of said main track, of a car having two sets of wheels, one for running on the main line, and provided with means, substantially as shown, whereby they may be tripped up off of said track, and the other for running on the switch-tracks, which are provided with means, substantially as shown, whereby they may be adjusted so as to bring their tread in different horizontal planes.

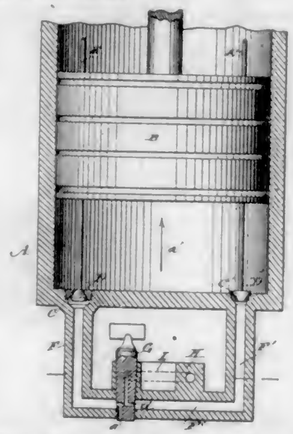
14. In the running-gear of a car for a conveyer apparatus, substantially as shown, the combination of the wheels O O and N N, arranged, respectively, on the bars K and L, the latter of which is mounted so as to be moved vertically by a spring when released from a holding-catch, substantially as and for the purposes mentioned.

15. In the running-gear of a car for a conveyer apparatus, substantially as herein shown, the combination, with the slotted post M', of the block P, bar L, carrying the wheels N, spring *p*, catch R, and trigger Q, substantially as and for the purposes mentioned.

16. In the running-gear of a car for a conveyer apparatus, substantially as herein shown, the combination, with the post M', of the bar on which the wheels are connected, pivoted to said post, and a compensating-spring attached to said post and bearing on said bar each side of said post, substantially as and for the purposes set forth.

17. In a conveyer apparatus, substantially as shown, the combination, with a main and a switch track lying side by side, and a car with two sets of wheels lying side by side, one of which sets is for use on the main track and the other on the switch-track, the former of which are adjusted upon a bar which will move up when released by the movement of a trigger, which extends above said car, as shown, of a finger, Q', adjusted above said track and in position to come in contact with said trigger when the car is opposite said switch.

18. In a conveyer apparatus in which the switch-tracks lie beside the main track and the switch-wheels on the cars lie beside the main wheels, the combination, with the said switch and car, of a friction-roller on the car, and guides *d*, at the switch-point of which guides the one opposite or across the main track from the switch extends along the track beyond the switch-curve, as shown, and for the purposes mentioned.



19. In a conveyer apparatus, substantially as shown, the combination, with a car having its main and its switch wheels lying side by side, and the said switch-wheels adjustable vertically, of two main tracks, one leading from and the other to the central station or cashier's desk, and switches at stations for each of said lines, which are graded in different planes above said lines successively as the said stations are serially removed from the said central station.

295,340. BALE-TIE SPLICE. FREDERICK BOMMARITO, New Orleans, La. Filed Jan. 10, 1884. (No model.)

Claim.—A bale-band formed of pieces of scrap or waste material A A', united at their adjacent ends by the longitudinal slit loops *b b*, transverse locking-lips *d d*, and a key, *c*, passing through loops *d d*, substantially as set forth.

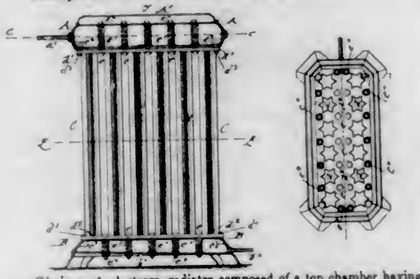
295,341. AIR-PUMP. MIGUEL BOOM, Port au Prince, Hayti. Filed Apr. 16, 1883. (No model.)

Claim.—1. In an air-pump, the combination, with a cylinder having inlet and outlet tubes alternately opened and closed by valves operated by a piston, of a tube communicating with said inlet and outlet tubes, and provided with a pipe for connecting it with a reservoir, and a two-way cock, substantially as herein shown and described, whereby communication may be established between the outer air and the inlet and outlet tubes, and between either of the said inlet and outlet tubes and the pipe leading to the reservoir, as set forth.

2. In an air-pump, the combination, with the cylinder A, of the tubes F F', having their inner ends alternately closed by valves, and having their opposite ends united by a tube, F^2, a cock-plug, G, having channels *a d*, and the tube H, adapted to be connected with a suitable vessel for receiving the compressed air, or in which the vacuum is to be produced, which tube H forms a by-pass, substantially as herein shown and described, and for the purpose set forth.

3. In an air-pump, the combination, with a cylinder, A, provided with ports C C' in its top and bottom, and a piston, B, carrying valves D D', of the tubes F F', united by a tube, F^2, the cock-plug G, having channels *a d*, the tube H, forming a by-pass, and the channels J J', connecting the ends of the tube F^2 with the opposite ends of the cylinder A, substantially as herein shown and described, and for the purpose set forth.

295,342. CONCENTRATION AND EVAPORATION OF SIRUPS. ALFRED PEARL BOON, St. Christopher, West Indies, assignor to Charles Henry Boon, same place. Filed Feb. 21, 1884. (No specimens.)



Claim.—1. The hereinbefore-described process of concentrating and evaporating sirups, consisting in pumping or injecting heated air at a high pressure and in an extremely fine state of division into the same, substantially as specified.

2. The hereinbefore-described process of concentrating and evaporating sirups, consisting in pumping or injecting heated air at a high pressure and in an extremely fine state of division into the same, and allowing the air to escape, substantially as described.

3. The hereinbefore-described process of concentrating and refining sirups, consisting in pumping or injecting heated air at a high pressure and in an extremely fine state of division into a column of the same, and allowing it to escape, substantially as specified.

4. The hereinbefore-described process of concentrating and refining sirups, consisting in pumping or injecting heated air at a high pressure and in an extremely fine state of division vertically through a column of the same, and allowing the air to escape by passing vertically up through the body of the liquid, substantially as specified.

295,343. STEAM-RADIATOR. ROBERT BRASS and JOHN CHAPMAN, Brooklyn, N. Y. Filed June 9, 1883. (No model.)

Claim.—1. A steam-radiator composed of a top chamber having bottom openings, an intermediate casting or castings, each composed of a row of circulating-pipes having top and bottom flanges cast integral therewith, a bottom chamber having openings at the upper part, and means whereby the top and bottom chambers are connected to the flanges of the intermediate casting or castings, substantially as and for the purpose set forth.

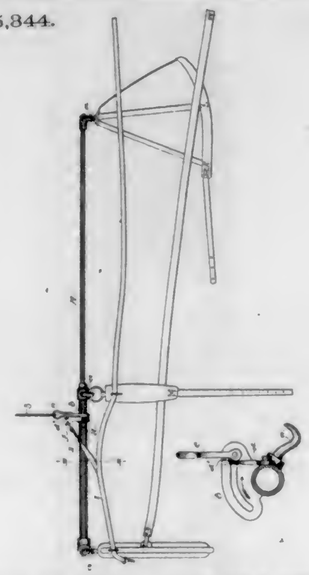
2. The combination, in a steam-radiator, of the top and bottom chambers, A and B, having openings *a a* and *b b*, and interior projecting lugs, *e e*, cast integral with said chambers, an intermediate casting, C, composed of a row of circulating-pipes, *d d*, and top and bottom flanges, *d' d^3*, cast integral therewith, said top and bottom chambers being connected to the flanges of the intermediate circulating-pipes by screw-bolts that take into the interior lugs of the chambers, substantially as set forth.

3. The combination of top and bottom chambers, A and B, having openings *a a* and *b b*, and interior side and center lugs, e^3 *e'*, intermediate castings, C C, each composed of a row of circulating-pipes, *d d*, and of top and bottom flanges, *d' d^3*, and screw-bolts e^4 and *s*, that connect the flanges of the castings with the lugs of the top and bottom chambers, substantially as set forth.

4. In a steam-radiator, the combination of the top and bottom chambers, A and B, having longitudinal openings, interior and partly-perforated side lugs cast integral with the walls of the chambers, and the intermediate castings, C C, each composed of a row of pipes having top and bottom flanges, substantially as described.

5. In a steam-radiator, the top and bottom chambers, A B, having openings *a a* and *b b*, interior and partly-perforated side lugs and perforated center lugs, said side and center lugs being cast integral with the body of said chambers, substantially as described.

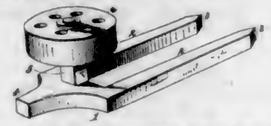
6. In a steam-radiator, the combination of the top chamber, A, provided with longitudinal openings in its bottom, the steam-inlet pipe *a'*, lugs *c' c^3*, partly-perforated castings C C, nuts c^2, the top plate, A, and the bottom chamber, B, provided with lugs *c' c^3* and discharging-pipe.



295,344. HARNESS-HOLDER. DANIEL D. BRIGGS, New Bedford, Mass., assignor of one-half to Frederick Macy, same place. Filed Jan. 18, 1884. (No model.)

Claim.—1. In a harness-holder, a rod provided at one side of its longitudinal center with a series of hooks adapted to support the collar, saddle, and rear part of a harness in position to be dropped directly upon a horse, and a supporting device for the rod, combined with a catch or latch to hold the rod with its hooks turned upward to sustain the harness, the said catch or latch, when withdrawn from contact with the said supporting device, permitting the hooks to turn down and discharge the harness, substantially as described.

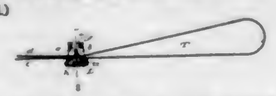
2. The rod A, provided with several hooks, *a*, projecting from one side thereof, and having an attached slotted sector, combined with a supporting device adapted to engage the said slot, and with a catch or latch, adapted to operate substantially as and for the purpose set forth.



3. The balanced rod A, provided with the hooks *a*, projecting from one side thereof, and the slotted sector *b*, and the supporting device *c*, one end of which engages the slot of the said sector, and the catch or latch *d*, adapted to lock the supporting device in that end of the slot of

295,344.

the sector contiguous to the hooks *a*, and with means to operate the catch or latch to release the sector that it may turn on the supporting device, all substantially as shown and described, and for the purpose set forth.



295,345. STAY-ROLLER FOR SLIDING DOORS. WARREN M. BRINKERHOFF, Auburn, N. Y., assignor of one-half to Jacob Brinkerhoff, same place. Filed Sept. 21, 1883. (No model.)

Claim.—1. A stay-roller support for sliding doors, having two or more shanks or prongs for preventing the support from turning, substantially as described.

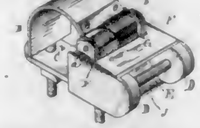
2. A stay-roller support for sliding doors, having two or more shanks or prongs, a journal-arm, a loosely-journaled roller on said arm, and a stem or projection for driving the support, substantially as described.

295,346. METALLIC SEAL. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Jan. 16, 1884. (No model.)

Claim.—1. The combination, in a metallic seal, of a sheet-metal strip having at or near one end a lead-holder integral therewith, and at its other extremity a threading end provided with an anchoring projection on its face, and a leaden part, cast fast within said holder, and constructed with a threading-hole and a detective-aperture in its protruding face portion, substantially as herein specified, for the purposes set forth.

2. An improved metallic seal composed, as herein specified, of a sheet-metal strip having at or near one end a lead-holder, and at its other extremity a threading end provided with an anchoring projection on its face, and a leaden part, cast fast within said holder, and constructed with a threading-hole and a detective-aperture to receive said threading end and expose its anchoring projection after the seal is pressed, said holder and projection being formed by simple transverse bends, as shown, for the purpose set forth.

295,347. PIN-AND-BOX JOINT FOR STONE-DRILLS. DUNCAN CAMERON, Randolph, N. Y. Filed Aug. 3, 1883. (No model.)

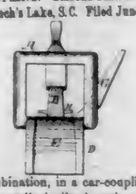


Claim.—1. In a pin-and-box joint for well-drills, the combination, with the box A, having the two female screws *a a'*, of the pin B B', with beveled shoulders *b*, said parts having a single seat, *s*, as set forth.

295,347.

2. In a pin-and-box joint for well-drills, a pin consisting of the parts B B' and beveled shoulders *b b'*, in combination with a box, A, constructed, as shown, to receive said pin, with a single seat, *s*, for the purposes mentioned.

295,348. THILL-COUPLING. ROBERT CAMERON, Burlington, Iowa. Filed Aug. 4, 1883. (No model.)

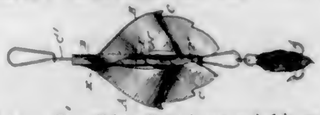


Claim.—1. The combination of the clip, the perforated cheek-pieces formed thereon, and having ears F F, the loose coupling-pin E, and the spring-actuated gate for keeping this pin in place, substantially as described.

2. The combination, with the clip and its thill-coupling, of the curved spring-plate J, covering the spring and the ends of the pivot of the gate G, substantially as described.

3. The combination of the clip, the cheek-piece and ears formed thereon, the pivoted gate actuated by a spring, *c*, the spring-plate covering this spring, and the removable pin E, substantially as described.

295,349. CAR-COUPLING. SAMUEL PARROTT CHANDLER and JAMES MALLORY CHANDLER, Lynch's Lake, S.C. Filed June 28, 1883. (No model.)



Claim.—1. The combination, in a car-coupling, with a draw-head having a fixed vertical rearwardly-inclined catch, of the hinged link-guide extending outward and downward from the lower front edge of the mouth of the draw-head, and on the same plane with the front edge of the catch, as hereinbefore described.

2. The combination, in a car-coupling having the fixed vertical rearwardly-inclined catch, of the link-lifter having a pivoted oscillating plate for lifting the link above the end of the catch and holding it in a straight position to effect this movement, as described.

3. The combination, in a car-coupling, with the draw-head formed with the fixed vertical rearwardly-extending catch or hook, of the link-guide adapted to be turned back out of the way, and the locking lever or catch resting against the top end of the hook to prevent the escape of the link, as described.

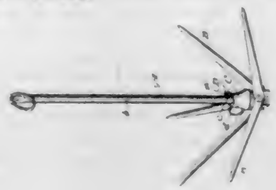
4. The combination, in a car-coupling, with the draw-head formed with a fixed vertical rearwardly-inclined catch or hook, of the pivoted link-guide on the same plane with the catch or hook, locking-lever pivoted at the top of the draw-head, and the link-raising lever, with pivoted oscillating plate pivoted at the side of the draw-head, as herein described and shown, for the purposes specified.

295,350. ARTIFICIAL FISH-BAIT. WILLIAM DUDLEY CHAPMAN, Theresa, N. Y. Filed Dec. 10, 1883. (No model.)

Claim.—1. The artificial trolling-bait, composed of the central tube, D, the curved plates A B, of gradually-increasing width toward their lower ends, having the notches C, and fastened to the central tube at the points E and F, whereby open spaces G are left on opposite sides of the tube, between it and the contiguous edges of the plates, and the lock-snood C', inserted through the tube, all constructed and combined substantially as and for the purpose set forth.

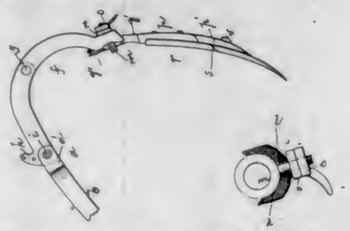
2. The artificial trolling-bait, composed of the central tube, D, having a foil envelope or wrapping, H, held in place by cords or a fine wire, I, the curved plates A B, of gradually-increasing width toward their lower ends, having the notches C, and fastened to the central tube at the points E and F, whereby open spaces G are left on opposite sides of the tube, between it and the contiguous edges of the plate, and the lock-snood C', inserted through the tube, all constructed and combined substantially as and for the purpose set forth.

295,351. UMBRELLA-RUNNER. EMILE G. CHARAGNAT, Paris, France. Filed Aug. 20, 1883. (No model.) Patented in France July 30, 1883, No. 144,232; in Belgium July 28, 1883, No. 62,165; in England July 31, 1883, No. 3,737; in Germany Aug. 2, 1883, No. 7,037, and in Italy Aug. 6, 1883, No. 259.



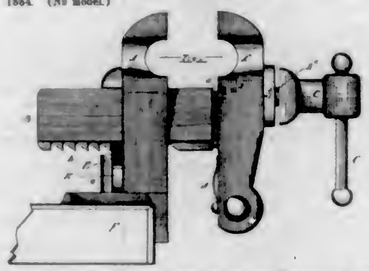
Claim.—1. The combination of the two tubes *a b*, telescopically arranged to form the runner, the flat-wire helical spring *c* in said runner, and connections *h* and *g*, respectively, from said tubes to the branches or ribs, substantially as and for the purpose described.

2. The combination of the two tubes *a b*, telescopically arranged to form the runner, the flat-wire helical spring *c* in said runner, and connections *h* and *g*, respectively, from said tubes to the branches or ribs, one of said tubes constructed with grooves, and the other provided with corresponding pins, *f*, substantially as and for the purpose described.



3. The combination of the spring *l*, constructed with the inclined nose *x*, the brace or connection *h*, boss *y*, and stud *k*, all substantially as and for the purpose described.

295,352. GRAPNEL. HUBBARD C. CHESTER, Noank, Conn. Filed Feb. 12, 1884. (No model.)



Claim.—The combination, with the shank and hinged and folding arms or flukes, of the recessed or cupped slide adapted to receive the points of the folded arms and to rest upon the unfolded or spread-apart arms, and the locking device whereby the slide is held in either of its two positions, substantially as hereinbefore set forth.

295,353. CULTIVATOR. WILLIAM H. CLARK, Harper, Kans. Filed Nov. 21, 1883. (No model.)

Claim.—In a cultivator, a sectional beam, the front portion of which is provided with a laterally-perforated bifercation near its curved rear end, in combination with a rear section pivoted to the rear end of the front section, and provided at its front end with a flat perforated head to fit the bifercation on the front section, and a securing-pin to regulate the adjustment of the sections, substantially as specified.

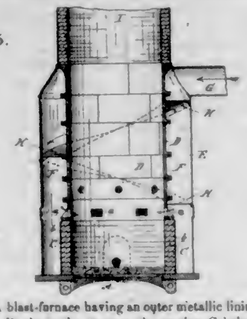
295,354. VISE. WILLIAM H. CLOUD, Detroit, Mich. Filed Jan. 23, 1884. (No model.)

Claim.—1. In a bench-vise, the toothed bar B, provided with an angular arm, B', and screw-cut extremity B², substantially as described.

2. In a bench-vise, the combination, with one of the jaws, of an angular toothed bar pivoted thereto, said bar constructed with a screw-cut extremity extending through said jaw, and mechanism operating upon said screw-cut extremity to operate the jaw, substantially as described.

3. In a vise, the combination, with one of the jaws, of an angular toothed bar pivoted thereto, and having a screw-cut end passing freely through said jaw, and means for reciprocating the upper end of said jaw upon said bar, substantially as described.

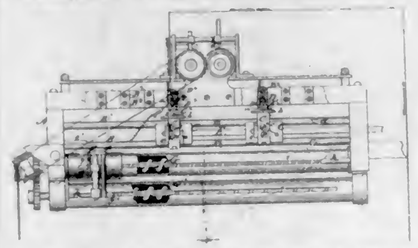
4. In a vise, the combination, with one of the jaws, of an angular toothed bar pivoted thereto, said bar constructed with a screw-tapped extremity passing freely through said jaw, a spring to retract the upper portion of said jaw, and means operating upon the screw-cut extremity of the bar to force said jaw into engagement with the work, substantially as described.



5. In a vise, an angular toothed bar pivoted in one of the jaws, and provided with a screw-cut extremity passing freely through said jaw, and means for reciprocating said jaw upon said bar and for limiting the reciprocation of the same, substantially as described.

6. The combination, in a vise, with the two jaws, of the angular toothed bar, said bar pivotally connected with one of the jaws and passing through the other, means for reciprocating one of the jaws upon said bar, and a latch adapted to be thrown into and out of operation with the toothed bar, substantially as described.

7. The combination, in a vise, with a slotted jaw adapted to be secured to a bench, of an angular toothed bar passed freely through said jaw and pivotally connected with the other jaw, said bar constructed with a screw-cut end passed freely through the latter jaw, the construction being such that the upper portion of the jaw may be reciprocated upon the bar, mechanism for giving said jaw a limited reciprocation, and a latch adapted to be thrown into and out of action with said bar, substantially as described.



295,355. FURNACE. VICTOR COLLIAU, Detroit, Mich. Filed Oct. 16, 1883. (No model.)

295,355.

Claim.—A blast-furnace having an outer metallic lining, F, an inner metallic casing, D, above the tuyeres, the section C below the tuyeres being of fire-brick, as described, to prevent damage to the portion of the furnace where there is no circulation of air, an air-inlet, G, into which air passes under pressure, and a spiral diaphragm between the casings extending from said air-inlet to the tuyeres for compelling the air to circulate around the section above the tuyeres and gradually descend to the same, whereby the air is gradually heated before entering the tuyeres, substantially as described.

295,356. AUTOMATIC ELECTRIC SWITCH. THOMAS A. CONNOLLY, Washington, D. C. Filed Apr. 10, 1883. (No model.)

Claim.—1. In a switching apparatus for connecting independent electric lines, the combination, with a series of terminal connecting devices moving independently in right lines, of mechanism for automatically effecting said movement and electro-magnetic devices for controlling the same.

2. In a switching apparatus for connecting independent electric lines, the combination, with terminal connecting devices moving in right lines, of rigid conducting-supports upon which said devices travel, and mechanism for automatically effecting the movement of said devices and controlling the same.

3. In a switching apparatus for connecting independent electric lines, the combination of two series of connecting terminals or terminal devices moving in intersecting right lines, with mechanism for effecting the automatic movement of said devices and controlling the same.

4. In a switching apparatus for connecting independent electric lines, the combination, with a series of terminal connecting devices moving in right lines, of a sweep constructed and adapted to move to and fro and to engage with and propel said connecting devices.

5. The combination, in an automatic circuit-changer or electric switch, of slides, blocks, or carriages carrying electric connecting devices, tracks, bars, or supports for the same to travel upon, mechanism for propelling said slides, blocks, or carriages, and electro-magnetic devices for controlling the movement of the same.

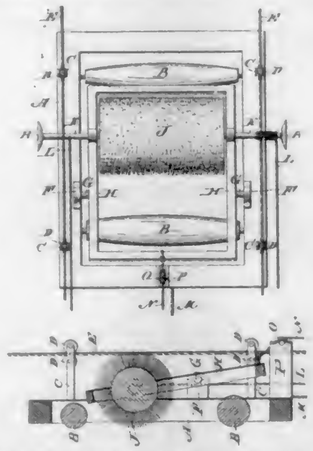
6. In an automatic circuit-changer or electric switch, the combination of a rotary screw or worm, with a sweep operated thereby, and designed and adapted to be moved by said screw, substantially as described.

7. The combination of a screw or worm, a sweep geared thereto, and a sliding or moving switch-block, slide, or carrier operated upon by said sweep.

8. The combination of a pair of geared screws or worms turning in opposite directions, a sweep propelled by said screws alternately, and automatic devices for shifting the connection of said sweep from one screw or worm to the other.

9. A local-station apparatus for the control of automatic electric switches, comprising means for the transmission of an electric current to the switch and means for registering intermissions in said current produced at or by the switch.

10. In a local-station apparatus for automatic electric switches, the



combination, with mechanism for registering intermissions in the current produced at or by the switch, of means for automatically diverting or opening the circuit when a given line is reached.

11. An electric switching apparatus provided with intersecting switch-bars, movable connecting devices to establish connection between said bars, mechanism for causing said devices to travel to and stop at given or predetermined points, devices through which an electric current coming from a distant station is caused to control the movement of said mechanism and allow said connecting devices a continuous movement between any given points, and means whereby the movement of the connecting devices effects a registration thereof at a distance.

12. The combination, in an electric switch, of a series of carriers moving in right lines, and another series of carriers moving also in right lines and intersecting the first-named lines, with mechanism for moving and stopping said carriers and connecting the same with electric lines, whereby when one of said carriers engages with another an electric circuit is established between the lines to which said engaged carriers belong, substantially as described.

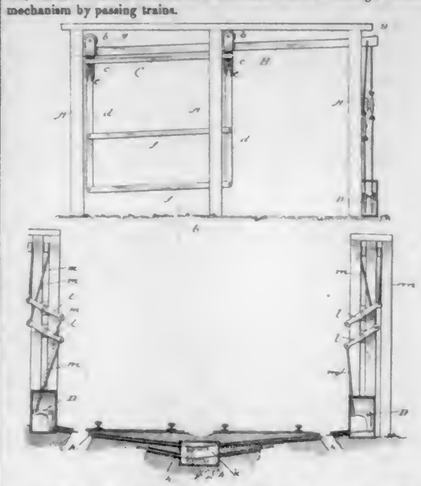
13. In an automatic electric switch, a traveling connecting-block adapted to travel forward and backward in the same plane, and provided with devices in circuit with a given line for obtaining contact with and circuit to another line.

295,357. APPARATUS FOR CLEANING SHIPS' SIDES, &c. JOHN LEE COOPER, San Francisco, Cal., assignor to James Osborne Cooper, Portland, Oreg. Filed Sept. 1, 1883. (No model.)

Claim.—1. In a ship-cleaner, the combination, with a frame, of an additional frame pivoted in the same, a cylindrical scarifier journaled in the pivoted frame, and means for revolving the scarifier, substantially as herein shown and described.

2. In a ship-cleaner, the combination, with a frame having convex rollers, of an additional frame pivoted in the above frame, a cylindrical scarifier journaled in the pivoted frame, and means for revolving the scarifier, substantially as herein shown and described.

3. In a ship-cleaner, the combination, with the frame A, of the convex roller B, the frame H, pivoted in the frame A, the cylindrical scarifier J, journaled in the frame H, and the ropes L, wound in inverse directions on the ends of the scarifier-shaft, substantially as herein shown and described.



4. In a ship-cleaner, the combination, with the frame A, of the frame H, pivoted therein, the cylindrical scarifier J, journaled in the frame H, means for revolving the scarifier, and means for pressing it against the ship, substantially as herein shown and described.

5. In a ship-cleaner, the combination, with the frame A, of the frame H, pivoted therein, the cylindrical scarifier J, journaled in the frame H, means for revolving the scarifier, the rope N, the bridge P, and the pulley O, substantially as herein shown and described.

6. In a ship-cleaner, the combination, with the frame A, of the standards C, the rollers D, the ropes E, the frame H, journaled in the frame A, a cylindrical scarifier journaled in the frame H, and means for revolving the scarifier, substantially as herein shown and described.

295,358. RAILWAY-GATE. DAVID W. COPELAND, Lowville, N. Y., assignor of seven-tenths to Miles H. Bronson, same place, and William H. Cole, Leyden N. Y. Filed Oct. 30, 1883. (No model.)

Brief.—Gate adjustably suspended from hangers traversing a tilting track having inclined outer ends, said track being vibrated through rod, chain, lever, and bell-crank connections actuated through treadle mechanism by passing trains.

Claim.—1. A gate suspended from wheels, in combination with a track-bar for the wheels, pivoted at or about its center, a rod at one end of the bar connecting it to a bell-crank lever, D, and means, substantially as described, for moving the said bell-crank, whereby the gate-track is either pushed or pulled and the gate caused to slide, as set forth.

2. In combination with the sliding gate, the track-bar B, having the inclines *g* at the ends, and means for shifting said bar, substantially as described.

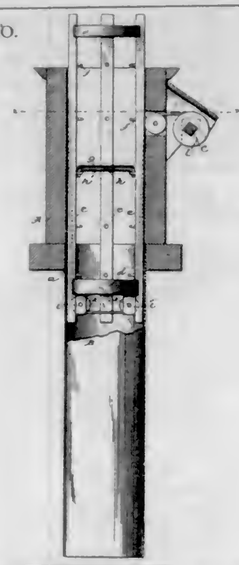
3. In combination, the gates—one on each side of a track—adapted to slide on a pivoted track-bar, bell-crank levers D, and connections therefrom to the ends of the bars, rods *h h*, and bell-crank levers E, with rods or ropes, and means whereby the wheels of the car operate the mechanism, all substantially as described.

4. In the described relation to the gates and their connecting-rods and levers, and in combination, the bell-crank lever G, connected lever *p*, pivoted to *q*, post *r*, and spring-treadle, all substantially as described.

5. In the described gate, the combination of the wheels *b b*, bangers *c c*, perforated, as described, bar C, and the gate-frame proper suspended from hangers *c c*, and adapted to be adjusted vertically thereon, substantially as described.

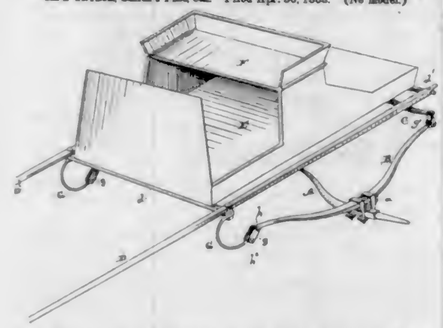
295,359. PERFUMERY-CHARGED CANE AND OTHER HANDLES. EZRA R. COWLES, HENRY A. COWLES, and MARTIN OSBORN, Westfield, Mass. Filed Jan. 21, 1884. (No model.)

Claim.—1. A knob or handle of a cane or other analogous article, made hollow, and having its shell perforated, and having within it a receptacle for perfumery and a perfume-absorbing material, said receptacle having a stopper capable, by means substantially as described, of permitting more or less of the contents of the receptacle to escape through it, substantially as set forth.



2. A knob or handle of a cane or other analogous article, made hollow, and having its shell perforated, and having within it a receptacle for perfumery, said receptacle having a stopper capable, by means substantially as described, of permitting more or less of the contents of the receptacle to escape through it, substantially as set forth.

295,360. HOISTING FOOD-COOLER. HENRY CRAWFORD and JOHN M. LONG, Virden, Ill. Filed June 29, 1883. (No model.)



Claim.—1. Combined with an adjustable refrigerator, the wire shelves, consisting of the ring *g* and cross-bars *h h'*, constructed substantially as described.

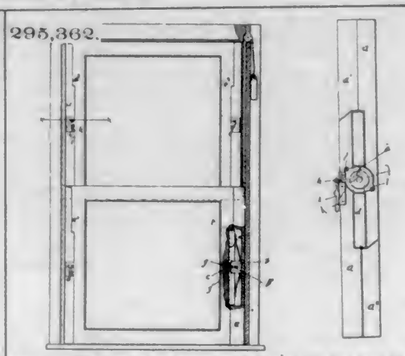
2. The frame consisting of the stripe *e e* and *e'*, and heads *d d'*, the said stripe being provided with staples and holes, as described, in combination with the shelf, formed as described, and adapted to said stripe, as set forth.

295,360.

295,361. TWO-WHEELED VEHICLE. JAMES S. CREIGHTON and JOSEPH TAYLOR, Smith's Flat, Cal. Filed Apr. 30, 1883. (No model.)

Claim.—1. In a two-wheeled vehicle, the platform-springs B B, in combination with the shafts D D, having cross-bar *d*, and the means for connecting the springs with the cross-bar, consisting of the curved strips G G, bolted to the cross-bar, and the shackle *g*, formed of separated plates, making a link, A, pivoted by bolts at each end to the springs and to the curved strips, substantially as herein described.

2. In a two-wheeled vehicle, the axle, side springs, and rear cross-spring, in combination with the shafts having front and rear cross-bars, the latter of which is clipped to the rear cross-spring, body E, bolted at its corners to said cross-bars, and the means for connecting the shafts with the forward ends of the side springs, consisting of curved strips G G, bolted to the front cross-bar, and shackle *g*, pivoted to the springs and curved strips G G, substantially as herein described.



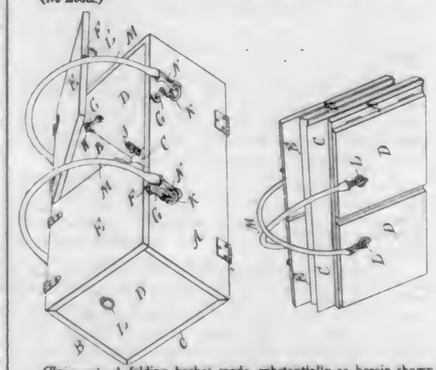
295,362. WINDOW. EBER R. CROFUT and CHARLES L. GRINNIK, Newark, N. J. Filed Aug. 1, 1883. (No model.)

Brief.—A sash horizontally pivoted in sliding stiles, and a detachable spring-locking strip whereby to connect or disconnect the sliding stile and pivoted sash.

Claim.—1. The combination, with the sash or sashes of a window, having recesses (as *r*) therein, and projections a^3, of a supplemental piece (as *a*) having a recess therein, and provided with recesses a' and a^2, adapted to receive said projections a^3, a locking-bar, *d*, and a spring, *e*, all substantially as and for the purposes set forth.

2. The combination, with the sash or sashes of a window, having a recess therein, and a cap (as *g*) provided with a thread, of a supplemental piece having a recess therein, a cylindrical piece, *b*, provided with a screw, *c*, and having a slot or opening, *b'*, therein, a locking-bar, *d*, having a depression, *d'*, said locking-bar moving within said slot *b'* in the piece *b*, and a spring secured to or within said piece *b*, all as set forth.

295,362.



3. In a window attachment, the combination of a cylindrical piece (as *b*) having a slot, *b'*, therein, and provided with a screw, a locking-bar moving within said slot, a spring, and means for operating said locking-bar, all substantially as and for the purposes set forth.

4. In a window attachment, the combination of a cylindrical piece (as *b*) having a slot, *b'*, therein, and provided with a screw, a locking-bar moving within said slot, a spring, (as *e*,) a lever, A, pivoted or attached to the cylindrical piece *b*, a thumb-piece, (as *i*,) and a lug, *k*, all substantially as set forth.

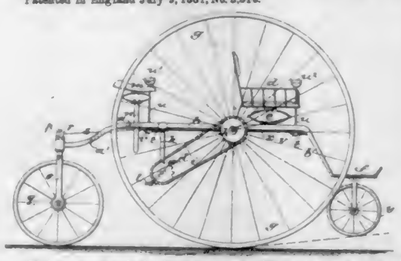
5. In a window attachment adapted to be applied to the sashes of a window, the combination of a supplemental piece (as *a*) having a recess therein, a locking-bar, (as *d*,) a spring, (as *e*,) a device (as *b*) provided with a screw, *c*, and adapted to hold said bar and spring in operative relation, a lever, A, pivoted to said device *b*, a thumb-piece, *i*, and a cap, *g*, all substantially as and for the purposes set forth.

295,363. FOLDING BASKET. ANTHONY DAUL, Jamaica, N. Y., assignor of one-half to Carl Winckens, same place. Filed Aug. 17, 1883. (No model.)

Claim.—1. A folding basket made, substantially as herein shown and described, with the front and back hinged to the opposite edges of the bottom, the ends hinged to the ends of the front, and the cover made of two halves hinged to the upper edge of the back, as set forth.

2. A folding basket constructed with a front hinged to the front edge of the bottom and adapted to be folded against the under surface of the same, a back hinged to the rear edge of the bottom and adapted to be folded on the upper surface of the same, ends hinged to the ends of the front and adapted to be folded against the inner surface of the same, and two cover-sections hinged to the upper edge of the back and adapted to be folded against the rear surface of the same, substantially as herein shown and described.

3. In a folding basket, the combination, with the bottom C, of the front A and back B, hinged to the same, the ends D, hinged to the ends of the front, the covers E, hinged to the back, the hooks G on the ends, and the eyes or loops H on the back, substantially as herein shown and described.



4. In a folding basket, the combination, with the bottom C, of the front A and back B, hinged to the same, the ends D, hinged to the front, the covers E, hinged to the back, the hooks G on the ends D, the loops

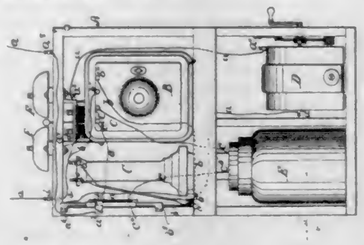
or eyes H on the back, and the sliding bolts J on the ends, substantially as herein shown and described.

5. In a folding basket, the combination, with the bottom C, of the front A and the back B, hinged to the same, the ends D, hinged to the front, the covers E, hinged to the back, the rings or loops L on the ends, the rings or loops L' on the covers, and the handles M, substantially as herein shown and described.

6. In a folding basket, the combination, with the bottom C, of the front A and the back B, hinged to the same, the ends D, hinged to the front, the covers E, hinged to the back, the loops or rings K on the front and back, the rings or loops L on the ends D, the rings or loops L' on the covers E, and the handles M, substantially as herein shown and described.

295,364. VELOCIPEDE. GEORGE LOUIS OUTRAM DAVIDSON, Manchester, County of Lancaster, England. Filed Jan. 2, 1884. (No model.) Patented in England July 9, 1881, No. 3,016.

Claim.—1. A velocipede constructed with a suitable frame, main wheels *g*, steering-wheel *q*, leading-wheel *y*, and a forward passenger-seat, *d*, and rear driver's seat, *m*, said seats *m d* being relatively positioned with each other and the main wheels and axle to cause the driver's weight to overbalance that of the passenger, to hold the steering-wheel to the ground and the leading-wheel therefrom, and to permit the passenger's weight to carry the leading-wheel to the ground when the driver dismounts, substantially as shown and described.



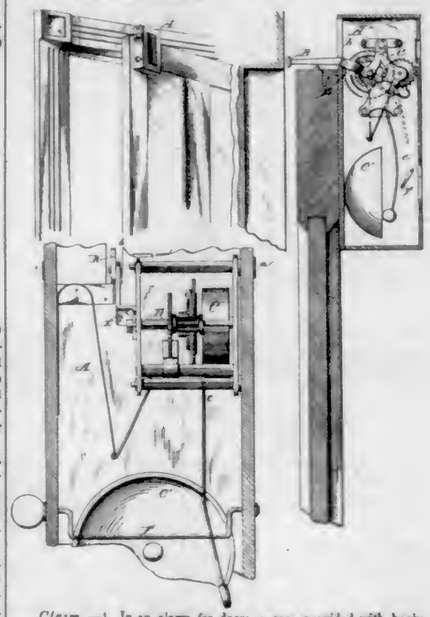
2. The velocipede-frame constructed of hollow bars bent to form a head, *a*, having extension *a'* for support of the steering-wheel, and side-bar extensions *b b*, which connect to the axle, support the seats, and are bent downward and forward at the front, where they have the connected bracing foot-board or stretcher *f*, for support of the leading-wheel, substantially as shown and described.

3. The combination, in a velocipede and with the steering-wheel *q*, its shaft-arm *r*, and rod *s*, of the slotted yoke *t*, provided on its under side with a rack, *w*, and the steering-shaft *u*, secured to the frame, and provided with a collar at its lower squared end, above the yoke, and with a pinion, *v*, below the yoke, whereby the yoke is operated and supported by the collar and pinion, substantially as set forth.

4. The combination, with the steering-wheel *q*, its shaft-arm *r*, rod *s*, yoke *t w*, pinion *v*, and handle-shaft *u u'*, arranged to be operated from the driver's seat *m*, of the rod *x* and duplicate gear *t w v u u²*, located for operation by the passenger from his seat *d*, whereby the velocipede may be guided either by the driver or passenger, substantially as shown and described.

5. The combination, in a velocipede, of a frame, *a a' b*, axle *c*, passenger-seat *d*, main wheels *g*, steering-wheel *q*, leading-wheel *y*, chain-wheels and gearing *h i j*, treadles *l*, driver's seat *m*, and the steering-gear *r s t w v u u' u²*, arranged at either or both of the seats *d m*, to be operated therefrom, and said seats *d m* being relatively positioned to have the driver's weight overbalance the passenger, the whole being constructed and arranged to operate substantially as shown and described.

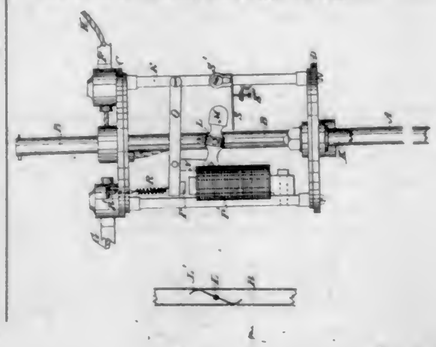
295,365. TELEPHONE-BOX. AUGUSTUS G. DAVIS, Baltimore, Md. Filed Mar. 30, 1883. (No model.)



Claim.—1. The combination, in a telephone-box, of the button I, provided with contact-point a^1, and pivoted to the side of the box, the spring i^3, for pressing its upper end normally outward, the springs J and K and connections a^3 and b^3, the door G, the springs M, and the conductors *a c e*, the whole arranged to operate substantially in the manner and for the purpose specified.

2. The combination, with the box and its door, of the spring-actuated button I and the metallic plates L and M, for the purpose set forth.

3. The combination, with the box and its door, of the metallic plates J, K, L, and M, as and for the purpose set forth.

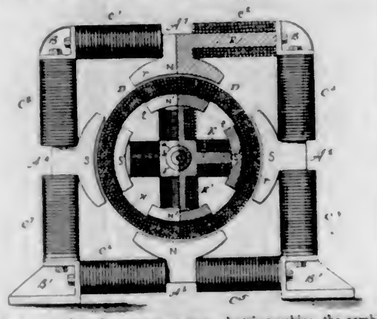


295,366. BURGLAR-ALARM. J. ARTHUR DINNEEN, Great Falls, N. H. Filed Oct. 18, 1883. (Model.)

Claim.—1. In an alarm for doors, a case provided with hooks, whereby it may be attached to a door, and provided with an alarm and spring-actuating means, said spring-actuating means being provided with a dog and arm, whereby the spring is wound up when the arm is forced within the receptacle, substantially as shown, and for the purpose set forth.

2. In combination with the case A, having an opening or slot, *b*, and inclosing an alarm-sounding mechanism, the dog E, attached to the shaft of the spring, and provided at its end with an arm, B, the parts being organized and combined substantially as shown, and for the purpose set forth.

295,367. ELECTRIC LAMP. THOMAS L. DENNE, Jersey City, N. J. Filed Dec. 19, 1881. Renewed Nov. 6, 1882. (No model.)



Claim.—1. In an electric lamp, the combination of the slotted tube for supporting the moving carbon with a frictional spring and its supporting-lever suspended by a second lever, which is controlled by an adjusting-spring in one direction and an electro-magnet in the opposite direction, as hereinbefore set forth.

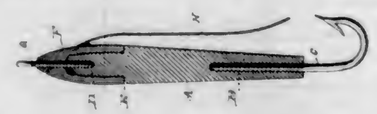
2. The combination of the slotted tube, the spring L', and the tilting lever M, with the adjusting table or bracket S, for releasing the rod and permitting the carbon to drop, as hereinbefore set forth.

3. In an electric lamp, the combination of the reacting-spring with the shunt or high-resistance magnet for regulating and controlling the length of the arc, as hereinbefore set forth.

295,368. DYNAMO-ELECTRIC MACHINE. THOMAS L. DENNE, New York, N. Y. Filed Nov. 9, 1882. (No model.)

Claim.—1. In a dynamo or magneto electric machine, the combination of interior and exterior field-magnet systems and a hollow cylindrical armature revolving between the two, the interior field system being adjustable relatively to the exterior field system, substantially as set forth.

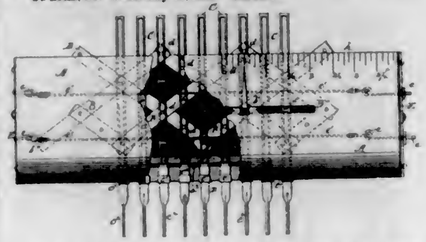
2. In a dynamo or magneto electric machine, a system of interior field-magnets, consisting of a hub, radial arms carrying coils, and enlarged polar extremities, all mounted upon a movable shaft and adapted to be adjusted relatively to the exterior field-magnet system, substantially as set forth.



3. The combination, in a dynamo or magneto electric machine, of an exterior system of field-magnets, an interior system of field-magnets, and means for changing or varying the relative position of the two systems, substantially as set forth.

4. The combination, with a collector or commutator, of two sets of brushes or springs for each polarity, electrically connected, and means for adjusting the sets of different polarity relatively to each other, substantially as set forth.

5. In a dynamo or magneto electric machine, the combination of a fixed system of exterior field-magnets, an adjustable system of interior field-magnets rigidly attached to or mounted upon a movable shaft, and a revolving hollow cylindrical armature supported by sleeves upon the shaft and capable of rotation thereon, substantially as set forth.



6. In a dynamo or magneto electric machine, a system of interior field-magnets, consisting of a hub, radial arms carrying coils, and polar extensions therefor, all mounted upon a movable shaft and adapted to be adjusted relatively to the exterior system of field-magnets, the movable shaft being perforated longitudinally to permit the passage therethrough to the inner field system of the requisite electrical conductors, substantially as set forth.

295,369. TROLLING-HOOK. NEWTON A. DICKINSON, Chester, Conn. Filed Oct. 4, 1883. (No model.)

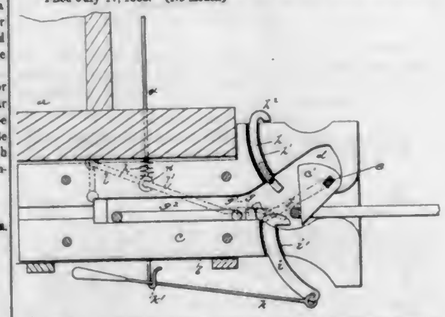
Claim.—The combination of a tapering stick having its upper portion reduced to form a shoulder, and having screw-threaded sockets in the ends of the same, a hook having a screw-threaded shank inserted into the lower end of the stick, a cap of heavy metal fitting over the reduced end of the stick, an eyed screw fitting into the upper end of the stick and holding the cap in place, and a flexible or elastic rod or fender fastened into the side of the cap and extending down to near the point of the hook, as and for the purpose shown and set forth.

295,370. CLAMP FOR RULING-PENS. JOHN WILLIAM DIRBOLD, St. Louis, Mo. Filed May 18, 1883. (Model.)

Claim.—1. The combination, with the hollow body of the clamp and the system of movable levers and pen-holders, of the wires *c' c'*, which are stretched taut and support said levers and holders, as shown and described.

2. In combination with the body of the clamp, having grooves *a f* and scale A, the system of levers B, with head *b'* and pointer *g*, the slotted holders C, the screws *d*, and the securing-wires *c' c'*, as described.

295,371. TIP FOR ELECTRICAL CONDUCTORS. GEO. DOOLITTLE, Bridgeport, Conn., assignor of one-half to Henry D. Stanley, same place. Filed Dec. 10, 1883. (No model.)

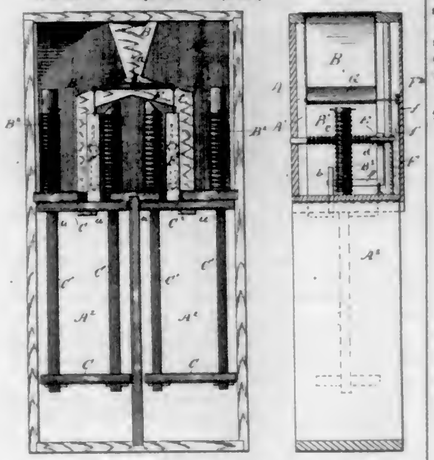


Claim.—1. In a tip for electrical conductors, a flexible metal or wire jacket arranged around the conductor and extended back beyond the rear end of the tip, substantially as set forth.

2. In an electrical conductor composed of a series of conducting-strands, a tip having its rear portion coiled around the conductor, and secured thereto by a knot at the outer extremity of the strands or core, substantially as described.

3. In an electrical conductor composed of a series of conducting-strands, a tip having its rear portion coiled around the conductor, and secured thereto by means of a knot at the outer extremity of the strands or core, in combination with a flexible sheath or jacket, substantially as and for the purpose set forth.

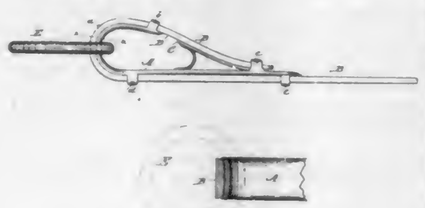
4. In an electrical conductor, the combination, with a tip secured to said conductor, of an independent detachable flexible jacket arranged around the outside of the conductor, and extended backward beyond the rear extremity of the tip, substantially as and for the purpose set forth.



295,372. CAR-COUPLING. ROBERT H DOWLING, Newark, Ohio, assignor of two-thirds to William Baker and Charles H. Follett, same place. Filed July 17, 1883. (No model.)

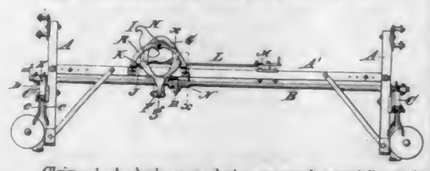
Claim.—1. In an automatic car-coupling, the draw-head *c*, having the recess *d* in its upper wall, in combination with the triangular-shaped steel coupling-block *c'* on the shaft *e*, having bearings in the said walls of the draw-head, and being provided with the crank *f*, having hole *f'*, the gravitating catch-book *h*, and the crank-shaft *l*, having its arm *l'* passed through the eye *f'*, substantially as specified.

2. In a car-coupling, the combination, with the draw-head, having the steel coupling-block *c'* on the shaft *e*, provided with the crank *f f'*, the catch-book *i*, and the crank-shaft *l*, having its arm *l'* passed through the eye *f'* of the rod *n*, having the eye *n'*, through which the arm *l'* of the crank-shaft *l* passes, and the spring *p*, encircling the rod *n*, and having its bearings against the eye *n'* and in a seat in the bumper, substantially as specified.



295,373. AUTOMATIC GRAIN-WEIGHER. THOMAS L. EASLEY, Laddonia, Mo. Filed Sept. 12, 1883. (Model.)

Claim.—1. In a grain-weigher, the combination of the hopper B, having valve G and spouts B', platforms C, having cross-heads C^2, springs B^2, and weights F', substantially as shown, and for the purpose described.



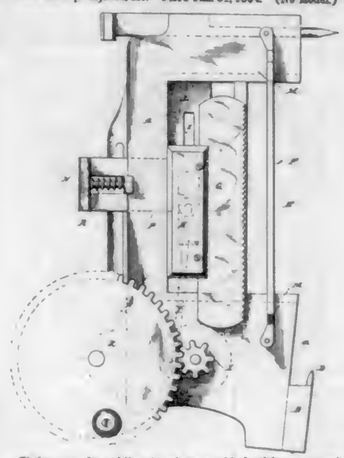
2. In a grain-weigher, the combination of the platforms C^2, notched weights F', secured to lever F, actuating-valve G, elbow-lever D, and spring-rod E, substantially as shown and described.

295,374. HARNESS-HOOK. SAMUEL BROCK EDSON, Monterey, Ind. Filed Dec. 29, 1883. (No model.)

Claim.—The hook having the curved body A formed with a concaved outer surface, and provided with pin *a*, located approximately near the end of the hook, and loops *b c d e* and guard C, substantially as shown and described.

295,375. CHECK-ROWER ATTACHMENT FOR CORN-PLANTERS. HENRY FARMER, Richmond, Ind. Filed Dec. 26, 1883. (No model.)

Claim.—1. A check-rower device composed, essentially, of the double-acting pawl G, in combination with the double-acting crank H, or its equivalent, adapted to be intermittently reciprocated, substantially as herein set forth.



2. In a check-rower device, the combination, with the pitman L, of the shaker-bar, the double-acting crank H, adapted to be alternately oscillated by a double-acting pawl for reciprocating the pitman, substantially as herein set forth.

3. In a check-rower device, the double-acting crank H, provided with the lug J', in combination with the double-acting pawl G, whereby the pawl is brought into alternate engagement with the opposite crank-hooks, I I', substantially as herein set forth.

4. The combination of the pitman L, the oscillating crank H, the double-acting pawls G, reciprocated by means of the oscillating shaft B, substantially as herein set forth.

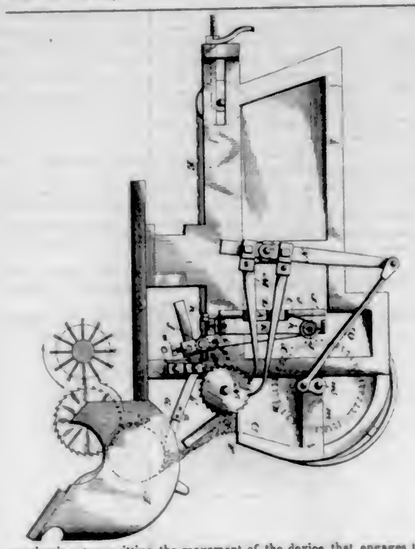
5. In a check-rower device, the combination, with the oscillating shaft B, of the fork C, loosely journaled thereon, with the lug E, secured to said shaft, whereby it is oscillated by engagement of one of the forked levers with said lug, substantially as herein set forth.

295,376. SIDING-BRACKET. ANDREW J. FLOWERS and MALON I. FLOWERS, Springfield, Mo. Filed Jan. 31, 1884. (No model.)

Claim.—1. In a siding-bracket provided with a saw and means for operating the same, the combination, with the frame having an inclined or beveled bearing-face and containing said saw, of the pin or spike for entering the studding of a building, and the adjustable slide provided with an adjustable knife which is adapted to fit under the siding already on said building, the whole device operating substantially as and for the purpose set forth.

2. In a siding-bracket provided with a reciprocating saw and actuating mechanism, the combination of the frame having an inclined or beveled bearing-surface, and carrying said saw and actuating mechanism, with the supporting-guide for holding the board while being sawed, all arranged to operate substantially as described.

3. The combination, with the frame and the supporting-guide, of the reciprocating saw, the adjustable frame which carries said saw and its spring and extension, and the gearing whereby the saw is reciprocated, substantially as specified.



4. In a siding-bracket, the combination, with the frame having an inclined bearing-surface, of the pin or spike, the adjustable slide carrying an adjustable knife, the reciprocating saw with the adjusting and the geared driving mechanism, the supporting-guide, and the handle, all arranged to operate substantially as and for the purpose set forth.

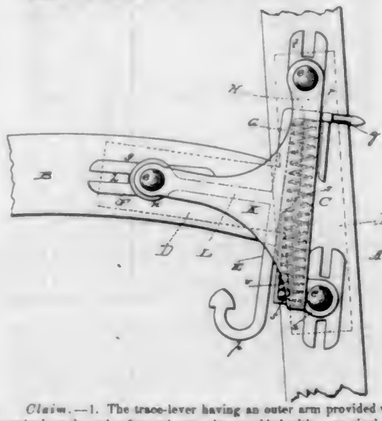
295,377. GOVERNOR FOR COTTON-GIN FEEDERS. LYCURGUS D. FORBIS, Stranger, Tex. Filed June 25, 1883. (No model.)

Claim.—1. The combination, with the roll-box of a cotton-gin, of a device constructed and arranged to swing within the arch of the roll-box and rest upon the roll in that arc of its circumference which has passed the saws before new cotton is taken onto the roll, a feed-roll, a feeding-apron for supplying cotton to the feed-roll, and means for transmitting the motion of the device that rests on the roll, caused by the increasing or diminishing of said roll, to the feeding-apron, whereby the feed of cotton into the gin will be accelerated when the roll diminishes and retarded when the roll increases beyond a fixed size, substantially as set forth.

2. The combination, with the roll-box of a cotton-gin, of a device arranged and adapted to rest on that portion of the roll which is in rear of the point at which the cotton is delivered thereto, of a feeding apron and roll and devices for transmitting the motion of the device that engages the roll, caused by the increasing and diminishing the size of the roll, to the feeding-apron, and thereby automatically starting, stopping, and regulating the rate of speed of the feeding-apron, substantially as set forth.

3. The combination, with the roll-box of a cotton-gin, of a vertically-movable device arranged and adapted to rest on that portion of the roll which is in rear of the point at which the cotton is delivered thereto, a feed-roll, a feeding-apron for supplying cotton to the feed-roll, a ratchet-wheel for actuating the feed-apron, pawls for operating the ratchet, and

mechanism transmitting the movement of the device that engages the roll to said pawls for regulating their adjustment, and thereby regulating the rate of speed of the feeding-apron, substantially as set forth.



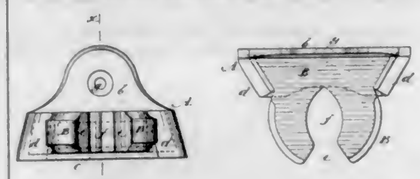
4. The combination, with the roll-box of a cotton-gin and a head-board arranged to rest on that portion of the roll which is in rear of the point at which cotton is delivered thereto, of a feed-roll and endless apron for supplying cotton to the feed-roll, a ratchet-wheel connected with one of the rollers of the feeding-apron, pawls for actuating the ratchet, devices for transmitting motion from the feed-roll to said pawls, and devices for transmitting the motion of the head-board to the pawls, and thereby regulating their adjustment and the rate of speed of the endless apron.

5. The combination, with the gin, of the head-board, arms *b b'*, slide, ratchet-wheel, holder-frame, dog-holder, dogs, vibrating lever, and devices connecting the arm *b'* to the dog-holder, substantially as set forth.

6. The combination, with the gin, of the endless apron, head-board, arms *b b'*, slide, dog-holder, dogs, and cords connecting the arm *b'* to the dog-holder, substantially as set forth.

7. The combination, with the gin, of the endless apron, head-board, arms *b b'*, ratchet-wheel, dogs, dog-holder, a screw for moving the lower dog independently of the upper one, and the cords connecting the arm *b* to the dog-holder, substantially as set forth.

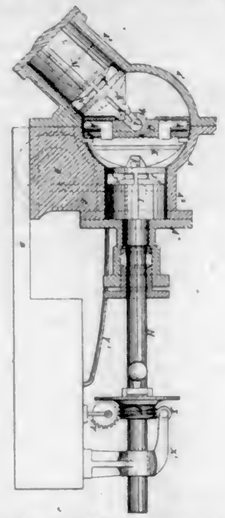
295,378. TRACE-HITCH. DAVID A. FOSTER, Dublin, Ind. Filed Dec. 10, 1883. (No model.)



Claim.—1. The trace-lever having an outer arm provided with a terminal catch, and a forward arm, also provided with a terminal catch, substantially as specified.

2. The fulcrum-plate having a shouldered bearing for the eye of the trace-lever, substantially as specified.

3. The plate H, having a recess to receive a spring, *s*, and adapted to be connected to the fulcrum-plate F by a cover-plate, K, forming a brace at the joint between the thill and cross-bar, substantially as specified.



4. The combination, with a plate adapted to hold a spring, of a fulcrum-plate and a hitch-lever pivoted on said fulcrum-plate and engaging the spring, substantially as specified.

295,379. BROOM-HOLDER. ALEXANDER FRAZIER and DANIEL J COBURN, Maywood, Ill. Filed Aug. 31, 1883. (Model.)

Claim.—The box A, constructed with a clamp-holding chamber having its sides *d d* arranged to incline toward each other both in a forward and upward direction, in combination with the jaw-like rubber clamp B, arranged to fit within said chamber, and to project in front thereof, and constructed with a receiving-space, *f*, and flaring mouth *e*, substantially as and for the purposes herein set forth.

295,380. ROTARY ENGINE AND PUMP. RICHARD H. FROUDE, Kensington, County of Middlesex, England. Filed Sept. 20, 1883. (No model.)

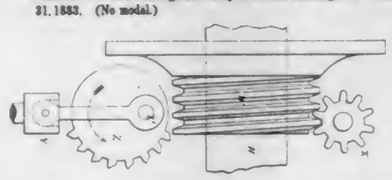
Claim.—1. The casing A A', divided transversely to the axial line of the engine-shaft, having cylindrical extensions A^2 A^3, with steam and exhaust chests C C', ports E E' F F', and passages G G', arranged and operating substantially as herein described.

2. The cylinder I, having steam and exhaust passages J J' and ports J^2 J^3, and pressed by screws L L' or equivalent devices against the flat face of the blade K, substantially as described.

3. The round-ended cylinder M, having passages N N' and ports N^2 N^3, and pressed by screws $L L^2$ or equivalent devices against the concave face of the blade K', substantially as described.

4. In combination with the divided cylinder M, the barrel-shaped bush P, through which the dummy-shaft O passes, for allowing a certain amount of lateral play of the shaft in the cylinder, substantially as described.

5. The blades K K', with notches *k'*, operating, in combination with the ports J^2 J^3 N^2 N^3, for alternately putting the spaces in the casing A A' in communication with the steam and exhaust.

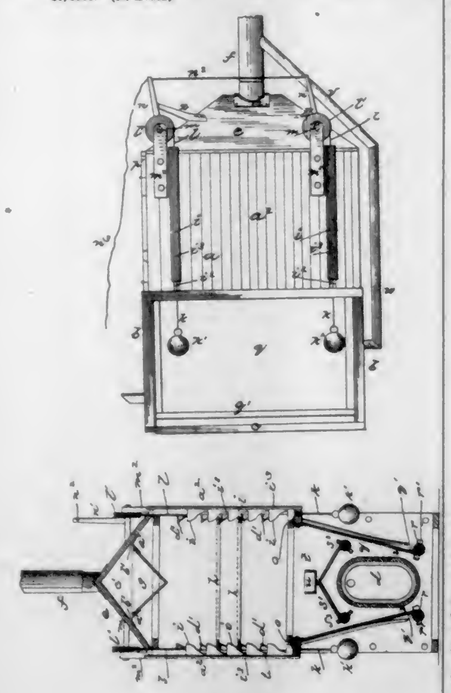


6. The blades K K', with trunnion-pins *k* formed in one piece there-

with, in combination with the disk or piston Q, having separate brasses S, for receiving the trunnion-pins fixed in gaps *q'* therein, substantially as herein described.

7. In combination with the blades K K' and piston Q, the packing-pieces R R', T, and U, arranged and operating substantially as herein described.

8. The combination of the dummy O, provided with the blade K', the shaft H, provided with the blade K, a worm on said shaft, a wheel having teeth on part of its circumference for gearing with the worm, a pump for supplying a lubricant to said parts, a crank-pin for imparting motion to said pump, and a pawl-and-ratchet connection between said wheel and crank-pin, whereby the said pump will be operated to supply a lubricant to said parts, substantially as and for the purpose set forth.

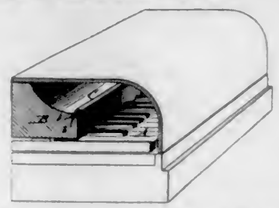


295,381. APPARATUS FOR LUBRICATING PISTONS, &c. RICHARD HURRELL FROUDE, Kensington, County of Middlesex, England. Filed Dec. 31, 1883. (No model.)

Claim.—1. In combination with a worm on a rapidly-revolving shaft, a wheel having teeth on part of its circumference for gearing with the worm, and a crank-pin for imparting motion to a lubricating-pump, the said wheel being rotated slowly by a pawl-and-ratchet motion derived from the said worm, until its teeth come into gear with the worm, whereby it receives a rapid motion for effecting the forcing-stroke of the pump, substantially as and for the purposes described.

2. The combination of the worm W, worm-wheel X, eccentric X^1, pawl X^2, ratchet-wheels Y Y^2, and wheel Z, having teeth gearing with the worm W, and a crank-pin, Z', for working a lubricating-pump, arranged and operating as herein described.

295,382. FRUIT-DRIER. CONRAD J. GEISER, Ashley, Ill. Filed July 28, 1883. (No model.)

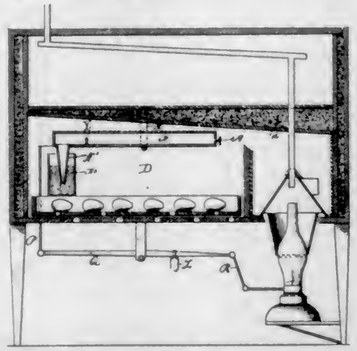


Claim.—1. In a fruit-drier, the case-wall provided with the recessed sills, the vertical openings for the rack-bars, and the recesses for the step ends of the spring-steps, in combination with rack-bars with the extended face-strips, the cords and weights at the lower ends of said rack-bars, the cords extending to the grooved wheels on the rock-shafts above the case-top, the rock-shafts having the connected lever-arms, and the operating-cord for lifting the fruit-trays within the case-wall, substantially as specified.

2. The combination, with the furnace extending the length of the drier and centrally thereof, of the flaring jacket, the lower edges of which are rodded, the ends of the rods bearing in slots in the end bearings of the furnace, and having the springs and nuts at the ends for adjusting and regulating the expansion and contraction of the metal, and the gable-shaped deflector having its edges rodded similarly to the edges of the jacket-walls, substantially as specified.

3. In a fruit-drier, the furnace-chamber *i*, provided with the drawer for containing sulphur for bleaching the fruit, substantially as specified.

295,383. KEY-RAIL FOR PIANOS AND ORGANS. PAUL GMELIN, New York, N. Y. Filed Oct. 25, 1883. (No model.)

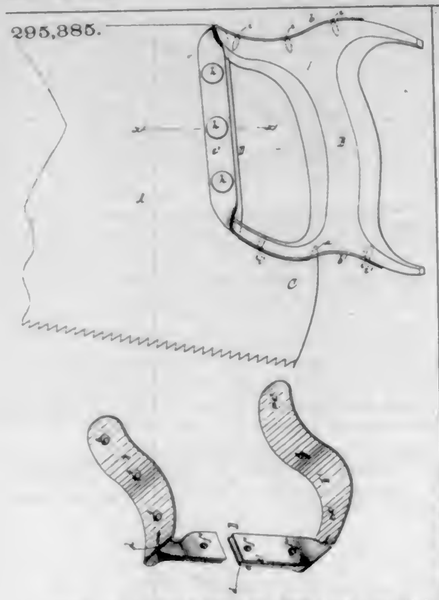


Claim.—1. The combination, with the key-rail of an upright piano or organ, of a guard-plate which covers the upper edge and projects somewhat in front of the key-rail, substantially as set forth.

2. The combination, in an upright piano or organ, of a key-rail having parallel longitudinal slits or recesses at the upper edge of its front face, with a guard-plate the ends of which are sprung into said slits, substantially as set forth.

3. The combination, in an upright piano or organ, of a key-rail having parallel longitudinal slits or recesses—one at each side of the upper edge of the front face of the key-rail—with a guard-plate the ends of which are sprung into said slits, and which project somewhat in front of the key-rail, substantially as specified.

295,384. DEVICE FOR REGULATING TEMPERATURE. JAMES M. HALSTED, Oakland, Cal., assignor to Kate K. Halsted, same place. Filed Aug. 29, 1883. (No model.)



Claim.—1. The combination, in an incubator or similar structure, of a casing adapted by the expansion of air it contains to shift or move devices controlling the heat source, and an air-induction valve admitting air to the casing to effect its return to its first position, substantially as described.

2. The combination, in an incubator or similar structure, of a casing adapted by the expansion of air it contains to set on a liquid cushion contained in a cup beneath to raise said casing, for the purpose described, and an air-induction valve admitting air to the casing, substantially as set forth.

295,385. SAW. WILLIAM H. HANKIN, Jr., Brooklyn, N. Y. Filed Jan. 7, 1884. (No model.)

295,385.

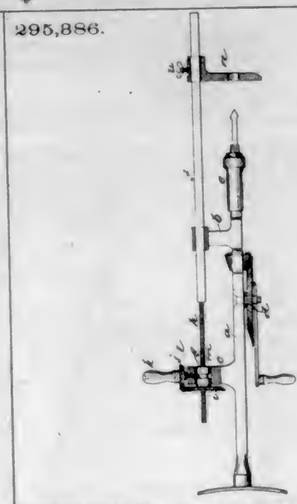
Claim.—1. A frame for connecting a handle with a saw-blade, composed of a single piece of sheet metal bent to form the upper and lower flexible arms, *b b'*, and the two parallel flexible jaws *c c'*, said arms being capable of bending to conform to the upper and lower edges of the handle, and the jaws capable of yielding laterally to receive between them saws of varying thickness, substantially as described.

2. The combination, with a handle, B, and a saw-blade, A, of the sheet-metal frame D, formed integral with the upper and lower flexible arms, *b b'*, bent to conform with and attached to the upper and lower edges of the handle, and the flexible jaws *c c'*, capable of yielding laterally and clamped upon the butt-end of the saw-blade, substantially as described.

3. The combination, with a saw-handle and a slotted frame attached thereto, of a saw-blade having its butt-end secured in the slot of the frame, and constructed with a tail, C, extending back of the butt-end of the blade and supported against the handle, substantially as described.

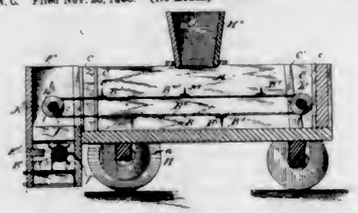
4. The combination, with a saw-handle, of a saw-blade having its butt-end connected with the handle, and constructed with a tail extending back of the butt-end of the blade and supported by the handle, substantially as and for the purpose described.

5. The combination of a handle, B, and a sheet-metal frame, D, constructed with upper and lower flexible arms, *b b'*, bent to conform with and secured to the upper and lower edges of the handle, and with two flexible jaws, *c c'*, capable of yielding laterally, with a saw-blade, A, having its butt-end secured between the jaws, and constructed with a tail, C, extending back of the butt-end of the saw-blade and supported by the handle, substantially as described.



6. The combination of a handle, B, and a sheet-metal slotted frame, D, having the flexible arms *b b'* and flexible jaws *c c'*, with the saw-blade having its butt-end secured between the jaws, and constructed with a tail, C, extending back of the butt-end of the blade and entering the slot in the frame, said tail being supported by the handle, substantially as described.

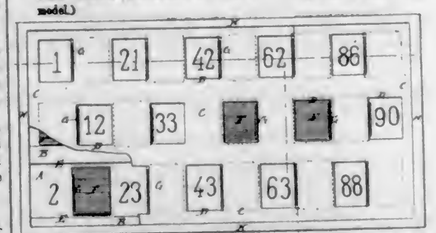
7. The combination of a handle, B, and a frame, D, having flexible arms *b b'* and flexible jaws *c c'*, with a saw-blade, A, having its butt-end secured between the jaws, and constructed with a tail, C, extending back of the butt-end of the blade, and provided with a spur, *a*, entering the handle, substantially as described.



295,386. BREAST-DRILL. JOHN F. HARDWIT, Bonaparte, Iowa. Filed Oct. 19, 1883. (No model.)

Claim.—1. In a breast-drill, the combination, with the drill-stock *a*, provided with the brackets *b c*, of the feed-bar *f*, having the screw-threaded section *h*, and carrying the bracket *n*, the feed-nut *g*, arranged in the bracket *c*, and means for turning said nut, substantially as herein shown and described.

2. The feed-nut *g*, having groove *m*, and bevel-wheel *i*, thumb-bit *k*, having pinion *j*, and the stud-pin *l*, supporting the thumb-bit and securing the feed-nut, in combination with the feed-bar *f* and drill-stock *a*, substantially as described.

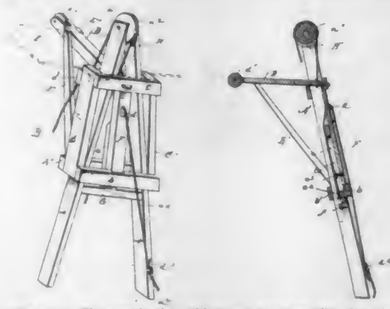


295,387. FERTILIZING-MACHINE. GEORGE W. HARKEY, Matthews, N. C. Filed Nov. 20, 1883. (No model.)

Claim.—1. A fertilizing-machine consisting of wagon A, having bopper H^2, annex-frame F, having pins *f'*, fenders D, shaft E, having pins *f*, pulverizing-bar E', chute G, adjustable by pins *m* in orifices *m'*, apron B, pulverizing-bar E', and the actuating mechanism, substantially as shown, and for the purpose described.

2. In a fertilizing-machine, the combination of the wagon A, having bopper H^2, apron B, having pins B^4, annex-frame F, having pins *f'*, fenders D, shaft E, having pins *f*, chute G, adjustable by pins *m* in orifices *m'*, pulverizing-bar E', and the actuating mechanism, substantially as shown and described.

295,388. CARD FOR PLAYING LOTO AND OTHER GAMES. HENRY HELLER HARRISON, New York, N. Y. Filed Jan. 5, 1884. (No model.)



Claim.—1. A card for playing loto and other games, made substantially as herein shown and described, and consisting of the base-plate A, having numbers printed upon it, the intermediate plate, B, having slots E over the lines of numbers, the top plate, C, having openings D over the numbers, and the slides F to cover the numbers, as set forth.

2. In a card for playing loto and other games, the combination, with the base-plate A, having numbers printed upon it, of the intermediate plate, B, having slots over the rows of numbers, the top plate, C,

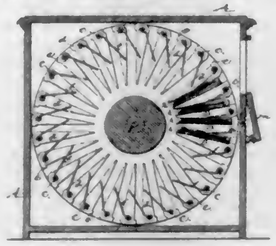
having openings D over the numbers, and the slides F to cover the numbers, and provided with handle-flanges G, substantially as herein shown and described, whereby the numbers can be readily covered and uncovered, as set forth.

295,389. SCAFFOLDING. JOHN THOMAS HASKELL, Norwalk, Ohio, assignor of one-half to H. E. Streator, same place. Filed Nov. 27, 1883. (No model.)

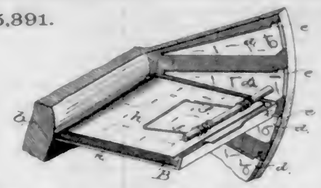
Brief.—Consists of a frame having a projecting bar with idler-wheel, said frame sliding upon two laterally-spreading uprights connected at their upper ends. Between said uprights slides a locking-bar formed of a cross-piece, and a vertical piece having a slot engaging a screw or bolt on a vertical piece of the sliding frame. Both sliding parts are controlled by cord and pulley.

Claim.—1. The combination, with two or more laterally-adjustable supporting-beams, connected at their upper ends and carrying a pulley, of a frame arranged upon said beams, and having a rope or chain adapted to engage said pulley, and a bar having a transverse locking-bar secured at its lower end, and provided with a longitudinal slot adapted to receive a bolt or screw projecting from one of the bars of said frame, substantially as set forth.

2. The combination, with the laterally-adjustable beams A A', connected at their upper ends and carrying a pulley, of a frame or scaffold adapted to slide thereon, and having a rope adapted to engage said pulley, and consisting of the side beams, C C', braces *b b'* and *c c'*, a beam, D, having an idler or roller, *d'*, bracing-beams E E', brace or bar F, having a pulley, *d*, and the locking device G, consisting of the slotted bar *s* and cross-bar *f*, and a rope or chain for operating said bars, substantially as set forth.



295,390. SNAP-HOOK. GEORGE HAVELL, Newark, N. J. Filed Oct. 10, 1883. (No model.)

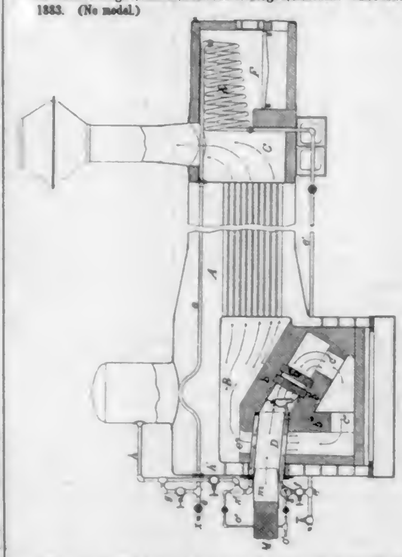


Claim.—1. A snap-hook consisting of a bar bent into a hook at one end and a loop at the other, having a shoulder near the loop, and a leaf-spring, the free end of which lies normally under the end of the hook, while the other end is provided with wings, which are bent around the bar between the shoulder and the loop for securing said spring in place, substantially as described.

2. The combination, with the hook having a shouldered shank, of the leaf-spring formed with a socket to fit upon the shank, and the swiveled loop secured to the end of the shank and bearing against the end of the socket, substantially as and for the purposes specified.

295,391. LETTER OR PAPER FILE. WILLIAM R. HAVENS, Denver, Colo. Filed Jan. 15, 1884. (No model.)

295,391.



Claim.—1. In a paper and letter file, the combination, with a vertically-revolving wheel entirely inclosed within a frame, A, of the trays B, provided with the flaps *h*, which are held in position by the springs *f*, secured to the connecting-rods *c*, the said rods being secured to each of the tray-supports *d*, having a shoulder, *e*, against which each of the trays abuts, substantially as and for the purpose set forth.

2. In a paper and letter file, the frame A, adapted to inclose a vertically-revolving wheel provided with a series of trays, B, arranged in guides formed by the supports *d*, having the shoulders *e*, in combination with the connecting-pieces *c*, provided with the springs *f*, and a flap secured to the tray B, substantially as and for the purpose set forth.

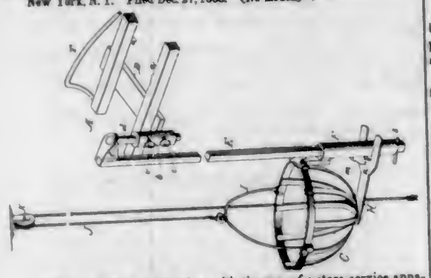
3. In a paper and letter file, a vertically-revolving wheel or tray receptacle provided on its inner faces with a series of tray-supports, *d*, having shoulders *e*, as and for the purpose set forth.

295,392. VAPOR AND GAS GENERATING FURNACE FOR LOCOMOTIVES, &c. HENRY F. HAYDEN, Washington, D. C., assignor to himself, John A. Logan, Illinois, and John T. Morgan, Alabama. Filed Mar. 20, 1883. (No model.)

Claim.—1. In furnaces for locomotives, a series of vertical and cross walls of refractory material arranged within a close fire-box, forming a compact heat-storer, and also increasing the length of the flame-flues within said box, in combination with checker-work arranged at the entrance of the flame-flues to break up and intermingle the air and gas, whereby the air and gas are brought into the proper relation and maintained at a proper temperature to insure complete combustion before reaching the boiler-sheets, substantially as and for the purposes specified.

2. In furnaces for locomotives, a series of vertical and cross walls of refractory material arranged within a close fire-box, forming a compact heat-storer, and also increasing the length of the flame-flues within said box, in combination with a superheater arranged in one of said vertical or cross walls, substantially as and for the purpose specified.

3. In a furnace for locomotives, the combination of a series of vertical and cross walls of refractory material arranged within a close fire-box, forming a compact heat-storer, and also increasing the length of the flame-flues within said box, a checker-work arranged at the entrance of the flame-flues to break up and intermingle the air and gas, and a burner arranged in front of the checker-work, substantially as and for the purpose specified.



4. In a fire-box, the combination of a series of refractory walls and arches arranged to form tortuous flame-passages, an annular generator arranged across the flame-passage and projecting into the mouth of the same, and a burner connected with the generator and arranged at the entrance of the flame-passage, substantially as and for the purpose specified.

5. In a furnace for locomotive-boilers, the combination of a series of vertical and cross walls of refractory material arranged within the close fire-box, forming a compact heat-storer, and also increasing the length of the flame-flues within said box, a burner arranged at the entrance of the flame-passage, a superheater, and a pipe leading therefrom, and an oil-supply pipe for supplying oil to the burner, substantially as and for the purposes specified.

6. In a furnace for locomotive and other boilers, the combination of a fire-box having a series of refractory walls and arches, forming tortuous flame-passages, an annular generator arranged across the flame-passage, and provided with a burner which projects into the flame-passage, a superheater provided with a pipe leading to the annular generator, an auxiliary furnace for the superheater, and an oil-supply pipe leading to the annular generator, substantially as and for the purpose specified.

7. In a furnace for locomotive and other boilers, the combination of a series of refractory walls and arches, arranged to form tortuous flame-passages, an annular generator arranged across and projecting into the flame-passages, a steam-pipe leading from the boiler to the generator, and an oil-supply pipe leading into the steam-pipe, substantially as and for the purpose specified.

295,393. ELEVATOR FOR CASH-CARRIERS. HARRIS H. HAYDEN, New York, N. Y. Filed Dec. 27, 1883. (No model.)

Claim.—1. The combination, with the way of a store-service apparatus, of an elevator for the carriers, provided with a receptacle, connected and arranged, substantially as described, to discharge the carrier upon the track at an angle thereto, for the purpose set forth.

2. The combination, in an elevator for store-service apparatus, of a vertical guide, a receptacle for the carriers, pivoted to a slide moving upon said guide, to swing at an angle to the way, substantially as specified.

3. The combination of the guide-rod, slide moving thereon, basket pivoted thereto, and an elevating-cord for moving the parts vertically upon the guide, substantially as set forth.

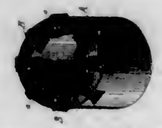
4. The combination, with the slide and vertical basket, of a catch device for retaining the basket horizontally in connection with the slide, and a stop arranged to be struck by the catch, to release the basket and permit it to turn upon its pivot, substantially as set forth.

5. The combination of the guide, slide, pivoted basket, catch device, and cord connected to the basket, substantially as specified.

6. The combination, with the way, of a pendent guide-rod carrying a slide to which the receptacle is connected, and adjusting means for securing the rod adjustably to the way, substantially as specified.

7. The combination, with the way and device for placing the carrier thereon, of a guard, for the purpose specified.

8. The combination, with the way, of the elevator-rod, the cross-piece R, and a steadying-rod, S, adjustably connected to one or both of the ways, as and for the purpose set forth.



9. The guide-rod connected to a pin, *d*, capable of being turned and secured in its bearing, substantially as described.

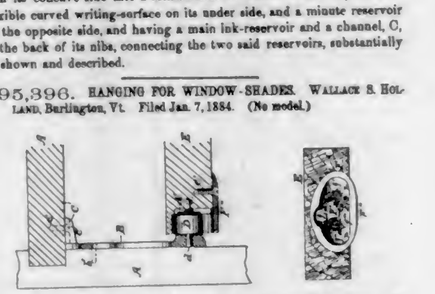
10. The combination of the slide, carrier pivoted thereto, catch device, elevating-cord, and means for releasing the catch, substantially as described.

295,394. SETTING DIAMONDS IN TOOLS. ANTHONY HESSELS, New York, N. Y. Filed Nov. 23, 1883. (No model.)

295,394.

Claim.—1. The combination of a stock provided with a transverse recess the sides of which are slightly inclined toward the vertical and longitudinal axes of the recess, and a diamond or carbon two opposite sides of which are shaped to correspond to the recesses of the stock, substantially as set forth.

2. The combination of a stock or tool body provided with transverse dovetail recesses, said recesses being alternately tapered in opposite directions, and a series of cutting-diamonds dovetailed and tapered to fit said recesses.

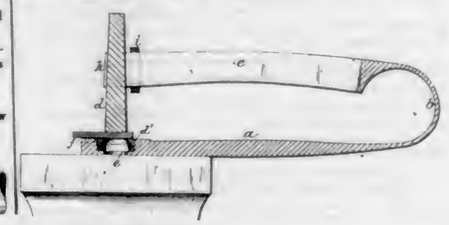


295,395. METALLIC PEN. HEZEKIAH HEWITT, Birmingham, County of Warwick, England. Filed May 16, 1883. (No model.) Patented in England Jan. 26, 1883, No. 429; in France Feb. 23, 1883, No. 141,582; in Germany Feb. 24, 1883, No. 16,738, and in Belgium Feb. 24, 1883, No. 44,123.

Claim.—1. The pen having the extreme points of its nibs bent backward from its concave side into a semicircular or hollow form, to provide a flexible curved writing surface or projection, D, substantially as shown and described.

2. The pen having the extreme points of its nibs bent backward from its concave side into a semicircular or hollow form, to provide a flexible curved writing-surface on its under side, and a minute reservoir on the opposite side, and having a main ink-reservoir and a channel, C, in the back of its nibs, connecting the two said reservoirs, substantially as shown and described.

295,396. HANGING FOR WINDOW-SHADES. WALLACE S. HOLLAND, Burlington, Vt. Filed Jan. 7, 1884. (No model.)



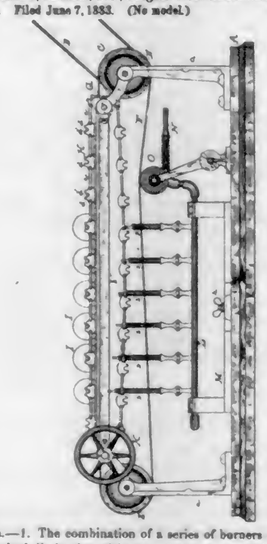
Claim.—1. The bracket B, having the right-angled flanges C, the projecting pin or axle *d*, and the roller D thereon, constructed to operate as and for the purposes described.

2. The hanger F, having the end opening, F', with arcs of circles *f f f''*, straight base *f'''* therein, and flange F'', with screw-hole *e* therein, as described.

3. The hanger F, having the opening F', and arcs of circles *f f f''*, straight base *f'''*, and flange F''', having screw-hole *e* therein, in combination with the top slat, E, of an inside window-blind, as and for the purposes described.

4. The combination of the hanging slat E and hanger F with the bracket B, having friction-roller D thereon, and operating substantially as described.

295,397. BLACKSMITH'S PUNCH. WILLIAM P. HOLMAN, Howard, Ga. Filed July 2, 1883. (No model.)



Claim.—1. The within-described punching implement, consisting of a punch-pin, *d*, tapering from its cutting to its driving end, a spring-arm, *c*, having a clamping-socket, a base-arm, *a*, joined to said spring-arm, and a die, *f*, having a downward-flaring opening, the said punch-pin being clamped directly by the spring-arm and held upon the plate to be punched by the positive action of said spring-arm, substantially as set forth.

2. The punch-pin *d*, tapering from its cutting to its driving end, in combination with a clamping-arm, *c*, therefor, a die, *f*, having a downward-flaring opening, and a base-arm, *a*, having a spring-connection with said clamping-arm, as shown and described.

3. The punch-pin *d*, tapering from its cutting to its driving end, in combination with a removable die, *f*, having a downward-flaring opening, a base-arm, *a*, having a recessed seat for the die, and an overhanging arm, *c*, having a clamping-socket for the punch-pin joined to the base by an integral plate-spring, as shown and described.

295,398. MANUFACTURE OF INCANDESCING ELECTRIC LAMPS.

WM. HOLZER, Harrison, N. J., assignor to the Edison Lamp Company, same place. Filed June 7, 1883. (No model.)

Claim.—1. The combination of a series of burners adapted to produce a gradual diminution of heat, and one or more lamp-holders arranged to travel above them, whereby a gradual cooling of said lamp is effected, substantially as set forth.

2. The combination of a series of burners arranged to produce a gradual diminution of heat, a series of lamp-holders arranged to travel above said burners, and means for revolving the lamps in their holders, substantially as set forth.

3. The combination, with the series of burners arranged substantially as described, of the series of lamp-holders, means for moving such holders a distance equal to that between the burners at each movement, and means for continually revolving the lamps in the holders, substantially as set forth.

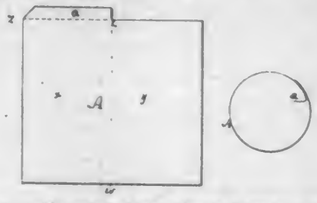
4. The combination, with the series of burners, of the endless chains carrying the lamps, and the belt on which also the lamps rest, substantially as set forth.

5. The endless chains formed of links connecting lamp-holders together, substantially as set forth.

6. The lamp-holders, consisting of notched plates joined together by links, substantially as set forth.

7. The combination, with the lamp-holding devices, of the adjustable series of burners, substantially as set forth.

8. The combination of the series of burners arranged to produce a gradual diminution of heat, and the series of lamp-holders, the latter extending beyond the last of the burners, substantially as and for the purpose set forth.



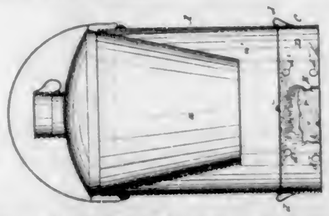
9. The combination, with the lamp-holders, of the series of burners of successively-decreasing height, substantially as set forth.

10. The method of annealing a sealed joint in an incandescing electric lamp, consisting in passing the lamp over a series of burners of gradually-diminishing intensity of heat, substantially as set forth.

11. The method of annealing a sealed joint in an incandescing electric lamp, consisting in passing the lamp over a series of burners of gradually-diminishing intensity of heat, at the same time continually revolving said lamp, substantially as set forth.

295,399. FERRULE.

GEORGE E. HOPKINS, Cincinnati, Ohio. Filed July 14, 1883. (No model.)



Claim.—1. The method of forming ferrules for brushes, which consists in forming the blank with a projection, *a*, on one edge, bending the projection to a position at right angles, or thereabout, to the body of the blank, then forming the ferrule with the flanged edge overlapped by the opposite edge of the blank.

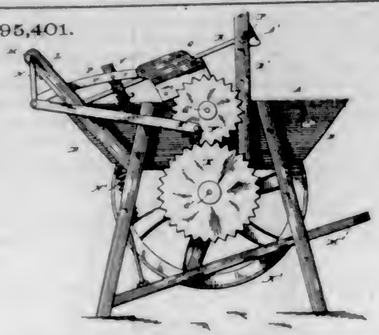
2. A sheet-metal ferrule provided with one or more internally-projecting flanges, formed by bending inward a portion or portions of the plate of which the ferrule is made, for the purpose set forth.

295,400. LUNCH-HEATER.

GEORGE S. IRDELL, Philadelphia, Pa. Filed June 12, 1883. (No model.)

Claim.—A heating attachment for dinner-kettles and similar vessels, comprising a lamp having a central burner and external surrounding walls, having two series of openings, one for the admission of air to support combustion and the other higher up for the escape of the products of combustion, said walls having attached to them upwardly-extending spring-clamps or spring-jaws, whereby the kettle or vessel to be heated is supported directly on the external walls of the lamp and clamped thereto by the spring-jaws, which latter hold the lamp below the kettle when the latter is being carried, said walls also serving to protect the exterior of the vessel from contact with the flames, substantially as specified and shown.

295,401. WASHING-MACHINE.



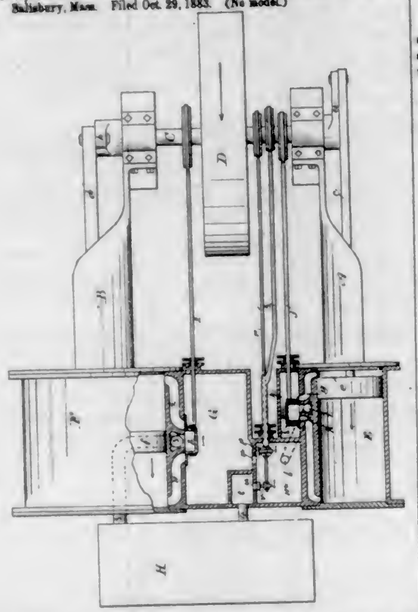
ADOLPHUS JACKSON, Frederick, Md. Filed Apr. 2, 1883. (No model.)

Claim.—1. The combination, with the tub A, provided with inclined rabbeted supports C, of the wash-board consisting of the parts *a b*, the upper one of which is provided with a slot, *d*, and a rail, *e*, the lower one being slotted and secured to the upper part by means of a bolt, G, and provided with springs H, and ledge I, and the rubber Q, and mechanism for operating the same, substantially as and for the purposes specified.

2. The combination, with the frame Q, provided with lugs T, of the concave rubbers S, perforated as described, substantially as and for the purposes specified.

295,401.

295,402. CLEVIS.

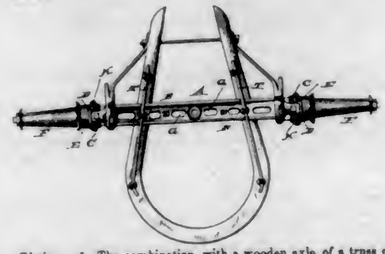


LOUDEN JAQUES, Maple Rapids, Mich. Filed Nov. 22, 1883. (No model.)

Claim.—In combination with the clevis A, provided with a perforated end, B′, having a lip, C, formed thereon, the pin D, having a slotted collar, D′, substantially as shown, and for the purpose set forth.

295,408. COMPOUND STEAM-ENGINE.

CLARENCE W. JENKINS, Salisbury, Mass. Filed Oct. 29, 1883. (No model.)



Claim.—1. In a compound or double-cylinder engine wherein the same steam acts first in the high and then in the low pressure cylinder, the combination, with said cylinders and the condenser, of suitable conduits and valvular devices, whereby the steam passing from the high to the low pressure cylinder will, without passing through said low-pressure cylinder, be diverted into the condenser at or near the point or time when the pressure of such exhaust-steam has produced an equilibrium of pressure in the two cylinders, substantially as specified.

2. In a compound or double-cylinder engine, the combination, with the high and low pressure cylinders and a condenser with suitable conduits and valvular devices, by which the steam as it is exhausted from the high-pressure cylinder enters and operates in the low-pressure cylinder, of a conduit and automatically-actuated valvular device, whereby when the piston in the high-pressure cylinder is at or near the dead-centers, and after the exhaust therefrom has produced an equal pressure in the two cylinders, the remaining exhaust-steam in said high-pressure cylinder will be conducted to the condenser without passing through the low-pressure cylinder, substantially as specified.

3. In a compound engine, the combination of high-pressure cylinder E, low-pressure cylinder F, condenser H, exhaust-pipe *l*, connected with cylinder E, steam-port *n*, and its valve *p*, arranged to admit to and exclude from cylinder F the steam issuing from said pipe, steam-port *u*, with its valve *v*, arranged to admit to and exclude from the condenser the steam issuing from said pipe, and actuating devices connected with and arranged to so actuate said valves that as the exhaust-steam intermittently escapes from pipe *l* it will, as soon as an equal pressure thereof is established in said cylinders, be shut off from cylinder F and conducted to said condenser, substantially as specified.

295,404. WAGON-AXLE.

THOMAS M. JENKINS, Moline, Ill., assignor to himself and WILLIAM UHLEMAN, same place. Filed Dec. 29, 1883. (No model.)

Claim.—1. The combination, with a wooden axle, of a truss consisting of a flat plate, A, having flanges B B, slots G, and brackets C, the skeins F, having flanges E, notches D, and flanges K, and suitable connecting-clips, as set forth.

2. The truss-plate A, having openings G, brackets C, and flanges B, provided with notches N, as and for the purpose set forth.

295,405. STATION-INDICATOR.

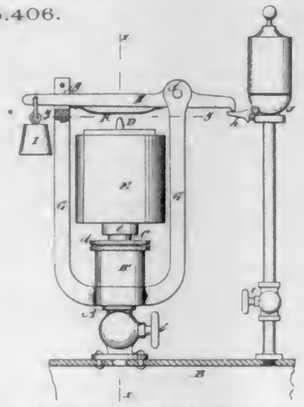
CHARLES H. JENNE, Indianapolis, Ind. Filed Dec. 7, 1883. (No model.)

Claim.—1. In a combined station and street indicator for railroad and street cars, the rollers *r* and *r′*, provided with journals on each end, annular grooves in which are fitted the rubbers *ru*, upon which the spring *sp* impinges, and the knobs *k* and *k′*, in combination with the canvas strip *c*, substantially in the manner and for the purpose described and set forth in the above specification.

2. In a combined station and street indicator for railroad and street cars, the brake-spring *sp*, provided with the collared adjusting-screw *as*, in combination with the friction-rubbers *ru*, fitted into the annular grooves of the rollers *r* and *r′*, substantially in the manner and for the purpose set forth.

3. In a combined station and street indicator for railroad and street cars, the face-board *f b*, with longitudinal slots *sl* and *sl′*, forming the face of an indicator, consisting of rollers *r* and *r′*, provided with annular grooves in which rest the friction-rubbers *ru* and *ru′*, adjusting-screw *as*, spring *sp*, knobs *k k′*, and canvas *c*, all in combination, substantially in the manner and for the purpose set forth.

295,406. HIGH-PRESSURE ALARM FOR STEAM-BOILERS.



CHARLES W. JOHNSTON and PATRICK BROWN, Philadelphia, Pa. Filed July 30, 1883. (No model.)

Claim.—1. A high-pressure alarm apparatus for steam-boilers, provided with a loaded steam-plunger and with a supplementary resistance device arranged for actuation by said plunger to give or sound the alarm, whereby the plunger is kept in motion by fluctuations in pressure of the steam in the boiler, essentially as specified.

2. In high-pressure alarms for steam-boilers, the combination of the plunger C and stuffing-box B′, for connection with a pipe leading from the steam-space of the boiler, the weight E, the superposed weighted lever H, and an alarm device operated by said lever H, substantially as specified.

3. In high-pressure alarms for steam-boilers, the combination of the spring K, with the weighted lever H, and an alarm device operated by said lever, the weight E, the plunger C, and the stuffing-box B′, for con-

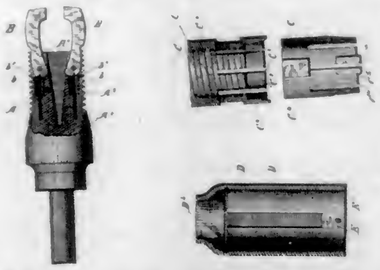
295,406.

nection with the steam-space of the boiler, essentially as and for the purposes herein set forth.

4. The combination of the steam pipe or connection A, the stuffing-box B', the plunger C, the rod D, the weight E, fitted to slip over said rod, the frame G, the weighted lever H, the spring K, and the steam-whistle J, for operation by the lever H, substantially as shown and described.

295,407. MANUFACTURE OF GLUCOSE OR GRAPE-SUGAR. ADOLF KATZER, Buffalo, N. Y., assignor of one-half to Albert B. Young, same place. Filed Feb. 1, 1884. (No specimens.)

Claim.—1. The herein-described improvement in the art of manufacturing glucose or grape-sugar from grain, which consists in neutralizing the acidulated converted material by sulphuret of calcium or its equivalent, substantially as described.



2. The herein-described improvement in the art of manufacturing glucose or grape-sugar from grain, which consists in neutralizing the acidulated converted material by a soluble sulphuret, substantially as described.

3. The herein-described improvement in the art of manufacturing glucose or grape-sugar from grain, which consists in purifying the neutralized liquid by passing an air-current through the same, substantially as described.

4. The herein-described improvement in the art of manufacturing glucose or grape-sugar from grain, which consists in neutralizing the material by a soluble sulphuret, and then purifying the neutralized liquid by passing an air-current through the same, substantially as described.

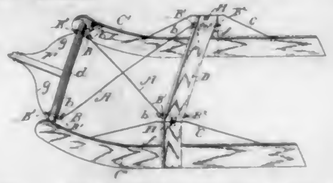
WITHDRAWN.

295,408. BRACE-CHUCK. GEO. W. KERR, Bridgeport, Conn. Filed Jan. 11, 1884. (No model.)

Claim.—1. The combination, with the jaws and the head, of an inner sleeve, screw-threaded thereon, and an outer sliding sleeve which engages with and is adapted to turn the inner sleeve, substantially as described.

2. The jaws pivoted in the head and operated by a sliding sleeve, in combination with a screw-threaded split sleeve having lugs which engage the outer sleeve and are expanded to lock said outer sleeve by an incline upon the head.

3. In a chuck, the combination, with means for gripping the tool, of a sliding sleeve which operates the gripping device, and a threaded split sleeve which, when expanded, locks the outer sleeve.



4. Head A, to which the jaws are pivoted, and which is provided with an external screw-thread, and an incline, A^3, in combination with a split sleeve, C, engaging the screw-thread, and provided with lugs which, when forced outward by the incline, engage in grooves in an outer sleeve, thus locking the two sleeves.

5. The head and the jaws, in combination with a sliding sleeve which closes the jaws, and means, substantially as described, for locking the sliding sleeve, and with it the jaws, by the rotation of said sleeve.

6. The head having an external screw-thread and an incline, and the jaws pivoted thereto, in combination with a sliding sleeve which closes the jaws, and lugs, engaging the screw-thread and operated by the incline, which lock the sliding sleeve.

7. In a chuck-head, A, a sleeve, C, having lugs C^4 C^5, in combination with sliding sleeve D, having grooves D' and shoulder D^2, and block E, secured in one of the grooves D', as described, and for the purpose set forth.

295,409. SLED. WILLIAM R. KILBURN, Petoskey, Mich. Filed Jan. 3, 1884. (No model.)

Claim.—1. A sled consisting of the brace-rods A, having hooks *b*, nutted bolts B, having eyes B', braces C, secured in straps or staples H, runners C', platform D, and shaft F, mortised in cross-bar *d*, and secured by bolts B, having eyes B', substantially as shown, and for the purpose described.

2. The combination of the brace-rods A, having hooks *b*, bolts B, having eyes B', braces C, secured in straps or staples H, platform D, and cross-bar *d*, substantially as shown, and for the purpose described.

3. In a sled, the combination of the shaft F, brace-bars *g*, cross-bar *d*, bolts B, having eyes B', brace-rods A, braces C, secured in straps or staples H, platform D, and runners C', substantially as shown, and for the purpose described.

295,410. PROCESS OF MANUFACTURING GLASS. LOUIS KNAFFL, Vienna, Austria-Hungary, assignor to Theodore M. Schleier, Nashville, Tenn. Filed June 27, 1883. (No specimens.)

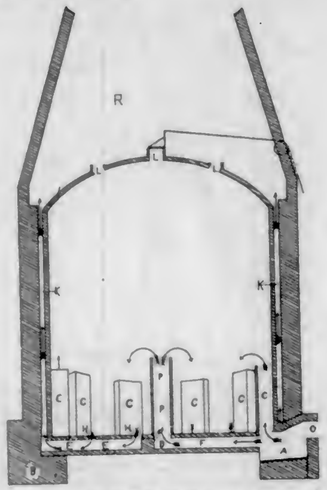
Claim.—1. The process of producing a clear and transparent as well as opaque and colored glass, which consists in the action of barium or strontium or calcium oxides upon zinc phosphate, substantially as described and set forth.

2. The process of producing glass by the use of phosphoric acid, substantially as set forth and described.

3. The process of producing glass by neutralizing zinc phosphate, evaporating to dryness, and then heating to a cherry-red heat, substantially as described and set forth.

4. As a new article of manufacture, a glass produced by the use of phosphoric acid, substantially as set forth and described.

5. As a new article of manufacture, a glass produced by the action of barium or strontium or calcium oxides upon zinc phosphate, substantially as described and set forth.



295,411. POWER-PRESS. GEORGE B. LANE, Waterbury, Conn., assignor to the Waterbury Farrel Foundry and Machine Company, same place. Filed Nov. 26, 1883. (No model.)

Claim.—1. The herein-described improvement in adjustable power-presses, consisting of the bed which carries the operative mechanism, combined with rockers upon which the bed is fixed, tracks or bearings upon which said rockers will work, and vertical arms extending upward and parallel with the sides of the rockers, said arms constructed with segment-shaped slots corresponding in shape to the path of movement of bolts in said rockers, and so that said bolts will work through the respective slots as the machine is turned to different positions, and so that said bolts through said slots will secure the machine at any desired position, substantially as described.

2. The combination of the bed A, carrying the operative mechanism, rockers C, supporting said bed and mechanism, and tracks or bearings D D, upon which said rockers work, said tracks constructed with an arm at the front and rear extending upward parallel with the sides of the rockers, and constructed with segment-shaped slots corresponding to the path of the bolts, which extend from said rockers through said slots, and by which bolts the machine may be secured at any desired position, substantially as described.

295,412. POTTERY-KILN. LEWIS LAWTON, Trenton, N. J. Filed Jan. 12, 1884. (No model.)

Claim.—1. In a kiln for firing pottery-ware, the return-flues E, in combination with the annular flue K, surrounding the inner lining of the kiln, substantially as shown and described.

2. In a kiln for firing pottery-ware, the return-flues E, provided with the downdraft-holes *A*, in combination with the annular flue K, surrounding the inner lining of the kiln, substantially as shown and described.

3. Means for firing pottery or other ware, consisting of a kiln provided with the flues F, connecting with the central well-hole, D, and the fire-bags C, and provided with the return-flues E, having downdraft-holes H, connecting with the annular flue K, surrounding the inner lining of the kiln, substantially as shown and described.

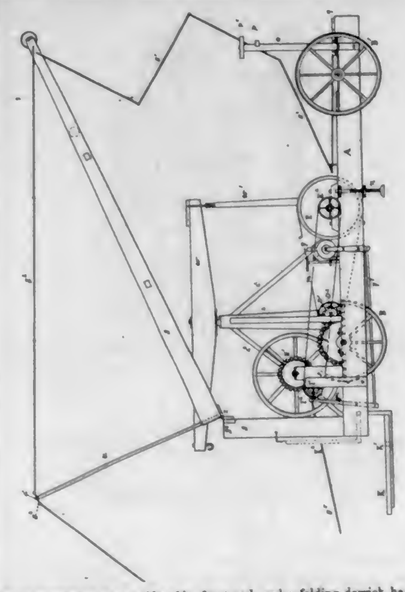
295,413. WELL-DRILLING RIG. JAMES GILLOTT MARTIN, Bradford, Pa. Filed July 9, 1883. (No model.)

Claim.—1. In a well-drilling rig, the combination of a bed-frame, A, mounted on wheels, and adapted by means, substantially as shown, to be converted into a traction-wagon, and a derrick adapted to fold down into a convenient position for transportation, substantially as shown.

2. In a well-drilling rig, the combination of a bed-frame, A, mounted on wheels and adapted to be moved by an engine mounted thereon, a band-wheel, E, having crank E', pitman *w'*, working-beam *w*, and derrick *s s*.

3. In a well-drilling rig, the combination of the bed-frame thereof and the screws *n n*, or either of them, for the purposes mentioned.

4. In a portable drilling-rig, a bed-frame widest at one end, with the wheels of one truck located inside the bed-rails, substantially as shown and described.



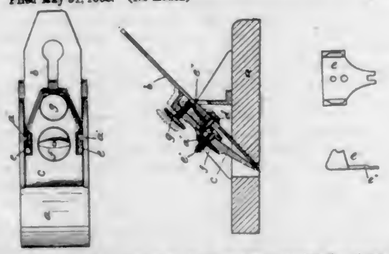
5. In a well-drilling rig, the floor K, adapted to let down into proper position for use and to fold up for transportation, substantially as shown and described.

6. In a well-drilling rig, the combination of a base or frame, A, a derrick joined to said base and having a break-joint above the base, and guys for holding the upper section of the base in position, and adapted to be folded upon each other, substantially as described, when the upper section of the derrick is folded upon the base, substantially as described.

7. In a well-drilling rig, the combination of a base and a vertical derrick formed in two parts, hinged together, the hinge on one side of the derrick being lower than on the other side, for the purpose set forth.

8. In a well-drilling rig, the combination of the derrick *s s*, swinging boom *u*, and guy *s'*, substantially as shown.

9. In a well-drilling rig, the combination of a frame or base, A, having support *o* at one side of its front end, and a folding derrick having the hinge on one side lower than on the other, substantially as described, so that when folded the upper end will rest upon the support *o*, for the purpose set forth.

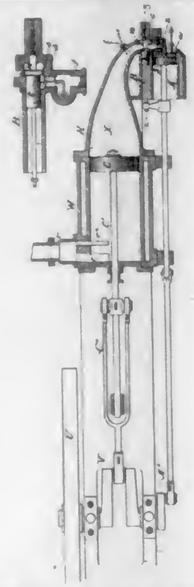


10. In a device for drilling in front of the rig, a frame having a derrick at its front end, a samson-post back of the derrick, and the bull-wheel between the samson-post and the derrick, substantially as described.

11. In a well-drilling rig, the combination of a spudding-shaft and the bull-wheel shaft by means of gear, substantially as described, and for the purpose set forth.

12. In a well-drilling rig, the combination of the band-wheel E, spudding-shaft I, and bull-wheel H.

13. In a well-drilling rig, the combination of the axle G', tiller-chains *w' w'*, and shaft of wheel *w*, substantially as described and shown.



295,414. BENCH-PLANE. CHARLES A. MEKEEL, New Hartford, Conn. Filed May 31, 1883. (No model.)

Claim.—1. In combination, the plane-body bearing the pivots, the plane-iron, the cap-iron attached to the plane-iron, the longitudinally-rocking clamp-iron, adjustably connected to the cap-iron and bearing between its points of connection upon the pivots on the plane-body, all substantially as described.

2. The combination of the longitudinally-rocking clamp-iron *e*, loosely attached to cap-iron *c* by pin *c'* and nut *f*, adjusting-screw *g*, plane-iron *b*, and plane-body *a*, with pivot-bearings for the clamp-iron, all substantially as described.

295,415. GAS-ENGINE. JOHANNES A. MENCK and ALEXANDER HAMBROCK, Ottensen, near Altona, Germany, assignors, by mesne assignments, to Wm. E. Hale, Chicago, Ill. Filed Jan. 5, 1884. (No model.) Patented in Germany Apr. 25, 1879, No. 13,673, Oct. 10, 1879, No. 12,674, and Jan. 6, 1880, No. 14,763.

Claim.—1. The combination, with the working-cylinder of a gas-engine, of devices constructed to measure separately and accurately the proportions of gas and air required for each explosive charge, and operating appliances whereby said devices are operated to throw the air and gas separately from the pumps directly into the engine-cylinder prior to each explosion, substantially as described.

2. The combination of the working-cylinder of a gas-engine, an air measuring and forcing pump communicating directly with said cylinder, and a gas measuring and forcing pump, also communicating with said cylinder, and devices whereby said pumps are operated to measure off and force into the cylinder prior to each explosion the gas and air required for the charge, substantially as described.

3. The combination, with the working-clyinder and air measuring and discharging pump, of a gas-pump provided with an outlet-valve so constructed and arranged that its flat face shall make contact with the flat end of the piston, to insure the expulsion of all the contents of the cylinder, for the purpose set forth.

4. A gas-engine having a working cylinder and piston, a cylinder provided with a piston and communicating with a gas-inlet pipe, an independent cylinder provided with a piston and communicating with an air-inlet, and passages between the air and gas cylinders and the working-cylinder provided with check-valves, substantially as described.

5. A gas-engine provided with devices for measuring and injecting the explosive charge at the rear end of the cylinder as the piston moves back, and with an exhaust-port at the front end arranged to be uncovered as the piston approaches the limit of its forward motion, the piston acting as the valve controlling said port, substantially as described.

6. The cylinder provided with an exhaust-port arranged to be uncovered by the piston as it reaches its forward position, and a port communicating with the space in front of the piston, and an exhaust-pipe communicating with both ports, substantially as described.

7. The mode of facilitating the discharge of the spent gases from the cylinder of a gas-engine, which consists in producing an outward current in the exhaust-pipe prior to opening the exhaust-port, substantially as described.

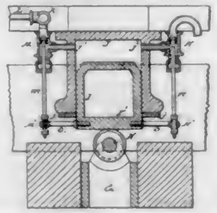
8. A gas-engine provided with an inlet-port for the charge, and with a chamber at the rear of the point reached on the back-stroke of the piston, contracted at the point where it communicates with said inlet-port, and means for forcing the charge into said chamber on the back movement of the piston, for the purpose set forth.

9. The combination, with a gas-engine having a chamber at the rear of the piston, of a pump for forcing in the explosive charge, and operating devices whereby the introduction of the charge is completed at the time the gas in the chamber is at its greatest density, substantially as and for the purpose set forth.

10. The combination, with the cylinder having a chamber behind the piston, of devices for forcing in the explosive charge, and valves constructed to lift only near the termination of the stroke, for the purpose set forth.

11. The combination, with the valves controlling the passage between the air and gas measuring pumps and the chamber X, of springs and appliances whereby to regulate the pressure on the valves and the flow of gas from the pumps, for the purpose specified.

295,416. COPY-HOLDER. WILLIAM F. MILLER, New York, N. Y., assignor to the American Writing Machine Company of New York. Filed July 14, 1879.



Claim.—1. In a copy-holder, the combination, with a frame pivoted to a pedestal, of shaft O at the bottom of said frame, carrying spring-clamps and handle O′, and the horizontal shaft P at the upper end of frame, carrying spring-clamps, coiled springs P², and handle P, substantially as and for the purpose described.

2. The combination, with the frame of a copy-holder, of shaft O, carrying spring-clamps, a shaft, E, carried in bearings above shaft O, a spring upon said shaft, sleeves T and T′, rod H, and marker D, substantially as and for the purpose described.

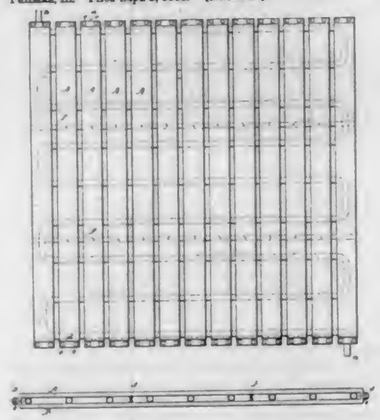
3. The combination, with the frame of a copy-holder, of shaft R, spring R′, sleeves T T′, rod H, and marker D, substantially as and for the purpose described.

295,417. CAR-TRUCK SPRING. GEORGE BAMMERMAN MILNE, Oswego, N. Y. Filed Jan. 5, 1884. (No model.)

Claim.—1. The branch pipe L, which is connected with the air-brake pipe of a train, in combination with said air-brake pipe, the transversely-arranged supply-pipe K, and the air-cushions at the sides and middle of a truck, all supplied by said pipe K, substantially as set forth.

2. In an air-cushion for car-trucks, a cylinder having at its upper and the inlet-opening j' and outlet-opening j^2, in combination with a piston fitted in said cylinder, and valves controlling said openings, and attached to said piston, so that the rising and falling of the cylinder will operate said valves, substantially as set forth.

3. A series of air-cushions attached to a car-truck and adapted to support a locomotive-body or car-body, in combination with devices for supplying compressed air to said cushions, each cushion consisting of a cylinder and a piston, and each cylinder being provided with inlet and outlet openings, which are governed by valves operated by said piston as said cushion rises and falls.



4. The cylinder J of an air-cushion, having openings j' j^2, in combination with piston I in said cylinder, valves governing said openings, horizontal arms o, and vertical valve-rods n, whereby said valves are attached to said piston, and devices for supplying air to said cylinder through opening j', substantially as set forth.

5. In combination with the transoms of a truck, two air-cushions resting on the same outside of the wheel-beams, in combination with rolls journaled in attachments of said transoms, and forming the immediate support for the lower parts of said cushions.

6. The middle cushion having a piston provided with rounded feet, in combination with the transoms on which said piston rests, and the means of supplying said cushion with compressed air, substantially as set forth.

7. The piston of an air-cushion and screw-tapped arms attached to the side thereof, in combination with inlet and outlet valves having their stems screwed into said arms, and thereby made adjustable, the cylinder in which said piston fits, and the supply-pipe connecting with the air-brake pipes, substantially as set forth.

295,418. APPARATUS FOR DRYING LUMBER. AARON S. NICHOLS, Pullman, Ill. Filed Sept. 3, 1883. (No model.)

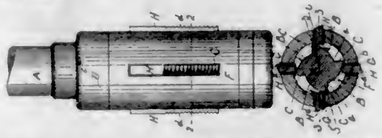
Claim.—1. The herein-described platen for drying lumber, consisting of a flat coil of tubing combined with transverse series of bars or strips arranged on opposite sides of said flat coil of tubing, the bars of the series arranged to leave an opening between them, the said coil of tubing constructed for connection with and discharge of a supply of steam or hot water, substantially as described.

2. The combination of a coil of tubing with transverse series of strips or bars, arranged on opposite sides of said flat coil, the bars constructed with their surface next the coils flat and the outside surface rounded, the bars arranged to leave an opening between them, and the said coil constructed for connection with and discharge of a supply of steam or hot water, substantially as described.

295,419. WIRE BALE-TIE. GRANVILLE NICHOLSON, New York, N. Y., assignor to John L. Clark, same place. Filed Dec. 26, 1883. (No model.)

Claim.—1. The wire bale-tie A, having a hooked head formed by the doubled portions a a', which are twisted together in rear of the head, and are bent outward and rearward to form the hook or shoulder A′, with the recess or seat b at the base or root thereof, substantially as and for the purpose herein described.

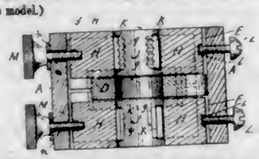
2. The wire bale-tie having a head formed by the doubled portions a a', which are twisted together in rear of the head, and are bent to form the hook or shoulder A′ and brace A^2, the portion a' being passed through the loop a^2 at that end of the brace which is adjacent to the base or root of said hook or shoulder, substantially as herein described.



295,420. BRAN-PACKER. JOHN D. OTIS, Peoria, Ill. Filed Aug. 14, 1882. (No model.)

Claim.—In a bran-packing machine, the combination, with the packing-tube and the sectional hinged case p, of the hook-clamps pivoted to the intermediate platform, and connected by toggle-arms to a T-lever pivoted to said platform, and connected by a rod to an L-lever pivoted to the frame a, and connected to a foot-lever at one side of the frame, substantially as specified.

295,420.



295,421. SCREW-TAP. ANDREW J. PEAVEY, Somerville, assignor to himself and Edwin B. Buckingham, Brookline, Mass. Filed May 1, 1883. (No model.)

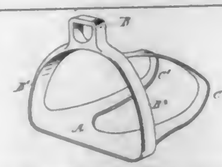
Claim.—1. A screw-tap composed of an arbor, A, carrying a cam-slotted collar or collars, D, and of a slotted sleeve, F, having screw-cutting dies H, constructed and arranged together substantially as described, for operation as specified.

2. A screw-tap composed of an arbor, A, having scrolls B, and a cam-slotted collar or collars, D, and of a slotted sleeve, F, having screw-cutting dies H, constructed and arranged together substantially as described, for the purpose specified.

295,422. SCREW-CUTTER. ANDREW J. PEAVEY, Somerville, assignor to himself and Edwin B. Buckingham, Brookline, Mass. Filed May 1, 1883. (No model.)

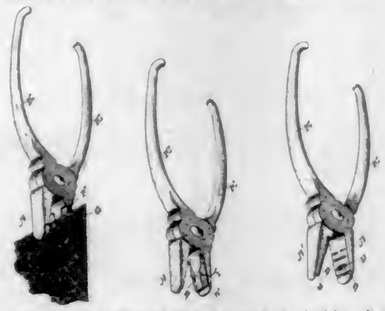
Claim.—1. A screw-cutter composed of a stock having scrolls C, and two chambers separated by a partition, D, and of two die-blocks, H, one in each of said chambers, and each block provided with radial dies K K², that are arranged within said blocks, as also said die-blocks within said chambers, for the dies to be acted upon by said scrolls, substantially as described, for the purpose specified.

2. A screw-cutter composed of a stock, A, having scrolls C, and two chambers, E F, separated by a partition, D, having scroll-slots G, and of two die-blocks, H, one in each of said chambers, and each block provided with radial dies that are arranged within said blocks, as also said die-blocks within said chambers, for the dies to be acted upon by said scrolls and said slots, substantially as and for the purposes described.



3. A die-block having peripheral groove and radial dies, in combination with a pin which enters said groove and holds said die-block against escape from, and at the same time leaves it free to turn within, a shell or stock, A, having scrolls C, to act upon said radial dies, substantially as described, for the purpose specified.

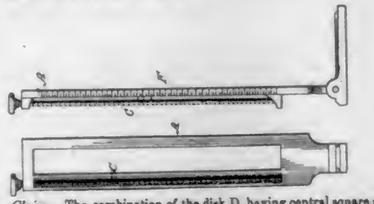
4. A die-block confined within a shell or stock, A, having scrolls C, against escape therefrom, and free to turn therein, and provided with radial sliding dies, in combination with a slot, n, and set-screw M, by which said die-block can be secured against turning, substantially as described, for the purpose specified.



295,423. STIRRUP FOR SADDLES. CHARLES C. PHILBROOK, Boston, Mass. Filed May 23, 1883. (Model.)

Claim.—An improved stirrup having suspension-bail B′ B², sole-plate A, strap-eye B, and toe-guards C C′, of a single casting, substantially as described, in which all the interior and back surfaces are formed and fashioned as draft-planes from one direction, and all the exterior and front surfaces are formed and fashioned as draft-planes from the opposite direction, for the purpose set forth.

295,423.



295,424. PLIERS FOR ATTACHING PIN-TICKETS. AQUILLA J. PLATT, De Graff, Ohio. Filed Aug. 10, 1883. (No model.)

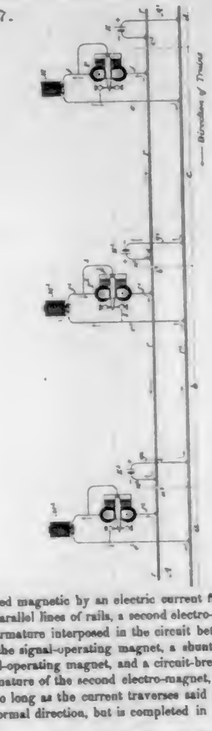
Claim.—1. An improved device for attaching pin-tickets, having suitably-pivoted jaws, one of which is provided with an integral tongue, B, beneath which the ticket may be placed, all substantially as set forth and shown.

2. The combination, in an instrument for attaching pin-tickets, of the jaws A and A', one of which is provided with transverse grooves or depressions, and the other with an integral tongue, B, beneath which the ticket may be placed, all substantially as and for the purpose set forth.

295,425. SIGHT FOR FIRE-ARMS. WILLIAM PLETTNER, Trinidad, Colo. Filed Dec. 26, 1883. (No model.)

Claim.—The combination of the disk D, having central square aperture, E, and horizontal groove or recess *e*, intersecting the same, slide F, having sight-hole *f* and brackets G, constructed with the conical holders H, removable spirit-level I, and means for adjusting the slide upon the disk, substantially as shown and set forth.

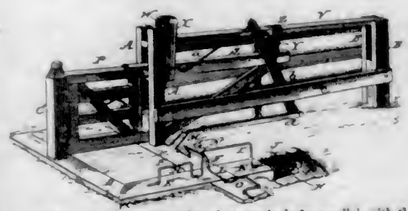
295,426. INSECTICIDE COMPOUND. HENRY POOL, Westminster, Md. Filed Aug. 3, 1883. (No specimens.)



Claim.—The herein-described composition of matter to be used as an insectide, consisting of slaked lime, plaster-of-paris, ammonia, sugar, oil of worm-seed, and oil of sassafras, in the proportions specified.

295,427. ELECTRIC SIGNALING APPARATUS FOR RAILROADS. FRANK L. POPE, Elizabeth, N. J., assignor to the Union Switch and Signal Company, Pittsburg, Pa. Filed July 30, 1883. (No model.)

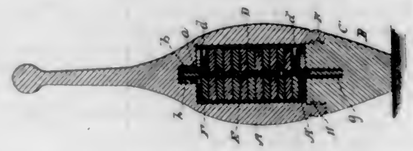
Brief.—Signals at "safety," except when the battery is short-circuited by a train on the section. To prevent danger from imperfect insulation, the batteries in adjacent sections have opposite poles to corresponding rails, and a polarized switch is used with each signal, whereby a current of the wrong polarity will cut the signal-magnet out of circuit.



Claim.—1. A line of rails of a railroad-track divided into two or more electric sections corresponding with or constituting signaling-sections, by means of interposed insulating-joints, and having its alternate insulated sections normally traversed by electric currents of unlike polarity, substantially as hereinbefore set forth.

2. The combination, substantially as hereinbefore set forth, of a section of railway-track consisting of two parallel lines of rails insulated from each other, each of which constitutes a continuous electric conductor throughout said section, a battery having its opposite poles connected with the respective lines of rails, a signal-operating electro-magnet normally rendered magnetic by an electric current from said battery traversing said parallel lines of rails, a second electro-magnet provided with a polarized armature interposed in the circuit between one of said lines of rails and the signal-operating magnet, a shunt uniting the terminals of said signal-operating magnet, and a circuit-breaker controlled by the polarized armature of the second electro-magnet, whereby said shunt is interrupted so long as the current traverses said signal-operating magnet in the normal direction, but is completed in case of the reversal of said current.

3. The combination, substantially as hereinbefore set forth, of a section of railway-track consisting of two parallel lines of rails insulated from each other, each of which constitutes a continuous electric conductor throughout the section, a battery having its opposite poles connected with the respective lines of rails, a signal-operating electro-magnet normally rendered magnetic by an electric current from said battery traversing said parallel lines of rails, an electro-magnet provided with a polarized armature, interposed in the circuit between one of said lines of rails and the signal-operating magnet, a helix for polarizing said armature, included in the circuit of the battery of the adjacent signal-section, a shunt uniting the terminals of said signal-operating magnet, and a circuit-breaker controlled by said polarized armature, whereby said shunt is interrupted so long as the current traverses said signal-operating magnet in the normal direction, but is completed in case of the reversal of said current.

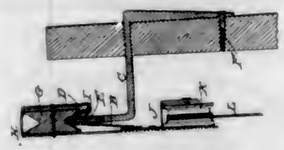


295,428. GATE. JOSEPH P. B. RAREY, Kokomo, Ind., assignor of one-half to Daniel Rarey, same place. Filed Aug. 11, 1883. (No model.)

Claim.—1. The combination of two rock-shafts parallel with the gate, each having a bail adapted to be tilted by a vehicle-wheel, a bail near its inner end in the same plane as the former, and a weight upon its end keeping it upright, with a rock-shaft parallel with the roadway, having two curved bails at each end at right angles to each other, and connecting means for operating a gate, one wheel-operated shaft being at each end of the gate-operating shaft, as and for the purpose shown and set forth.

2. The combination of an abutment-post having a slotted catch-plate, a gate sliding between two sets of posts, having an upwardly-hooked catch at its abutting end, and a roller at its center rolling upon the upper side, and a roller at its end traveling upon the lower side of a horizontail rail, a connecting-rod hinged to the gate to the rear of its center, a lever having the said connecting-rod hinged to its upper longer end, a connecting-rod hinged to the lower short end of the lever, a rock-shaft having a pair of divergently-curved bails at each end, the bails in each pair being at right angles to each other, and a double crank, to which the connecting-rod is hinged, and a pair of rock-shafts having bails adapted to be operated by a vehicle-wheel, bails straddling the rock-shaft between each pair of curved bails, and weights at their ends keeping the bails upright, as and for the purpose shown and set forth.

295,429. INDIAN CLUB. ROBERT REACH, Philadelphia, Pa. Filed Dec. 3, 1883. (No model.)



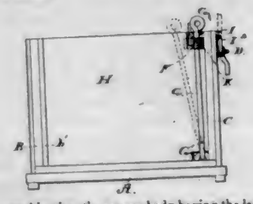
Claim.—1. An Indian club consisting of the hollow club A, having the detachable head B, and weights D, secured upon rods E by means of lock-weights F, having screw-orifices *f* for reception of set-screws *d* and *d'*, substantially as shown and described.

2. An Indian club having a cylindrical recess, A', for rod E, detachable head B, having orifice *g*, weights D, removable on orificed weight-rod E, and weight-locks F, secured by set-screws *d* and *d'*, substantially as shown, and for the purpose described.

3. In an Indian club, the combination of the handle-section having recess *a*, head B, having orifice *g*, weight-rod E, having female-screw orifices, weights D, lock-weights F, and set-screws *d* and *d'*, substantially as shown, and for the purpose described.

295,430. FIRE-ESCAPE. HORACE RESLEY, Cumberland, Md. Filed May 26, 1883. (No model.)

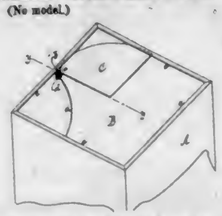
Brief.—A fire-escape in which the rail is formed of a strip of sheet metal bent to straddle the upper ends of the projecting brackets. The pulley-frame is bent to form a hook on its inner side to hook under the flange of the rail.



Claim.—1. In a fire-escape of the described class, the rail formed of a strip of stout sheet metal and bent at its upper portion to form a downward-bent flange adapted to straddle the upper ends of the projecting brackets and fit tightly upon them, as and for the purpose shown and set forth.

2. In a fire-escape of the described class, the combination of the rail, formed by a strip of sheet metal doubled to form a downward-bent flange, as described, with the brackets, consisting of bars of iron bent in double-L shape, inserted into the wall with their horizontal portion, and secured by anchors to the inside of the same at their inner downward-turned ends, and forming T-heads or cross-heads upon their outer upward-turned ends, as and for the purpose shown and set forth.

3. In a fire-escape of the described class, the combination of the rail, having inward and downward turned flange, with the pulley-frame, having the upper portion bent inward and downward, forming bearings for the pulley riding upon the rail, and bent inward to form a hook catching in under the flange of the rail, as and for the purpose shown and set forth.

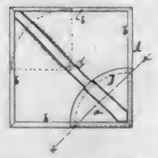


4. The herein-described fire-escape, consisting in the rail having inward and downward turned flange, the double-L-shaped brackets, the pulley-frame, having inward-bent hook upon its downward-turned upper end, and having the pulley riding the rail and the hoisting-pulleys journaled in it, the hoisting-ropes, the cage having the outward-extending bracket upon the upper edge of its outer side, the inward-opening doors, and the top frame, and the guide-ropes attached to the lower edge of the cage and to the bracket, all constructed, combined, and arranged to operate as and for the purpose shown and set forth.

295,431. END-GATE. JOHN SCHEERER, Springdale, Ohio. Filed Dec. 14, 1883. (No model.)

Claim.—In combination, the wagon-body having the latch-bar fixed to the inner side and formed with the recess *c'*, and provided with a retaining-spring, F, the swinging end-gate H, the hinged bar G, the button I, formed and arranged as described, and provided with a handle, I', at its outer end, and a cross-bar, D, the whole arranged to operate substantially as described, and for the purpose set forth.

295,432. CANISTER. AUGUST SCHILLING, San Francisco, Cal. Filed Nov. 15, 1883. (No model.)

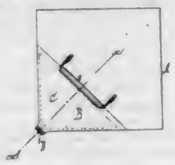


Claim.—1. The combination, substantially as described, of a canister having a corner opening in its top and inwardly-turned flanges, and a lid pivoted to swing above the top of the canister in a plane parallel to such top, and to pass beneath the flanges.

2. A canister having a top provided with a corner opening, a lid pivoted to swing above said top, means for preventing the lid moving upward when closed, and a spring for throwing the lid into its closed position, substantially as described.

3. A canister having a top provided with a corner opening, flanges projecting inwardly above said top, a lid pivoted to swing above the latter and in a plane parallel thereto, for engaging under the flanges, and a spring for throwing the lid to a closed position, to cover the opening, substantially as described.

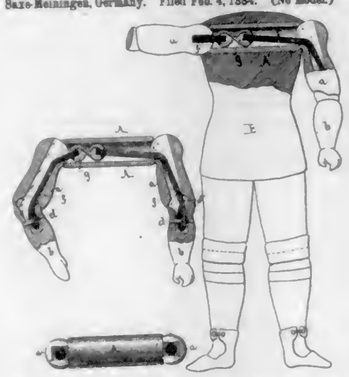
295,433. CANISTER. AUGUST SCHILLING, San Francisco, Cal. Filed Nov. 15, 1883. (No model.)



Claim.—1. The combination, substantially as hereinbefore described, with a canister having a corner opening, of a sliding lid and a guide on which said lid slides.

2. The combination, substantially as hereinbefore described, with a canister having a corner opening, *a*, and flanges *b*, of the sliding lid and the guide on which the lid slides.

3. The combination, substantially as hereinbefore described, with a canister having a corner opening, of the sliding lid and the lid-guide formed in the metal composing the top of the canister.

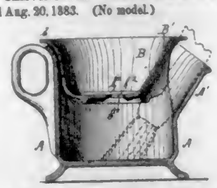


295,434. CANISTER. AUGUST SCHILLING, San Francisco, Cal. Filed Nov. 15, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, with a canister having a corner opening of triangular shape, of a lid of similar shape to the opening, hinged on one of its sides to swing outward, and a catch arranged to engage the angle of the lid which is opposite to the hinged side.

2. The combination, substantially as hereinbefore described, with a canister having a corner opening of triangular shape, of a lid similar in shape to the corner opening, hinged on its inner side to swing outward, and a catch arranged to engage the angle of the lid which is opposite to the hinged side, the same being at the corner of the canister.

295,435. DOLL. STEPHAN MAX FERDINAND SCHILLING, Sonneberg, Saxe-Meiningen, Germany. Filed Feb. 4, 1884. (No model.)



Claim.—1. The combination of a doll-body having a fixed transverse tube at the shoulder portion, with articulated arms, elastic cords secured to the arms, and means for connecting the cords within said tube, substantially as set forth.

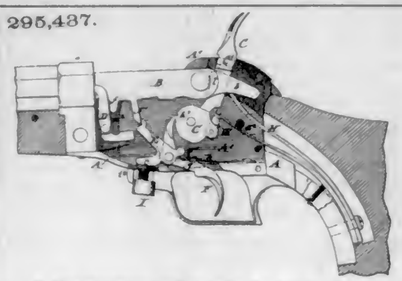
2. The combination of a doll-body having a fixed transverse tube at the shoulder portion, perforated upper arm-sections, jointed forearms having fixed transverse pins, and elastic cords that are attached to said pins, passed through the upper arm-sections, and connected in the transverse tube, substantially as described.

3. The combination of a doll-body, a fixed transverse tube having concave end seats or sockets, upper perforated arm-sections having ball-shaped terminals, jointed forearms having recesses and fixed transverse pins, and elastic cords attached to said pins, said cords being passed through the upper arm-sections, and connected by a double wire hook within the transverse tube, substantially as specified.

295,436. SHAVING-MUG. GÜNTHER SCHOEMAN, Hüttensteinach, Germany. Filed Aug. 20, 1883. (No model.)

Claim.—1. A shaving-mug composed of a mug having a spout, and of a detachable soap-dish supported by the mug and having a convex inwardly-projecting side portion adapted to hold the shaving-brush, in connection with the spout, substantially as set forth.

2. A shaving-mug composed of a cup-shaped mug having a spout, and of a detachable soap-dish having a circumferential supporting-flange, a ribbed and perforated bottom, and a convex inwardly-projecting side portion, substantially as specified.



3. In a shaving-mug, a detachable soap-dish having a convex inwardly-projecting side portion, substantially as set forth.

4. In a shaving-mug, a detachable soap-dish having a circumferential supporting-flange, a ribbed and perforated bottom, a base-rim, and a convex inwardly-projecting side portion, substantially as specified.

295,437. BREECH-LOADING FIRE-ARM. FRANZ SCHRAUD, San Antonio, Tex. Filed Oct. 2, 1883. (No model.)

Claim.—1. The combination, with the fulcrumed breech-block B, having a centrally-recessed tail end and its spring H, of a hammer, C, guided in the recessed tail end, and provided with a laterally-projecting head above the tail end, whereby the breech-block is moved by the setting of the hammer, substantially as set forth.

295,437.

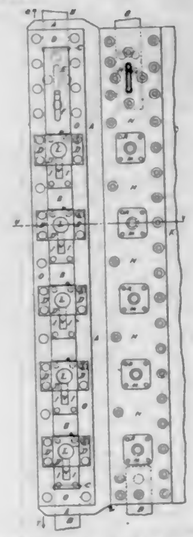
2. The combination, with the main and covering plates A′ A^2 of the casing, having depressions *a′ a′*, of a fulcrumed breech-block, B, having a recessed tail end and laterally-projecting abutments *b b*, a spring, H, pressing upon the tail end, and a pivoted hammer, C, having a laterally-projecting head, C′, above the tail end, substantially as set forth.

3. The combination of the fulcrumed and spring-actuated breech-block B, having a downwardly-extending front lug, *f′*, a fulcrumed and spring-pressed locking-lever, E, and a guided and spring-pressed push-button, I, below the lower arm of the locking-lever, whereby the same is released from the breech-block, substantially as set forth.

4. The combination of the fulcrumed and spring-pressed breech-block B, having downwardly-extending front lugs, *f f′*, a fulcrumed and spring-pressed locking-lever, E, a guided and spring-cushioned push-button, I, located below the lower arm of the locking-lever, and a fulcrumed elbow-shaped extractor, D, the lower arm of which is engaged by the lug *f* of the breech-block, substantially as set forth.

5. The combination of the fulcrumed and spring-pressed breech-block B, having an interior firing-pin, B′, pivoted and spring-pressed hammer C, having laterally-projecting head C′ above the tail end of the breech-block, locking-piece E, trigger F, and spring-cushioned push-button I, whereby the breech-bolt can be set into a partly-lowered position of safety, substantially as set forth.

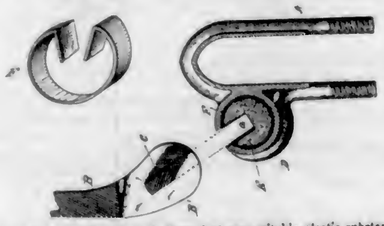
6. The combination of the fulcrumed and spring-pressed breech-block B, having a recessed tail end, a pivoted hammer, C, a hammer-spring, G, links G′, connecting the hammer-spring and hammer-tumbler, a transverse stop-bolt with which the hammer-spring comes in connection when the hammer is at half-cock, and from which it is drawn away by means of the links when the hammer is at full-cock, and a trigger, F, substantially as described.



7. The combination, with the casing A, having stop *n′*, of a hammer, C, and a pivoted and spring-actuated dust-guard, L L′, that extends across the casing back of the hammer, substantially as set forth.

295,438. BUSTLE. LEO L. SCHWAB, New York, N. Y. Filed July 21, 1883. (Model.)

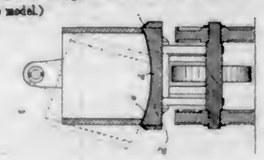
Claim.—A bustle consisting of a band, C, a plaited outer fabric, *a*, having a lining, *b*, with loops D, secured thereto about midway between the top and bottom of the bustle, the loops holding a large spiral spring, E, and the loops G′, securing the ends of the spring to the edges of the bustle, and the flaps H, laced together in front and independent of the spring, substantially as shown and described.



295,439. MAIL-BAG. ADAM SEVERIN, Jr., Chattanooga, Tenn. Filed Jan. 12, 1884. (No model.)

Claim.—1. The combination, in a mail-bag having a flap or overlapping portion provided with a series of perforated loops, D, adapted to engage the studs M of the front of the bag, and the slotted locking-strap B, provided with plates I J, the plate I having a lug, *a*, formed at one end thereof, as and for the purpose set forth.

2. A mail-bag having a flap provided with loops D and slots *c c* and E, in combination with the slotted strap B, provided with staple H, plates I J, and lug *a*, the bag proper having a slot, G, substantially as described, and for the purpose specified.

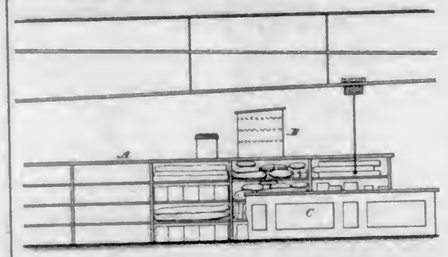


295,440. THILL-COUPLING. WINFIELD S. SHANAHAN, East Chatham, N. Y., assignor of two-thirds to Sylvester C. Hulbert, same place, and Mont G. Curtis, Troy, N. Y. Filed Jan. 14, 1884. (No model.)

Claim.—1. The block E, formed of any suitable elastic substance, and surrounded by a metallic spring, F, in combination with an axle-clip and shaft-iron of a vehicle, the several parts being constructed substantially as and for the purpose set forth.

2. The block E, provided with a rectangular opening, *a*, and surrounded with a metallic spring, the ends of which project into the said opening for the purpose of keeping the block distended, substantially as specified.

295,441. BOBBIN-TRUCK. WM. F. SHARPLES, Fall River, assignor of one-half to George Draper & Sons, Hopedale, Mass. Filed Feb. 1, 1884. (No model.)

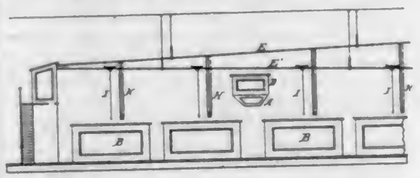


Claim.—1. The combination, with a wheeled platform and one or more boxes or compartments, of a movable box, C, consisting of two sides and ends, and open at bottom and top, and arranged above the said platform with the lower edges of the box in close relation therewith, substantially as and for the purpose specified.

2. The combination, with a wheeled platform and one or more boxes or compartments fixed thereon, of a pivoted box or frame, C, consisting of two sides and ends, the said box having its open lower side or bottom edges in close relation to the top of the said platform *d*, and with its pivotal points above the top edge of said box, substantially as set forth, and for the purpose specified.

3. The wheeled platform and the open-bottomed box C therein, the upper side of the said platform and the under sides of the said box being lined, substantially as described, with a soft or yielding lining, as and for the purposes set forth.

295,442. STORE-SERVICE APPARATUS. HENRY W. SHARPLESS, Philadelphia, Pa. Filed July 21, 1883. (No model.)



Claim.—1. The combination, with the counters and cases of a store, of stations for the receiving and packing clerks, arranged above and supported by the cases and accessible from the salesmen's stations, substantially as specified.

2. A store provided with packing-stations arranged above and supported by the cases, substantially as and for the purpose set forth.

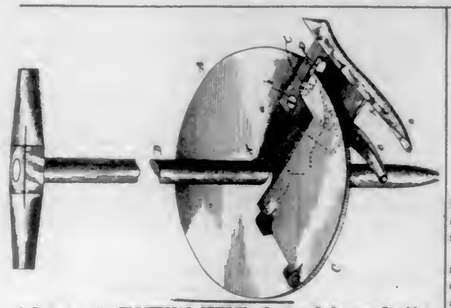
3. The combination, with the counters of a store, of a movable case and packing desk or station above and supported thereby, for the purpose specified.

295,443. STORE-SERVICE APPARATUS. HENRY W. SHARPLESS, Philadelphia, Pa. Filed Feb. 1, 1884. (No model.)

Claim.—1. A packing-desk arranged at a point accessible to the salesmen of a store, but away from the main floor thereof, substantially as and for the purpose set forth.

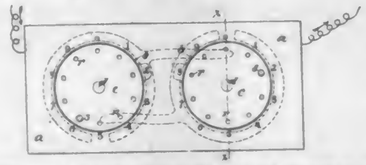
2. The combination, with the counters or stations of a store, of a packing desk or platform arranged in a position above or below the main floor, substantially as set forth.

3. The combination, in a store, of the counters or stations, a store-service apparatus constructed to receive and deliver the cash at the said counters, and one or more packing-stations away from the main floor and accessible to the salesmen, substantially as specified.



4. The combination, with the counters of a store, of a packing-desk arranged below an opening in the main floor, substantially as set forth.

295,444. EARTH-AUGER. SAMUEL S. SHERMAN and JEREMIAH G. SHERMAN, West McHenry, Ill. Filed Dec. 27, 1883. (No model.)



Brief.—Auger-disk having a hinged or valve section has a plate with cutting tines and edge adjusted through slots and bolts to or from the disk-center for varying the bore of cut.

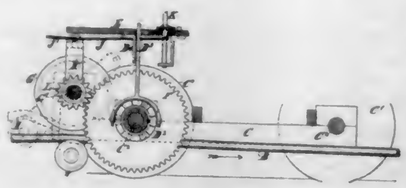
Claim.—1. The adjustable plate D, provided with tines *e e*, in combination with the plate A and its handle, substantially as and for the purpose set forth.

2. The adjustable plate D, in combination with the plate A and its valve C, constructed substantially as and for the purpose set forth.

295,445. ELECTRICAL SWITCH. CHARLES S. SHIVLER, Brooklyn, N. Y. Filed Aug. 29, 1883. (No model.)

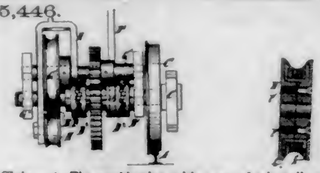
Claim.—1. A secret permutation electrical switch, consisting of one or more commutators or switches movable through a gradnated path or range and upon a seat whose continuity is interrupted at a certain point or gradnation in said path, and at which point of interruption the circuit is opened, with means, substantially as set forth, for secretly indicating the position or gradnation of said point of interruption, and means, substantially as set forth, for changing the indications or gradnation representing said points, substantially as herein set forth.

2. An electrical permutation-switch, consisting of two or more contact-makers or switches movable through a gradnated range or path and upon a seat the continuity of which is interrupted at a certain point, and at which the circuit is opened, with a contact brush or conductor connecting each switch with the seat of the other switch and with circuit-connections extending to the said seats and brushes, substantially as set forth, whereby a duplex or multiplex passage is afforded for the current through the several contacts of the said connected switches, and whereby the circuit will become opened or closed only when all the contacts are set to their position of break, substantially as herein set forth.



3. A secret permutation-switch for electrical circuits, consisting of two rotary contact-makers or switches, each movable through or over a gradnated circle and upon a seat which is interrupted at a certain point to interrupt the circuit, with brushes or conductors connecting each switch with the seat of the other switch and circuit-connections with said seats and brushes, substantially as and for the purpose set forth.

4. An electric switch substantially such as described, formed with the rotary contact-maker *f g*, in combination with the seat *h* and brush *i*, with circuit-connections extending to said seat and brush, substantially as herein set forth.



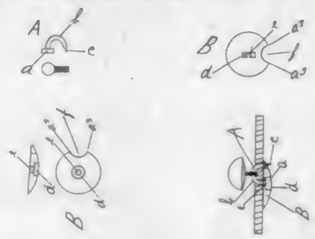
5. An electrical switch substantially such as described, having one or more plates or disks perforated with holes, in combination with changeable crank-pins adapted to be fixed in one of said holes, and with gradnations corresponding with said holes, substantially as and for the purpose set forth.

295,446. ENDLESS-ROPE RAILWAY. WM. H. H. SEUM, Brooklyn, N. Y. Filed Oct. 25, 1883. (No model.)

Brief.—The car is gradually started through grip-palleys, one of which is adjustable, the other carrying upon its axle a wheel which gears with one upon one of the car-axles. A double clutch on said car-axle adapts the grip-palleys to cables traveling in either direction.

295,446.

Claim.—1. The combination, with a car, of grip-pulleys adapted to impinge upon a rope or cable, and wheels serving to derive motion from one of the pulleys and transmit it to one of the axles of the car, so as to start the car gradually, substantially as specified.



2. The combination, with a car, of a grip-pulley supported on a shaft provided with a wheel engaging with another wheel mounted on one of the axles, another grip-pulley supported on a lever adapted to be adjusted into a position which will enable it, in conjunction with the grip-pulley first named, to grip a rope or cable, substantially as specified.

3. The combination, with a car, of a grip-pulley supported on a shaft provided with a wheel engaging with another wheel mounted on one of the axles, another grip-pulley supported on a lever, and means whereby the lever may be swung in either direction to cause the grip-pulley which it supports, in conjunction with the grip-pulley first named, to grip a rope or cable, substantially as specified.

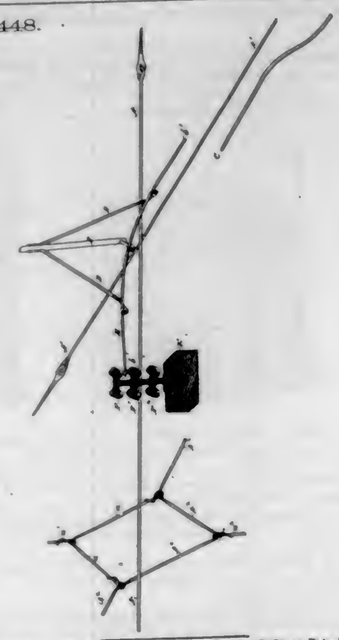
4. The combination, with a car, of grip-pulleys, means whereby the grip-pulleys may be made to grip a rope or cable, a wheel on the same shaft as one of the grip-pulleys, a wheel on one of the axles of the car, through which motion is transmitted to this axle, clutch-pieces rigidly affixed to this axle, and another clutch-piece locked to the wheel, through which motion is transmitted to this axle and adapted to be shifted into engagement with either of the clutch-pieces that are affixed to this axle, substantially as specified.

5. The combination of an axle, C^3, clutch-pieces D D' D^2, gear-wheel F, shaft G', gear-wheel L, grip-pulley G, lever H', and grip-pulley H, substantially as specified.

295,447. BUTTON-FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Jan. 23, 1884. (No model.)

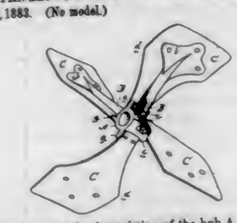
Claim.—1. The metallic fastener A, having head portion *a*, curved loop *b*, and point *c*, arranged and adapted for use as described.

2. In a button-fastener, the metallic hook A, having head *a*, loop *b*, point *c*, and the non-metallic washer B, provided with central opening, *e*, counterbored portion *d*, and recess *f*, combined, substantially as shown and described.



295,448. CONVEYER APPARATUS. HERVEY SMITH and GEORGE C. BLICKENSDERFER, Erie, Pa. Filed Feb. 7, 1884. (No model.)

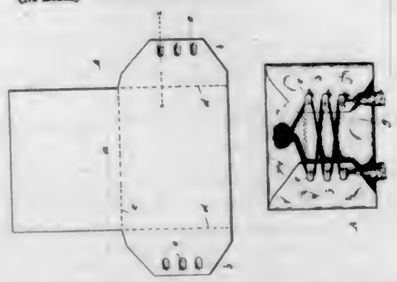
Claim.—1. In a conveyer apparatus substantially as shown, the combination, with the main track and a car having two or more sets of wheels, arranged substantially as shown, of a transfer-switch placed at the angles or branches of said main track which will receive said car from one part of the main line upon a set of wheels not used on said line, convey it by a proper curve to the other part of said main line, and place it thereon upon a set of wheels not used on said switch, substantially as shown.



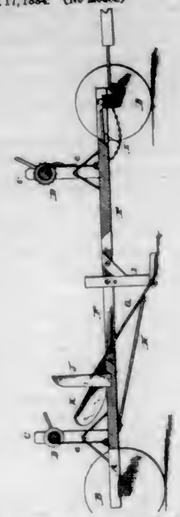
2. In a conveyer apparatus substantially as shown, the combination, with a main track having branches or intersecting lines and station-switches along said branches, of transfer-switches at the intersecting points which have their points lying removed from and in vertical planes with said lines, as shown, and a car having a separate set of wheels for the main tracks, the transfer-switches, and the station-switches, substantially as shown and described.

3. In a conveyer apparatus substantially as shown, the combination, with the main track branched or angled, as shown, of a transfer-switch, B, having its points *b* and *b'* graded with relation to the grade of said main track, in a manner substantially as shown, and for the purposes mentioned.

295,448.



295,449. FAN-BLOWER WHEEL. WRIGHT D. SMITH, Detroit, Mich. Filed June 27, 1883. (No model.)

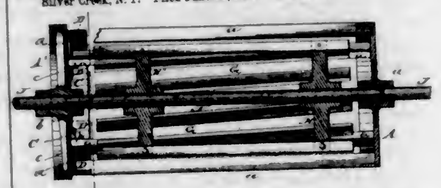


Claim.—A fan-blower wheel consisting of the hub A, provided with the radial arms B, having expanded flanges *b* at their outer ends and flanges *a* at the hub, all cast integral therewith, and radial blades C, provided with curved edges, substantially as set forth.

295,450. ENVELOPE OR FOLDING CARD. CHARLES SNEIDER, New York, N. Y., assignor to Philipp Haka, Hoboken, N. J. Filed Oct. 18, 1883. (No model.)

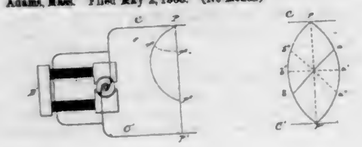
Claim.—An envelope or folding card provided with folding flaps having struck-up hooks near their edges, in combination with a lacing adapted to be secured around said hooks, to hold the parts of the envelope together, substantially as specified.

295,451. EXCAVATOR. ALLEN J. SNYDER and ALVIN L. KULP, Keota, Iowa. Filed Jan. 17, 1884. (No model.)



Claim.—The platform E, provided with the opening F, inclined cutting-plate G, cutter J, and wings K K, in combination with a frame on wheels, to which it is adjustably attached and rendered capable of vertical adjustment, substantially as and for the purpose set forth.

295,452. SHOE-LACE FASTENER. HELEN MARIA SNYDER, Pine Bluff, Ark. Filed July 12, 1883. (No model.)



Claim.—In a shoe-lace fastener, the combination, with a shoe-tongue, of the spring *g* and piece of leather or cloth *d*, provided with the hook *e*, adapted to operate substantially as specified.

295,453. CENTRIFUGAL BOLTING-REEL. ALBERT H. SPAULDING, Silver Creek, N. Y. Filed June 20, 1883. (No model.)

Claim.—The combination, in a centrifugal flour-bolt, of the reel provided with heads A A', the tail or discharge head A' having a series of apertures through it, located at the circumference thereof, and interior wind-guards applied over said apertures, with the rotating beaters G, substantially in the manner and for the purposes described.

295,454. ELECTRO-DYNAMIC MOTOR. FRANK J. SPRAGUE, North Adams, Mass. Filed May 2, 1883. (No model.)

Claim.—1. In an electro-dynamic motor, the combination of sections of field-coils, the armature in a shunt-circuit around a variable number of said sections, and means for varying the relation between the number of sections around which the armature is shunted and the number with which said armature is in series, substantially as set forth.

2. In an electro-dynamic motor, the combination of sections of field-coils, the armature in a shunt-circuit around all or a part of said coils, means for varying the number of sections of coils around which the armature is shunted, and means for reversing the current in said armature-shunt, substantially as set forth.

3. In an electro-dynamic motor, the combination of sections of field-coils, the armature in a shunt-circuit around all or a part of said coils, means for varying the number of coils around which the armature is shunted, and supplemental field-coils connected with the armature-circuit, substantially as set forth.

4. In an electro-dynamic motor, the combination of sections of field-coils, the armature in a shunt-circuit around all or a part of said coils, means for varying the number of coils around which the armature is shunted, and supplemental field-coils in parallel circuit with the armature, substantially as set forth.

5. In an electro-dynamic motor, the combination of sections of field-coils, the armature in a shunt-circuit around all or a part of said coils, means for varying the number of coils around which the armature is shunted, means for reversing the current in said armature-circuit, and supplemental field-coils connected with said armature-circuit, substantially as set forth.

6. In an electro-dynamic motor, the combination of sections of field-coils, the armature in a shunt-circuit around all or a part of said coils, means for varying the number of coils around which the armature is shunted, and independent field-coils connected with the supplying-circuit, substantially as set forth.

7. In an electro-dynamic motor, the combination of sections of field-coils, the armature in a shunt-circuit around all or a part of said coils, means for varying the number of coils around which the armature is shunted, supplemental field-coils connected with the armature-circuit, and independent field-coils connected with the supplying-circuit, substantially as set forth.

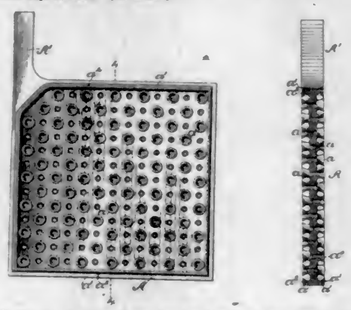
8. In an electro-dynamic motor, the combination of two ranges of sectional field-coils, the armature in a shunt-circuit between the ranges, means for changing the connections of the armature-circuit terminals from one field-section to another, and means for reversing the currents in the armature-circuit, substantially as set forth.

9. In an electro-dynamic motor, the combination of one or more ranges of sectional field-coils, one or more ranges of contact-blocks in electrical connection with the junctions of the field-sections, and one or more movable arms in electrical contact with said blocks, said arm or arms forming part of a shunt-circuit including the armature, substantially as set forth.

10. In an electro-dynamic motor, the combination of two ranges of sectional field-coils, electrical connections from the junctions of the sections to contact-blocks, and two arms in electrical contact with said blocks and forming the terminals of the armature-circuit, substantially as set forth.

11. In apparatus for regulating electro-dynamic motors, the combination, with sections of field-coils and the armature in a shunt around all or a part of said coils, of means operating automatically upon variations in the speed of said motor for varying the number of coils around which the armature is shunted, substantially as set forth.

12. In regulating apparatus for electro-dynamic motors, the combination of mechanism operated by variations in the speed of the motor, secondary mechanically-operated apparatus thrown into action by the movements of said primary mechanism, and means operated by said secondary apparatus for varying the current supplied to the motor-armature, substantially as set forth.



13. In an electro-dynamic motor, the combination of sections of field-coils, the armature in a shunt around such coils, means for varying the number of coils around which the armature is shunted, independent field-coils connected with the supplying-circuit, and means for varying the magnetizing effect of said independent coils, substantially as set forth.

14. The combination of sectional field-coils, a circular commutator, two movable arms, bearing on said commutator and forming terminals of a shunt-circuit, and connections from the junctions of said sectional coils to the plates of said commutator, whereby the current in the shunt is varied and reversed by the movement of said arms, substantially as set forth.

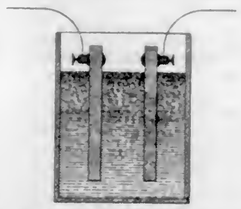
15. The combination of sections of coils, a circular commutator, two movable arms bearing on opposite blocks of said commutator and forming terminals of a shunt-circuit, and connections from the sectional coils to the commutator, as follows: (see Fig. 11,) the first and last sections connected, respectively, to opposite blocks o o^2, the second and next to last sections connected each to two blocks, o' o', and so on until the blocks meet, substantially as shown and described.

16. The method of regulating electro-dynamic motors, consisting in varying the relations between the number of field-magnet coils in series with the armature and the number around which the armature is shunted.

295,455. SECONDARY-BATTERY PLATE OR ELECTRODE. ELI T. STARR, Philadelphia, Pa., assignor of one-half to William J. Peyton, Washington, D. C., and H. M. Lewis and James W. White, Philadelphia, Pa. Filed Sept. 8, 1883. (No model.)

Claim.—1. A battery-plate having a body or back with a projecting or raised undercut, dovetailed, or shouldered retaining rim or border surrounding the edges of the plate, whereby a secure retaining-chamber is formed in the side or face of the plate for the retention of the active material thereof, substantially as described.

2. A battery-plate having perforated lugs or pins projecting from the side or face of the plate, and provided with enlarged heads or ends, as described.



3. A battery-plate having lugs or pins projecting from the side or face thereof, and a retaining-rim extending around the edges of said plate, substantially as described.

4. A battery-plate having lugs or pins with enlarged heads or ends, and the undercut or dovetailed rim extending around its edges, substantially as described.

5. A battery-plate having a body or back and a projecting or raised retaining rim or border extending around its edges, with an active material or layer packed in the recessed or chambered side of the plate and interlocking with said retaining rim or border, substantially as described.

6. A battery-plate consisting of a body portion having lugs or pins projecting from the side or face thereof, and provided with a raised or projecting retaining rim or border extending around the edges of the plate, with an active material or layer packed in the recessed or chambered side of the plate and interlocking with said retaining rim or border, substantially as described.

295,456. SECONDARY BATTERY AND METHOD OF CONSTRUCTING ELECTRODES THEREFOR. ELI T. STARR, Philadelphia, Pa., assignor of one-half to H. M. Lewis and James W. White, both of same place, and William J. Peyton, Washington, D. C. Filed Oct. 22, 1883. (No model.)

Claim.—1. The method of constructing electric-battery electrodes hereinbefore set forth, consisting in incorporating active material in a finely-divided state with mercury, and then permitting the mixture to amalgamate and harden into a self-sustaining body, substantially as described.

2. The method of constructing electric-battery electrodes hereinbefore set forth, consisting in mixing finely-divided active matter with mercury, then subjecting the mixture to pressure in a mold to express the excess of mercury from the mixture and give shape to the electrode, and then permitting amalgamation and hardening of the mixture to take place to convert the mixture into a self-sustaining body, substantially as described.

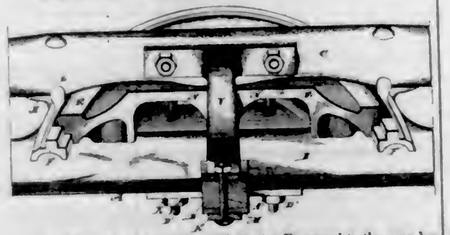
3. The method of constructing battery-electrodes hereinbefore set forth, which consists in mixing metallic matter with mercury to form an amalgam, and then shaping the mixture in a mold while in its plastic condition.

4. The improvement in constructing electric-battery electrodes hereinbefore set forth, which consists in mixing active material with mercury to form a plastic or fluid mass, and then artificially removing a portion of the mercury.

5. The improvement in constructing and forming secondary-battery electrodes, which consists in mixing mercury with another metal or metallic compound capable of becoming active in a secondary battery to form a plastic mass, then shaping or molding said mass in a mold, and then subjecting the electrode thus formed to the action of an electric current while immersed in the electrolytic liquid of a battery-cell, substantially as described.

295,457. SHOO-FLY ROCKER. GEORGE P. STEINBACH, Baltimore, Md., assignor to himself, Trustee for Albert Steinbach, same place. Filed June 11, 1883. (No model.)

Claim.—1. The combination, substantially as described, in a rocker of two parallel horses, having a seat and back between them and rockers attached to their feet, of the table E, pivoted to one horse at e, and having the hook e' and the loop or staple e^2 attached to the other horse, as set forth.

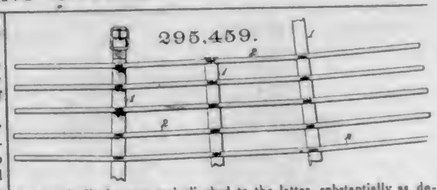


2. The combination, with a shoo-fly rocker having the usual seat, back, and rockers, as shown, of a table pivoted to the inside of one horse, and engaging, as shown, with the inside of the other horse, whereby the whole structure is braced and stiffened, and free access is provided to the seat, as set forth.

3. The combination, with a shoo-fly rocker having the ordinary seat, back, and rockers, and a pivoted table, as described, of the dovetailed stiffening-bars b, inserted in the position shown, and for the purposes set forth.

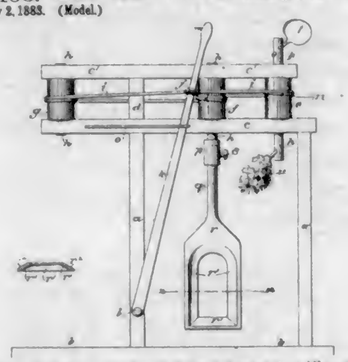
4. The combination, with a shoo-fly rocker having the ordinary seat, back, and rockers, of two pairs of wheels, each pair mounted on a bar a little longer than the distance between the horses, and links pivoted to the inner side of the rockers, and on the bars which carry the wheels at points slightly outside the plane of the inner sides of the rockers, one pair of wheels being mounted near the front end and one pair near the rear end of the rockers, for the purposes set forth.

5. The combination, with the rockers C, of pivots f', bars or links f, rods f^2, and wheels F F', the distance on the rods f^2 between the links f being slightly greater than the distance between the rockers, whereby friction is produced between the links f and the inside of the rockers, for the purposes set forth.



295,458. FIFTH-WHEEL. WILLIAM H. STICKLE, Terre Haute, Ind. Filed July 21, 1883. (No model.)

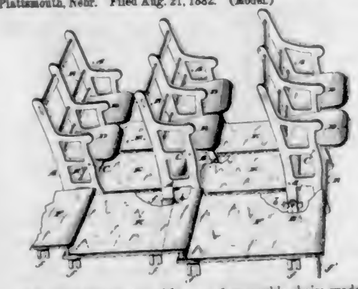
Claim.—The combination, with the bar F, secured to the cross-bar or bolster, said bar provided on its top and inner side with a double trackway, T, of the plate E, secured to the axle and provided with bearing-faces on its periphery, that fit the double trackway T, and the plate K, secured to the axle and pivoted to the perch, substantially as set forth.



295,459. FLY-NET. ELBRIDGE G. STUDLEY, Grand Rapids, Mich. Filed Jan. 28, 1884. (No model.)

Claim.—1. A fly-net consisting of longitudinal and transverse straps, the adjacent abutting ends of the lengths composing the transverse straps being connected and attached to the former by staples, the arms of which pass, respectively, through the end portions of such lengths and through the longitudinal straps and clinched to the latter, substantially as described.

2. A fly-net consisting of longitudinal and tranverse straps held together and prevented from longitudinal displacement by staples, the arms of which pass through both the transverse and longitudinal straps, the head of the staple extending in the direction of the length of the transverse straps, substantially as described.

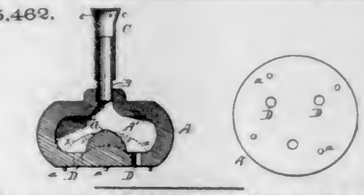


295,460. CHURN. WILLIAM H. TAWNEY, Louisburg, Kans. Filed July 2, 1883. (Model.)

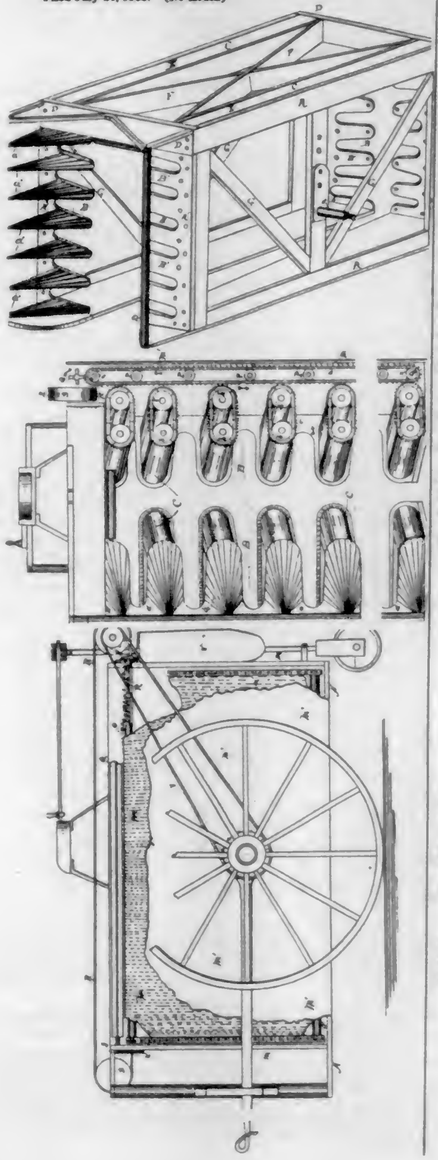
Claim.—1. The combination of the cross-heads c c', an idler-roll, g, a roll, f, carrying the dasher-shaft, a roll, e, carrying the fan and brush at the opposite ends of its shaft, a cord, i, coiled about each of said rolls, the staples n, preventing slip of said cord on the rolls, and the lever k, as shown and described.

2. A churn-dasher consisting of the plate r, inwardly inclined at r' toward a central aperture, into which the cream is thus guided, and reversely inclined upon the opposite side, whereby the cream may be whipped inwardly and outwardly, as described.

295,461. SEAT FOR PUBLIC BUILDINGS. GEORGE H. THOMPSON, Plattsmouth, Nebr. Filed Aug. 21, 1882. (Model.)



Claim.—In combination with rows of removable chairs graded from the main floor and grouped in sections, with aisles or passages between the sections, a stepped sectional aisle-platform between the sections, and supported by the end chairs of the rows, substantially as shown and described.



295,462. BOILER WASHING-MACHINE. WILLIAM H. THURMOND, Forsyth, Ga. Filed June 14, 1883. (Model.)

Claim.—The within-described new article of manufacture, the same consisting of the hollow body A, having supports a, perforations through its bottom, and a central elevation, G, in combination with the centrally-arranged fixed tube B and the adjustable tube C, having a closed top and perforations through its sides, substantially in the manner and for the purpose described.

295,462.

295,463. COTTON-HARVESTER. GEORGE N. TODD, Fort Smith, Ark. Filed July 26, 1883. (No model.)

Claim.—1. In a cotton-picking machine, in combination with suitable driving mechanism, a series of horizontal cylinders extending lengthwise of the machine, or nearly so, and a series of endless belts arranged on said cylinders so as to pass between the branches of the plant, substantially as described.

2. The combination of the supporting-frame, two series of horizontal cylinders extending lengthwise of said frame, or nearly so, with a passage-way between them, endless picker-belts arranged on the cylinders, substantially as described, and suitable driving mechanism, all substantially as shown and set forth.

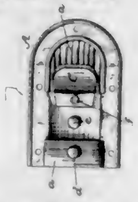
3. The combination, with the front plates having spaces therein, as described, of the guide-fingers, arranged to guide the branches of the plant into said spaces.

4. The combination, with the plates A', having spaces B therein, of the guide-fingers *a'* in front of projections B', said guide-fingers being pointed in front, and gradually increasing in breadth and thickness toward projections B', as shown and described.

5. The combination, with the frame having front plates, A', provided with projections, as stated, of the guide-fingers of the form described, arranged in front of said projections, and the cylinders journaled in said projections and carrying endless picker-belts, substantially as described, and for the purpose stated.

6. The combination, with a series of endless picker-belts and suitable operating mechanism, of stripper-belt arranged, as described, in proximity to the picker-belts, so as to strip and convey the cotton therefrom, substantially as described.

7. The combination, with a series of picker-belts arranged horizontally, or nearly so, and operating mechanism, substantially as described, of a stripper-belt arranged in proximity thereto, and adapted to strip and convey the cotton therefrom by suitable mechanism, substantially as stated.



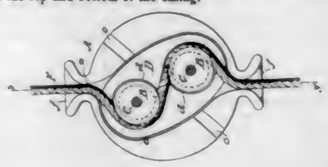
8. The combination, with the series of picker-belts, arranged as described, of a stripper-belt arranged in proximity thereto, as stated, and a screen arranged parallel with one face of the stripper-belt, whereby the cotton may be stripped from the picker-belts and carried between the stripper-belt and the screen to a point of delivery, substantially as stated.

9. The combination of a series of picker-belts, arranged as described, the stripper-belt and screen, and a revolving wiper, all arranged with reference to each other, substantially as set forth.

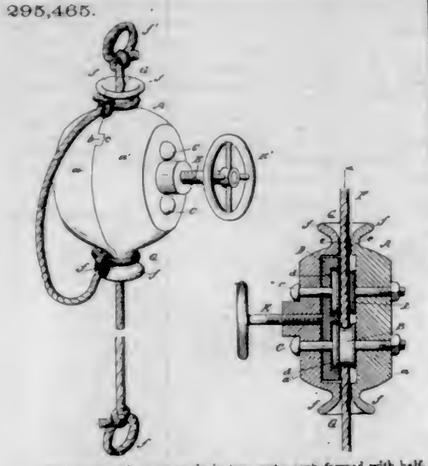
10. The combination of the stripper-belt, the rotating wiper, and the carrier-belt, all arranged and operating as set forth.

11. The combination of the stripper-belt, the rotating wiper, the conveyer-belt, and the scraper arranged as described, to scrape the cotton from the conveyer-belt into a suitable receptacle, substantially as described.

295,464. TRAY-BOLT FOR TRUNKS. JAMES S. TOPHAM, Washington, D.C. Filed Jan. 17, 1884. (Model.)



Claim.—1. The combination of the raised projections on the face plate or bed and on the bolt proper, working together to form a locking device, substantially as described.

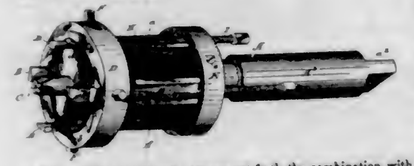


2. The combination of the main plate or bed, the bolt proper, and the thumb-piece riveted directly to the bolt between the loops, all operating together to form a perfect bolt, substantially as described.

295,465. FIRE-ESCAPE. CHARLES VON DER LINDEN, Rhinebeck, N. Y. Filed Oct. 24, 1883. (No model.)

Brief.—Two hollow castings bolted together and inclosing a brake-plate countersunk and holding the rope-pulleys, and a hand-screw for operating the brake-plate. The body belt or strap is secured to flaring necks at the top and bottom of the casing.

295,465.



Claim.—1. The case made in two parts, each formed with half-openings *e* and diverging lips *f* at its top and bottom, and provided with the securing-bolts C, extending through the case, and having mounted thereon the pulleys and the brake, and a brake-screw, E, substantially as set forth.

2. In a fire-escape, the brake-plate D, countersunk, as shown at *d*, to receive the pulleys B, substantially as and for the purposes set forth.

3. In a fire-escape, the holder A, composed of the hollow castings *a a'*, held together by the bolts C C, in combination with the inclosed pulleys B B and brake-plate D, placed upon the said bolts, the casting *a'* being provided with the screw E, for operating the brake-plate, substantially as described.

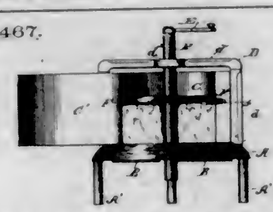
295,466. CUTTING-TOOL. J. BENNETT WALLACE, Chicago, Ill. Filed Dec. 18, 1882. (No model.)

Claim.—1. In a tool for the purpose set forth, the combination, with the head provided with longitudinal grooves *a'*, deeper at their front than at their rear margins, of the rearwardly-beveled cutters B, and means for securing them adjustably in said grooves, substantially as described.

2. In combination with the head provided with grooves *a'*, and with the cutters fitted to lie in said grooves, a ring, D, embracing said head and provided with notches *d* opposite the cutters, gibs fitted to said notches, and set-screws F, threaded through the ring in position to bear on the gibs, substantially as described.

3. In a tool for the purpose set forth, the combination, with the head having longitudinal grooves *a'* for the cutters, of the ring or flange E, secured to the head, and the adjusting-screws I, threaded through said ring, substantially as described.

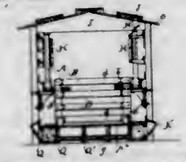
4. In a tool for the purpose set forth, the combination, with the cutters, of a longitudinally-movable burr-cutter, and means for securing it adjustably in place, substantially as described.



5. In a tool for the purpose set forth, the combination, with the head, of the center-post constructed as a reamer for a portion of its length, and a longitudinally-adjustable cutter or cutters, substantially as described.

295,467. ICE-SHAVER. GILBERT B. WEBB, Bell's Ferry, N. C. Filed Sept. 6, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of the base having suitable cutting-blades, the vertically-moving shaft, and the follower-plate secured on said shaft, and provided on its under face with means whereby to clutch the ice, as and for the purposes specified.



2. The ice-shaving machine, substantially as described and shown, composed of the base having slots or openings, and suitable blades secured therein, the casing having a suitable door, the arch-frame, the vertically-movable shaft, and the follower-plate secured thereon, and provided with barbs or other means whereby to clutch the ice, as set forth.

295,467.

3. In an ice-shaving machine, the combination, with the knives and the necessary framing, of a vertically-movable follower-plate provided on its under side with means to clutch the ice, and means whereby said plate is revolved, as and for the purposes set forth.

295,468. STOCK-CAR. THEODORE D. WILLIAMS, Chicago, Ill. Filed June 23, 1883. (No model.)

Claim.—1. The combination of the standards situated on vertical lines, a vertically-sliding gate or partition, connecting means which unite the gate or partition with the standards, and which have horizontal pivots or hinges uniting the gate or partition with the connecting means, substantially as set forth.

2. In a stock-car, the combination of the standards or supports A, situated vertically, sliding sleeves thereon, and the gate or partition suspended upon said sleeves by horizontal pivots or hinges, whereby the gate or partition can be moved bodily upward and can thereafter be swung upon said pivots or hinges, substantially as set forth.

3. The combination of the gate or partition arranged, substantially as set forth, to slide bodily up and down, a hinge-like support for said gate or partition, relatively to which it is adapted to swing vertically when near the top of the car, in combination with means which support it near the top of the car after it has been moved upwardly, substantially as set forth.

4. The combination of the gate or partition arranged, substantially as set forth, to move bodily up and down, a pivot rod or bar stationary relatively to the car at or near the top thereof, the gate or partition being suspended from said bar or rod loosely, whereby it can swing vertically around the rod or bar while the latter remains stationary, substantially as set forth.

5. The combination of the car, a horizontally-arranged supporting rod or bar, means for holding said rod or bar stationary relatively to the car at or near the top thereof, a gate or partition suspended from said rod or bar loosely, and adapted to bodily rise and fall and to have its lower edge swing upward toward the top of the car, and means for supporting said lower edge from the car while the other edge of the gate or partition is being supported upon said rod or bar, substantially as set forth.

6. The combination of a horizontally-arranged hinge rod or bar, means for holding said rod or bar stationary relatively to the car at or near the top thereof, a gate or partition which rises and falls bodily relatively to the car, and is suspended from said rod or bar, and adapted, substantially as set forth, to be rocked thereon into different vertical positions.

7. The combination of the rising and falling partition or gate, the supporting-standard, a sliding sleeve on the standard, the hinge or pivot interposed between the sleeve and the gate, and means engaging directly with the standard and with the sleeve for locking the latter in its uppermost position, substantially as set forth.

8. The combination of the partition or gate which both slides vertically and swings about a horizontal axis, a supporting-standard, the means which connect the gate and the standard together, and the pin which engages with the connecting means and holds the gate stationary relatively to the car after it has been bodily moved upward, substantially as set forth.

9. The combination of the gate or partition, the supporting-standard, the guide-rod in length shorter than the height of the body of the car, the inwardly-projecting metallic bracket which supports the standard or guide, and which is situated above the central horizontal line of the gate or partition when the latter is in its lowermost position, substantially as set forth.

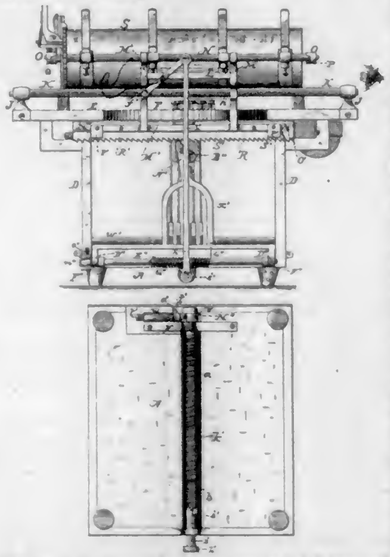
10. The combination of the car-frame having cross-bars at the top extending from side to side, and provided with sockets or apertures, the vertically-sliding gates or partitions, and the vertical standards or sup-

ports inserted into said sockets or apertures in the top beam, means for supporting the lower ends of said standards, and a hinge-connection between the gates or partitions and the standards, substantially as set forth.

11. The combination of the supporting-standards situated on vertical lines, the gate or partition, sliding guides for the gate or partition supported on the standards, pivots connecting the guides with the gate or partition, whereby after the latter has been pushed up it can be rocked in vertical planes, and devices at or near the lower end of the gate or partition which prevent it from swinging when down, substantially as set forth.

12. In a stock-car, the combination of the gate or partition, arranged substantially as set forth, to be moved vertically and to swing vertically when in its uppermost position, and the recessed cleats or bars secured to the floor at points inside of the walls of the car, and which engage with both sides of the lower edge of the partition to hold it horizontally, and which have inclined or beveled ends, as set forth.

13. In a stock-car, the combination, with a gate or partition, of a spring interposed between the gate and an abutment secured to the car to receive the endwise thrust of the gate, substantially as set forth.



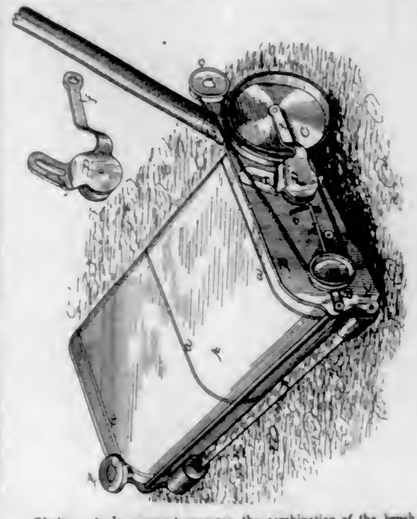
14. In a stock-car, the combination, with a gate or partition and a pivot connected to the car, of a spring carried by said pivot and arranged, substantially as set forth, to take the endwise thrust of the partition.

15. In a stock-car, the herein-described water-trough, it having its sides or vertical walls constructed of the sills or girts of the car, the bottom of the trough being secured directly to the said sills or girts, substantially as set forth.

16. In a stock-car, the combination of the apartment for the cattle, the floor of said apartment having a series of apertures, respectively, directly beneath the heads of the cattle, a water-trough constructed, substantially as hereinbefore described, with the sills or stringers of the car as parts thereof, the passage-way G' through the outer stringer or sill, a funnel by the side of said sill or stringer, whereby water may be supplied to all of the animals above said series of apertures, and the threaded stop, which, when withdrawn, will permit the escape of the water, substantially as set forth.

17. In a stock-car, the combination of the lower hinged bar, A, the upper hinged bar, A', the connecting parallel hinged bars A^2 A^3, arranged substantially as set forth, whereby the rack formed thereby can be folded up against the side of the car, the bars A^2 A^3 remaining vertical both when the rack is up and when it is down, substantially as set forth.

295,469. TYPE-WRITER. GEORGE W. N. YOST, New York, N. Y., assignor to the American Writing Machine Company, of New York. Filed June 28, 1880. (No model.)



Claim.—1. In a type-writer, a lever connected at its upper end with the paper-carriage, and hinged or pivoted at its lower end upon a shaft having a spring-tension toward the left, and a means for regulating the tension.

2. A driving-power for the paper-carriage of a type-writer, consisting of an arm or lever hinged or pivoted at its lower end and having a tension toward the left, the upper end being connected with the paper-carriage and adapted to vibrate with it, substantially as shown and set forth.

3. In a type-writing machine, the lever A', having at its upper end the link or rod g', connecting it with the paper-carriage frame, while its lower end is pivoted on the end of the shaft i', provided with the spring k', substantially as set forth.

4. In a type-writer, a paper-carriage capable of lateral movement, in combination with the rod k', connected with the carriage at its upper end, and mounted at its lower end upon the shaft i', supplied with the spiral spring k' and toothed nut N'', whereby the tension of the spring may be regulated, substantially as set forth.

295,470. CARPET-SWEEPER. GEORGE W. ZIEGLER, Norwalk, Ohio. Filed June 30, 1883. (Model.)

Claim.—1. In a carpet-sweeper, the combination of the brush-driving pulley, the auxiliary pulley in rear of the drive-wheel, the drive-wheel, the belt passing around the pulleys and over the drive-wheel, the bracket having one arm pivoted to the stud-bearing of the drive-wheel, and another slotted arm adjustable on the frame by means of a set-screw, and a tightening-pulley journaled in this two-arm bracket, substantially as set forth.

2. In a carpet-sweeper, the combination, with the rotary brush, of the pivoted adjusting-lever having a long and a short arm, between which the journal of the brush is supported, said lever being adjustable on its pivot to vertically adjust the brush, substantially as set forth.

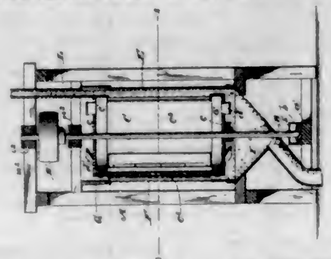
3. In a carpet-sweeper, the combination of the casing provided with vertical slots, the rotary brush having journals working in said slots, the lever pivoted to the casing and bent to form a short arm and a long arm, between which the journal of the rotary brush is received, a rack on the side of the casing, and a projection on the end of the long arm for engaging this rack, substantially as set forth.

4. In a carpet-sweeper, a case provided with a carpet-beater having friction-rolls at its ends, substantially as set forth.

5. In a carpet-sweeper, the combination, with the case carrying the rotary brush, of a carpet-beater arranged across the front lower edge of the case, and provided with friction-rollers at its ends, substantially as set forth.

6. The combination, in a carpet-sweeper having the flanged ends, as described, of the sliding bottom provided with the ring m, and the spring i, for returning the bottom and retaining it in position, substantially as set forth.

7. In a carpet-sweeper, the combination of the casing carrying the rotary brush, the mouth-pieces having the removable shoes attached to their lower ends, the rear mouth-piece being provided with teeth, the shoe H, and the removable bottom, substantially as set forth.



8. In carpet-sweepers, the rear mouth-piece consisting of the elongated strip H^3, slightly concave, and having on its upper edge a series of slits, the free ends of the portions between said slits being bent at right angles, substantially as and for the purpose set forth.

9. In a carpet-sweeper, the improved adjusting-spring having a long and short arm, between which the journal-bearings are to be supported, substantially as set forth.

10. In a carpet-sweeper, the improved handle-socket provided with the interior screw-threads and with a longitudinal slot, whereby it is adapted to clasp the handle and take up the wear of the same, substantially as set forth.

11. In a carpet-sweeper, the combination, with pieces forming the mouth of the sweeper, and provided with the shoulder n^3, of the removable spring-shoes sprung over said shoulder and binding against the same, substantially as and for the purpose set forth.

295,471. MACHINE FOR SCOURING AND POLISHING CEREALS. WILSON AGEE, New York, N. Y. Filed Aug. 22, 1883. (No model.)

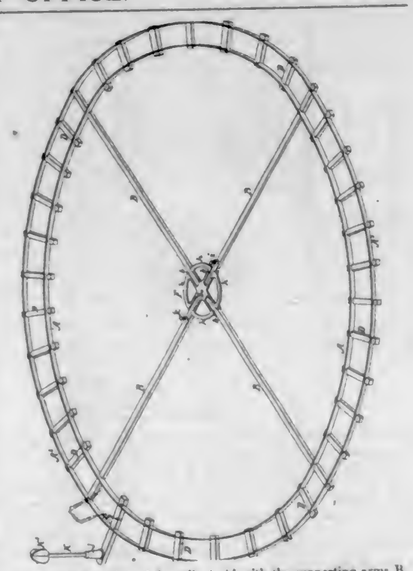
Claim.—1. A grain scouring and decorticating apparatus, combining in its structure an outer drum having its walls constructed with an imperforate abrading-surface provided at intervals with foraminous sections, and an inner cylinder having its wall constructed with blast-openings and means for indocing air into the cylinder and driving it through the blast-openings therein and through the foraminous sections, substantially as described.

2. A grain scouring and decorticating apparatus, combining in its structure an outer drum having its wall constructed with an imperforate abrading-surface provided with gauze sections at intervals, an inner cylinder having blast-apertures, an external surface of bristles, and an air-opening at its end, and means for indocing air into the air-openings and forcing it through the blast-apertures and the gauze sections of the drum, substantially as described.

3. A grain scouring and decorticating apparatus, combining in its structure an outer drum having its wall constructed with an imperforate abrading-surface having gauze sections arranged therein at intervals, an interior cylinder, and means for driving air through the inner cylinder and the gauze sections of the imperforate abrading-surface of the outer drum, substantially as described.

4. A grain scouring and decorticating apparatus, combining in its structure an upright drum having its wall provided with vertical openings and an imperforate abrading-surface, gauze pieces arranged in the vertical openings, and an internal cylinder having vertical openings and bristles, and provided at its end with air-forcing hooded openings, substantially as described.

5. The combination, with the inner cylinder having air-forcing devices in its two heads, of the lower hopper and grain-chute having a gauze-covered air-opening to admit air to the lower end of the cylinder, substantially as described.



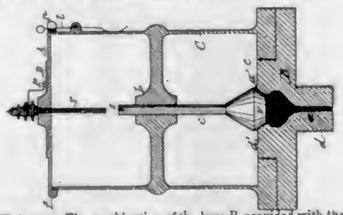
295,472. TRUSS. DAVID S. ARMER, Columbus, Ind., assignor of one-half to Thomas C. Woodburn and John N. Maring, both of same place. Filed Feb. 8, 1883. (No model.)

Claim.—In a truss, the rigid supporting-band or waist-belt flaring outward and extending only partially around the body, the two ends thereof being connected in the back by a flexible band, combined with two inwardly-curved springs pivoted near each other to the front of the supporting-band, and each spring carrying upon its outer end a loosely-pivoted pad, all substantially as and for the purpose specified.

295,473. TOY ELECTRIC RAILWAY. MURRAY BACON, Philadelphia, Pa., assignor to the Novelty Electric Company, same place. Filed Dec. 10, 1883. (No model.)

Claim.—1. A toy electric railway in which are combined the following elements, namely: a suitable generator of electricity, a central frame, a series of radial arms, B, of series a cross-ties, D, two sheet-metal strips adapted to notches in the said arms B and ties D, and two wires, i' and k', as set forth.

2. The combination of the rails A A' with the supporting-arms B, notched at the outer end for the reception of the rails, and having secured to them wires communicating with said notches, as set forth.



3. The gage-bar G, having a pivot-pin, n, and notches p p in its under side for adaptation to the rails A A', as set forth.

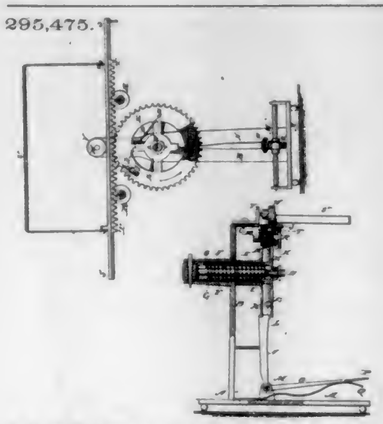
4. The combination of the frame F, having sockets b, with the bars B, having in their under sides notches d, in which the bottom bars of the sockets fit, whereby radial withdrawal or displacement of the bars is prevented, as set forth.

5. The center frame, F, having sockets b and recessed on the under side to form a cage for containing, when coiled, the strips composing the rails, as set forth.

6. The combination of the rails and their supporting structure with a short-circuiting connection between the rails and a signal device constructed to make and break said connection, as set forth.

295,474. LUBRICATOR. PETER J. BALTES, Oswego, N. Y., assignor of one-half to James B. Donnelly, same place. Filed Jan. 9, 1884. (No model.)

Claim.—1. The combination of the base B, provided with the screw-threaded bosses d d', and with the channel a and valve-seat a' in the same, the cup C, provided with the screw-threaded orifice e in its bottom, and the guide b above the bottom, and the valve v, having the stem c, sliding in the said guide, substantially as specified and shown.



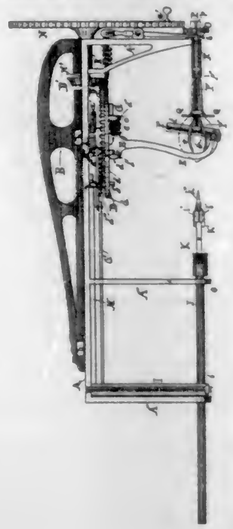
2. The combination, with the lubricant-cup, of a cap screwed onto the top thereof, and having an overhanging flange provided with a notch, and a latch connected to the exterior of the cup and adapted to engage said notch, substantially as described and shown.

3. In combination with the cup C, valve v, provided with the stem c, and the regulating-screw r, the dial D, arranged on top of the cup concentric with the regulating-screw, and the pointer p, fixed to said screw, substantially as described and shown, for the purpose set forth.

295,475. TYPE-WRITING MACHINE. WALTER J. BARRON, New York, N. Y., assignor, by mesne assignments, to the American Writing Machine Company, of New York. Filed Aug. 28, 1879.

Claim.—1. In a type-writing machine, the combination of two series of ratchet-teeth, which are adapted to move alternately in one direction, each independently of the other, for a letter-space distance at a

295,475.



time, with the driving mechanism and carriage, and with only one letter-space ratchet, which is adapted to work alternately in both series of ratchet-teeth, first in one and then in the other.

2. In a type-writing machine, the combination of two ratchet-wheels, which are adapted to turn alternately in one direction, each independently of the other, for a letter-space distance at a time, with the driving mechanism and carriage, and with only one letter-space ratchet, which is adapted to work alternately in both ratchet-wheels, first in one and then in the other.

3. In a type-writing machine, the combination of two ratchet-wheels, which are adapted to turn alternately in one direction, each independently of the other, for a letter-space distance at a time, the first of which is attached to the driving mechanism and the second to the first, with a spring on the first ratchet-wheel, which is adapted to press against and turn the second one, with an arm or shoulder on the second ratchet-wheel, which is adapted to strike and stop against the first one, and with only one letter-space ratchet, which is adapted to work alternately in both ratchet-wheels, first in one and then in the other.

295,476. COMBINED FRUIT PARER AND SEEDER. JOSEPH O. BRADLEY and ISAAC L. MORRIS, Baltimore, Md. Filed Jan. 9, 1884. (Model.)

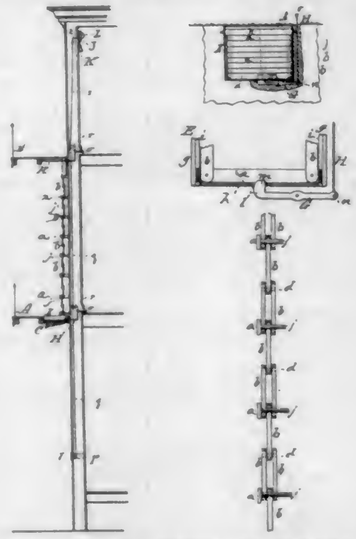
Brief.—This machine pares, splits, and stones the fruit at one operation. The stoning-knife is made up of two thin curved spring-metal strips. Two splitting-knives are carried on same frame with stoning-knife—one on each side of the latter. The paring-knife has a sickle-edge, with the grooves extending entirely across one face of the blade.

Claim.—1. A machine, as herein described, having a paring-knife, double splitting-knives, to pass each side of the kernel of the fruit, and two elastic coring-blades for removing the kernel, all combined and operated substantially as and for the purpose described.

2. The combination of the driving mechanism, the wheel D, with its cam-rim *d*, the pin *d'''*, sliding bar M, arm I, rod J, carrying the splitting and coring knives, the levers G G', and arm H, substantially as and for the purpose described.

3. The wheel D, with cam-rim *d*, rod R', lever S, with its yoke *s*, and sleeve and pinion O, having the hole *o''* in its inner face, in combination with the pin *r* in the side of the arm A', all substantially as and for the purpose described.

4. The splitting-knives *k'''*, pivoted to the back bar, *k*, having the spring *k'*, in combination with the bifurcated end springs, *l l*, and the spring-blades L L, all substantially as and for the purpose described.



5. The spring coring-blades L L, curved as described, in combination with the bifurcated end springs, *l l*, and the binding-springs *m m*, and the bars *K''* of the splitting-knives *k'''*, and the back bar, *k''*, all substantially as and for the purpose described.

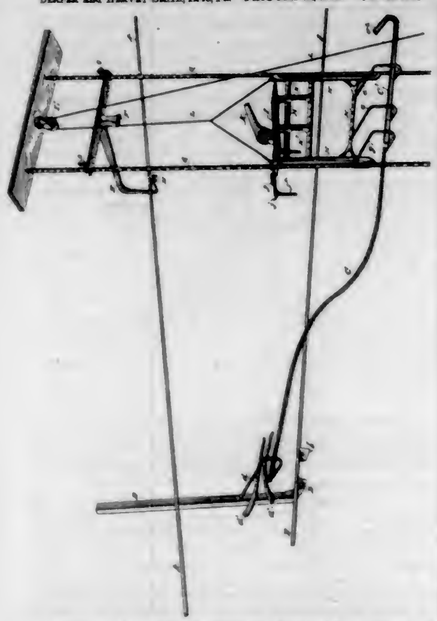
6. The combination of the spur-wheel N, pinion O, shaft P, and fruit-holder P', having an adjustable screw and nut, and tines for holding the fruit, and gage *P''* for the stone, and gages Q Q for the fruit, substantially as described.

7. The paring-knife F, having one side and the sharp edge cut into sickle-teeth, substantially as and for the purpose described.

295,477. FIRE-ESCAPE. VITAL BESSER, New York, N. Y., assignor of one-half to Henry A. Robbins, Washington, D. C. Filed Dec. 20, 1883. (No model.)

Brief.—When not in use, the ladder is folded within a three-sided frame held up by a suitable latch, and forms the flooring of the hatchway of the balcony, beside which it is hinged. A trip-rod releases the latch and sounds an alarm. The stays or struts gradually increase in length toward the bottom of the ladder, to suitably incline the same.

Claim.—1. A ladder, C, constructed to fold with its rounds side by side, and contained in a frame, E, in combination with the hatchway of a balcony-floor or other landing, whereby the said folded ladder and its frame form a close door for the said hatchway, substantially as and for the purpose herein specified.



2. The combination of a closely-folding ladder, C, a three-sided frame, E, hinged at the middle side to one side of a floor-hatchway, and a catch, *m*, for sustaining the ladder shut into the hatchway, substantially as and for the purpose set forth.

3. The combination of a folding ladder, C, hinged in a balcony or landing hatchway, a sustaining lever or holder, G, and a trip rod or rods, H, reaching from the holder to one or more positions inside of the building, substantially as and for the purpose herein specified.

4. The combination of a folding ladder, C, hinged in a balcony or landing hatchway, a sustaining lever or holder, G, a trip-rod, H, a tripping-pull, *p*, accessible near the ground outside of the building, and mechanism connecting the said pull and trip-rod, substantially as and for the purpose set forth.

5. The combination of a folding ladder, C, hinged in a balcony or landing hatchway, a sustaining lever or holder, G, tripping mechanism H, an alarm, L, and mechanism connecting the alarm with the tripping mechanism, for the purpose herein specified.

295,478. CONVEYER APPARATUS. GEORGE CANFIELD BLEKKER-DERPER and HERVEY SMITH, Erie, Pa. Filed Jan. 24, 1884. (No model.)

Claim.—1. In a conveyer apparatus, substantially as shown, the combination, with a continuous taut-wire track which passes curves or corners by angular bends, of a curved track formed of another piece of metal and adjusted with relation to the main wire, substantially as shown, so as to form a continuous properly-curved track.

2. In a conveyer apparatus, substantially as shown, the combination, with a continuous taut-wire track which passes curves or corners by angular bends and a separate curved track, of an iron forming a connection for said curved track upon said main track, through which the said main track is deflected downward, so as to allow the curved track to lie in the plane of the main track, substantially as set forth.

3. In a conveyer apparatus, substantially as shown, the combination, with the curved track A' and the main track A, of the connecting-iron (R or T) which connects both tracks and deflects the main track below the end of the curved track, substantially as and for the purposes mentioned.

4. In a conveyer apparatus, substantially as shown, a car having thereon a running-gear for running on the direct line of track, which is provided with means, substantially as shown, whereby the wheels thereof may be tripped or thrown out of operative position, for the purposes mentioned.

5. In a conveyer apparatus, substantially as shown, the combination, with the main or direct track, of a switch-track, the point of which lies in a substantially vertical plane with said main track, and a car having two sets of wheels arranged one set above the other, substantially as and for the purposes mentioned.

6. In a conveyer apparatus, substantially as shown, the combination, with a main or direct track and a switch or side track, the latter of which has its point lying in a substantially vertical plane with the said direct track, of a car having two sets of wheels arranged one set above the other, one of which sets is designed to traverse the main track, and is so adjusted as to be thrown out of position for use, and the other set is designed for use upon the switch-track when the said main wheels have been thrown out of position for use.

7. In a conveyer apparatus, substantially as shown, the combination, with the tracks B and C and finger *b*, of the main car-wheels N, cross-bar N', pivoted catch-bar P, spring-bolt p^2, pin p^3, spring p^3, and the wheels O.

8. In a conveyer apparatus, substantially as shown, the combination, with the tracks B and C, arranged relatively, substantially as shown, and a car, substantially as described, of the hanger *d* and guides *d'' d''*, arranged as shown, and for the purposes mentioned.

9. In a conveyer apparatus, substantially as shown, the combination, with the side track, C, of the track C', attached to the elevator, substantially as and for the purposes shown.

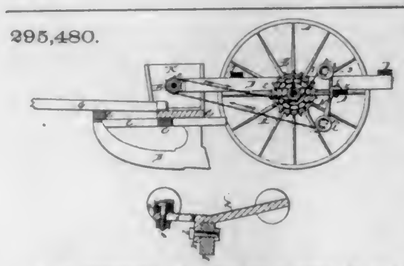
10. In a conveyer apparatus, substantially as shown, the combination, with the elevator, of a sliding platform or car-holder, J, and means, substantially as shown, for sliding out said car-holder by the upward action of the elevator.

11. In a conveyer apparatus, substantially as shown, the combination, with the elevator, of the sliding platform J, adapted to hold the car, the elbow-lever K, and finger F, for the purposes mentioned.

12. In a conveyer apparatus, substantially as shown, the combination, with the elevator, of the tilting platform I and the sliding car-holder J, with hooks *j* and fingers J', for the purposes mentioned.

295,479. LAMP. CHARLES B. BOYLE, New York, N. Y., assignor to the Boyle Illuminating Company, same place. Filed Aug. 25, 1882. Renewed Aug. 23, 1883. (No model.)

Claim.—1. In combination with the vase V, having apertures *g* in its base, and exits J at top, the lamp-reservoir A, having a flange at top, to adapt it to hang on the edge of the vase and permit the circulation of air freely around the font and through the exits J, as and for the purpose set forth.



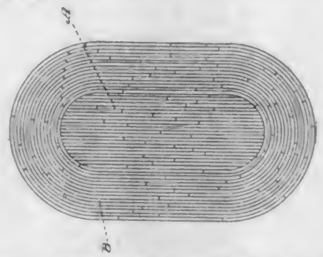
2. In combination with the vase V, having perforated base, and exits J at top, the oil-reservoir A, hung within said vase, so as to leave a free air-space, H, and central and annular air-passages, D and B, the apertures *g* in the vase being of sufficient area to provide a free supply of air to the three air-passages D, B, and H, as set forth.

3. In combination with an oil-reservoir having central air-chamber and surrounding annular wick and air passages, the removable burner and wick carrier adapted to be screwed upon the reservoir, and having corresponding central air-tube and surrounding annular wick and air passages, as set forth.

295,480. SEEDING-MACHINE. GEO. S. BRIGGS, Rockford, Ill. Filed Nov. 12, 1883. (No model.)

Claim.—1. The combination, in a seed-planting machine, of a sprocket-wheel cone made adjustable on the shaft of the supporting-wheels, a sprocket-wheel fixed on the seed-wheel shaft, a sheave-supporting bracket adjustably secured to a cross-bar of the machine and carrying adjustable idle-sheaves, and a chain-belt connecting the sprocket-wheel of the seed-shaft with one of the cone-wheels and passing around said idle-sheaves, substantially as set forth.

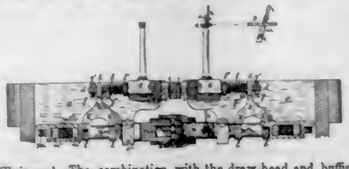
295,480.



2. The combination, with a chain-belt to connect the sprocket-wheels, of adjustable idle-sheaves supported by a bracket extending both above and below the cross-bar to which it is secured, substantially as set forth.

3. The combination, with the sheave-supporting bracket N, fixed to one of the cross-bars of the frame and extending both above and below the latter, of the bracket P, adjustably secured to the bracket N, to afford a vertical adjustment for the sheave, substantially as set forth.

295,481. FLOOR. CHAS R. BROTHWELL, Bridgeport, Conn., assignor to Phineas Taylor Barnum, same place. Filed Feb. 4, 1884. (No model.)



Brief.—A central section or core having strips of flooring arranged around it, so that the grain of the strips has the same general direction as the perimeter of said core, each strip being secured to the next preceding and to the floor beneath, thus forming an outer track, the grain of the strip of which being in the course most commonly traveled by the skater or rider.

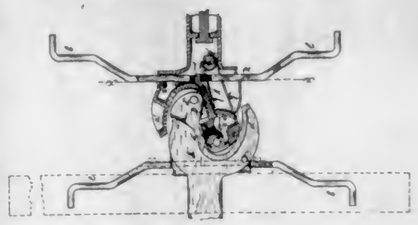
Claim.—1. A floor composed of a central section or core having arranged around the same strips of flooring, each strip adapted to the contour of the outer edge of the next inside strip and securely fastened thereto and to the floor beneath, substantially as set forth.

2. In a floor, the combination of a central section composed of boards laid longitudinally and parallel with independent strips of flooring bent and secured around said central section in succeeding bands, substantially as described.

295,482. COMBINED CAR COUPLER AND BUFFER. CLINTON BROWNING, Shoustown, assignor to James H. Lindsay, Trustee, Allegheny City, Pa. Filed Jan. 3, 1884. (No model.)

Claim.—1. The combination, with the draw-head and buffing apparatus supported independently above the same, and having the resistance-plate *h*, supported in the stop-brackets *g*, of the standard or frame *k*, carrying said resistance-plate, and extending down therefrom, and so connected with the neck of the draw-head as to permit the draw-head to slide back independently in buffing, but to be drawn forward with the draw-head on draft-strain, substantially as and for the purposes set forth.

2. The combination, with the draw-head and buffing apparatus supported independently above the same, and having the resistance-plate *h*, of the standard or frame *k*, carrying said resistance-plate, and extending down therefrom, and provided with the rings *l l'*, fitting around the neck of the draw-head, the key *u*, passing through the said neck, and stop-brackets *g*, substantially as and for the purposes set forth.



3. In combination with the buffer-platform *c*, pivoted to the buffer-bar *d*, and spring *f*, the stop-brackets *g*, and the standard or frame *k*, carrying the resistance-plate *h*, and connected to the draw-head by a sliding connection, substantially as and for the purposes set forth.

4. In combination with the draw-head having the jaws *a a'*, and the interlocking lever *b*, journaled in the entering jaw *a*, the bent or coiled spring *p*, confined in said entering jaw and pressing against said lever, substantially as and for the purposes set forth.

5. The combination of the railing *t*, having the slot *t'* and shouldered space *t²*, with the operating-lever *s* and pivoted block *u*, substantially as and for purposes set forth.

6. The combination of a bifurcated draw-head, interlocking lever journaled therein, having the arms *b'*, operating-lever *s*, and connecting-bar *b²*, having the slot *c*, substantially as and for the purposes set forth.

295,483. CAR-COUPLING. CLINTON BROWNING, Shoustown, assignor to James H. Lindsay, Trustee, Allegheny City, Pa. Filed Jan. 3, 1884. (No model.)

Claim.—1. The bifurcated draw-head having the entering jaw provided with an opening for a coupling-link, and a coupling-pin hole in the nose thereof, in combination with an interlocking lever journaled in said jaw back of said coupling-pin hole, and independent thereof, substantially as and for the purposes set forth.

2. The bifurcated draw-head having the entering jaw provided with the opening *d*, and recess *e*, having the journaling-face *c'*, and ridge *c²*, extending across said recess, in combination with the interlocking lever journaled in said recess across said face *c'*, and having grooves *b'* fitting over said ribs, substantially as and for the purposes set forth.

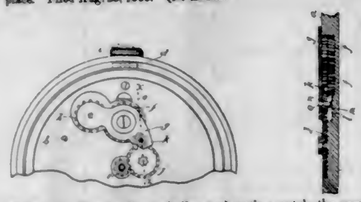
3. The bifurcated draw-head having the entering jaw *a*, provided with the opening *d*, and the journaling-recess *c*, having the curved faces *c'*, in combination with the interlocking lever journaled in said recess, and having the opening *d'* and shoulders *e*, substantially as and for the purposes set forth.

4. The combination of the bifurcated draw-head, the interlocking lever journaled in the entering jaw, and having the operating-arm *b*, and the spring *g*, having one or more coils, *g'*, and secured within the draw-head and pressing against said arm *b*, substantially as and for the purposes set forth.

5. The combination of the bifurcated draw-head provided with teats or lugs *h* in the back thereof, the interlocking lever journaled in the entering jaw thereof, and provided with the operating-arm *b*, and the spring *g*, having the coils *g'*, fitting over said teats and extending back of said operating-arm, substantially as and for the purposes set forth.

6. In combination with a bifurcated draw-head and an interlocking lever journaled therein, and operating-bar supported in or on said draw-head and extending out on each side thereof, and connected with said interlocking lever, substantially as and for the purposes set forth.

7. In combination with the bifurcated draw-head and an interlocking lever journaled therein, a sliding bar passing transversely through said draw-head and extending out on either side thereof, and connected with said interlocking lever, substantially as and for the purposes set forth.



8. In combination with the bifurcated draw-head and interlocking lever journaled therein, and having the arm *b*, the sliding bar *k*, extending transversely through said draw-head, and having the slot *m*, in which said arm *b* fits, substantially as and for the purposes set forth.

9. In combination with the bifurcated draw-head and interlocking lever journaled therein, the sliding bar *k*, extending transversely through the draw-head and connected with the lever, and provided with suitable stop apparatus engaging with the draw-head to hold the lever in its uncoupled position, substantially as and for the purposes set forth.

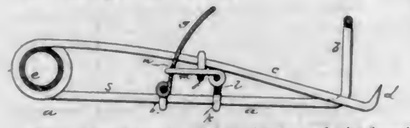
10. In combination with the bifurcated draw-head having the shoulder *q* thereon, and the interlocking lever journaled therein, the spring *g*, and sliding bar extending through the draw-head and connected to the lever, and having the shoulder *r* on the upper edge thereof, substantially as and for the purposes set forth.

11. In combination with the bifurcated draw-head and interlocking lever journaled therein, and having the arm *b*, the sliding bar *k*, extending through the draw-head, and having the slot *m* and lug *l*, and the pin *l'*, substantially as and for the purposes set forth.

295,484. STEM WINDING AND SETTING WATCH. DUANE H. CHURCH, Waltham, Mass., assignor to the American Watch Company, same place. Filed Aug. 23, 1883. (No model.)

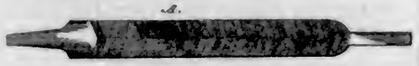
Claim.—1. In a pendant winding and setting watch, the combination, with the hand-setting wheels *i j* and crown-wheel *f*, rotated by the winding-arbor, of the intermediate winding-wheel adapted to move on a fixed stud or arbor in a direction at right angles with the plane of its rotation, into and out of engagement with its co-operating wheels, a spring adapted to move the intermediate wheel outwardly into engagement with said co-operating wheels, and the yoke bearing upon the intermediate wheel and adapted to control the position thereof, as set forth.

2. In a pendant winding and setting watch, the combination, with the hand-setting wheels *i j* and the crown-wheel *f*, rotated by the key-pipe, of the intermediate hand-setting wheel, *k*, adapted to move on its supporting pin or arbor in a direction at right angles with the plane of its rotation, the winding-wheel carrying yoke *g*, pivoted on the crown-wheel, and a spring which presses the hand-setting wheel *k* outwardly against the yoke, said yoke and wheel being provided, respectively, with an orifice and a projection, whereby when the yoke is in its hand-setting position the spring is allowed to force the wheel *k* outwardly into engagement with the crown-wheel and minute-wheel, and when the yoke is in its winding position the wheel *k* is forced inwardly out of engagement with said crown and minute wheels, as set forth.



295,485. MAINSPRING FOR WATCHES. DUANE H. CHURCH, Waltham, Mass., assignor to the American Watch Company, same place. Filed Aug. 29, 1883. (No model.)

Claim.—1. The process herein described of forming ears on mainsprings, the same consisting in splitting the end of the spring, bending outwardly the parts of the split end, and trimming said outwardly-bent parts to form ears, as set forth.

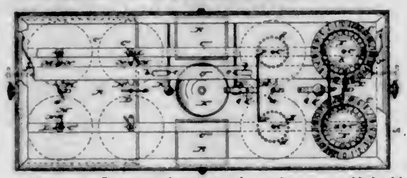


2. A mainspring having laterally-projecting ears *c c* integral with the body of the spring, as set forth.

295,486. ANIMAL-TRAP. WILLIAM L. B. COSHING and AMBROSE D VEST, San José; said Vest assignor to Thomas A. Vest, North San Juan, Cal. Filed Aug. 11, 1883. (No model.)

Claim.—The combination, with the spring-frame *a*, having the arch *b* at its front, and its arms *c c*, coiled around and secured to the tube *e*, extended forward from the coil, provided with the enlargement *i*, connected in front of the enlargement by the downwardly-curved cross-bar *f*, and provided at the points with the teeth *d d*, of the hinged and perforated trip-plate *g*, and the set-rod *m*, constructed and adapted to operate substantially as specified.

295,487. FILE. GEORGE COSTER, Whitney, Tex. Filed Nov. 2, 1883. (No model.)



Claim.—1. A file provided with longitudinal teeth upon one or both of its edges, as described.

2. A file having the teeth upon its sides so cut that they extend only half-way across the width of the file, the inner ends of the said teeth meeting at an angle at the center of the width of the blade, as and for the purpose shown and set forth.

3. A file provided with longitudinal teeth upon one or both of its edges, and having the teeth upon its sides so cut that they extend only half-way across the width of the file, the inner ends of the said teeth meeting at an angle at the center of the width of the blade, constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

295,488. GAME BOARD AND COUNTER. TIBERIAS DOUGHERTY, Philadelphia, Pa. Filed Aug. 16, 1883. (No model.)

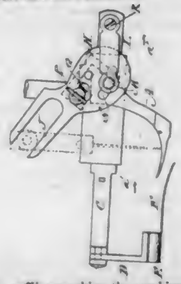
Claim.—1. In a game board or casing, a drawer provided with a tilting table or plate, and means for moving said plate operated by the opening of the drawer, whereby cards in the drawer may be produced, substantially as and for the purpose set forth.

2. A game-board casing or frame having a false bottom, forming a way for a chess or checker board, substantially as and for the purpose set forth.

3. A drawer in combination with a tilting table or plate, a pivoted arm with a loop and a slotted standard connected with said drawer, and a pivoted arm with a stud connected with the stationary part of the casing, substantially as and for the purpose set forth.

4. In a game-board, a connected casing having coincident register-wheels in pairs, the sides of said casing having openings, each exposing the numbers of one wheel of each pair, all arranged substantially as described, whereby the counts of opposite players may be seen on one side of the casing.

5. Register-wheels with spur or gear wheels F, and the pawl or tooth E, engaging with both wheels F, and the operating-shaft D, combined and operating substantially as and for the purpose set forth.

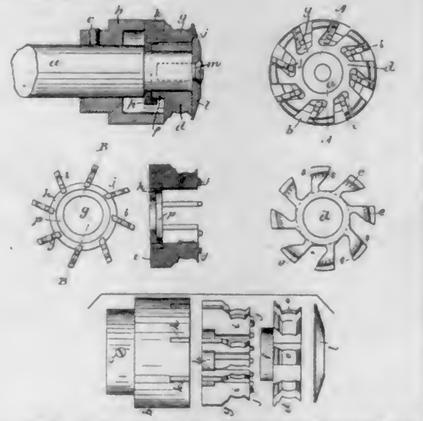


6. In a game-counter, register-wheels, in combination with the slotted slide J, the nose H thereon, the rotary tooth G, the pins *c*, bell-hammer arms K, and the bell, substantially as and for the purpose set forth.

7. The bell and bell-hammer arms, in combination with the slide J, with slots *b b*, and noses H and the springs J' at opposite ends, substantially as and for the purpose set forth.

8. In a game-counter, register-wheels having a winding-spring, I, and tooth M, the stop N, the wheels F, the locking-tooth P, and operating-rod Q', combined and operating substantially as and for the purpose set forth.

295,489. RUFFLING AND SHIRRING ATTACHMENT FOR SEWING-MACHINES. WILLIAM DUDLEY, Newark, N. J. Filed May 3, 1883. (No model.)



Brief.—The throw of the ruffler-blade may be increased or diminished by adjustment of an angular plate over a slot in the rock-arm. The vertical arm carrying the ruffler-blade is secured to its carrier by means of an open-ended slot and a set-screw.

Claim.—1. In a ruffling-machine, the combination, with the frame B, of the sliding bar C, the arm D, provided with a slot, D², the screw D', the ruffling-blade F, and device for reciprocating the bar C, substantially as herein shown and described, and for the purpose set forth.

2. In a ruffling attachment to a sewing-machine, the combination, with the grooved frame B, horizontally-reciprocating bar C, sliding in said frame, and provided with a pintle, K, to the outer end of which the bar L, provided with a pintle, M, is pivoted, slotted arm D, screw D', and ruffling-blade F, of the rocking plate H, forked at J, to surround a pintle on the needle-bar, and provided with the slots N Q and adjustable plate O, substantially as shown and described.

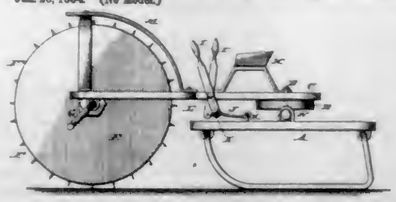
295,490. ROTARY CUTTER. JOHN B. EMERY, Lynn, Mass. Filed Jan. 14, 1884. (No model.)

Claim.—1. In combination with a rotary cutter formed with outwardly-projecting teeth, a guard formed with a ring and a series of wings radiating therefrom, and arranged to enter the spaces between the teeth of the cutter and to be adjusted in their relative distance from the front and rear faces of said teeth, substantially as specified.

2. In combination with rotary cutter *d*, having teeth *e*, guard *g*, formed with ring *h*, and wings *i*, formed upon or secured thereto, and arranged to enter between teeth *e* of the cutter, with means whereby the relative distance between said wings and the rear and front faces of said teeth may be adjusted, substantially as specified.

3. In combination, collar *b*, having radial slots *k*, cutter *d*, having the outwardly-projecting teeth *e*, a guard having ring *h*, and wings *i*, radiating and extending therefrom, and adapted to enter the spaces between teeth *e* of the cutter, and to be adjusted in relation to the front and rear faces thereof, all substantially as specified.

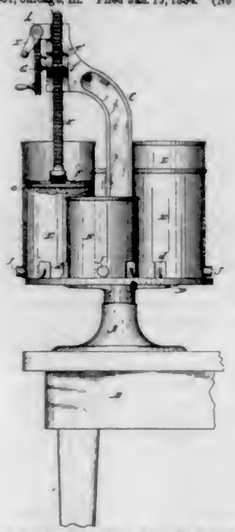
4. A rotary cutter-guard, *g*, formed with a centering-ring, *h*, adapted to receive the cutter-arbor *a*, and with a series of radial guard-wings, *i*, formed upon or secured thereto, and having their outer lines or faces molded or outlined to conform to and co-operate with the teeth of cutter *d*, to gage and govern the depth of cut of the teeth *e* thereof, substantially as specified.



5. In combination with cutter *d* and rand-disk *l*, the guard formed with wings *i*, supported by ring *h*, and with studs *j*, arranged to enter corresponding holes, *n*, in said disk, substantially as specified.

6. In combination, slotted collar *b*, formed with an annular chamber, and having slots *k* formed in its front portion, guard *g*, formed with ring *h*, to enter the chamber in said collar, and having radial wings *i*, cutter *d*, formed with teeth *e*, with space to receive said wings *i* of the guard, and for adjustment thereof, and having sleeve-like extension *f*, adapted to enter the annular recess in ring *h* of the guard, rand-disk *l*, formed to interlock with studs *j*, and means for locking said cutter in position, all substantially as specified.

7. In combination with collar *b*, cutter *d*, and disk *l*, the guard-wings *i*, arranged between the teeth *e* of said cutter, and interlocked in said collar and disk, substantially as specified.



8. In combination with collar *b*, rand-disk *l*, and guard-wings *i*, interlocked in said collar and disk, the cutter *d*, arranged to receive said wings *i* between its teeth, and to be adjusted relatively thereto, substantially as specified.

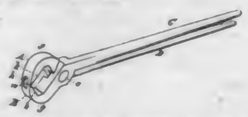
295,491. ICE-VELOCIPEDE. ELLIOTT H. FUNK, Sturgis, Mich. Filed Jan. 26, 1884. (No model.)

Claim.—The chisel-point-spurred wheel E, levers I I, the iron rods J J, with their connections to staples K K, and oscillating turn-table B, in combination with sled A, as hereinabove set forth.

295,492. STAND AND PRESS FOR PAINT AND OTHER CANS. FRANK R. GROUT, Chicago, Ill. Filed Jan. 19, 1884. (No model.)

Claim.—1. A stand and press for paint and other cans, consisting of the standard C, removably secured to a suitable base, a revolving table adapted to hold the cans in positions respectively concentric with said standard, a plunger and piston for expelling the contents of the can, with the cogged crank-wheel G, worm-gear *h'*, and crank I, substantially as and for the purposes set forth.

2. In a press and stand for paint and other cans, the combination of the standard C with a suitable base, the rotary table D, plunger F F', wheel G, shaft H, and worm A', all constructed and operating substantially in the manner and for the purposes set forth.



3. In a press and stand for paint and other cans, the combination of the standard C with a suitable base, the rotary table D, plunger F F', wheel G, shaft H, worm *h'*, and spring-brake *h*³, all constructed and operating substantially in the manner and for the purposes set forth.

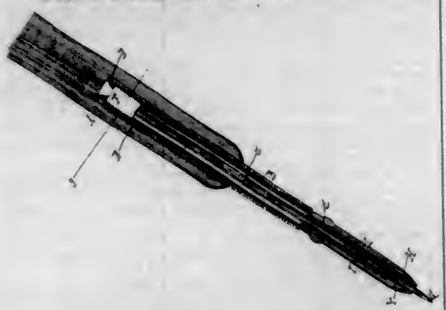
295,493. DRIVING-CALK. GEORGE H. HATHORN, Chester, Me. Filed Jan. 3, 1884. (No model.)

Claim.—The improved driving-calk herein described, provided with the point *a*, angular in cross-section, the shoulder *b*, for resting on the boot-bottom, the round shoulder *c*, entering the leather of said bottom, and the bulging portion *c*, having an angular cross-section, substantially as herein set forth and shown.

295,494. STAPLE-EXTRACTOR. BENJAMIN HUBBELL, Afton, Iowa. Filed Feb. 4, 1884. (No model.)

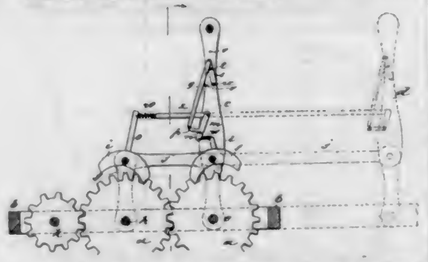
Claim.—The staple-extractor consisting of a pair of lever-jaws pivoted together, and having laterally-projecting rounded fulcrum surfaces *g*, interior inclined surfaces commencing at the meeting edges of the jaws and forming with said rounded surfaces wedge-like ends *k*, and the central staple-receiving notches, *n*, made in the terminal ends of the jaws, substantially as specified.

295,495. NOISE-DEADENER FOR MILK AND OTHER CANS. JOHN H. IRWIN, Burlington, N. J., and THEODORE P. APPLE, West Chester, Pa. Filed Mar. 26, 1883. (No model.)



Claim.—A can-handle having a tapering opening, *a*, in combination with the rubber plug B, of tapering form, said opening *a* extending entirely through the handle and exposing the narrow end of said plug, substantially as and for the purpose set forth.

295,496. HAME-FASTENER. BENJAMIN F. JONES, Beauregard, Miss. Filed Aug. 15, 1883. (No model.)



Claim.—In a hame-fastener, the combination of the bar A, having slots *a* and bifurcated end hook, B, the lever C, having a rear hook pivoted between the bifurcations of hook B, the bar D, having hook *c* and mortise *d*, and the bar E, having toggle *e* and hook *f*, substantially as shown and described.

295,497. LEAD AND CRAYON HOLDER. JOHN H. KNAPP, New York, N. Y. Filed May 17, 1883. (No model.)

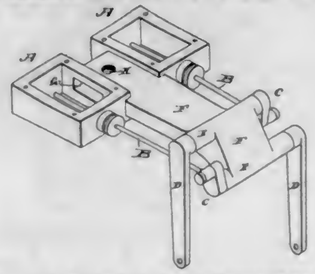
Claim.—The combination, in a lead or crayon holder, of a handle provided with a screw, B, a slotted tube, C, having its inner end constructed with a laterally-projecting shoulder, D, swiveled upon the inner end of the screw, and the follower E, having a screw-head, F, projecting through the slotted tube, substantially as described.

295,498. LEVER-POWER MECHANISM. FREDERICK KUBEL, Riverside, Iowa. Filed Jan. 22, 1884. (No model.)

Claim.—1. In a lever-power consisting of two wheels, *a*, with a working-lever and ratchet-pawls, arranged as described, the pawls *f* and *i*, connected, respectively, to the arms of a rock-lever, *m*, and said lever *m* connected to a working-lever, *s*, substantially as specified.

2. In a lever-power consisting of two wheels, *a*, with a working lever and ratchet-pawls, arranged as described, the pawls *f* and *i*, connected, respectively, to the arms of a rock-lever, *m*, by rigid arms *l o* and springs *w*, and said rock-lever *m* connected to a working-lever, *s*, substantially as specified.

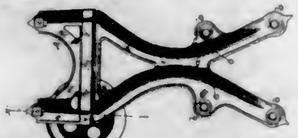
3. In a lever-power consisting of two wheels, *a*, with a working-lever, *c*, and ratchet-pawls, arranged as described, the pawls *f* and *i*, connected, respectively, to the arms of a rock-lever, *m*, pivoted on said lever *c*, and said rock-lever connected to a working-lever, *s*, also pivoted on the lever *c*, substantially as specified.



295,499. VENTILATING APPARATUS. WILLIAM LORD, Middlesbrough, County of York, England. Filed July 16, 1883. (No model.) Patented in England Mar. 23, 1883, No. 1,567.

295,499.

Claim.—A ventilator or chimney-top consisting of two or more rings or cylinders, the upper ones being of larger diameter than the lower ones and slightly overlapping the latter, which have inclined blades on the outside, substantially as described.



295,500. VALVE ARRANGEMENT FOR DUPLEX PUMPING-ENGINES. JAMES R. MAXWELL, Cincinnati, assignor to the Gordon & Maxwell Company, Hamilton, Ohio. Filed Sept. 15, 1883. (No model.)

Claim.—1. In the valve arrangement of duplex pumping-engines, the combination of a steam-chest, two rock-shaft bearings, and a bracket, F, joining said bearings to said steam-chest, substantially as and for the purpose specified.

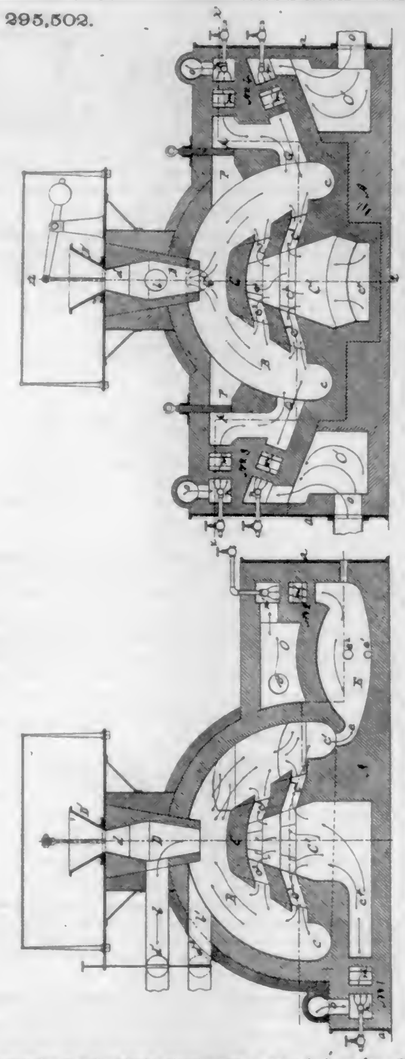
2. In the valve arrangement of duplex pumping-engines, the combination of two steam-chests, a pair of rock-shaft bearings, and the bracket F, joining said bearings with said steam-chests, and extending between them to form a portway from chest to chest, substantially as and for the purpose specified.

295,501. DOOR-HANGER. EDWARD Y. MOORE, Chicago, Ill. Filed Jan. 26, 1884. (No model.)

Claim.—The combination of a wheel or roller provided with an axle and a door-hanger frame, having a short back plate and a long front plate, united by bolts and caps, and provided on the coincident sides of said plates with horizontal grooves or recesses for the axle of the wheel or roller, substantially as described.

295,502. GAS-FURNACE. JOHN T. MORGAN, Selma, Ala., and HENRY F. HAYDEN, Washington, D. C. Filed June 4, 1883. (No model.)

Claim.—1. The combination, with a reducing or smelting chamber having a central mound for the reception of the material to be treated, of one or more fires arranged to deliver tangentially into the reducing-chamber, substantially as and for the purposes specified.



2. The combination, with a reducing-chamber having one or more fire-chambers delivering into the same, of a hollow perforated central mound for the reception of the material to be treated, substantially as and for the purposes specified.

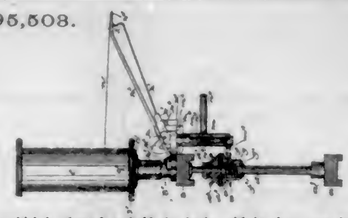
3. The combination, with a reducing-chamber having a centrally-arranged hollow perforated mound, of a fire-chamber which delivers into the central fine of the perforated mound, and one or more fires, arranged to deliver tangentially into the reducing-chamber, substantially as and for the purposes specified.

4. In a reducing and refining furnace, the combination of a reducing-chamber having a central mound, an inclined metal channel surrounding the same, and its own fire-chamber or fire-chambers, delivering into the reducing-chamber, and a refining-chamber which connects with the inclined metal channel of the reducing-chamber, and is provided with its independent fire-chamber, so as to receive the molten metal therefrom, substantially as and for the purpose specified.

5. The combination, with a reducing-chamber having a central ore-mound, of one or more double fire-chambers arranged tangentially to and

295,502.

connecting with the reducing-chamber by an upper and a lower flue, substantially as and for the purposes specified.



6. A reducing-chamber provided with a central ore-mound having a hollow central and curved discharge-flues, substantially as and for the purposes specified.

7. In an ore reducing and refining furnace, the combination of a reducing and smelting chamber having a central ore-mound and a series of fires arranged to deliver tangentially thereinto, with a refining hearth or chamber, which communicates with and receives the molten metal from the reducing and smelting chamber, substantially as and for the purposes specified.

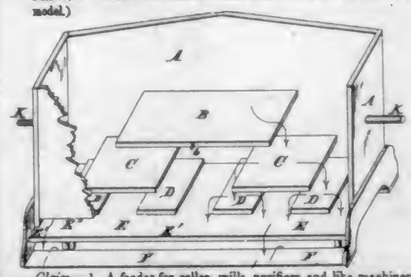
295,503. STOP-MOTION DEVICE FOR SPOOLING-MACHINES. JAMES H. NORTHROP, Hopedale, Mass., assignor of one-half to the Hopedale Machine Company, same place. Filed May 19, 1883. (Model.)

Claim.—1. A spooler-spindle, a loose whirl thereon adapted to be driven continuously by a band, an opposed clutch, *c*, provided with a groove, *c'*, and a spring to force the clutch and whirl together, a drop-lever, and the oscillating brake provided with a shoe, m^2, and with a projection, 4, and a spring to move the brake, combined with a latch-

295,503.

lever which is adapted to hold the brake with its shoe away from the clutch, and to be acted upon by a drop-lever after the breaking of a thread to turn the latch-lever and release the brake, substantially as described.

2. The spooler-spindle, its loose whirl, the clutch and spring to press it into engagement with the said whirl, the drop-wires, and latch-lever, combined with the oscillating brake provided with an arm to act upon the latch-lever and move it to lift the drop-lever after the breakage of a thread, as described, and with a spring to move the brake whenever the latter is released from the latch-lever by the falling of a drop-lever, substantially as and for the purpose set forth.



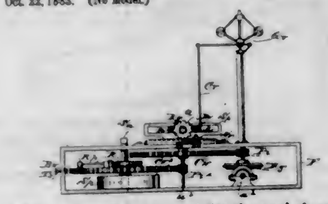
3. The spooler-spindle, its loose band-receiving whirl, grooved clutch connected with the spindle, a drop-lever, and a latch actuated by the drop-lever after the breaking of a thread, combined with an oscillating brake interposed between the said latch-lever and clutch, one part of the said brake being adapted to engage the said clutch, another part of the said brake being adapted to be engaged and held by the said latch, substantially as described.

4. The spindle *d*, its collar or shoulder, the loose whirl, and clutch, the brake provided with a shoe, and a projection, 4, means to move the brake and drop levers or wires, and a rest or support for the threads, combined with a latch-lever, one end of which engages and holds the brake with its shoe away from the clutch, while the other end of the said lever is adapted to be struck and moved at the descent of a drop-lever, substantially as described.

5. The thread rest or support, the drop levers or wires, the brake m^2, provided with the arm m^2 and shoe, and the latch-lever provided with the finger k^4, combined with the clutch, the spindle upon which it is secured, and the loose whirl, and means to hold the same in opposition to the pressure of the clutch against it, substantially as described.

6. The thread rest or support, the drop levers or wires, the brake m^2, provided with the shoe and the arm, having an incline, 3, and projection 4, and handle combined with the pivoted latch-lever adapted to be operated by the drop-levers, substantially as and for the purpose described.

295,504. FEEDING MECHANISM FOR ROLLER-MILLS, PURIFIERS, &c. HENRY CLAY POTTS, Lancaster, Ky. Filed Dec. 18, 1883. (No model.)



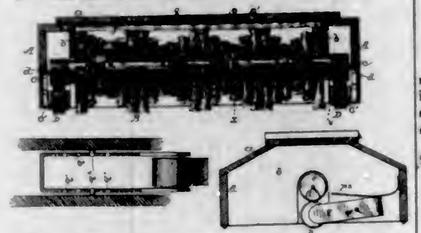
Claim.—1. A feeder for roller-mills, purifiers, and like machinery, comprising a feed-box or hopper and a series of steps constructed and arranged to pass the material to be fed over the first or upper step in two equally-divided streams or sheets, each of which is in turn received upon the next step and equally divided into two other sheets or streams, and so on, for the purpose of distributing the material evenly over an extended surface and supplying a constant and regular feed.

2. In a shake-feed, a series of steps, B C D, for evenly distributing the grain, in combination with the floor E and a feed-box or hopper having discharge-apertures E'', substantially as set forth.

3. In a shake-feed for roller-mills, the series of steps B C D, &c., floor E, and a feed-box or hopper, A, having apertures E'', in combination with the steps F, at right angles to the others, as and for the purpose described.

4. In a roller-mill or purifier-feed, the combination, with the feed-box or hopper, of a series of substantially-horizontal division-plates, arranged substantially as described, whereby the inflowing stream of grain or middlings is divided and subdivided as often as desired, in order to discharge it in one or more thin, even, and continuous sheets.

295,505. SPRING-MOTOR. JESSE B. POSH, Indianapolis, Ind., assignor of one-half to E. A. Nichols and A. S. Visiria, both of same place. Filed Oct. 22, 1883. (No model.)



Claim.—1. In a device for regulating the speed of spring-motors, the escapement E_W, working on pallet P, mounted on shaft *a*, working in annular slot A_S of spring-plate Sp, said shaft being provided with rubber cog-wheel R_g to work in segmental rack-bar Sr, substantially in the manner and for the purpose set forth.

2. In a device for regulating the speed of spring-motors, the set-screw Sc to move the guide-block Gb in collar C, in combination with the escapement E_W, pallet P, and shaft *a*, substantially in the manner and for the purpose set forth.

3. In a device for regulating the speed of spring-motors, the inclined spring-plate Sp, with annular slot A_S, T-shaped sliding block *ap*, and adjusting-screw *as* for clamping the shaft *a*, substantially for the purpose set forth.

4. In a device for regulating the speed of spring-motors, the rubber cog-wheel B_W, mounted on spring Sp', supplied with thumb-screw Ts, in combination with cog-wheel C_W^3, substantially in the manner and for the purpose set forth.

295,506. CARPET-SWEEPER. GEORGE M. ROCKWELL, Woonsocket, R. I. Filed Jan. 17, 1883. (Model.)

Claim.—1. The combination, substantially as hereinbefore described, of carpet-sweeping mechanism and a dampener for moistening the sweeping-brush.

2. The combination, substantially as hereinbefore described, of carpet-sweeping mechanism, a dampener for moistening the sweeping-brush, and a reservoir for water or other fluid, communicating with and supplying the dampener with moisture.

3. The combination, substantially as hereinbefore described, of a suitable casing, a revolving sweeping-brush, and a suitable absorbent fabric located within the casing, and in contact with the periphery of the brush for serving, when moistened, as a dampener, as set forth.

4. The combination, substantially as hereinbefore described, of the revolving brush, the casing having a chamber for a dampener, and a removable plate for closing said chamber adjacent to said brush, as set forth.

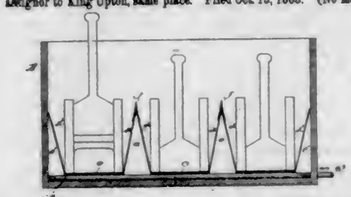
5. The combination, with the casing of a carpet-sweeper, of a detachable dust-pan, and a pin-and-slot connection for mounting said pan in the casing, substantially as described, whereby the dust-pan can be readily removed from the sweeper-casing for dumping and as readily replaced, and also whereby the pan is firmly maintained in proper position with relation to the sweeper-brush, as set forth.

6. The combination, with the casing, of a laterally-detachable dust-pan provided with angular recesses, the studs for occupying said recesses and supporting the pan, and the cushion and button for tightly locking the pan in position, substantially as described.

7. The combination, with the casing and the revolving brush, of a friction-wheel beneath the axle of the brush for driving and supporting the same, and a longitudinally-adjustable friction-wheel frame pivoted to the casing, substantially as described, and means whereby said friction-wheel may be adjusted with relation to the axis of the brush and enable the latter to be operated in varied horizontal planes, as set forth.

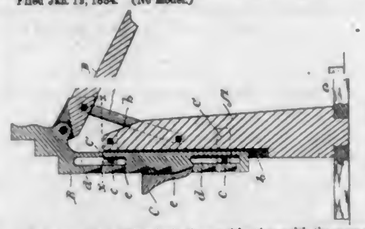
8. The combination, with a carpet-sweeper casing and a friction-wheel, of a laterally-flexible tilting frame provided with pivots on which it tilts, and also with bearing-pivots for said wheel, substantially as described, whereby on expanding the outer end of said frame the friction-wheel may be removed, and on then contracting said outer end said frame may be detached from the casing, as set forth.

9. The combination, in a carpet-sweeper, of the revolving brush, a friction driving-wheel provided with oppositely-located conical center bearings, and a laterally-flexible driving-wheel frame, substantially as described.



10. The combination, with a carpet-sweeper brush, of a friction driving-wheel provided with rawhide center bearings, and a laterally-flexible frame for said wheel, provided with oppositely-located conical centers or pivots, which occupy the rawhide bearings, substantially as described.

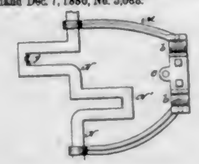
295,507. DOOR-CHECK. JOHN H. EUNYAN, Flint, Mich. Filed Aug. 27, 1883. (Model.)



Claim.—In a door-stop, and in combination with the bracket and eccentrically-journaled wheels, constructed substantially as described, the spring-bracket D, substantially as and for the purposes set forth.

295,508. VAT OR KETTLE FOR REDUCING OR TREATING ANIMAL OR VEGETABLE MATTER. THOMAS SWANTON, Peabody, Mass., assignor to King Upton, same place. Filed Oct. 13, 1883. (No model.)

Claim.—In a vat for treating glue-stock or animal or vegetable matter or material, a perforated bottom plate, a perforated partition having an open space between its walls, and perforated ends set to leave spaces *s* between the said perforated ends and the end of the vat-case, substantially as described.



295,509. WAGON-JACK. HENRY C. TORREY, Central Village, Conn. Filed Jan. 19, 1884. (No model.)

Claim.—1. In a lifting-jack, the combination, with the support having the longitudinal front recess and staple-shaped frames, of the vertically-adjustable stepped bar having slots through which the cross-bars of the frames pass, and the lever pivoted to the angle of an upper L-shaped portion of the stepped bar, and connected by parallel links or plates to the support having an upper beveled end, substantially as described, and for the purpose set forth.

2. In a lifting-jack, the combination, with the stepped sliding bar having the T-shaped front surface, of the bracket with its lower end entering the notches of the steps of the sliding bar, and its upper end provided with arms embracing the cross or flange of said T-shaped surface of the bar, substantially as and for the purpose set forth.

295,510. HARVESTER AND BINDER. CHARLES WHITNEY and WILLIAM W. MARSH, Sycamore, Ill. Filed Dec. 13, 1883. (Model.) Patented in England Dec. 7, 1880, No. 5,068.

Claim.—1. The traversing and horizontally-swinging butter S, having its forward end at the inner divider-point and in front of the cutter-bar, whereby the machine is kept clear at that point, substantially as described.

2. The rotating and horizontally-swinging butter S, having its driving-roller S′ located in front of the cutter-bar, and at or near the inner end of the same, whereby the butter and its driving-roller serve as a rotating divider, substantially as specified.

3. The combination of the swinging traveling butter with the carrying or grain platform, the fixed platform and packing-fingers *a*, substantially as set forth.

4. The combination of the compressing-finger *f* with frame *a′*, having the springs *b b″*, shoulders *b‴*, rods *a″ a⁗*, and adjustable nuts *c′ c″ c‴*, all constructed and operating substantially as set forth.

5. The spring-connecting link, constructed substantially as described, and the compressing-finger *f*, in combination with the arms *x′* and *c″*, substantially as and for the purpose specified.

6. The combination, with the shaft *g*, carrying the compressing-finger *f*, of a trip device to automatically size the bundle, a wheel, *q*, and a single link connecting the compressing-finger shaft and the said wheel and provided with a spring or springs for actuating both the finger and the automatic bundle-sizing device, substantially as described.

7. The combination, with the shaft *g*, carrying the compressing-finger *f*, of a trip device for sizing the bundle, a driving-wheel, *q*, and a yielding link connecting the wheel and the compressing-finger shaft, and serving to actuate the latter and also the trip device, substantially as described.

8. The combination of the arm or crank *x*, the arm *x′*, shaft *g*, and compressing-finger *f*, with the adjustable spring-connecting link, whereby the required pressure against the compressing-finger is regulated for disengaging the arm *x* from the pawl *i*, substantially as specified.

9. The combination of pivoted rotating bundle-discharging fingers 27 and 29 with a fixed shield, K′, having slots 42, the inner edges of which serve to fold the fingers inward from the bundle, to strip them from the latter after it has been discharged from the binding-platform, substantially as described.

10. The combination of pivoted rotating bundle-discharging fingers, means whereby they are folded inward from the bundle, to strip them from the latter after it has been discharged from the binding-platform, and overhanging guide-rods for holding the bundle against the fingers and directing it downward toward the ground, substantially as described.

11. The discharging-arm 27, having the heel-extension 33, in combination with the disk 24 and stop 34, substantially as specified.

12. The discharging-arm 29, having the extension and pin 35, in combination with the disk 25, rod 30, the spring 31, and guide 32, substantially as described.

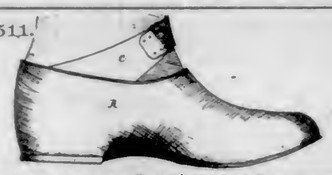
13. The yielding or spring-detaining fingers *f″*, in combination with the compressing-finger and shaft *g*, whereby the grain is kept in position without being compressed at the ends of the bundle, when compressed about the middle for binding, substantially as described.

14. The ejecting-fork *v*, in combination with the link or rod *u*, and the crank *t*, for discharging bundles which may have been held or caught, substantially as described.

15. The tucker-arm and binding-arm, in combination with the tucker-crank 13, and the slot *k′*, whereby the tucker is operated by the binding-arm, and the cord is brought up to the knotter, substantially as described.

16. The combination of the plate K, having the angular raised projection *k* and slot *k″*, with tucking devices operating beneath the plate and under the projection *k*, whereby the bundle is raised and a portion of the strands of cord left clear between the grain and tucking-arm, for the tucking-arm to act upon and carry to the tying device, substantially as described.

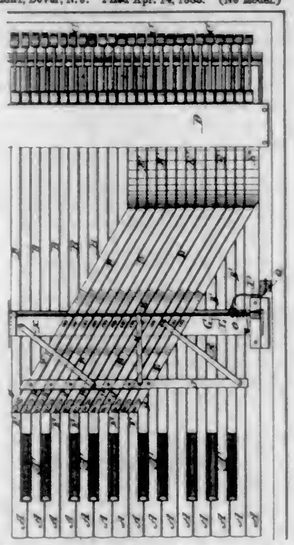
17. The combination of the plate K, having the angular projection *k* and slot *k″*, the tucker-arm 5, and tucking-crank 13, arranged to have the tucker-arm operated beneath the plate and directly under the projection and the binder-arm, whereby the bundle is raised and a portion of the strands of the cord left clear between the grain and tucking-arm, for the tucking-arm to act upon and carry to the tying device, substantially as described.



18. The horizontally-moving plate or bar 17, having the cord-guide 18 at its front edge and a cord-cutter, 44, at its back edge, in combination with the knotter 8, substantially as set forth.

19. The combination of the rubber spring 19 and adjusting-screws 20 with the jaw-roller 21, and the cord-holder 10, and knotter-jaw, substantially as specified.

295,511. RUBBER SHOE. DAVID WILKIT, Rock Island, Quebec, Canada. Filed Feb. 26, 1883. (No model.)



Claim.—As a new article of manufacture, a lumberman's low-quartered rubber shoe, such as herein shown and described, provided with two straps, each having a broad end or base attached to one side of the shoe at or near the top edge thereof, and substantially forward of the location of the wearer's ankle-bone, and tapered and extended forward diagonally from the said broad end or base to its outer end, where it is provided with means for securing it to the forward end of the other strap, the arrangement of

295,511.

said straps being such as to cause them, when connected over the wearer's ankle, to draw inward the sides of the shoe and cause them to bear snugly against the wearer's inner foot-covering and form a close joint therewith, and at the same time prevent the shoe from being pulled off, substantially as described.

295,512. HARMONIC COUPLER FOR PIANO-ACTIONS. WILLIAM S. WRIGHT, Dover, N. J. Filed Apr. 14, 1883. (No model.)

Claim.—1. In a piano-action, the combination, with the key-levers, of coupling-levers resting on the same and extending to other key-levers, and of slitted beveled sliding blocks for coupling the coupling-lever with another key-lever, and thus coupling the key-levers to operate together by depressing the key of one of them only, substantially as herein shown and described, and for the purpose set forth.

2. In a piano-action, the combination, with key-levers having their rear ends beveled, of diagonal coupling-levers resting on the said beveled levers, and having their front ends over other levers, and sliding blocks for coupling the front ends of the coupling-levers with the key-levers above which they rest, substantially as herein shown and described, and for the purpose set forth.

3. In a piano-action, the combination, with key-levers, of coupling-levers resting on the same, and having their front ends over other levers, slitted beveled sliding blocks for coupling the front ends of the coupling-levers to the key-levers above which they rest, and devices for adjusting all the coupling-blocks to couple simultaneously, substantially as herein shown and described, and for the purpose set forth.

4. In a piano-action, the combination, with the key-levers B, the coupling-levers resting on them and crossing to other key-levers, which coupling-levers E have slots *d* in the front ends, the sliding blocks H, resting on the coupling-levers and having their front ends provided with slits *g*, and devices for moving all the blocks H forward simultaneously, substantially as herein shown and described, and for the purpose set forth.

5. In a piano-action, the combination, with the key-levers B′, of the coupling-levers E, adapted to operate the hammers, the pins F, the sliding blocks H, having slits *g*, the rail J, the bars K, the rocking shaft L, having an arm, M, and the coupling-bar N, substantially as herein shown and described, and for the purpose set forth.

6. In a piano-action, the combination, with the key-levers B′, of the coupling-levers E, adapted to operate the hammers, the pins F, the slitted blocks H, the rail J, the bars K, the shaft L, having an arm, M, the coupling-bar N, the arm P, the rod Q, and the spring O, substantially as herein shown and described, and for the purpose set forth.

H. PETERS, Photo-Lithographer, Washington, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

READ, EXECUTRIX, v. RAYNOR, *et al.*

Decided January 23, 1884.

1. PRACTICE IN COURTS—AMENDMENT TO BILL.

A bill was brought before the patent expired, but it was defective, and an amendment was filed after the patent had expired: *Held* that the amendment made the bill as it should have been at first, and in effect as if it had been so at first, and if a case for equitable relief is shown the bill should be retained for that and such cognate relief as is necessary to do complete justice.

2. REISSUE—CLAIM TOO BROAD.

The original patent showed certain devices to which no function was ascribed, and the position of which with reference to a particular part of the machine was not shown with accuracy. The reissue described such devices as occupying a definite position with reference to said particular part of the machine and as having a specified function: *Held* that a claim in the reissue covering the arrangement described therein embraced an invention different from that shown in the original, was too broad to be added at any time, and was therefore void.

3. REISSUE—LAPSE OF TIME.

The reissue was taken out more than three years after the original, and would seem to be for that reason unseasonable and invalid.

4. REISSUE—PARTIAL INVALIDITY.

Invalidity of one claim does not necessarily render the other claims of the reissue invalid.

5. PROCESS—FUNCTION OR MODE OF OPERATION OF A MACHINE NOT PATENTABLE.

A function or mode of operation of a machine is not patentable apart from the machinery.

6. INFRINGEMENT—EQUIVALENT.

The use by defendants of the combination of the patentee, except that an equivalent element is substituted for one of the elements of the latter's combination, is an infringement.

7. INFRINGEMENT—SILENCE NOT ESTOPPEL UNDER THE CIRCUMSTANCES.

Where it does not appear that the patentee led the defendants into any expenditure or course of conduct by his silence when he ought to have spoken which they would not have made or followed if he had spoken, an infringement will not be avoided.

8. PARTICULAR PATENTS.

Reissue Letters Patent No. 2,529, granted March 26, 1867, valid in part and invalid in part.

Mr. Arthur v. Briesen for the complainant.

Mr. Stephen D. Law and *Mr. John Van Santvoord* for the defendants.

WHEELER, *J.*:

The testator of the oratrix was the owner of Reissue Letters Patent No. 2,529, granted March 26, 1867, upon the surrender of original Letters Patent No. 39,702, granted to him August 25, 1863, for improvements in envelope-machines, which would expire August 25, 1880. The bill was brought June 12, 1880, upon the original patent, without referring to the reissue, to restrain the use of machines alleged to be infringements, and for an account. No motion was made for a preliminary injunction. An answer was filed setting forth the reissue August 19, 1880. The oratrix moved to amend the bill, and September 22, 1880, it was by stipulation amended to cover the reissue in place of the original. The defendants now move, on the authority of *Root* v. *Railway*, (105 U. S., 189,) that the bill be dismissed for want of jurisdiction in equity, because the patent had expired before the amended bill was filed upon which only the oratrix could have any equitable relief. (*Dowell* v. *Mitchell*, 105 U. S., 430.)

The infringement is solely by the use of machines made before the bill was brought and continued ever since, and would be covered by the general allegation of infringement, made in both the original and amended bills, if filed during the term of the patent; but the continued use after the expiration of the term would not be so covered by that general allegation in a bill filed after the expiration. Special allegations setting forth that the machines were infringements when made would be necessary. (*Root* v. *Railway*, 105 U. S., 189; *American Diamond Rock Boring Co.* v. *Rutland Marble Co.*, 2 Fed. Rep., 355.)

It is urged for the oratrix that the amended bill is to be considered for this purpose as if the original had been as it is amended when filed, and for the defendants that it is to be considered as if it had been filed as an original bill when it was filed. The oratrix had the reissue when she brought her original bill, and must have intended to bring her bill upon the patent which she had, and not upon one which she did not have. Under these circumstances it would have been competent for the court to allow the amendment. That which could be done by the court without consent could well be done by the parties by consent. When done it made the bill as it should have been at first, and in effect as if it had been so at first. Such amendment only was necessary as would make the bill what it should have been to be good when brought, not what would have been necessary to make it what it would have to be to be good at some other time. If the oratrix has shown a case for any equitable relief she is upon all the decided cases entitled to have the bill retained for that and such cognate relief as is necessary to do complete justice. (*Dowell* v. *Mitchell*, 105 U. S., 430.)

The defendants set up that the reissue is too broad for the original. The original showed and described two arms extending from a table in the interior of the machine, under which the envelope-blank is made to pass on its way to a creasing-box in the rear, one on each side of the box, to or nearly to a line with the rear side of the box. No use of these arms was stated. In the reissue these arms are described as applied in

such position that they extend parallel to the edges of the creasing-box with their lower edges level with or rather below the top edge of the box, so as to bear down on the ends of the blanks and hold them in position on the box to be creased, and as secured to the table or any other fixed part of the machine. No other reference to the table in connection with them is made. No claim was made in the original in respect to them. They are the subject of the new fourth claim. The original showed these arms only as extensions from the table. Their height in respect to the creasing-box was not shown with accuracy otherwise than by reference to the table. As no function was ascribed to them, their position could not be inferred from what they were to do. When they were described as in a certain position with reference to the creasing-box instead of the table, and as attachable to some other part of the machine when they would not be extensions of the table, and an office was ascribed to them, an invention different from that in the original was shown. This claim was too broad to be added at any time, and therefore void. (*Gill* v. *Wells*, 22 Wall., 1; *Russell* v. *Dodge*, 93 U. S., 460.) Besides, the reissue was taken out more than three years after the original, and would seem to be for that reason unseasonable and invalid. (*Miller* v. *Bridgeport Brass Co.*, 104 U. S., 350.) That this claim is invalid does not necessarily render the other claims of the original reproduced in the reissue invalid. (*Schillinger* v. *Greenway Co.*, 24 O. G., 495; *Gage* v. *Herring*, 107 U. S., 640.) In the first claim in both what is called a "slide" in the original is called a "carrier" in the reissue. The description of it or of its opration is not changed. The claim is in substance thee same in both. Only the first, second, fifth, seventh, tenth, and twelfth claims, besides the fourth claim of the reissue, are said to be infringed. The fifth claim is merely for feeding the blanks under the table which supports the gum-box instead of over it. The machinery described, some of which is the subject of other claims, does feed the blanks under that table. The claim is merely for that function or mode of operation of that machinery. As such this function or mode of operation does not seem to be patentable apart from the machinery. (*McKay* v. *Jackman*, 20 Blatchf., 466; XII. Fed. Rep., 615.) Want of novelty of the other claims is alleged and infringement of them is denied.

Envelope-machines were in use before this invention. This inventor was entitled to and claimed a patent only for his improvements. Slides or platforms to hold envelope blanks, lifters, or pickers to receive gum on their faces and take it to the proper place on the blank, and by its adhesiveness to lift them so they could be taken by carriers or conveyers, carriers or conveyers to take them to creasing-box, creasing-boxes to crease them, and folding apparatus to fold them were all then known. The seventh claim is for a balance-weight connected with this form of conveyer, and the twelfth for rib on the face of the plunger which works in the creasing-box and presses the envelopes after they are folded. The defendants are not found to make use of either of these devices or what is the equivalent of either in the working of this invention.

In this invention the lifters or pickers, after receiving gum on their faces, fall by their own weight upon a pack of blanks on a movable slide, which receives the pack and carries it to and holds it in the proper place, and lift the upper blank until it is disengaged by the table supporting the gum-box and taken by the conveyer under the table and steadied by it to the creasing-box. This combination of the movable slide and falling lifters and arrangement of the table and conveyer form the subjects of the first and second claims. Also a cam and roller connected with the plunger bring its face to a pressure upon the envelope to stick its folds firmly after it has been folded. This cam and roller, in combination with the plunger, are the subjects of the tenth claim. Careful and repeated examinations of the machines and patents put in evidence to show anticipations and want of novelty have failed to discover such combinations and arrangements as these covered by these three claims. The falling lifters, the arrangement of the table over the conveyer to steady the blank, and the combination of the cam and roller with the plunger appear to be new with this invention. These claims, therefore, appear to be valid. The defendant's machines have the movable slide to carry the pile of blanks to the proper position under the pickers, the falling pickers, and the conveyer arranged under the table supporting the gum-box. They also have the cam and roller pressing the support of the envelope against the folded envelope, instead of the plunger against it to press it. The support is the equivalent of the plunger for this purpose. Therefore the defendants are found to infringe these three claims by the use of the machines made during the life of the patent in violation of rights of the inventor; and it appears that they would continue the use if not restrained.

It is claimed that the inventor so conducted himself by seeing machines similar to those of the defendants made, without claiming that they infringe his patent, that neither he nor the oratrix as his personal representative could have any equitable right to restrain their use. It does not appear, however, that he led the defendants into any expenditure or course of conduct by his silence when he ought to have spoken which they would not have made or followed if he had spoken. The fact of the patent was open to them as well as known to him. They could respect it or take the risk of having what they did turn out to be an infringement. They chose the latter course, and he does not appear to have been responsible for their choice. The oratrix appears to be entitled to an injunction to restrain the use of so much of these machines as were infringements when they were made. (*Grossley* v. *Derby Gas Light Co.*, Webst. Pat. Cas., 119, 4 Law Jour. N. S. Chan. Pt. 1, 25; *American, &c., Co.* v. *Sheldon*, 18 Blatchf., 50; Curtis on Pat., Sec. 436.) The right to an account for past infringement follows.

Let there be a decree that the first, second, and tenth claims of the patent are valid and have been infringed, and for an injunction against the use of such parts of machines as were made in violation of those claims, and for an account, with costs.

—

REAY v. BERLIN & JONES ENVELOPE COMPANY.

Decided January 23, 1884.

FORMER DECISIONS AFFIRMED.

Cause upheld for the same reasons, and patent sustained to the same extent as in the case of *Oratrix* v. *Raynor et al.*

Mr. Arthur v. *Briesen* for the executrix.
Mr. Stephen D. Law for the defendant.

WHEELER, *J.*:

This suit is brought upon the same patent, in the same manner, and involving the same questions as to its maintenance as that of the *Oratrix* v. *Raynor et al.*, heard at this term. The cause is upheld for the same reasons, and the patent is sustained to the same extent upon the same grounds as in that case. Only the second, fourth, and fifth claims are said to be infringed. Of these only the second is held to be valid. The defendant appears to infringe this claim. Their machine has the arrangement of the table over the conveyer, so that the blanks are held even and in place by the table while being carried by the conveyer to the creasing-box, as described in that claim.

Let a decree be entered for the oratrix accordingly.

U. S. Circuit Court—District of Rhode Island.

MORGAN *et al.* v. ROGERS.

Decided February 12, 1884

1. TRADE-MARKS—A TRADE-MARK MAY BE CONVEYED WITH THE PROPERTY WITH WHICH IT IS ASSOCIATED.

As an abstract right, apart from the article manufactured, a trade-mark cannot be sold, the reason being that such transfer would be productive of fraud upon the public, but in connection with the article produced it may be bought and sold like other property.

2. TRADE-MARKS WILL PASS UNDER BILL OF SALE WITHOUT SPECIFIC MENTION.

For a trade-mark to pass under a bill of sale it is not necessary that it should be specifically mentioned. If a trade-mark is an asset, as it is, there is no reason why it should not pass under the term "assets" in an instrument which conveys the entire partnership property.

Mr. Nathan F. Dixon, *Mr. J. Van Santvoord*, and *Mr. A. Chester* for the complainants.
Mr. Benj. F. Thurston and *Mr. J. C. B. Woods* for the defendant.

COLT, *J.*:

It appears by the bill and evidence that the complainants had from time to time advanced large sums of money to the firm of J. Miller & Sons, who were carrying on the business, in Providence, R. I., of the manufacture and sale of certain proprietary medicines, notably the compound known as "Dr. Haynes' Arabian Balsam." To secure the complainants, Miller & Sons executed a chattel mortgage to them, dated June 1, 1875. On or about March 22, 1876, the complainants took possession under the mortgage and proceeded, through an agent, to carry on the business of the manufacture and sale of these medicines. Subsequently, on February 13, 1877, Miller & Sons conveyed to the defendant, Rogers, the exclusive right to use their trade-marks and to make and sell their medicinal compounds. The present suit is brought to restrain the defendant from using these trade-marks. The main question in the case turns upon the meaning of the following clause in the mortgage:

> The following articles of personal property, now in our possession, and now in and upon the premises known and designated as numbers (8) eight and (12) twelve High street, in said city of Providence, viz: The entire property, stock, furniture and fixtures, and other articles now in and upon said premises, together with all debts and book accounts, assets and effects of every kind and nature belonging to said firm of J. Miller & Sons.

The complainants contend that the above recital includes all trade-marks then owned and used by Miller & Sons in their business on High street, and that such was the intention of the contracting parties. The defendant claims that this description does not cover any trade-mark, but only the property, stock, accounts, &c., belonging to the firm; that such was the intention of the parties, and that the proof shows that at most, and independent of the mortgage, the complainants have a parole license to use the trade-mark until reimbursed for their advances to Miller & Sons.

The clause of conveyance in the mortgage is very broad in its terms. Clearly the language bears the construction and will bear no other than that the whole property of Miller & Sons upon the premises occupied by them, together with their assets of every kind, passed by way of mortgage to the complainants. The description plainly identifies the property and states what is conveyed. It is not a case where there is an ambiguity by reason of two inconsistent descriptions in the same instrument, nor is it a case where the instrument fails to point out the subject-matter, so that a stranger after examination might be deceived, but in plain and unequivocal language, and for the large consideration of $48,500, the entire property of the firm of Miller & Sons at their place of business and all the firm assets are conveyed by way of mortgage to the complainants.

There is no reason why a trade-mark cannot be conveyed with the property with which it is associated. As an abstract right, apart from the article manufactured, a trade-mark cannot be sold, the reason being that such transfer would be productive of fraud upon the public. In this respect it differs from a patent or a copyright; but in connection with the article produced, it may be bought and sold like other property. It constitutes a part of partnership assets, and is properly sold with the firm property. (Brown on Trade-Marks, secs. 360, 361; *Hall* v. *Barrows*, 10 Jur. N. S., 55; *Ainsworth* v. *Walmesley*, 44 L. J. R., 252; *Kidd* v. *Johnson*, 100 U. S., 617; *Walton* v. *Crowley*, 3 Blatch., 440; *Congress and Empire Spring Co.* v. *High Rock Congress Spring Co.*, 57 Barb., 526, and 4 Am. Law Times R., 168; *Dixon Crucible Co.* v. *Guggenheim*, 2 Brewster, 321.)

For a trade-mark to pass under a bill of sale it is not necessary that it should be specifically mentioned. In *Shipcright* v. *Clements* (19 Weekly Reporter, 599) there was a sale by one partner to the other of all his interest in the partnership, stock in trade, goods, chattels and effects, book-debts, moneys in the bank, and all other property not being on the premises, the defendant covenanting that he would not carry on the trade within one mile of the premises or in any way affect the business to be thereafter carried on by the purchaser, the court held that this was a sale of the business, and that a trade-mark passed under such a sale, whether specially mentioned or not. If a trade-mark is an asset, as it is, there is no reason why it should not pass under the term "assets" in an instrument which conveys the entire partnership property. To hold that the trade-mark is not included in this mortgage is to say that the most valuable part of the partnership property is not covered by the words "assets and effects of every kind and nature."

The evidence, in our opinion, strongly confirms the construction we have put upon the instrument, and shows that such was the intent of the parties. The

complainants proceeded to take possession under the mortgage of the entire property and assets of the firm, to use the trade-marks, and to manufacture and sell the medicinal compounds. At the time possession was taken one of the Millers sent for Mr. Morgan and surrendered the keys. Two of the Millers for months after this continued to sell the medicines under the direction of the agent who was carrying on the business for the complainants. The annual royalty due Dr. Haynes the complainants assumed and paid. The defendant, Rogers, as shown by his letters, understood that the complainants had succeeded to all the rights of Miller & Sons and were running the business. He says, however, that in the fall of 1876, after a consultation with the Millers, and after what they said, he took legal advice, and found that the complainants had title under the mortgage only to the goods and effects of Miller & Sons; but that his mind was not clear on the question of the trade-marks is shown by the fact that subsequently, in his conveyance from Miller & Sons, of February 13, 1877, under which he now claims the right to use these trade-marks, there is a provision that if, at the expiration of two years, he should not be in the exclusive enjoyment of the trade-marks in consequence of any act done by the Millers in conveying or encumbering them, then, at his option, the annuities to be paid to the Millers under the agreement were to cease.

The fact that the complainants agreed to turn over the property to the Millers after they had been paid cannot operate to divest them of the exclusive right to the trade-marks if they acquired such under the mortgage. With such exclusive right they, as well as Miller & Sons, might hope the debt would soon be extinguished, but without such exclusive right such a result would be most improbable.

Upon a proper construction of the clause of conveyance in the mortgage, and upon the evidence showing the intent of the parties, we are satisfied that the relief prayed for should be granted, and that the defendant should be enjoined from the use of the trade-marks.

Supreme Court of the United States.

COOK, APPELLANT, v. THE SANDUSKY TOOL COMPANY.

Decided January 21, 1884.

1. HICKS'S PATENT—HOES.
   Letters Patent No. 189,220 granted April 3, 1877, to O. H. Hicks, for an improvement in hoes, considered.
2. INFRINGEMENT.
   If an invention made and sold prior to the date of the patentee's invention is not an anticipation, it is not an infringement of it.

APPEAL from the Circuit Court of the United States for the Northern District of Ohio.

Mr. Geo. N. Howard and *Mr. H. E. Paine* for the appellant.

Mr. M. D. Leggett and *Mr. L. L. Leggett* for the appellee.

Mr. Chief Justice WAITE delivered the opinion of the Court.

The decree in this case is affirmed. If the hoe made by the Tool Company infringes the patent of the appellant, it was an anticipation of the invention, and the patent is void, for the testimony leaves no doubt whatever in our minds that the company made and sold their hoes long before the date of the invention patented. If it is not an anticipation, it is not an infringement.

Affirmed.

Attorneys.

DEPARTMENT OF THE INTERIOR,
Washington, March 13, 1884.

SIR: I am directed by the Secretary to inform you that the order of the Department, dated March 17, 1883, disbarring Samuel McKee, of Louisville, Kentucky, from practice as attorney before the Department and its bureaus, has this day been rescinded.

Very respectfully,
AMOS HADLEY,
Acting Chief Clerk.

The Commissioner of Patents.

Issue of March 25, 1884.

DESIGNS.

14,897.—SLEEVE-BUTTON.—*Frederick F. Rivers* and *James C. Bloxam*, Newark, N. J. Application filed November 3, 1883. Term of patent 14 years.

14,898.—CARPET.—*Edwin Fisher*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed February 19, 1884. Term of patent 3½ years.

14,899.—CARPET.—*Ella O. Frost*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed February 19, 1884. Term of patent 3½ years.

14,900.—CASE FOR MUSICAL INSTRUMENTS.—*Merritt Gally*, New York, N. Y. Application filed January 26, 1884. Term of patent 14 years.

14,901.—SHOE OR SLIPPER.—*Charles B. Hatfield*, Troy, N. Y., assignor to *Nathan D. Dodge*, Newburyport, Mass. Application filed December 29, 1883. Term of patent 3½ years.

14,902.—ORNAMENTATION OF TEXTILE AND OTHER FABRICS.—*Adolph Hirsch* and *Henry M. Marx*, New York, N. Y. Application filed January 19, 1884. Term of patent 7 years.

14,903 to 14,909, inclusive.—CARPET.—*Henry Horan*, East Orange, N. J., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed February 19, 1884. Term of patents 3½ years.

14,910.—MITT.—*Warren P. Jennings*, Brooklyn, N. Y. Application filed December 19, 1883. Term of patent 7 years.

14,911.—SPOON OR FORK HANDLE.—*George B. Kelley*, Rockford, Ill., assignor to *The Rockford Silver Plate Company*, same place. Application filed February 18, 1884. Term of patent 7 years.

14,912.—FURNITURE BACK FRAMES.—*Ferdinand Masset*, Chicago, Ill. Application filed December 19, 1883. Term of patent 3½ years.

14,913.—CARPET.—*John McMann*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed February 19, 1884. Term of patent 3½ years.

14,914 and 14,915.—CARPET.—*Howard North*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed February 19, 1884. Term of patents 3½ years.

14,916.—LADY'S WRAP.—*Catherine O'Hara*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed February 13, 1884. Term of patent 3½ years.

14,917.—LADY'S BASQUE.—*Catherine O'Hara*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed February 13, 1884. Term of patent 3½ years.

14,918.—LADY'S SKIRT.—*Catherine O'Hara*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed January 23, 1884. Term of patent 3½ years.

14,919.—WATCH-MOVEMENT.—*Girard Perregaux*, Chaux-de-Fonds, Neufchâtel, Switzerland. Application filed December 15, 1883. Term of patent 14 years.

14,920.—LADY'S POLONAISE.—*John Quincy Reed*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed February 13, 1884. Term of patent 3½ years.

14,921.—GIRL'S COSTUME.—*Catherine Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed February 13, 1884. Term of patent 3½ years.

14,922.—MISS'S COSTUME.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed February 13, 1884. Term of patent 3½ years.

14,923.—CARPET.—*Lucy W. Valentine*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed February 19, 1884. Term of patent 3½ years.

14,924.—EAR-RING PENDANT.—*John B. Van Houten*, Newark, N. J. Application filed February 8, 1884. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

11,029.—HAT-BRUSHES.—*Gustave Bossange*, New York, N. Y. Application filed February 13, 1884.
"A representation of the head and bust of the Statue of Liberty."

11,030.—RYE AND BOURBON WHISKY.—*Solomon C. Herbst*, Milwaukee, Wis. Application filed February 26, 1884.
"The words and letters 'JNO. E. FITZGERALD.'"

11,031.—RYE AND BOURBON WHISKY.—*Solomon C. Herbst*, Milwaukee, Wis. Application filed February 26, 1884.
"The words 'CLIFTON SPRING.'"

11,032.—CIGARS, CIGARETTES, AND SMOKING-TOBACCO.—*Kaufmann Bros. & Bondy*, New York, N. Y. Application filed February 15, 1884.
"The arbitrary words 'TOUNG TALOUNG.'"

11,033.—COUGH-REMEDIES.—*Kerry, Watson & Co.*, Montreal, Quebec, Canada. Application filed February 23, 1884.
"The figure of an Indian."

11,034.—CIGARS AND CIGARETTES.—*Herman Segnitz & Co.*, Milwaukee, Wis. Application filed February 11, 1884.
"The pictorial representation of Governor Morton."

11,035.—LIQUORS AND SPIRITS.—*E. Cusenier Fils Aîné & Co.*, Paris and Ornans, France. Application filed January 11, 1884.
"Two circular seals having escutcheons upon them, and a band connecting the said seals."

11,036.—LIQUORS AND SPIRITS.—*E. Cusenier Fils Aîné & Co.*, Paris and Ornans, France. Application filed January 11, 1884.
"Three escutcheons, the initials 'E. C. & C.,' and the facsimile of the firm-signature."

11,037.—STEEL AND CERTAIN IMPLEMENTS MADE THEREFROM.—*William Kirkby Peace* and *Hugh Kirkby Peace*, Sheffield, England. Application filed January 5, 1884.
"A fleur-de-lis-shaped figure, the letter 'P,' and the figures '17' and '10.'"

11,038.—LAUNDRY-SOAP.—*Procter & Gamble*, Cincinnati, Ohio. Application filed January 14, 1884.
"The word-symbol 'CLEAN QUICK' on a parallelogram, in white letters with a heavy dark shade, and on different imaginary lines, forming thus a diagonal whole from the upper left-hand to the lower right-hand corner of the parallelogram."

11,039.—LAUNDRY-SOAP.—*Procter & Gamble*, Cincinnati, Ohio. Application filed January 14, 1884.
"The word-symbol 'WASH WELL' on a parallelogram, in dark letters shaded in red and on a white ground, with a fanciful red bordering forming a lesser parallelogram."

11,040.—LAUNDRY-SOAP.—*Procter & Gamble*, Cincinnati, Ohio. Application filed January 16, 1884.
"The word-symbol 'CLEAN-FAST' within a parallelogram, in fanciful red letters."

11,041.—LAUNDRY-SOAP.—*Procter & Gamble*, Cincinnati, Ohio. Application filed January 16, 1884.
"The word-symbol 'WORK-WELL' within a parallelogram, in plain solid-brown lettering."

11,042.—LAUNDRY-SOAP.—*Procter & Gamble*, Cincinnati, Ohio. Application filed January 16, 1884.
"The word-symbol 'CLEAN-WELL' within a parallelogram, in fanciful black letters, the lower half of each letter being in pink shaded with black."

11,043.—WHISKIES.—*B. J. Semmes & Co.*, Memphis, Tenn. Application filed February 7, 1884.
"The word 'YANNISSEE.'"

11,044.—WHISKIES.—*B. J. Semmes & Co.*, Memphis, Tenn. Application filed February 7, 1884.
"The word 'MEMPH' in Coptic letters."

11,045.—PREPARED WHITING.—*Arthur Buel*, New York, N. Y. Application filed February 21, 1884.
"The word 'ELEKTRIK.'"

11,046.—ARTICLE OF FOOD MADE FROM GRAIN.—*Glaser, Kohn & Co.*, Chicago, Ill. Application filed February 23, 1884.
"The letters and word 'OATINE.'"

11,047.—VARNISHES, JAPANS, BLACKS, COLORS, PAINTS, WOOD-FILLINGS, AND ROUGH STUFFS.—*Valentine & Company*, New York, N. Y. Application filed February 19, 1884
"The letters composing the word 'VALENTINES' and the letter 'R' and the letters 'I S H,' so arranged with reference to each other and so proportioned in regard to size as to produce the two words 'VALENTINES' and 'VARNISHES' without duplicating the letters 'V,' 'A,' 'N,' 'E,' 'S,' which are common to both of said words, the letters 'L' and 'E' being arranged directly over the letter 'R,' after the letters 'V' and 'A,' and the letters 'T I N' directly over 'I S H,' after the letter 'N,' and all of the letters but 'V,' 'A,' 'N,' 'E,' 'S' being smaller than the latter letters. The arrangement and blending of said letters are such as to produce the following result, viz: 'VALENTINES VARNISHES.'"

LABELS.

4,008.—Title: "HEART" (FOR PLUG-TOBACCO.)—*Jas. G. Butler & Co.*, St. Louis, Mo. Application filed March 4, 1884.

4,009.—Title: "SOAP."—*Willard G. Crane*, Cambridge, Ill. Application filed February 29, 1884.

4,010.—Title: "ELY'S GLASS PAINT."—*Oscar A. Ely*, Hartford, Conn. Application filed February 28, 1884.

4,011.—Title: "FAHRNEY'S CELEBRATED BLOOD CLEANSER OR PANACEA."—*Peter Fahrney*, Chicago, Ill. Application filed February 22, 1884.

4,012.—Title: "DR. GALLAGHER'S PILE OINTMENT."—*R. F. Gallagher*, Philadelphia, Pa. Application filed March 3, 1884.

4,013.—Title: "DR. COOK'S CELERY BITTERS."—*Edward G. Jay*, Newark, Del. Application filed March 1, 1884.

4,014.—Title: "ROSCOE CONKLING" (FOR CIGARS.)—*Kirkland Brothers*, Utica, N. Y. Application filed February 29, 1884.

4,015.—Title: "DR. SHERWOOD'S KING OF PAIN."—*Randall & Mulford*, Ottumwa, Iowa. Application filed February 19, 1884.

4,018.—Title: "OUR OWN FRUIT SALT" (FOR A MEDICINAL PREPARATION.)—*Frederick Stearns & Co.*, Detroit, Mich. Application filed February 15, 1884.

PATENTS

GRANTED MAR. 25, 1884.

295,513. WIRE-BARBING MACHINE. GEO. C. BAKER, Des Moines, Iowa. Filed July 16, 1883. (No model.)

Brief.—A flat metal strip is notched by the feed-rollers and fed over the upper of two main wires. A spring-actuated mandrel lies under the wire in a notch in an anvil or under die. A vertical bar descends, cuts off a barb, and bends its ends downward over the anvil, one on each side of the upper main wire. Lateral slides move inward, one shoving back the mandrel, and bend the depending ends of the barb past each other and clamp it onto the main wire. The barbed and the unbarbed main wires are then twisted and reeled.

Claim.—1. In a wire-barbing machine, a pair of feed-rollers having coinciding projections and notches in the opposite edges of their peripheries, to adapt them to notch the edges of a metal strip as it is advanced toward the barb-cutters between the rollers.

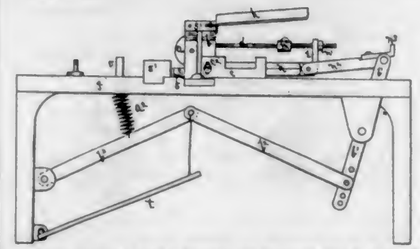
2. The driving-shaft B, having a cam, k', the rack k'', having a bridle at its lower end, and a stud-roller, k''', the spring k'''', and the feed-rolls A and A', the shaft g, having a loose pinion, l l', a pawl, l'', and a fixed ratchet, l''', arranged and combined substantially as shown and described, for the purposes specified.

3. The post G, fixed to the base A, the cutter-carrier c c' c'' d d', the cutter d'', and the driving-shaft B, having cams d''' and d'''', arranged and combined substantially as shown and described, for the purposes specified.

4. The horizontal cutter f, the barb-guide m'', the sliding bar m''', having a finger, n', the triangular-shaped bar n n''', and the vertical cutter and bender d'', having a transverse groove in its end, arranged and combined substantially as shown and described, to simultaneously cut and bend a barb double, in the manner and for the purposes specified.

5. The sliding bar m''', having a finger, n', the triangular bar n n''', the sliding barb-bender o o', having a cam, o'', and the spring n'''', arranged and combined substantially as shown and described, for the purposes specified.

6. The driving-shaft B, having cams r r, in combination with the sliding barb-benders o o', having studs r', substantially as and for the purposes set forth.



295,514. SEAL-LOCK. ANDREW B. BARNARD, St. Joseph, Mo. Filed Nov. 3, 1883. (No model.)

Claim.—1. The barrel B, having the slotted shoulder b, the face-plate D, having the loop d, and the bolt C, having the feather, and the projecting eye C', all combined and operating substantially as specified.

2. In a car seal-lock, the combination of a bolt, C, entering the door from the outside, and having an outstanding eye, C', and an outstanding loop, d, lying vertically parallel to said eye, said eye or loop, or one of them, being provided with shoulders f upon their outer edge, whereby to support a tag-seal horizontally and parallel to the car side, substantially as and for the purpose specified.

295,515. NAILING-MACHINE. EDWARD F. BARTON, Ravenna, Ohio, assignor of one-half to Theodore Grundel, same place. Filed Dec. 5, 1883. (No model.)

Claim.—1. In a nailing-machine, the oscillating carrier a, having a horizontal or nearly horizontal axis and a slot, a', provided with spring e, and formed, as shown, of sufficient dimensions to receive but one nail hanging by its head on the circumference of the carrier, in combination with trough c, substantially as described.

2. The inclined slotted conductor b, in combination with carrier a, arranged to oscillate in a vertical or nearly vertical plane, and pivoted to the conductor, the carrier being actuated by a suitable mechanism, and having slot a', provided with spring e, and formed as shown, substantially as described.

3. The driver n and trough c, in combination, by suitable means, with rod d and carrier a, having slot a', provided with spring s, and formed as shown, and suitable actuating mechanism, substantially as described.

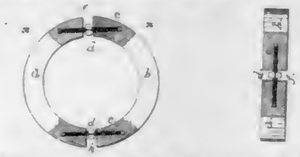
4. The rod d, provided with collar m and nut n', in combination with driver n, carrier a, having slot a', provided with spring e, and formed as shown, trough c, and suitable actuating mechanism, substantially as described.

5. The driver n, trough c, rod d, and carrier a, having slot a', provided with spring e, and formed as shown, in combination, as shown, with pitman n^3, levers b' b^3 b^3, spring a^3, and treadle t, substantially as described.

6. Carrier a, having slot a', provided with spring e, and formed as shown, in combination with rod d, nut n', collar m, driver n, formed with lug i, rod e', and pitman n^3, provided with the pivoted cap n^3, substantially as described.

7. The oscillating carrier a, having slot a', provided with spring e, and formed as shown, in combination with conductor b, driver n, trough c, and suitable actuating mechanism, substantially as described.

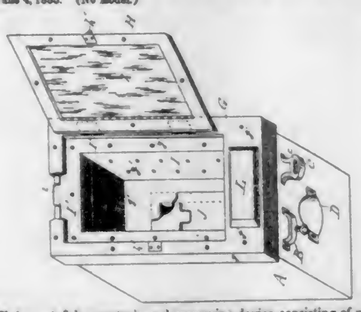
8. The frame f, formed with grooves c^3 o^3, in combination with the slotted adjustable stops o o', trough c, carrier a, having slot a', provided with spring e, and formed as shown, driver n, and suitable actuating mechanism, substantially as described.



9. The adjustable trough c, formed to fit the transverse groove g in frame f, and with slotted lug c^2, in combination with conductor b and carrier a, having slot a', provided with spring e, and formed as shown, substantially as described.

10. The trough c, provided with spring s, in combination with driver n and suitable actuating mechanism, substantially as described.

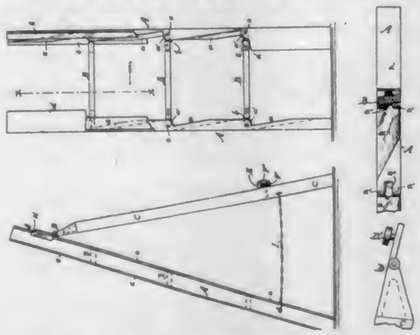
11. The oscillating carrier a, having slot a', formed as shown, and provided with spring e and actuating mechanism, the carrier being piv-



oted to conductor *b*, the driver *a*, pitman *a*², and trough *c*, in combination with a similar carrier, driver, pitman, and trough, rod *c'*, lever *b'*, and suitable actuating mechanism, substantially as described.

295,516. HOOP-NAILING MACHINE. ANDREW C. BATCHELLER, Bay City, Mich. Filed Jan. 13, 1884. (No model.)

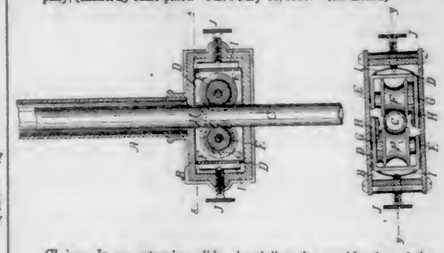
Claim.—In a hoop-nailing machine, a circular form consisting of the semicircular parts *a* and *b*, joined together at their ends, as described, by the bolts *c*, which are provided in their centers by the rigid nuts *d*, and at one end a right-hand thread, and at the opposite end a left-hand thread, and adapted to engage with corresponding threads in the ends of the parts *a* and *b*, all in combination, substantially as set forth.



295,517. FISH-BOX. CHARLES A. BERGTOLD, New York, N. Y. Filed June 4, 1883. (No model.)

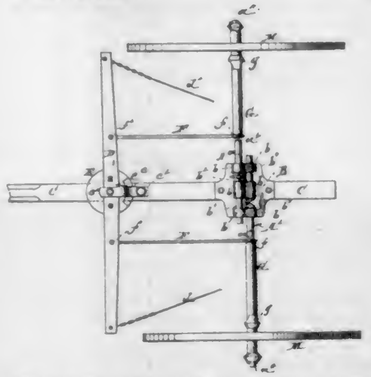
Claim.—A fish receptacle and preserving device consisting of main box A, having handles D, towel-holder B, knife-support C, removable top G, having depending edges *g*, perforations *g'*, and dressing-block L, inner box, I, having lip I', handles *i*, trap J, and perforations *g'*, the main box being provided with cleats E and F, and the whole combined and arranged to operate substantially as shown and described.

295,518. FOLDING STEP-LADDER. AUGUST BOHMAN, Chicago, Ill., assignor of one-half to Charles J. Stromberg, same place. Filed Dec. 13, 1883. (No model.)



Brief.—Consists of side rails having their inner faces beveled and provided with recesses, and steps having pierced tenons which enter said recesses. Detachable brace-legs are connected with the side rails, and have a brace-bar having eyes engaging hooks on said brace-legs.

Claim.—1. A portable folding step-ladder in which are combined the side rails, A A, having on their sides or faces the beveled portions *a a*, and the recesses *a'' a''*, and the steps B B, having on their ends tenons *b b*, entering the said recesses, and there hinged or jointed to the side rails, substantially as and for the purposes set forth.

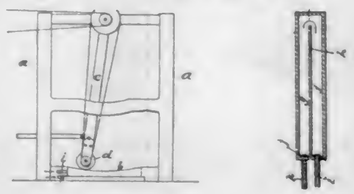


2. A portable folding ladder, combined with the brace-legs C C, and means for connecting the said legs detachably to the side rails, and the detachable brace-bar E, substantially as and for the purposes set forth.

295,519. EXTENSION-SLIDE CHANDELIER. JOHN P. BONNER, Brooklyn, N. Y., assignor to the William C. Voeburgh Manufacturing Company, (Limited,) same place. Filed July 28, 1883. (No model.)

Claim.—In an extension-slide chandelier, the combination of the following elements: a tube, A, box B, tube C, boxes D, scored wheels F, and ratchet-wheels G, journals E, pawls H, curved springs I, and regulating-screws J, constructed and operating substantially as and for the purpose specified.

295,520. CULTIVATOR. BYRON C. BRADLEY, Chicago, Ill., assignor to the First & Bradley Manufacturing Company, same place. Filed Nov. 27, 1883. (No model.)

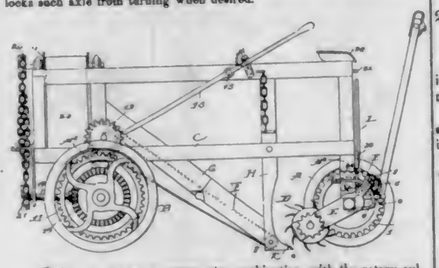


Claim.—1. The combination of the arch-sections A A', the plate B, formed with the sockets *b*, divided into sections, and the set-thimbles *b'*, encircling the arch-sections in the spaces between the sections of the sockets, to adjust and hold the arch-sections, substantially as described.

2. The combination of the arch-sections A A', plate B, formed with the sockets *b*, divided into sections, the set-thimbles *b'*, encircling the arch-sections in the spaces between the sections of the sockets, the carrying-wheels M on the arch-sections, and the plow-beams, whereby the wheels and beams can be adjusted to suit the width of row of the plants, substantially as described.

3. The double-tree D and plate E, having a central tubular stud, *d'*, and recess *e* in its periphery, in combination with the tongue C, plate E', and the hammer-strap *c*, connected with tree D and fitting in recess *e*, substantially as described.

295,521. FINISHING-MACHINE FOR PRESS-BOARDS. FREDERICK L. CASE, Chaplin, Conn. Filed Nov. 15, 1883. (No model.)



Claim.—1. In a finishing-machine for press-boards, in combination, the frame, the vibrating arm bearing the roller, and the bed-plate heated by steam, hot air, or the like, all substantially as described.

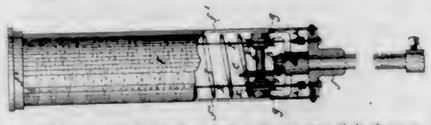
2. In a finishing-machine, the bed-plate with chambers *f* and *g*, connected by opening *g'*, having vertical web A, and inlet and outlet openings for steam, all substantially as described.

3. In a finishing-machine, the bed-plate with inlet and outlet openings for steam, the chambers with the bottom sloping to the outlet, and the vertical partition, all substantially as described.

295,522. EXCAVATING-MACHINE. THOMAS CLARK, Quincy, Ill. Filed June 22, 1883. (No model.)

Brief.—A swinging frame pivoted on the front axle of a carrying-frame and locked by pins inserted through the front cross-bar into arms on the main frame carries at its rear an excavator-roller driven from the front axle. The lower hinged section of an elevator-frame whose belt is driven from the rear riding-wheels is supported by slotted hangers vertically adjusted by bolt-and-nut connections. A forked bar passed down through brackets on both the main frame and the forward axle locks such axle from turning when desired.

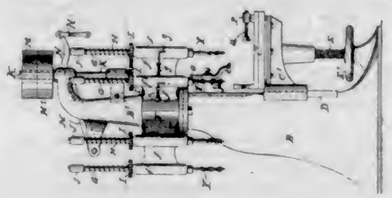
Claim.—1. In an excavator, the combination, with the rotary cylinder having cutters and driven from the forward axle, of a carrier-belt driven independently from the rear axle.



2. In combination with the axle of the forward wheels, a swinging frame mounted on such axle, and a rotary excavator journaled in the frame, and means for adjusting and locking the frame.

3. The swinging frame and the rotary excavator, in combination with the arms and pins.

4. The combination, with the hinged section of the dirt-carrier, of the slotted hangers H H, the bolt, and the described locking devices.



5. In a ditching-machine, a pair of swiveled guiding-wheels, in combination with the locking device, substantially as described, for holding the axle and bolster rigidly in line with the main frame.

295,523. HAND-BORER. WILLARD E. CLOUGH, Concord, N. H., assignor of one-half to Phillip Pethick, same place. Filed Sept. 24, 1883. (No model.)

Claim.—In a hand boring-tool, the hollow handle F, having a reciprocal motion upon the bit-spindle A, and containing mechanism, consisting of a spiral spring, I, and said bit-spindle A, connected by means of the bevel-gears B C to the horizontal shaft D, carried by the hanger G, and provided with grooved pulleys E, to which are attached spring-pawls K and ratchet-wheels J, all combined and arranged to be driven continuously in one direction by means of the driving-cords H, substantially as specified, and for the purposes hereinbefore set forth.

295,524. BORING-MACHINE. WILLARD E. CLOUGH, Concord, N. H., assignor of one-half to Philip Pethick, same place. Filed Oct. 29, 1883. (No model.)

Claim.—1. In a boring-machine constructed substantially as described, having a cored iron frame, B B', and an adjustable operating-table, C, a revolving turret, F, provided with arms *f*, containing bearings *f'* for the bit-spindles G, operated by suitable gearing, in the manner and for the purpose specified.

2. In a boring-machine constructed substantially as described, having a cored iron frame formed of two or more parts, and an adjustable operating-table, C, the combination of two or more bit-spindles, G, and springs H, with the revolving turret F, operating as and for the purpose described and set forth.

3. In a boring-machine constructed substantially as described, the combination, with a cored iron frame, B B', of a vertical shaft, K, carrying the pulleys M M', and a spur or friction gear, L, the spur or friction gear I, bit-spindles G, springs H, some suitable lever or levers, N, and the revolving turret F, all operating as described and set forth.

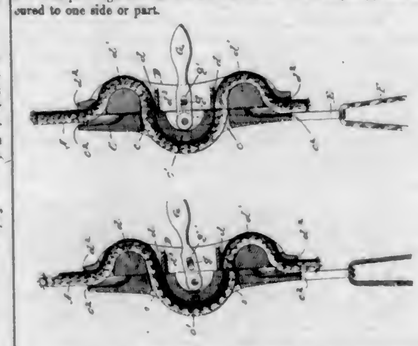
4. The combination, with the cored iron frame B B', having slot *b*, and a revolving turret, F, carrying the bit-spindles G, of suitable spring-catches, *g*, attached in some convenient manner to the arms *f*, and operating within the said slot *b*, substantially as and for the purpose set forth.

295,525. COMPOUND FOR WATERPROOFING AND PRESERVING BUILDINGS. BENJAMIN DENNE, Camden, N. J., assignor of one-fourth to Joseph Chapman, Philadelphia, Pa. Filed Feb. 21, 1884. (No specimens.)

Claim.—1. The within-described waterproofing compound, consisting of fossil wax, carnauba-wax, refined paraffine-oil, and carbolic acid, united by heat.

2. The within-described waterproofing compound, consisting of fossil wax, carnauba-wax, refined paraffine-oil, and carbonic acid, combined in about the proportions and in the manner specified.

295,526. COLLAR OR TIE ADJUSTER. WARD W. DENETON, Washington, D. C. Filed Dec. 7, 1883. (No model.)



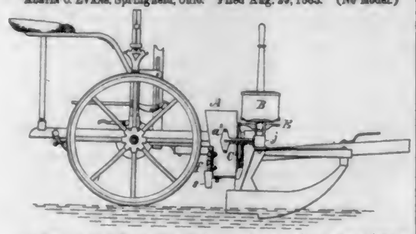
Claim.—1. A device formed of the strips A B C, the parts B C having inward end projections provided with teeth, whereby the collar may be secured to the band of the shirt, substantially as described and specified.

2. A device formed of the strips A B C, the parts B C thereof being provided with inward end projections having teeth *b c*, respectively, the part C having spurs D D upon its outer side, substantially as described, and for the purpose set forth.

3. A device for securing a collar to a shirt-band, consisting of a single piece of metal carved at *a d*, whereby the parts A B C are formed, the outer ends of the parts B C having inturned pointed ends, for the purpose of engaging or clamping the shirt-band and collar, in the manner and for the purpose set forth.

295,527. FIRE-ESCAPE. ROBERT EMLAH DOWNER, Clinton, assignor of one-half to George A. Honston, Beloit, Wis. Filed Nov. 7, 1883. (No model.)

Brief.—The friction device is composed of two independent parts with their flat sides together, and the rope is rove through perforations therein, and a lever pivoted to one side or part and having its fulcrum on the other part regulates the amount of friction. The body-support is secured to one side or part.



Claim.—1. In a fire-escape, a slide composed of two independent parts arranged side by side, with their inner faces flat and in contact, in combination with a suspended rope passing in and out through both parts of the slide, a carrier attached to one member of the slide, and a lever pivoted at one end to one member of the slide, and having its fulcrum on the other member, substantially as and for the purposes set forth.

2. In a fire-escape, the rope A, in combination with a slide member, C, provided with apertures *c* and boss *c'*, the companion slide member D, provided with apertures *d* and bosses *d'*, and the bail E, attached to one member of the slide, substantially as and for the purposes set forth.

3. In a fire-escape, the suspended rope A, in combination with the slide B, composed of the two members C and D, constructed substantially as specified, the bail E, attached to one of the members of the slide, and the lever G, substantially as and for the purposes set forth.

295,528. FERTILIZER-DISTRIBUTER FOR SEED-PLANTERS.

AUSTIN C. EVANS, Springfield, Ohio. Filed Aug. 29, 1883. (No model.)

Claim.—1. In a fertilizing attachment for a two-horse corn-planter, the combination, with the fertilizer-hopper and the sowing devices in the bottom of the same, of a fixed screen inclosed within said hopper over said sowing devices, for the purpose of preventing lumps of the fertilizer substance from getting into and obstructing the movement of said sowing devices.

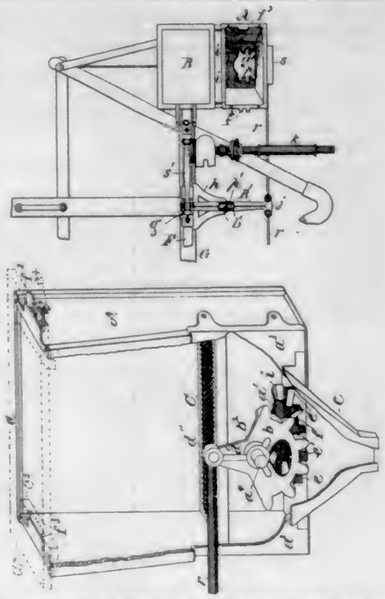
2. In a fertilizing attachment having its dropping-disk driven from a shaft extending through the hopper, and having a ratchet-wheel on its outer end, the combination therewith of a vertical oscillating lever pivoted over said ratchet-wheel, provided with pawls adapted to engage the teeth of the latter, and having its top end engaged with a notch in the drive-frame on the slide-bar, whereby an oscillating movement is given to said lever, communicating an interrupted rotary motion to the dropping devices, substantially as set forth

3. The combination, with the dropping devices and the ratchet-wheel on the outer end of the driving-shaft, having lugs extending therefrom, of the pivoted oscillating lever formed with lateral arms having pawls pivoted thereon, engaging the teeth of said ratchet-wheel, and provided also with a stop on each of its arms, adapted to engage with the lugs on the ratchet-wheel at each throw of said lever, as and for the purpose set forth.

4. In a fertilizing attachment for a seed-planter, a vertical lever pivoted upon the front of the hopper between the slide-bar and the dropping devices, having lateral arms extending therefrom and provided with pawls and stops, engaging with the teeth and lugs of a ratchet-wheel on the end of the driving-shaft of said dropping-devices, said lever being engaged with and operated by the slide-bar, substantially as and for the purpose set forth.

5. The combination, with lever C, having the lateral arms c^3 and c^3, provided with stops i and i' on the ends of the same, of the pivoted pawls *e* and *e'*, having a tail extension between the stops, which latter govern the movement of said pawls and prevent their disengagement from the teeth of the ratchet-wheel.

6. The combination, with the rotating shaft extending through the hopper for driving the dropping devices in the latter, of the hollow metal casing extending from one side of the hopper to the other over said shaft, to protect the bearings of the latter from exposure to the fertilizer substance, as set forth.



7. In an adjustable connecting-shaft having a series of gears thereon for changing the drop, the combination therewith of a series of grooves corresponding with the number of pinions, and a key for securing said shaft in adjustment, extending through the sleeve within which it is pivoted, and adapted to engage the groove corresponding with the engaging pinion.

8. In a two-horse corn-planter having a fertilizer attachment, a shield attached to the outside of the fertilizer-hopper over the discharge-wheel, between the covering-wheel and the discharge-spout, whereby dirt is prevented from dropping from off said covering-wheel into said discharge-spout with the fertilizer.

295,529. FERTILIZING ATTACHMENT FOR SEED-PLANTERS.

AUSTIN C. EVANS, Springfield, Ohio. Filed Nov. 2, 1883. (No model.)

Claim.—1. In a fertilizing attachment, a horizontal feed plate or disk having its shaft pivoted vertically through the bottom plate of the hopper, (or a hub cast thereon,) and provided with two horizontally-cutting teeth extending radially therefrom—one from either side of a space on its front edge—and having a group of filling-teeth in rear of each cutting-tooth, with inclined points extending tangentially rearward, and a rear tooth square in its cross-section dividing the two groups of filling-teeth.

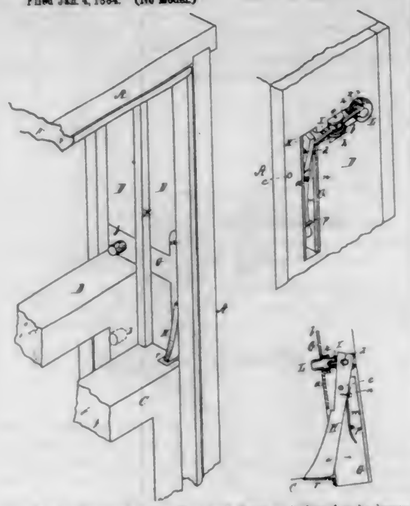
2. In a fertilizing attachment, the horizontal oscillating disk *d'*, having the chisel-shaped teeth *i* on either side of a front peripheral space, their front faces inclined downward and forward from the upper to the lower surface of the disk, the raking or gullet-shaped teeth *e e e*, grouped on either side of the median line, *y*, having their longest points in line with the rear face, and the intermediate tooth, *e'*, between the two groups of teeth *e e e* on the rear of the disk.

3. In a fertilizing attachment for a seed-planter, a horizontal oscillating feed-disk, an oscillating toothed sector pivoted vertically over the same, engaging with the teeth of the latter at right angles to the plane of the disk, operating it from side to side, and discharging the fertilizer substance therefrom at the same time.

4. In a fertilizing attachment for a seed-planter, a horizontal oscillating feed-disk pivoted upon a vertical shaft, a central hub through which said shaft extends, and an elevated ring supporting the disk above the hopper-bottom, said disk being operated by a toothed sector pivoted vertically over the same, the teeth of which engage the teeth of the disk at right angles thereto.

5. The combination, with the horizontal oscillating feed-disk having teeth of the form described, of the toothed sector pivoted upon the outside of the hopper above said feed-disk and engaging therewith, said sector being connected by a rod or rods and an intermediate shaker-bar or pivoted lever with the slide-bar of the planter, whereby an oscillatory movement is transmitted to said feed-disk from said slide-bar.

6. In a disk for sowing or dropping fertilizer substance, adapted to have an oscillatory movement, the combination of the group of teeth on either side of the center of oscillation, having their ends terminating in angular points cut tangentially from front to rear perpendicular to the plane of said disk, their rear faces being longer than their front faces, to adapt them to enter the fertilizer substance more easily, and to collect it by means of the long angular points extending from their rear faces, and carry it out from within the hopper to the point of discharge.

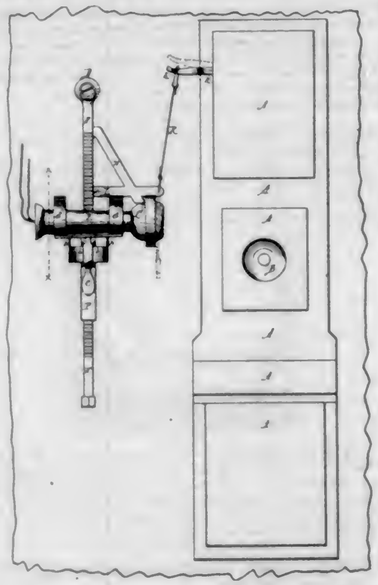


7. In a fertilizing attachment for a seed-planter, an oscillating feed-disk pivoted by a vertical shaft, a threaded hole for an oil-inlet through said disk, and a screw for capping the same, in combination with a dish-shaped cavity in the top of the hub or collar under said disk, on the bottom plate of the hopper, said cavity forming a reservoir for the oil with which the shaft of the disk is lubricated.

8. In a fertilizing attachment for a seed-planter, a metal plate, a^2, forming the lower section of the rear wall of the hopper, a journal, a^4, extending horizontally therefrom, in combination with the toothed sector *b*, pivoted on said journal, and adapted to operate the oscillating disk *a'* through its connection with the slide-bar of the planter.

9. In a seed-planter having a fertilizing attachment, the combination, with the rotary seed-disks and the slide-bar actuating the same, of the oscillating fertilizer-disks, the toothed sectors engaging therewith, and the auxiliary devices connecting the latter with said slide-bar, as and for the purpose set forth.

295,530. SASH-FASTENER.

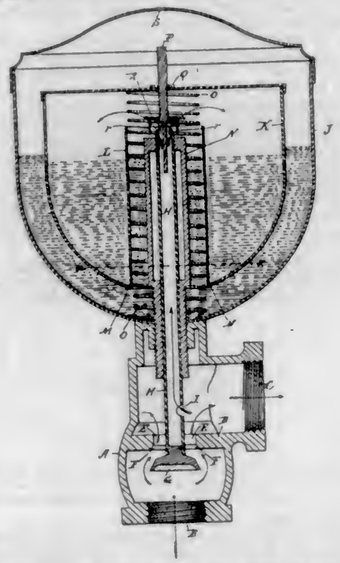


SAMUEL FARQUHAR, Newton, Mass. Filed Jan. 4, 1884. (No model.)

Claim.—The within-described sash-fastener designed to be located in the pulley-stile, consisting of the lever H, pivoted to the vertical portion *a* of the casing A, and having a slot, *d*, in its upper end, the connecting-arm I, pivoted to lugs *h h*, projecting from the horizontal portion *b* of the casing A, and the bolt L, having a slot, *i*, in its outer end, in combination with the upper sash, B, provided with recesses *l*, and the lower sash, C, all constructed and arranged as set forth.

295,531. TELEPHONE-SUPPORT.

GEORGE W. FREE, Pecatonica, Ill. Filed Dec. 5, 1883. (No model.)



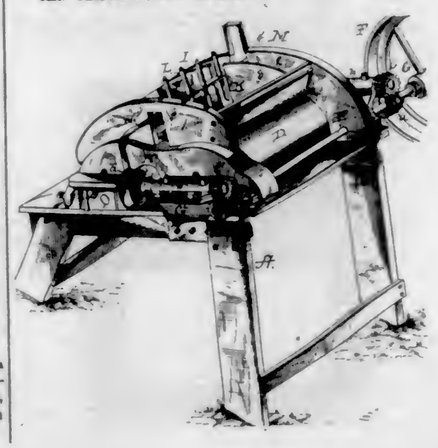
Claim.—1. The combination, with a telephone-transmitter, of a vertical support produced in toothed-ratchet form, and a receiver-supporting bracket made vertically adjustable on the tooth-ratchet support, said receiver-support having a spring-actuated pawl to engage the teeth of the vertical support, substantially as and for the purpose set forth.

2. The combination, with a telephone-tranemitter, of a receiver and a vertically-adjustable bracket-support for said receiver, arranged relatively to said transmitter, substantially in the manner as and for the purpose herein shown and described.

3. The combination, with the fixed supporting-bracket and with the switch-lever, of an elastic-link connection, substantially as and for the purpose set forth.

295,532. GAS-PRESSURE REGULATOR.

LEWIS G. FRANCIS, La Grange, and JOHN A. TIEBS, Hinsdale, Ill. Filed Dec. 13, 1883. (No model.)



Claim.—1. The combination, in a gas-pressure regulator, of the valve G, diaphragm D, provided with an opening, E, the hollow valve-stem H, provided with an opening, I, the float K, and case J, and mechanisms for guiding the valve-stem, substantially as specified and shown.

2. In a gas-pressure regulator, the combination of the case J, float K, the tube L, and the spiral spring O, as specified and shown.

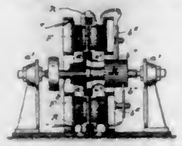
3. The combination, in a gas-pressure regulator, of the adjustable tube N, the hollow valve-stem H, the float K, and case J, as specified and shown.

295,533. CLAY-CRUSHING MACHINE.

FREDERIC E. FENT, Bucyrus, Ohio. Filed Feb. 11, 1884. (No model.)

Claim.—1. In combination with a clay-crushing machine, the rake or crusher arranged over and parallel with the rollers, and means for imparting a reciprocating motion to said rake, substantially as and for the purpose set forth.

2. In combination with a clay-crushing machine, the rake or crusher, consisting of a bar arranged over and parallel with the rollers, and provided with a plurality of fingers made vertically adjustable, and means for imparting a reciprocating motion to said rake, substantially as and for the purpose set forth.



3. In combination with a hopper of a clay-crushing machine, provided with retaining-springs, the sectional partitions hinged to the ends of the hopper and adapted to be held or restored to position by the retaining-springs, substantially as described.

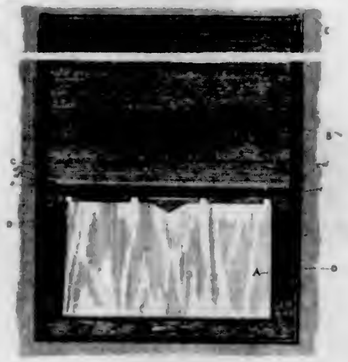
4. In combination, the shaft E, provided with screws *a a'*, the shafts G G', with gear-wheels *b b'* and crank-heads H, and the rake I, having tubes L and a series of vertically-adjustable fingers K, projected through the bar and into said tubes, substantially as and for the purpose stated.

5. In combination with a clay-crushing machine, a rake or crusher arranged parallel with the rollers, means for imparting a reciprocating motion to said rake, and a hopper having sectional partitions hinged to the ends of the hopper, and held or restored to position by retaining-springs, substantially as described, and for the purpose set forth.

6. In combination with a clay-crusher, the rake arranged parallel with the rollers and provided with tubes L and fingers or teeth K, projected through the bar and into the tubes, and adapted to automatical adjustment, substantially as described, and for the purpose set forth.

295,534. MAGNETO AND DYNAMO ELECTRIC MACHINE. FRIEDRICH GUSTAV FREK, Bayenthal, near Cologne, Germany. Filed Mar. 19 1883. (No model.) Patented in Germany Dec. 6, 1877, No. 3,147.

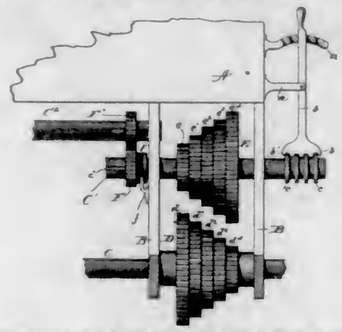
Claim.—1. In a magneto or dynamo electric machine, the combination, with the field-magnets, of a revolving armature-disk having radial wires connected in a closed circuit and to commutator-plates, substantially as set forth.



2. The combination, with the field-magnets, of a revolving armature-disk having radial wires connected to the commutator, substantially as set forth, and having a support around the outer portions of such radial wires, and means for connecting the inner portions of such wires to the revolving shaft, substantially as set forth.

3. The combination, in a dynamo or magneto electric machine, of an armature composed of radial wires connected in a closed circuit at the outer and inner portions of such radial wires alternately, as set forth.

4. The combination, in the revolving armature, of two or more layers of armature-coils having radial wires connected alternately at their outer and inner ends, and placed at progressive angles to the axis of rotation, substantially as set forth.



5. The combination, in an armature, of numerous coils forming loops, with the side portions of each loop in the line of the radius, substantially as set forth.

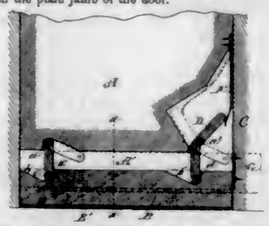
295,535. DEVICE FOR HOLDING THE CURTAINS OF CAR-WINDOWS. FRANK FURNESS, Philadelphia, Pa. Filed Dec. 6, 1883. (No model.)

Claim.—The combination of the window-curtain and the grooved beads arranged on each side thereof with the strip C, having elastic end pads, the length of said strip and pads being greater than the distance between said beads, substantially as and for the purposes specified.

295,536. GEARING FOR CHANGING SPEED. SILAS N. GALLUP, Macedon, N. Y. Filed Jan. 24, 1884. (No model.)

Claim.—1. In a device for changing speed, the cones D and E, mounted upon parallel shafts, and having a lateral adjustment one relatively to the other, in combination with the laterally-adjustable pinion I, mounted in the jointed arm H H', arranged and operating substantially as described.

2. The combination of the cone-gears D and E, fast one on the driving-shaft C and the other on the driven shaft C', one of said shafts being longitudinally adjustable in its bearings, in combination with adjustable bearing-boxes for one of said shafts, and means for effecting the adjustment of said shafts and bearing-boxes, substantially as described.



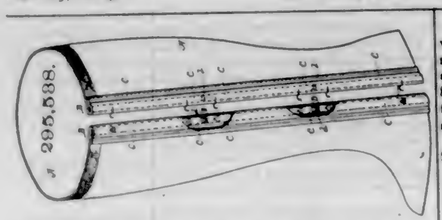
3. The combination of the cones D and E, the sliding shaft C', the pinion F, feathered to and sliding on said shaft, and means for adjusting said shaft longitudinally in its bearings, substantially as described.

4. The pinion I, for communicating motion from the cone D to the cone E, and, in combination with said pinion and cones, the jointed arm H H', provided with the knuckle or rib for limiting the movement of the part H' of said arm, rock-shaft G, to which said arm is secured, and means for adjusting said shaft and arm, all substantially as described.

5. The combination of the shafts C and C', the cones D and E, the latter adjustable laterally with its shaft, the pinion F, feathered to and sliding on the shaft C', means for adjusting said shaft C' and its cone laterally, the connecting-pinion I, and means for adjusting the latter, all substantially as and for the purpose described.

295,537. WEATHER-STRIP. EUGENE E. GILLETT, Western Union, Wis. Filed Aug. 27, 1883. (No model.)

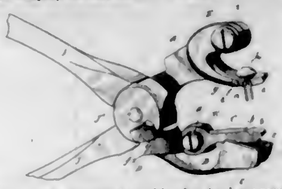
Brief.—A weather-strip consisting of a guard inclosed, together with its link and lever, wholly in a longitudinal groove in the bottom of the door, and operated by said elbow-lever and the impact of the end of the guard with the plain jamb of the door.



Claim.—In combination with a door provided with a longitudinal central slot or groove, A', formed in the under side of its lower edge, and a plain-surface door-jamb, the guard B, suspended by suitable links within the groove A', and with its end directly engaging the said plain jamb, and the elbow-lever D, wholly inclosed and adapted to operate in the groove of the door, substantially as set forth.

295,538. LEGGIN. JOSEPH N. GOLDBACHER, New York, N. Y. Filed Jan. 31, 1884. (No model.)

Claim.—1. An improved leggin or trousers-protector provided along each of its longitudinal edges with ribe of rigid material broken or separated at certain intervals, arranged substantially as set forth.



2. An improved leggin or trousers-protector provided along each of its longitudinal edges with ribe of rigid material broken or separated

at certain intervals and articulated to each other, substantially as described, and for the purpose set forth.

3. An improved leggin or trousers-protector provided with the elastic string M and the ribs C, articulated to each other, arranged substantially in the manner described, and for the purpose set forth.

295,539. IMPLEMENT FOR SETTING BUTTON-FASTENER STAPLES. JOHN H. GOODFELLOW, Troy, N. Y., assignor to the Heaton Buttor Fastener Company, Providence, R. I. Filed Sept. 28, 1883. (No model.)

Claim.—1. The combination, with a jaw having a recess to receive a staple and eye of a button, substantially as set forth, of the described button-lock pivoted to said jaw, and adapted to be moved beneath and across a button having a staple through its eye in said recess, and thereby secure the button and staple to the jaw, substantially as described.

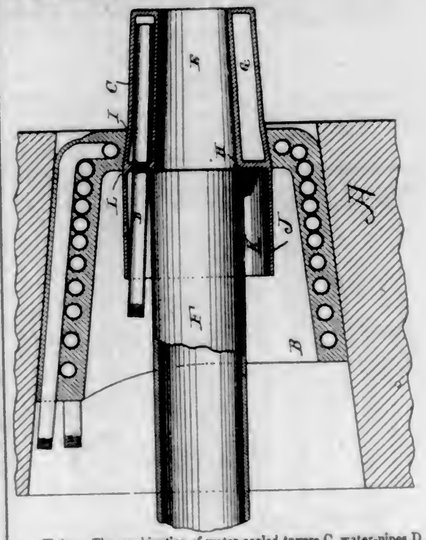
2. The combination, with a jaw having a recess to receive a button and staple, and furnished with the described button-lock pivoted to said jaw, and adapted to secure the button and staple to the jaw, substantially as set forth, of a jaw furnished with means, substantially as described, for bending and clinching the legs of the staple by the closing of said jaws.

3. The combination, with a jaw having a recess for receiving the bow of a staple, of the described holder pivoted to said jaw, so as to move across said recess in a plane about parallel to the plane of that recess, and bear against one side of the two legs of the bow of a staple in the recess, substantially as set forth.

4. The combination, with a jaw having means for holding a button and staple, of a second jaw having the lateral dies *c' c'*, and the anvil C, mounted on said second jaw, so as to move to and fro between said dies, and connected with said other jaw by devices, substantially as described, for positively controlling the retreating movement of the anvil as the jaws are closed in bending the legs of a staple, as set forth.

5. The combination, with a jaw having means for holding a button and staple, of a second jaw having the lateral dies *c' c'*, and the anvil C, mounted on said second jaw, to move between said dies, and connected to said other jaw by devices, substantially as described, for positively controlling the retreating movement of the anvil as the jaws are closed in bending the legs of a staple, and means for returning the anvil in opening the jaws, substantially as set forth.

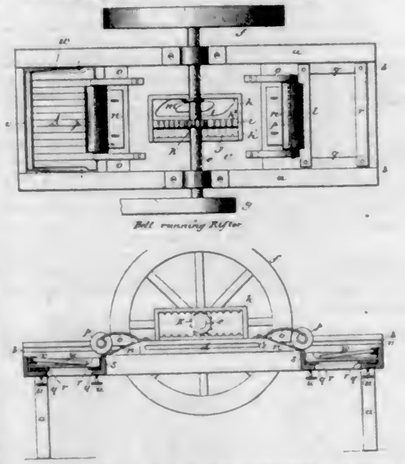
6. The combination, with a jaw having means for holding a button and staple, of the jaw B, jointed to said other jaw, and having the side inclines, *c' c'*, lever D, mounted on the jaw B, and furnished with the anvil C and the cam *f*, or its equivalent, on said other jaw, substantially as described.



7. The combination, with a jaw having means for holding a button and staple, of a second jaw furnished with an anvil and lateral clinching-dies, having reversely-inclined faces, with guide-grooves in two parallel planes about at right angles to the plane of the bow of the staple held by said other jaw, and connecting devices, substantially as described, for bending and clinching the legs of the staple by the closing of said jaws, substantially as set forth.

8. In an instrument for attaching buttons by staples, the part A, provided with the cam *f* or equivalent, and means for holding a button and staple, in combination with a jaw, B, provided with a slot, *m*, and side inclines, *c' c'*, having guide-dies *d d*, combined with a pivoted retreating anvil, C, mounted on a lever, D, adapted to operate substantially as described.

9. In an implement for setting buttons, a jaw, A, provided with an arched recess, *n*, to receive a staple, and a slot to receive a button-eye, and furnished with the button-lock E, as described, to wedge a button and staple, in combination with the jaw B, provided with a pivoted anvil, substantially as set forth, adapted to bend and clinch a staple, substantially as described.

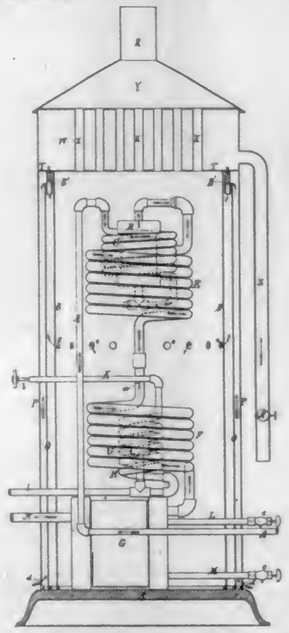


10. In an instrument for setting buttons, a member, A, provided with means for holding a button and fastener, and cam *f*, jointed to the member B, provided with a retreating anvil, C, furnished with dies *b b*, and lever D and sides *c' c'*, adapted to operate as described, of a spring, S, arranged in the fulcrum-joint J' in the manner set forth, and adapted to return the deflecting-anvil C and members A and B to their open position, substantially as described.

295,540. TUYERE. FRED. W. GORDON, Pittsburg, Pa. Filed Nov. 26, 1883. (No model.)

Claim.—The combination of water-cooled tuyere C, water-pipes D, centering-lugs H or their equivalents, and the rear shell, J, as the external periphery of the tuyere, outside of the water-pipe, substantially as set forth.

295,541. SHINGLE SHAVING AND RIFTING MACHINE. APPLETON GOULD, Bangor, Me. Filed Mar. 8, 1883. (No model.)



Claim.—1. The combination of the reciprocating knife-bearing table, self-adjusting pressure-rolls, and end bar, o, supported upon spring-arms *w*, said bar extending across the end of the shingle-bed beyond said bed, and operating to resist the pushing action of the shingle-shaving knife by serving as a rest for the point of the shingle, and depressible by the advancing reciprocating table, substantially as set forth and described.

2. The combination of the reciprocating knife-bearing table, self-adjusting pressure-rolls, spring end bars extending across the shingle-bed beyond its end and serving as a rest for the shingle-point, and adjustable shingle-bed, as set forth.

3. The shingle-bed formed from separate bars unattached to and independent of each other, as described, and capable of adjustment in different planes, substantially as set forth, in combination with mechanism whereby said adjustment may be effected.

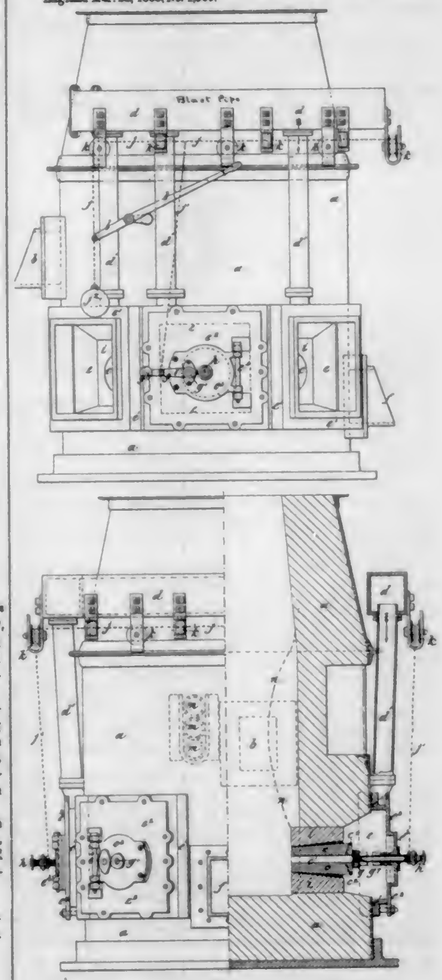
295,542. STEAM-GENERATOR. DANIEL MCBRIDE GRAHAM, Chicago, Ill., assignor to the Company of Vulcan, New York, N. Y. Filed May 29, 1883. (No model.)

Claim.—1. The combination of the drums D and G and the coils C, E, and F, the coil C being within the coil E and around the drum D, and the coil F above the drum G, as described, with the heater composed of the pipes I and K, the coil H, and the deflector U, arranged with and within the coil F, as represented, the pipe K of such heater being provided with one or more jet-holes, *a*, as explained.

2. The combination of the case B, provided with one or more air-leducts, *c*, with the drums D and G, coils C, E, and F, the coil C being within the coil E and around the drum D, and the coil F above the drum G and the heater, as described, consisting of the pipes I and K, coil H, and deflector U, coil H and deflector U being within the coil F, all being adapted substantially as described, and the coil C furnished with an induct, A, for supplying it with water.

3. The combination of the air-heating chamber W, provided with the pipes X and Z, and with conduits leading from it into the air-jacket, as described, with such jacket, the case B, and the heater, the coils and drums arranged within such case, and adapted substantially and to operate as set forth.

295,543. BODY-PROTECTOR. WILLIAM GRAY, Hartford, Conn., assignor of one-half to William W. Tucker, same place. Filed Oct. 18, 1883. (No model.)



Claim.—1. As a new article of manufacture, a body-protector of the within-described class, made of air-tight material conforming in general outline to the part protected, and having a narrowed lower extremity, the whole provided with means for inflation and for securing it to the body of the wearer, all substantially as described.

2. As a body-protector, the air-cushion, of the within-described shape, having lateral corrugations, whereby the cushion is rendered flexible longitudinally, all substantially as described.

3. In combination, the air-cushion *a*, having the transverse corrugations *b* and the narrowed lower extremity, *c*, the air-valve *f*, and the strap *d* and belt *e*, all substantially as described.

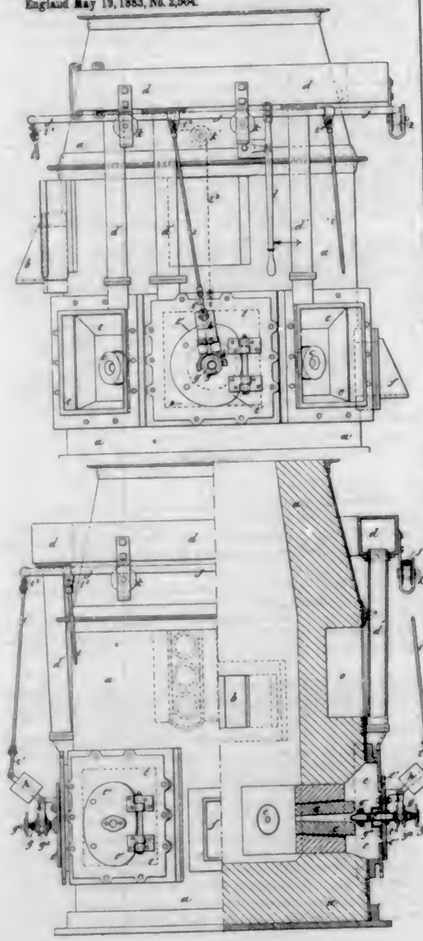
295,544. CONVERTER. THOMAS GRIFFITHS, Abergavenny, County of Monmouth, England. Filed Oct. 15, 1883. (No model.) Patented in England Mar. 22, 1883, No. 1,509.

Claim.—1. The combination, in a converter having tuyeres and air-chambers arranged at the outer end of the tuyeres, of laterally-sliding valves or covers for opening and closing the tuyeres, having axes extending through the side or cover of the wind-boxes, with actuating mechanism connected to the several axes for turning the same to cause the simultaneous operation of the valves, substantially as and for the purpose described.

2. The combination, with a converter having tuyeres and external air-chambers, of sliding valve or cover *g*, axis *g'*, lever *g³*, chains *j j*, weights

j⁷ g⁴, guide-rollers *k*, and lever *l*, substantially as herein shown and described, and for the purpose stated.

3. The combination, in a converter having tuyeres and external air-chambers surrounding the tuyeres, of a laterally-sliding valve for closing the tuyeres, and an independent axially-moving stem extending through the cover or side of the air-chamber for forcing and holding the valve tightly to its seat, substantially as and for the purposes set forth.



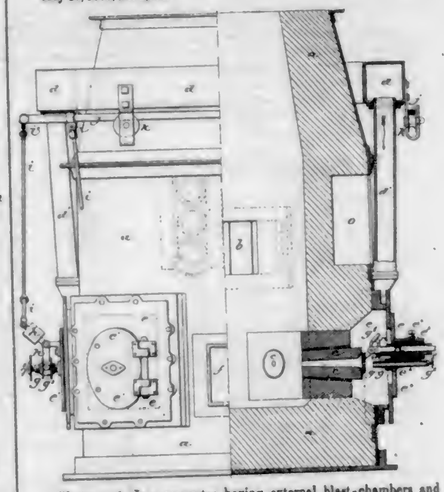
4. The combination, in a converter having tuyeres and external air-chambers, of the tuyere and its perforated valve, with a sight-tube extending through the door or side of the air-chamber, substantially as and for the purposes described.

5. The combination of the tuyere and its perforated sliding valve with a screwed sight-tube constructed to force the valve to its seat, substantially as and for the purposes described.

6. The combination, in a converter, of the tuyere-blocks *i*, tuyeres *c*, of greater length than the blocks, and provided with lateral openings connecting with the air or blast chambers *s*, and valves situated in the chamber for closing the tuyeres, substantially as and for the purposes described.

7. The combination, in a converter having tuyeres and external air-chambers, of a laterally-sliding valve arranged in the air-chambers for closing the tuyeres, each having an axis, with a weighted radial lever connected to the axis for turning it to open the valve, and means for closing the valves simultaneously, substantially as and for the purposes described.

295,545. CONVERTER. THOMAS GRIFFITHS, Abergavenny, County of Monmouth, England. Filed Nov. 3, 1883. (No model.) Patented in England May 19, 1883, No. 2,504.



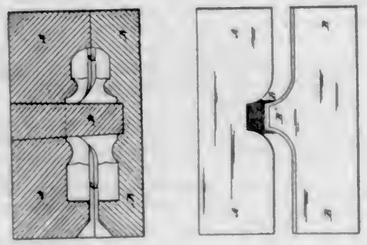
Claim.—1. The combination of stem or tube *g*, plug or stopper *g'*, grooved collar *g²*, and weighted clutch-lever *h*, connected to the rod *j*, by which all the plugs or stoppers *g'* are simultaneously operated, substantially as herein shown and described, and for the purpose stated.

2. In a converter having blast-chambers and tuyeres, the combination of the axially-moving tube *g** and stem or tube *g* with a plug or stopper *g'*, and means for adjusting the stem or tube *g* with relation to the tube *g** and to the tuyere, substantially as and for the purposes described.

3. In a converter having external air-chambers, the combination of the tuyere with its plug or stopper and one or more small grooves in their meeting faces, to admit a small stream of air to the tuyere when the valve is closed, substantially as and for the purposes described.

4. In a converter having external blast-chambers, the combination of the tuyeres and their plugs or stoppers with sliding stems for operating said plugs or stoppers from the outside of the chamber, weighted crank-levers for operating the stems in one direction, and mechanism for operating them simultaneously in the other, substantially as and for the purposes described.

295,546. CONVERTER EMPLOYED IN THE MANUFACTURE OF IRON AND STEEL. THOMAS GRIFFITHS, Abergavenny, County of Monmouth, England. Filed Jan. 28, 1884. (No model.) Patented in England May 19, 1883, No. 2,504.

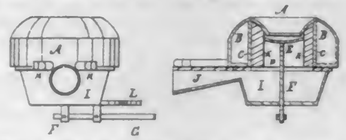


Claim.—1. In a converter having external blast-chambers and tuyeres, the combination of a hinged weighted tuyere, valve, or cover, *g'*, with a rod or pusher, *n*, grooved collar *g²*, and weighted lever *h* for operating the same, substantially as herein shown and described.

2. In a converter having external blast-chambers and tuyeres, the combination of a hinged tuyere, valve, or cover, *g'*, rod or pusher *n*, link *g³*, collar *g²*, and tube *g*, substantially as herein shown and described.

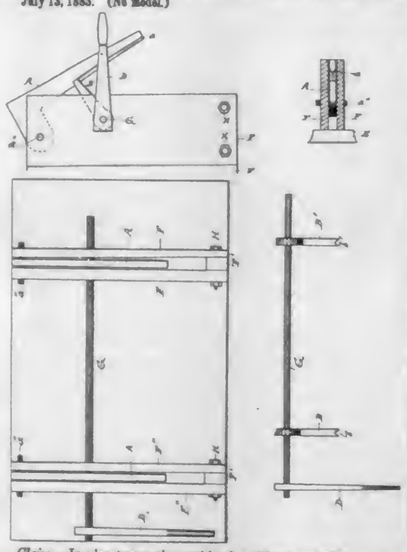
3. In a converter having external blast-chambers, the combination of the tuyeres, with hinged tuyere covers or valves arranged in said blast-chambers and operated from the outside by means of a sliding stem, tube, or pusher, substantially as and for the purposes described.

295,547. DIE FOR FORGING HAMMERS. HENRY HAMMOND, Hartford, Conn. Filed June 13, 1881. Renewed Oct. 1, 1883. (Model.)



Claim.—1. The finishing-die A B, having the joint between the upper and lower parts of the form shown and described, whereby the line of junction passes along the middle portion of the ends of the hammer, and thence curves outward to the top of the eye, substantially as described.

2. In a finishing-die for hammers, of the form shown and described, the combination of the mandrel D upon one part of the die with the buttresses B' upon the other part, both extending the full length of the eye, substantially as described.



3. The die A B, of the form shown and described, having the freed portions C, jointly with the die E F, of the form shown and described, having the freed portions G at right angles to those at C, substantially as set forth.

295,548. TUYERE. JACOB F. HARLY, Kipton Station, assignor to William K. Burton, Elyria, Ohio. Filed Aug. 6, 1883. (No model.)

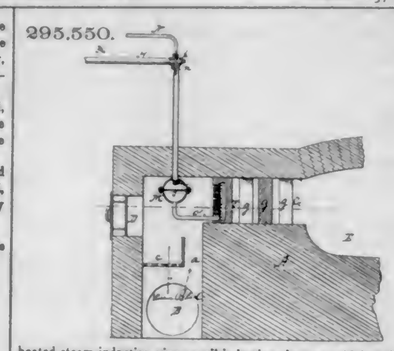
Claim.—A tuyere-iron constructed with a water-chamber, B, throat D, ash-box I, valve E, and pipes H and J, in combination with the lugs K, attached to the walls of the throat or passage-way D, and straight stem F, and lever G, operating the valve E, all as above set forth, and substantially as described.

295,549. LOG-TURNER. SAMUEL T. HAVILAND, Jamison, Ala. Filed July 13, 1883. (No model.)

Claim.—In a log-turner, the combination of the frames F F', mounted upon a suitable base, the arms A, having an elbow pivoted to said frames and provided with V-shaped slides *a*, the arms B B', secured to said shaft and having notches *b b'*, and the shaft G, mounted in the said frames and having a handle, D, as described, and for the purposes set forth.

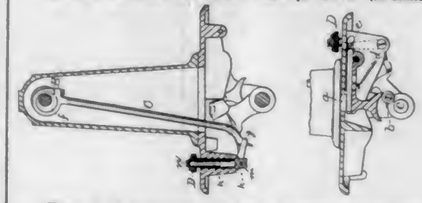
295,550. PROCESS OF AND APPARATUS FOR VAPORIZING HYDROCARBON OILS. HENRY F. HAYDEN, Washington, D. C. Filed Aug. 30, 1883. (No model.)

Claim.—1. The method herein described for generating hydrocarbon vapors for immediate use as fuel and for like purposes, which consists in combining superheated steam and hydrocarbon oils under gradually-increasing pressure and heat, together with rapid and continuous expansion and compression, and conducting off the vapors from the combining-chamber in the direction of gravity and pressure, substantially as and for the purposes specified.



2. In apparatus for combining hydrocarbon oils and superheated steam for generating combustible vapors, the combination of a superheated-steam-induction pipe, an oil-induction pipe, a combining-chamber divided by a perforated diaphragm, the steam and oil pipes entering the combining-chamber above the diaphragm, and a vapor-eduction pipe so arranged with relation to the induction-pipes and combining-chamber that the vapors shall escape by gravity as well as pressure, substantially as and for the purposes specified.

3. In an apparatus for combining hydrocarbon oils and steam for generating combustible vapors, the combination of the superheated-steam-induction pipe, the oil-pipe delivering thereinto, the combining-chamber divided into two compartments by a perforated or a reticulated diaphragm, and a vapor-eduction pipe leading from the lower compartment of the combining-chamber, substantially as and for the purposes specified.



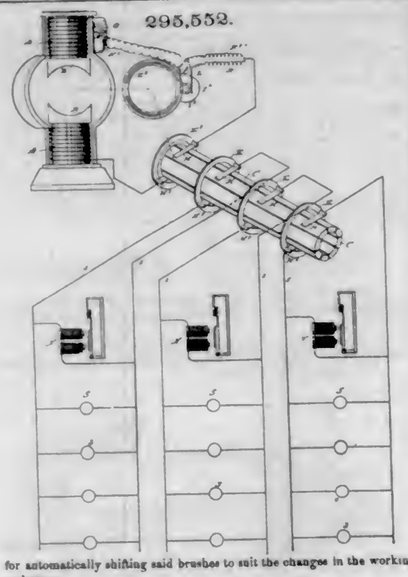
4. The combining-chamber composed of the longitudinal flanged separable sections and the interposed centrally-arranged perforated or reticulated diaphragm, substantially as and for the purposes specified.

5. The combination of a combining-chamber having a central perforated diaphragm, with oil and steam pipes delivering thereinto above the diaphragm, and eduction-pipes leading from the opposite side of the diaphragm to a series of burners, said combining-chamber being arranged in the air-well of the furnace, with a series of vertically-arranged hollow perforated burners, which deliver against the combining-chamber and toward the air-well, substantially as and for the purposes specified.

295,550.

295,551. FEEDING MECHANISM FOR SEWING-MACHINES. C. WALLACE HEALEY, Marlborough, N. H., assignor to the Companion Sewing Machine Company, New Britain, Conn. Filed Sept. 10, 1883. (No model.)

Claim.—1. In combination with feeding mechanism and the rock-shaft which drives it, having the arm *g*, mechanism for raising and lowering the end of the shaft which carries said arm, and the reciprocating rod for acting upon said arm, substantially as described, and for the purpose specified.



2. The combination of feeding mechanism and rock-shaft A, having arm *g*, the reciprocating rod C, for acting upon said arm, the block *k*, carrying one end of the rock-shaft, and the adjusting-screw *d*, for raising and lowering said block, substantially as described, and for the purpose specified.

295,552. APPARATUS FOR REGULATING AND DISTRIBUTING CURRENTS FROM DYNAMO-ELECTRIC MACHINES. WILLIAM HOCHHAUSEN, New York, N. Y. Filed May 4, 1883. (No model.)

Claim.—1. The combination, with a dynamo-electric machine whose field-magnetism is sustained by a derived-circuit current from the armature, and is automatically corrected, by any suitable means, to suit any change in the external or working circuit, so as to remain constant, of an automatic regulator for adjusting the current in such working-circuit to any changed resistance therein.

2. The combination, in a dynamo-electric machine having a commutator provided with two sets of brushes, of a field-magnet supplied with current from one set of brushes, means for automatically adjusting said brushes so as to correct any changes in the magnetic force induced by the current from said brushes, and keep the magnetism constant, an exterior working-circuit supplied from the other set of brushes, and means

295,552.

for automatically shifting said brushes to suit the changes in the working resistance.

3. The combination, with a dynamo-electric machine, of two supply-conductors connected in multiple arc from the armature, one including the field-magnets and the other a working resistance or resistances, means for compensating for changes in the distribution of current consequent upon changes in the working resistance, so as to keep the field constant, and regulating devices for adjusting the current supplied to the exterior circuit to suit the changes of resistance on such circuit.

4. The combination, with a dynamo-machine whose field-magnet coils are in a derived circuit, of means for automatically regulating the current flowing around the field-magnet, so as to correct any changes of magnetism produced by changes in the external or working circuit or circuits, and thus keep the magnetism constant, and an external or working circuit provided with independent regulating devices for regulating the current to suit the changes in the external resistance.

5. The combination, with a dynamo-electric machine having its field-magnetism maintained by a current derived from the armature, of means for automatically regulating the magnetizing-current, so as to correct the field-magnetism and keep it constant, despite any tendencies to variation due to variation in distribution of current in the derived circuit supplying the field and the main or working circuit, and an automatic regulator for adjusting the current in the main or working circuit to any change of working resistance.

6. The combination, with a dynamo-electric machine, of two or more sets of commutator-brushes bearing on the same commutator-cylinder, each set supplying a separate or independent circuit, and independent means for automatically adjusting said brushes.

7. The combination, with the same commutator-cylinder for a dynamo-electric machine, of two or more sets of independently-adjustable commutator-brushes, each set supplying an independent circuit.

8. The combination, with a dynamo-electric machine, of two or more working-circuits, each connected with an independent set of commutator-brushes bearing on the same commutator-cylinder, and means for automatically shifting a set of brushes in accordance with changes in the working resistance with which such set is connected.

9. The combination, with a dynamo-electric machine, of several sets of commutator-brushes bearing on the same commutator-cylinder, and means for automatically adjusting said sets of brushes independently of one another, according to changes in the resistance of their respective circuits.

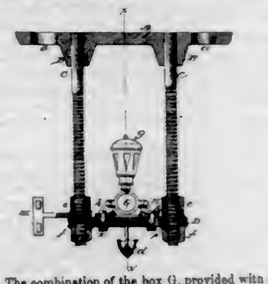
10. The combination, with the commutator-cylinder, of a set of commutator-brushes mounted on a ring encircling said cylinder, and supported on friction-wheels, as and for the purpose described.

11. The combination, with the ordinary commutator-brush, of auxiliary sets of brushes mounted on independent ring or wheel supports encircling the commutator-cylinder, as and for the purpose described.

12. The combination, with a dynamo-electric machine, of two or more sets of auxiliary commutator-brushes independently adjustable, each set supplying a separate multiple-arc circuit, and a governing electro-magnet for said adjustable brushes placed in a multiple-arc branch, substantially as and for the purpose described.

13. The combination, with a dynamo-electric machine, whose field-magnetism is maintained by a local circuit from the commutator-brushes, of two or more auxiliary sets of commutator-brushes independently adjustable, each set supplying a multiple-arc circuit, and a governing electro-magnet for an auxiliary set of brushes placed in one of the multiple-arc branches.

14. The combination, with a dynamo-electric machine having its field-magnetism maintained by a local closed circuit from the commutator-brushes, of means for automatically adjusting said brushes controlled by the magnetism induced by the current in such local circuit, one or more exterior multiple-arc working-circuits, each connected to one set of a series of auxiliary adjustable commutator-brushes, and means for automatically adjusting said auxiliary sets controlled by electro-magnets in one of the several multiple-arc branches for the respective working-circuits.



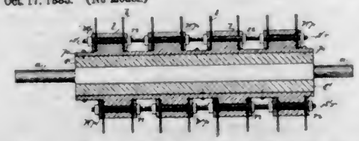
15. The combination, with the commutator for a dynamo-electric machine, of one or more auxiliary commutator-brush supports, E, consisting of rings encircling, but out of contact with, the commutator-cylinder mounted on rollers F F^2 F^3, and encircling the commutator-cylinder.

16. The combination, with the commutator-brush supports E, of the guide and supporting rollers F F^2 F^3, substantially as described.

17. The combination, with the adjusting or regulating mechanism for a dynamo-machine, of an operating lever or handle moving over a scale graduated to candle-power of the electric lamps, whose current is governed by such regulating mechanism.

18. The combination, with the retractile spring for the regulator of a dynamo-machine, of an adjusting device, and a scale over which such device moves, graduated to candle-power.

295,553. HANGER FOR SHAFTING. JOSEPH E. HOPPER, Newark, N. J. Filed Oct. 10, 1882. (No model.)



Claim.—1. The combination of the box G, provided with a convex bottom, and the plate D, provided with the concave seat held in adjustment by bolts *h h*, substantially as and for the purpose herein described.

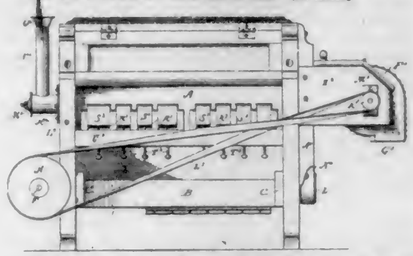
2. The combination of the plate H and its bolts A and the plate D, provided with the slots for the engagement of said bolts, substantially as herein described.

3. The combination of the rods C, plate D, provided with the slot *j*, and the set-screws K K, as shown and described, for the purpose specified.

295,554. HOMINY-MILL. THEODORE HUDNUT, Terre Haute, Ind. Filed Oct. 17, 1883. (No model.)

Claim.—1. The wooden cylinder C, having square sides and mounted on axis *a*, the metal plates *p*, adapted to be secured to the squared sides of the cylinder, and provided with lugs *l*, integral with the plates, and set at such distances apart as to break a continuous spiral from one end of the cylinder to the other, all combined substantially as described.

2. The wooden cylinder C, having squared sides and mounted on axis *a*, the metal plates *p*, provided with lugs *l*, integral with the plates, adapted to be secured to the sides of the cylinder, and balancing devices secured at the corners of the cylinder, all combined substantially as described.



3. The plate *p* with lugs *l*, adapted to receive the rod *sr*, in combination with such rod and set-nuts *n*, substantially as described.

4. The plate *p* with lugs *l*, adapted to receive the rod *sr*, in combination with such rod, the set-nuts *n*, washer-plates *wp*, and blades *b*, substantially as described.

5. The cylinder C, mounted on axis *a*, the plates *p*, having lugs *l*, the rods *rr*, set nuts *n*, and blades *b*, all combined substantially as described.

6. The cylinder C, mounted on axis *a*, having plates *p*, provided with lugs *l*, the rods *rr*, passing through said lugs, the set-nuts *n*, washer-plates *wp*, and blades *b*, with open slots, all combined substantially as described.

295,555. BOLT FOR PURIFYING MIDDLINGS, &c. OLIVER PERRY HERFORD, Oakdale, Nebr. Filed Apr. 19, 1883. (No model.)

Claim.—1. In a rotary bolt, the combination of a reel mounted upon tubular gudgeons, cross-bars at the inner ends of said gudgeons, a shaft mounted securely in said cross-bars, and brushes mounted pivotally upon said shaft, said brushes consisting, essentially, of frames weighted at their lower ends and having vertically-adjustable brushes at their upper ends, substantially as and for the purpose set forth.

2. In a rotary bolt, the combination of the reel mounted upon tubular gudgeons, means for feeding the reel through the gudgeon at the upper end of the same, radial wings or scatterers upon the inside of the reel at the upper end of the same, and a suction-fan arranged outside and connected with the gudgeon at the lower end of the reel, as set forth.

3. The combination of the bolting-chest, the cylindrical ring or band upon the inner side of the lower end of the same, and the reel, the lower end of which is fitted within the said ring or band, substantially as and for the purpose set forth.

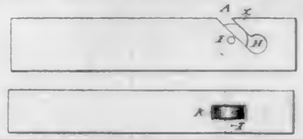
4. The combination of the bolting-chest, the reel hung in the same upon tubular gudgeons, the openings in the lower head of the reel beveled down to the edge of the latter, the ring or band upon the inside of the lower end of the chest surrounding the lower head of the reel, the slanting chute at the lower end of said ring or band, and the drop-valve, all arranged and operating substantially as set forth.

5. The combination of the bolting-chest, the reel, tubular gudgeons for said reel, a spider formed at the outer end of the lower gudgeon and having a spindle or journal, a box or casing secured at the lower end of the chest and having an opening into which the lower gudgeon of the reel extends, and a cross-bar upon the inner side of said opening forming a bearing for the spindle upon the lower gudgeon of the reel, as set forth.

6. The combination of the bolting-chest, the reel, tubular gudgeons for said reel, means for feeding the reel through the gudgeon at its upper end, radial wings or scatterers upon the inside of the reel at its upper end, a box or casing secured on vertical bars or brackets upon the lower end of the chest and having an opening into which the gudgeon at the lower end of the reel projects, the fan-case arranged in said box or casing, and the fan journaled transversely in the sides of the box or casing, as set forth.

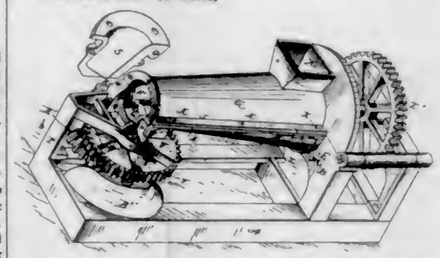
7. The combination of the chest, the vents, the transverse partitions, the deflector, the reel hung upon tubular gudgeons, openings in the lower head of the reel, a band encircling the said lower end, a chute and a valve, as described, means for feeding the reel through the gudgeon at its upper end, and a suction-fan connected with the tubular gudgeon at the lower end of the reel, substantially as set forth.

8. The combination of the bolting-chest, the conveyer-shaft arranged longitudinally in the trough at the bottom of said chest, the reel mounted in the chest upon tubular gudgeons, the lower one of which extends through the casing and is formed with a spindle, a box mounted on vertical bars or brackets at the lower end of the chest and having a bearing for said spindle, a band-wheel on the lower end of the conveyer-shaft, a belt connecting the said band-wheel with the lower gudgeon, and suitable operating mechanism, all arranged and operating substantially as set forth.



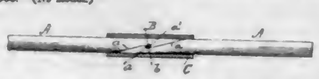
295,556. BLASTING-BARREL. GEORGE A. INGRAM, Plymouth, Pa. Filed Jan. 10, 1884. (No model.)

Claim.—1. A blasting-barrel provided with one or more perforations or slots, the latter having their upper edges beveled or formed countersunk, so that the powder may rest within and protrude a short distance through the perforations, for the purpose set forth.



2. As an improved article of manufacture, a blasting-barrel perforated or slotted at one end, and having said end provided with a plug or cap formed with a perforation or opening, said plug or cap being removable, as desired, for the purpose set forth.

295,557. TAG. MATTHEW WHEELER KASE and JAMES DE WITT KASE, Danville, Pa. Filed Nov. 7, 1883. (No model.)



Claim.—The herein-described rotary rubber disk, applied in combination with a slotted tag, and pivoted in such slot, all substantially as set forth.

295,558. BRICK-MACHINE. PHILIP HENRY KELLS, Adrian, Mich. Filed Oct. 18, 1883. (No model.)

Claim.—In a brick-machine, the combination, with the tapering conical horizontal tempering-chamber G, provided with the nose-piece S, and rotary knives for feeding the clay to the discharge, of the mold-wheel arranged horizontally beneath the discharge-opening, provided with molds having bottom flanges to support the plungers, the plungers provided with downwardly-projecting bearings carrying friction-rollers, and a cam-track out of line with the discharge-opening, on which the friction-rollers travel to operate the plungers to expel the brick, and upon which they descend to permit the molds to be filled at the proper time, and mechanism for operating the parts, substantially as specified.

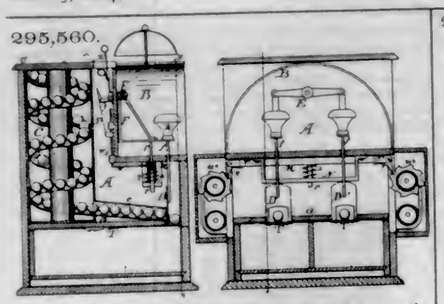
295,559. COUPLING FOR ELECTRIC WIRES. GEORGE L. KITSON, Philadelphia, Pa., assignor to William J. Philips, same place. Filed Aug. 15, 1883. (No model.)

Claim.—1. A coupling for electric wires, comprising overlapping wire ends with transverse opening or seat in the line of their junction, a sleeve with transverse opening, and a key passing through the latter and said junction-opening, substantially as shown and described.

2. A coupling for electric wires, comprising overlapping wire or conductor ends and a surrounding sleeve having a transverse opening or way for a key, which locks said parts together, substantially as shown and described.

3. In a coupling for electric wires, the combination of beveled or overlapping ends of wires A A, having transverse opening *b*, the sleeve C, with registering opening *c*, and a key, B, substantially as shown and described.

4. The combination of wires A A, having double-inclined ends *a a*, with intervening shoulders, *a' a'*, and opening *b*, the sleeve C, with registering opening *c*, and key B, substantially as shown and described.



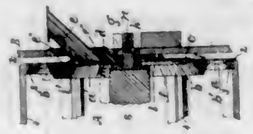
5. The combination of wires A A, having beveled ends, with opening *b*, sleeve C, with opening *c*, and key B, said parts being surface-soldered before coupled together, substantially as shown and described.

6. In a coupling for electric wires, the combination of two uniting-wires having an opening in the line of their junction, a surrounding sleeve with registering opening, and a key for locking said parts together, as set forth.

295,560. BALLOT-BOX. JOSEPH KLINGER, Cleveland, Ohio. Filed Jan. 24, 1884. (No model.)

Claim.—1. In a ballot-box, the combination, with the two cylinders C C, having spiral chambers terminating with discharge-spouts *c c*, of the mechanism constructed and arranged to eject and deposit one ball

295,560.



at a time, and the mechanism constructed and arranged to operate the register, and a mechanism constructed and arranged to operate the bell-signal simultaneously, as described.

2. The pivoted balance-lever E, brackets F F', supporting the rods *f f*, provided with the knobs *k k*, and carrying the gates D D', in combination with the spouts *c c* of said cylinders C C, and the traps T T, operating to eject and deposit the balls, substantially in the manner and for the purpose specified.

3. The combination, with the balance-lever E, brackets F F', and rods *f f*, provided with knobs *k k*, and carrying gates D D', of the lever M, hung in the slotted frame N, and provided with pin *p* and spring *s*, and the dog *v*, for operating the registering device, substantially as and for the purpose specified.

4. The combination, with the balance-lever E, brackets F F', and rods *f f*, provided with knobs *k k*, of the lever M, hung in the slotted frame N, and provided with pin *p* and spring *s*, and the arm W, sliding in sockets W^3, and provided with spring-catch y^3, operating the bell-hammer *r*, for sounding the bell-signal, substantially as and for the purpose specified.

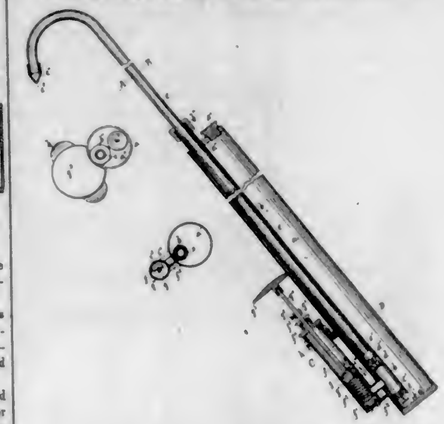
295,561. BOLTING-CHEST. LAWRENCE B. KOHNLE and WILLIAM B. HAMILTON, Lima, Ohio, assignors to James Irvine, same place. Filed Oct. 25, 1883. (No model.)

Claim.—1. In a reel-head, the combination of a ring or annulus, a stationary disk within the same, an opening in said disk, and a feed-spout extending through said opening, with means for closing the latter in adjusting the reel-head.

2. In a bolting-chest, the combination of a reel-head with a revolvable annulus, a non-revolvable disk, a sleeve-opening in said disk, and a feed-spout of less vertical diameter than the opening in said sleeve extending from the head-boards of the chest through the latter, with flanges extending therefrom covering said opening, to provide for the adjustment of the reel-head, as set forth.

3. In a bolting-chest, the combination of a feed-spout, an adjustable reel, and a reel-head, a non-revolvable central circular section provided with a short sleeve extending outward therefrom to adapt it for the insertion of the feed-spout, the opening in said sleeve being of greater vertical diameter than said feed-spout, to allow of the adjustment of the reel-head, irrespective of the latter.

4. In a reel-head, a revolvable section, *a*, annulus *f*, projecting inwardly therefrom, and an inner flange, *a'*, in combination with a fixed section, *b*, sleeve *d*, opening therein, semicircular ledge *l*, block A, and ring *c* with rabbet *i'*, adapted to be bolted to section *a* over the edge of section *b* to form a groove for the latter, as and for the purpose set forth.



5. In a bolting-chest, a feed-spout, *e*, with upper and lower flanges, *e''*, in combination with the reel-head A, constructed as described, and adapted for adjustment vertically over said spout, as set forth.

6. In a reel-head, A, constructed as described, the combination, with section *b*, and flange *i*, projecting therefrom, of the wooden block *h*, substantially as and for the purpose set forth.

7. The combination, with the shafts *n* and concentric disk-shaped metal section *b*, having the projecting flange *i*, of the wooden block A, as and for the purpose hereinbefore set forth.

8. In a reel-head, the combination of flange 2, rib *b'*, extending at right angles inward therefrom, and head-bands 3, as and for the purpose hereinbefore set forth.

295,562. OIL-EJECTOR. GEORGE F. LAWRENCE and ALEXANDER MCDONALD, Worcester, Mass. Filed Jan. 7, 1884. (No model.)

Claim.—1. In an oil-ejector, the oil-reservoir *a*, valve-pipe *b*, with its valves *c' d'*, valve-seats *c d*, and extension-pipe *e*, having discharge-nozzle d'' e^2, combined with a pump to draw the liquid from reservoir *a* and to force it out through the delivery and discharge pipe, as and for the purpose set forth.

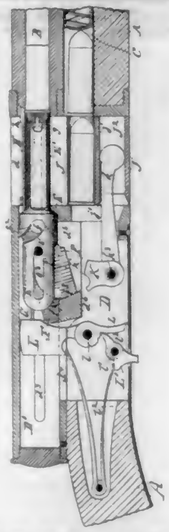
2. An oil-ejector consisting, essentially, of a reservoir, *a*, a valve-pipe, *b*, having valves *c' d'*, extension-pipe *e*, and a pump or pressure device, as and for the purpose set forth.

3. In an oil-ejector, the reservoir *a*, with inclosed valve-pipe *b* and valves *c' d'*, extension-pipe *e*, with discharge-nozzle d'' e^2, combined with a pump or pressure device arranged on the outside of said reservoir *a*, as and for the purpose set forth.

4. In an oil-ejector having reservoir, valve-pipe, and extension discharge-pipe, as described, the pump *e*, with its coiled spring f^4 and handle A, piston *g*, with its self-closing valve *i*, and piston-rod *g''*, having upper handle, g^2, and adjustable collar g^4, as and for the purpose set forth.

295,563. MAGAZINE FOR FIRE-ARMS. JAMES P. LEE and LOUIS P. DUBE, Ilion, N. Y., assignors to E. Remington & Sons, same place. Filed Jan. 9, 1884. (No model.)

Claim.—1. A cartridge or magazine box of the form or character substantially such as shown, composed of thin sheet metal or similar material and having its sides corrugated or indented, substantially as shown and described.



2. In a magazine for fire-arms, the combination of the box A and the spring-arm *b*, said parts being arranged to operate substantially as shown and described, whereby the spring-arm is adapted to be swung across the open end or mouth of the box to hold the cartridges therein, and when released to automatically assume a position directly over and parallel with the wall of the box, out of the way of the escaping cartridges, as set forth.

3. In combination with the box A, the spring *b*, secured to one wall of the box and having its free end provided with a hook, *c*, arranged to engage with the opposite side, substantially as and for the purpose set forth.

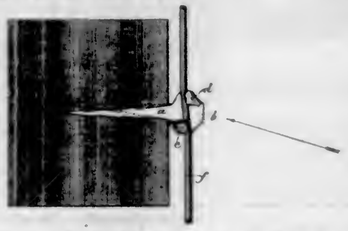
4. In combination with the box A, having the hole *d* and indentation *f* formed in one of its walls, the spring-arm *b*, secured to its opposite wall and provided with a hook, *c*, arranged to engage with said indented portion, substantially as and for the purpose set forth.

295,564. MAGAZINE FIRE-ARM. JULIUS LEHMANN, St. Louis, Mo., assignor of one-half to John C. Fischer, same place. Filed Nov. 30, 1883. (No model.)

295,564.

Claim.—1. In a fire-arm, the combination, with the breech-chamber D and hollow cylinder D', having side slots, d^3, of the breech-block E, having side slots at e^3, the transverse pin i' on a side bar, I', connected to a hand-slide, I, fitted to reciprocate along the stock of the arm, by means whereof the said breech-block can be made to slide longitudinally backward and forward, substantially as and for the purposes set forth.

2. In a fire-arm, the combination, with the breech-chamber D, having shoulder at d^2, and hollow cylinder D', having side slot, d^3, of the breech-block E, consisting of side arms, e e', having diagonal slots e^3 and opposite side slots, e^3, the lock-piece F, having journals f, curved slot at f^2, and shoulder at f^3, and the reciprocating hand-slide I, with its connecting mechanism, to operate the said breech-block and lock-piece, in the manner and for the purposes set forth.



3. In a magazine fire-arm, the combination, with the breech-chamber D, hollow cylinder D', having side slot, d^3, of the breech-block E, its plunger E', carrying the extractor H, the said breech-block having opposite side slots, e^3, in which the transverse pin of the side bar, I', connects the breech-block and its said parts to a hand-slide, I, fitted to reciprocate along the magazine, barrel, or stock of the gun, by means whereof, at the same time that the breech-block is moved backward, the extractor withdraws the empty shell of cartridge.

4. In a magazine fire-arm, the combination, with the breech-chamber D, having shoulder at d^2, hollow cylinder D', having longitudinal slot d^4, of the breech-block E, forming part of which is the plunger E', extractor H, said breech-block consisting of side arms, e e', having diagonal slots at e^3, and opposite side slots, e^3, the lock-piece F, journaled in the breech-block and having the groove f'', curved slot f^2, shoulder at f^3, the needle-bar G, the hammer and trigger, the elbow-lever and elevator, and the hand-slide mechanism, having shoulder at k^2, by means whereof the complete backward pull or motion imparted to said hand-slide unlocks the breech, cocks the hammer, extracts and throws out the empty shell of cartridge, and lifts a new cartridge in line of the bore of the firing-chamber.

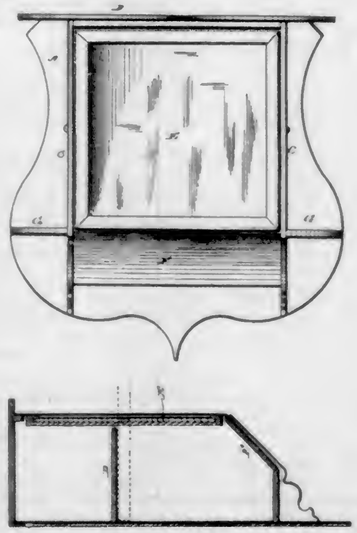
5. In a magazine fire-arm, the combination, with the breech-chamber D, having shoulder at d^2, hollow cylinder D', having longitudinal slot d^3, of the breech-block E, plunger E', carrying the extractor H, said breech-block consisting of the side arms, e e', having diagonal slots e^3 and opposite side slots, e^3, the lock-piece F, having journals f, curved slot f^2, shoulder at f^3, and groove f'', in which the needle-bar or percussion-stem G is seated, its forward end extending through the bore of the plunger, the hammer and trigger, the elbow-lever and elevator, and the hand-slide mechanism, having the shoulder at k^2, by means whereof the complete forward motion imparted to said hand-slide moves the breech-block and its said parts forward, thrusts the previously-elevated cartridge into the bore of the firing-chamber, locks the breech, thrusts the elevator downward, and loads the arm preparatory to its being fired or discharged.

6. In a magazine fire-arm having breech-chambers D D', with longitudinal slots d^3, shoulder at d^2, the combination of the longitudinally-moving breech-block and plunger E E', the former consisting of the side arms, e e', having diagonal slots e^3 and opposite side slots, e^3, its lock-piece F, having journals f, groove f'', curved slot f^2, and shoulder at f^3, the needle bar or stem G, with extractor H, said parts arranged within and carried by said moving breech-block, the U-shaped hand-slide capable of reciprocation, and connected by its side bar, I', and transverse pin i', to said moving breech-block and its parts, the side bar of hand-slide further having shoulders at k^2 k^3, in operative relationship to the elbow-lever K, having arms k k', the elevator J, having subdivided chambers J' J², and the further hammer and trigger parts, all operating substantially as described.

295,565. FENCE-WIRE FASTENING. EDWIN S. LENOX, Worcester, Mass. Filed June 4, 1883. (No model.)

Claim.—The fastening for fence-wire having a spike portion to be driven into the post, the studs c d on the side of the head portion, and inclined in opposite directions and at a sufficient distance apart longitudinally of the wire to allow such wire to be introduced between the studs when at an inclination to the fastening, substantially as set forth.

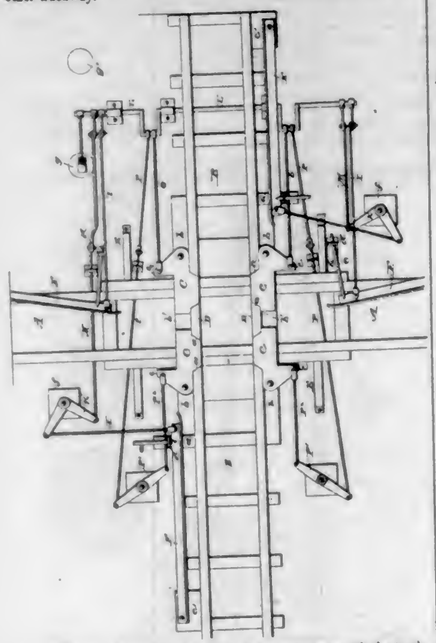
295,566. FENCE-WIRE FASTENING. EDWIN S. LENOX, Worcester, Mass. Filed June 4, 1883. (No model.)



Claim.—1. A fastening for fence-wire, made of metal and having a V-shaped slot and lips, and one or more holes through the same for the nails or staples employed for attaching the fastening to the posts, substantially as set forth.

2. The fastening for fence-wire, composed of sheet metal with two V-shaped slots, folded and perforated for the reception of the attaching staple or rails, substantially as set forth.

3. The fastening for fence-wires, composed of sheet metal with two V-shaped slots with lips and perforations, in combination with the staple passing through sheet metal, and the parts galvanized, as set forth.



295,567. TOILET-BRACKET. CHAS. LINDNER, Carlinville, Ill. Filed June 18, 1883. (No model.)

Claim.—In a toilet-bracket case, the combination of the case A, horizontal shelf D, bracket-shelves G G, and pivoted glass E, substantially as described, whereby the glass is raised to a vertical position or dropped to a horizontal position to open and close the case, all constructed, arranged, and operating as and for the purposes set forth.

295,568. RAILROAD-CROSSING. DAVID LEPPY, Mansfield, Ohio. Filed May 19, 1883. (No model.)

Brief.—An automatic frog composed of horizontally-movable rail-sections operated by horizontally-movable bars adapted to lie diagonally across the rails of one trackway and on one side of the rails of the other trackway.

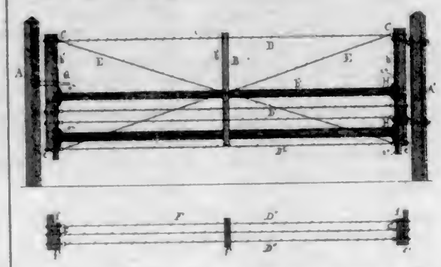
Claim.—1. In a railroad-crossing, the combination, with the trackways A and B and horizontally-movable rail-sections, of horizontally-movable bars, two of which are adapted to lie diagonally across the rails of one trackway, while the other two rails lie to one side of the rails of the other trackway, and devices connecting the said bars, whereby the movable rail-sections are operated, substantially as set forth.

2. The combination, with the trackways A and B and cross-rails, the adjacent ends of the rails of the trackway B and cross-rails being beveled, of the horizontally-movable rail-sections, provided with the beveled surfaces a and an outwardly-extending arm, c, and devices for automatically operating said movable sections on the approach of a train, substantially as set forth.

3. The combination, with the trackways A and B, the cross-rails, and the bases b and b', the adjacent ends of the rails of the trackway B and the cross-rails being beveled, of the movable rail-sections, provided with the beveled surfaces a, and devices for automatically operating the movable rail-sections on the approach of a train, substantially as set forth.

4. The combination, with the trackways A and B, cross-rails, and horizontally-movable rail-sections, of the pivoted bars F, the inner or adjacent ends of which move on suitable stands situated in the same horizontal planes with the rails of the trackways, substantially as set forth.

5. The combination, with the trackways A and B, cross-rails, and movable rail-sections, of the bars F, provided with guide-rods, standards, each provided with a slot for the passage of its respective guide-rod, and devices connecting the bars F and movable rail-sections, substantially as set forth.



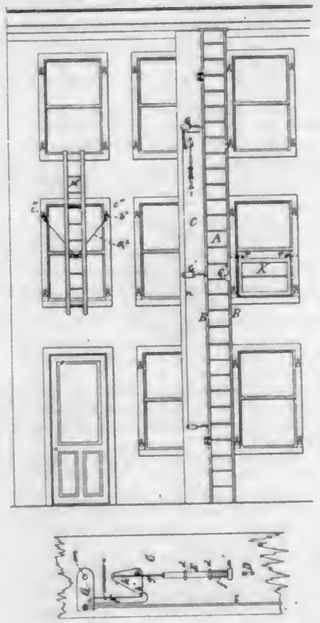
6. The combination, with the trackways A and B, the cross-rails, movable rail-sections, and bars F, of the rock or crank shaft connected indirectly to the bars F, and also to the movable rail-sections, for the purpose of moving the parts simultaneously, substantially as set forth.

7. The combination, with the trackways A and B, cross-rails, and movable rail-sections, of the bars F, crank-shaft, and rods connecting the bars F and movable rail-sections to the crank-shaft, substantially as set forth.

8. The combination, with the trackways A and B, cross-rails, and movable rail-sections, of the bars F, crank-shaft, rods and levers connecting the bars and movable rail-sections to the crank-shaft, and a weighted lever secured to one end of the said shaft, substantially as set forth.

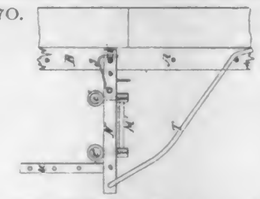
9. The combination, with the trackways A and B, the cross-rails, and movable rail-sections, of the bars F, crank-shaft, and the rods and levers, substantially as shown, whereby the movable rail-sections and bars F are moved simultaneously, substantially as set forth.

295,569. GATE. HENRY HARRISON LOCKLING, Magnolia, Iowa. Filed Sept. 4, 1883. (No model.)



Claim.—1. The frame b b' b^2 b^3, in combination with the continuous wire-strand D D² E E, the latter held loosely to the frame, except at one end, as set forth.

2. The pieces b b' b^2 b^3 and the bolts C, having the eyes c and nuts c', in combination with the continuous strands D E D², as set forth.



3. The section F, consisting of the vertical pieces f' f^2 f^3, horizontal wires D", and the tightening-bolts C, as set forth.

295,570. FIRE-ESCAPE. ABRAHAM W. LOHER, New York, N. Y. Filed Feb. 8, 1883. (No model.)

Brief.—A vertical ladder secured to the wall and provided with a hinged door. Simultaneously with the unlatching of the door by the pull-rod a bolt on the inner side of the door is dropped upon a percussion-cap, sounding an alarm. Hinged platforms are arranged to fold within the window-frame when not in use. A platform is also hooked to an upper rung, and is provided with a short ladder reaching the roof.

295,570.

Claim.—1. The combination, in a fire-escape, of a ladder, A, permanently fixed within a wall-casing, B, provided with the catch G'', and a door hinged to one side of said casing, with a locking device and an alarm device, both arranged upon the inner side of the said hinged door, and means, substantially such as described, for operating said locking device, arranged upon the outer side of said door, and means for protecting said operating device, substantially as described.

2. The combination, with the fixed wall-ladder A, its inclosing-case, and a door hinged to one side thereof, of a locking device, *n* G' G'', and means, substantially such as described, attached to the inner side of the door for connecting said fastening device with an alarm device attached to the inner side of the door, said connection being such that the act of unlocking the door will actuate the alarm, substantially as described.

3. The combination, with the window of a building, of a fixed inclosed wall-ladder, A, and a barred platform, K, hinged to the window-sill in such manner that when raised and fastened to form a window-guard it will prevent access to its hinges, and form a stop to limit the descent of the upper sash to prevent access through the window from the outside, and form the means whereby access is had from the inside of the building to the operating device for opening the ladder-case and giving the alarm.

4. The combination, with the horizontal rows of windows of a building, of the fixed vertical ladder A, a movable horizontal platform, N, provided with means for attachment to the fixed vertical ladder, and a horizontal supplemental ladder carried by said platform and arranged to project horizontally to the windows remote from the ladder A, all substantially as and for the purpose herein set forth.

5. The combination, with the movable platform N, having arms slotted at their inner ends, and having the hooks S, and provided at its outer end with a vertical ladder, *u*, and the braces T, of the fixed vertical wall-ladder A, all constructed and arranged for use substantially as described.

6. The combination of a nipple, D, percussion rod or striker E, spring *f*, dog *h*, hook F, lever G, and a knob or handle, *a*, with the door and inclosing-casing *n* of the fixed vertical ladder A, all substantially as and for the purpose herein set forth.

7. The adjustable platform K, hinged at its lower end to the window-sill, so as to be capable of being placed horizontally, and of vertical adjustment to cover and guard the window, and devices, substantially as described, for locking the said platform in said vertical position, substantially as and for the purpose herein set forth

8. The ladder M', detachable from the platform N, and furnished with chains and hooks, whereby it may be suspended as a scaling-ladder from hooks or pintles adjacent to the window, substantially as and for the purpose herein set forth.

9. The combination, with the platform K, hinged or attached at its lower part, of the pins *r*, saddle M, and block L, substantially as and for the purpose set forth.

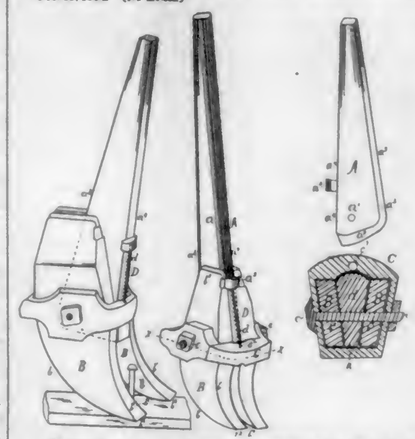
10. The combination, with the platform hinged at its lower part, of the hinges T', attached to the platform, and covered thereby when the platform is in a vertical position, and suitable devices for retaining it in such position, substantially as and for the purpose herein set forth.

11. The combination, in a fire-escape, of a ladder, A, permanently fixed within a wall-casing, B, provided with a catch, G'', and a door hinged to one side of said casing, with a locking device and an alarm device, both arranged upon said door, and means, substantially such as described, whereby said locking device is actuated from the outside of said casing, for the purpose specified.

12. The combination of the movable platform N and the fixed vertical wall-ladder A with devices, substantially such as described, whereby said movable platform is suspended and braced, substantially as described, for the purpose specified.

13. The combination, with an inclosed fixed wall-ladder, A, and a door, C, of a locking device and an alarm device, connected for simultaneous operation, as described, and an outside knob, *a*, of the signal device, also actuating the locking device, substantially as set forth.

14. The combination, in a fire-escape, of the fixed wall-ladder A, the open wall-casing B B therefor, provided with a suitable catch, G'', and a door, C, hinged to one side of said wall-casing, with a locking device and an alarm device, both arranged upon the inner side of the door, and means, substantially such as described, for actuating the locking and the alarm devices from the outside of the inclosing wall-casing, substantially as set forth.



15. The combination, with the fixed wall-ladder A, of a separate attachable platform, N, provided with a vertical ladder, *u*, at its outer end, and suitable means for attaching it to and supporting it upon the rungs of the wall-ladder, the said platform having an opening, *n'*, at its inner end for access from the wall-ladder, substantially as described.

16. The combination, in a fire-escape, of an inclosed fixed wall-ladder, and a door, C, provided on its inner side with a suitable locking device and an outside knob, *a*, for actuating said door-lock, with a barred platform, K, hinged to the window-sill, adapted to form a fixed guard to the window, and means whereby the said outside lock-actuating knob may be reached from the windows, substantially as herein set forth.

17. The combination, with the fixed wall-ladder A, and an open casing, B B, therefor, with the movable platform N, having an opening, *n'*, at its inner end for access thereto from the wall-ladder, means for attaching it to the rungs of the wall-ladder, and a brace or braces, T, hinged to the outer end of said platform, and adapted to be supported against the wall upon the ladder-rung, substantially as described.

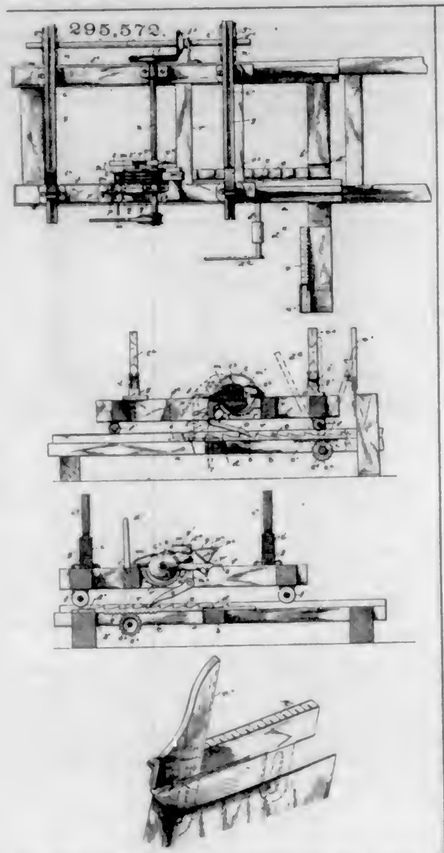
18. The combination of the fixed wall-ladder A, with a platform adapted for attachment thereto, and a supplemental ladder, M', adapted for attachment to said platform, all arranged, as described, to form a fire-escape, substantially as set forth.

295,571. CLAW-BAR. WILLIAM H. LYMAN, Springfield, Mo. Filed Feb. 13, 1884. (No model.)

Claim.—1. An improved claw-bar, composed of a lever, A, having a wedge-shaped lower end, to which are attached movable claws B by means of a yoke or collar, C, and a connecting-bolt, *c*, said yoke being held forward by a spring, D, all substantially as shown and described.

2. A lever for a claw-bar, having its lower end made wedge shape, through which is a hole, *a'*, to receive a connecting-bolt, and above which is a lug, a^3, or other equivalent device for supporting the back end of attached claws, all substantially as shown and described, for the purpose set forth.

3. The combination of movable claws B, attached to the lower end of a lever by means of a collar, C, and bolt *c*, with a spring, D, supported on a guide-rod, *d*, said rod having a free end playing in a hole, c^2, of the collar, all substantially as and for the purpose specified.



295,572. SAW-MILL HEAD-BLOCK. VAN BUREN MARTIN and CHARLES W. METCALFE, Hopkinsville, Ky.; said Martin assignor to W. J. Graham, same place. Filed Jan. 24, 1884. (No model.)

Claim.—1. In a saw-mill carriage, the combination, with the carriage-frame provided with head-block guides, and head-block provided with rack-arms adapted to work in said guides, of a shaft having pinions engaging the head-block, racks geared to a cross-shaft having a ratchet-wheel near one end, a loop-arm provided with a triple pawl engaging the ratchet-wheel, and a pivoted pawl adapted to engage a rack-bar on the track-frame, whereby the head-blocks may be operated automatically by the forward motion of the carriage-frame, to set the log forward any predetermined distance, substantially as specified.

2. In a saw-mill carriage, the combination, with the graduated rule provided with a knee-set adjustably secured thereon, secured to the sawcab, of a carriage-frame provided with head-blocks, having rack-arms working in head-block guides, and mechanism for automatically feeding the head-blocks forward by means of a set-pawl and rack-bar, when the carriage-frame is moved forward, substantially as specified.

3. In a saw-mill carriage, the combination of the ratchet-wheel on the cross-shaft *k*, provided with gearing for operating the head-blocks in

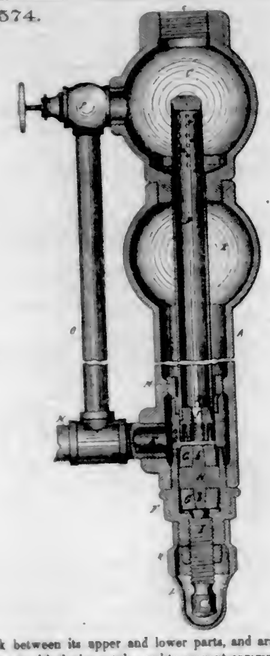
295,572.

their guides, with the triple pawl *m*, face-plates, with loop *p*, connected to the pivoted pawl *o* by an arm, the hinged detent, the double-crank lever, and hook-rod connected thereto, and the rack-bar for engaging the hinged pawl *o*, substantially as specified.

4. In a saw-mill carriage, the combination, with the longitudinal shaft having a miter-gear, and pinions engaging the rack-arms of the head-block, of the cross-shaft having a miter-gear and a ratchet-wheel and a ratchet-lever at the front end of the cross-shaft *k*, the triple lever and hinged detent, and mechanism for throwing the same out of gear, whereby the head-blocks may be moved to their starting-points by operating said ratchet-lever, substantially as specified.

5. In a saw-mill carriage, the combination, with the ratchet-wheel on the cross-shaft *k*, the curved rack and lever on said shaft, provided with the spring-pawl, the triple pawl, the pawl *o*, and pivoted detent, of the double crank and angular rod connected to its arm, and the rack-bar working in guide-boxes on the track-frame, substantially as specified.

295,573. STEAM-TRAP. GEORGE B. MCCRACKEN, Willimantic, Conn. Filed Aug. 27, 1883. (No model.)



Claim.—1. In a steam-trap of the character herein set forth, the seat-disk carrier provided with the two disks, and made reversible in its holder, substantially as and for the purposes set forth.

2. The herein-described seat-disk, made conical, and arranged in the holder, substantially as explained, so as to leave a space between the two, for the purposes and objects set forth.

3. In a steam-trap of the character herein set forth, the discharge end of the expansion-tube, having the two independent edges or rings, with the annular space between them, for contact with the seat-disk, substantially as shown and described.

4. In a steam-trap, the packing-gasket combined with the inner and outer tubes, the same being reamed out at top, having a narrow connect-

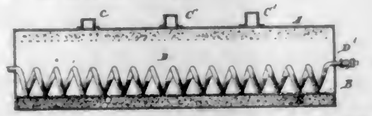
295,574.

ing-neck between its upper and lower parts, and arranged to expand and contract with the inner tube, and to prevent communication between the two compartments into which it divides the outer tube, substantially as shown and described.

5. In a steam-trap, the outer tube provided with the separating-chamber, the expansion-tube extending up into said separating-chamber, and being perforated, as explained, the packing-gasket surrounding the lower end of the expansion-tube, and preventing communication between the compartments above and below it, and a valve or cut-off operated by the expansion-tube, all combined and arranged substantially as shown and described.

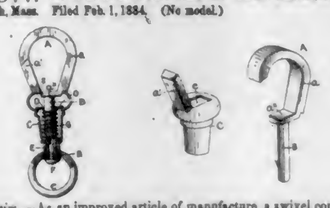
6. In a steam-trap of the character herein set forth, the combination of the expansion-tube, outer tube, packing-gasket, separating-chamber, cut-off operated by the expansion-tube, and the blow-off pipe provided with a valve and connecting the discharge-pipe and separating-chamber, substantially as shown and described.

295,574. SEALED GALVANIC-BATTERY CELL. WILLIAM T. MCGINNIS, New York, N. Y., assignor to James H. Shaw, same place. Filed Aug. 27, 1883. (No model.)



Claim.—The combination, in a galvanic battery, with a bottle-shaped vessel formed with a single contracted opening, and within which one of the battery-elements is inclosed and secured in the process of manufacture, of an elastic plug or stopper of insulating material adapted to be forced into the contracted opening, and to carry and suspend within the vessel the remaining element, substantially in the manner and for the purpose herein set forth.

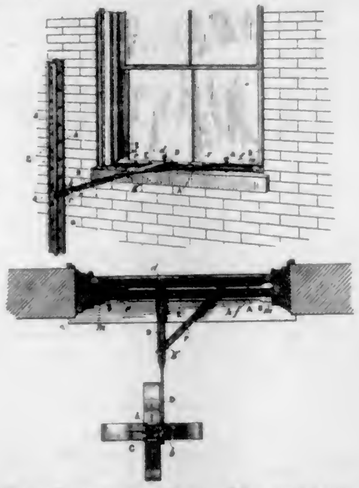
295,575. BUTTON-FASTENER. MILTON H. MCNAIR, Meadville, Pa. Filed July 6, 1883. (No model.)



Claim.—The improved button-fastener herein described, consisting of a piece of wire bent to form the loop A, and curved pointed prongs B, adapted to underlie the material and form hooks whose points are embedded in the material when strain is brought upon the button, all substantially as described.

295,576. CHEMICAL CAR-WARMER. CLIFFORD MITCHELL, Chicago, Ill. Filed Feb. 16, 1883. (No model.)

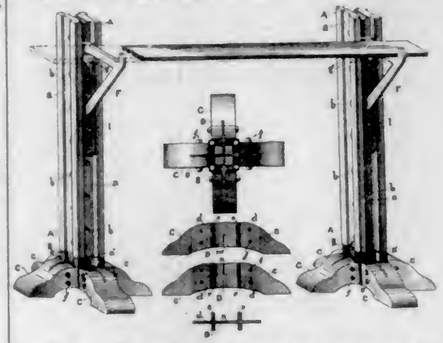
Claim.—The combination of a case, warmth-emitting chemicals therein, openings for providing a direct circulation of air through the case in direct contact with the chemicals, and means for fusing the chemicals, substantially as described.



295,577. SWIVEL FOR WATCH-CHAINS. PETER NERMEY, Attleborough, MASS. Filed Feb. 1, 1884. (No model.)

Claim.—As an improved article of manufacture, a swivel composed of a stem, B, having a bow portion, *a*, rigidly secured thereto, a neck member, C, having the remaining bow portion rigidly secured to its head, and said head provided with a perforation, *c*, to receive the foot of the bow portion *a*, the bridge-piece D, secured to and within the neck member C, the swivel-sleeve F, having a ring attached thereto and secured upon the stem, as described, and the spiral spring G, mounted on the stem and bearing against bridge-piece D and the sleeve F, substantially as set forth.

295,578. ATTACHMENT FOR SCAFFOLDING. JOHN T. O'BRIEN, Philadelphia, Pa. Filed Oct. 25, 1883. (No model.)

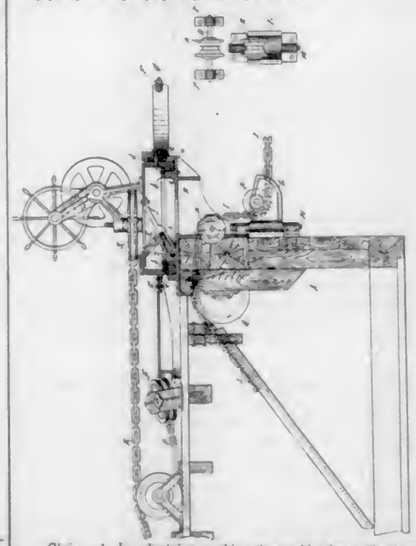


Brief.—Consists of a horizontal brace connected at one end with an upright and having its other end secured to a telescopic locking-piece having end recesses engaging the window-beads. A diagonal stay is secured to the center of said brace and to the locking-piece.

Claim.—The combination, with the scaffold-upright, of the horizontal brace D, attached thereto, the telescopic locking-piece E, having end recesses substantially of the form and for the purposes specified, the diagonal stay F, and suitable means for securing said parts together, substantially in the manner set forth.

295,579. INTERIOR AND EXTERIOR SCAFFOLDING. JOHN T. O'BRIEN, Philadelphia, Pa. Filed Oct. 25, 1883. (No model.)

Brief.—Provides an upright having vertical grooves and slotted at its base to receive the feet and flanged locking-pieces fitting in said grooves and slots. Bracket-pieces vertically adjustable at different heights in the grooves of the upright serve as supports.



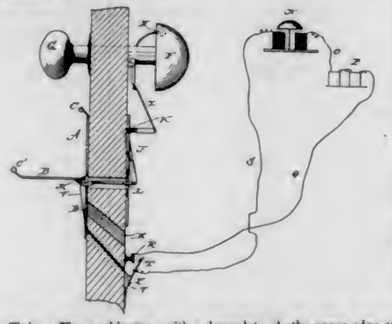
Claim.—1. The combination, with the upright A, having longitudinal grooves *a* upon its sides and slots *c* at its base, of the feet C and locking-piece D, said locking-piece being adapted and arranged with reference to the said grooves and slots substantially as set forth.

2. The combination, with the upright A, having longitudinal grooves *a* upon its sides and slots *c* at its base, of the feet C, having a locking-piece, D, adapted and arranged with reference to said grooves and slots substantially as set forth, and the bracket-pieces F, adjustable vertically in said grooves, whereby the supports of the upright may be arranged at different heights on opposite sides of the upright, as and for the purposes specified.

295,580. DREDGE. RALPH R. OSGOOD, Albany, N. Y., assignor to the Osgood Dredge Company, same place. Filed May 12, 1883. (No model.)

Brief.—The turn-table has an interior diagonally-arranged strut suitably braced, with a roller to run on an interior track on the foundation, over and around which the turn-table is arranged. The connection of swinging chains is by eyebolts running through spring-bumpers. The backing-chain is led around a pulley on a swinging bracket or crane to a slip-pulley having a play longitudinally on its shaft.

Claim.—1. In a dredging-machine, the combination, with a foundation provided with an interior track, of a turn-table arranged over and around the track, and having secured thereto a diagonally-arranged strut carrying a wheel arranged to travel upon said track of the foundation, for the purpose herein set forth.



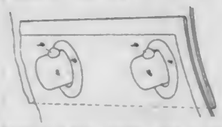
2. In a dredging-machine, the combination, with a foundation provided with an interior track, of a turn-table arranged over and around the track, and having secured thereto a diagonally-arranged strut with a wheel suitably braced and arranged to travel upon the said track of the foundation, for the purposes herein set forth.

3. In a dredging-machine, the combination of a turn-table provided at the forward end with springs or buffers F, and the swinging chains with eyebolts, the latter passed through the elastic buffers of the turn-table, substantially as shown and described.

4. In combination with the swinging crane carrying the sheave, the slip-sheave mounted above said crane, substantially as and for the purposes set forth.

5. In combination with the backing-chain, a sheave mounted in a swinging crane, L, with axial bearings above and below, adapted to move with said chain and to direct it without cramping, substantially as and for the purposes set forth.

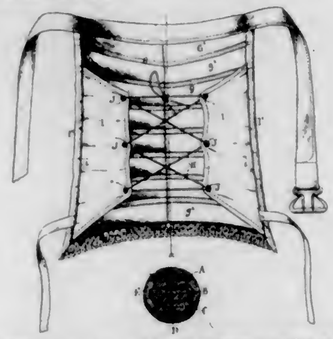
295,581. COMBINED DOOR-PLATE AND MAIL-RECEIVER. ROBERT G. PACK and WALTER J. WEW, Lynchburg, Va. Filed Apr. 7, 1883. (No model.)



Claim.—The combination, with a door-plate, A, the upper edge of which has a catch, C, and the lower half of which has a transverse slot, D, registering with the letter-way, of a flap, B, hinged transversely across the center of said door-plate, and having a suitable catch, C', to register with the catch on the plate, by means of which the said flap may be retained in a raised position and conceal the outer surface of both plate and flap, as set forth.

295,582. HANDLE FOR DIAL-LOCK KNOBS. TRACY L. PAINE, Milwaukee, Wis. Filed July 26, 1883. (No model.)

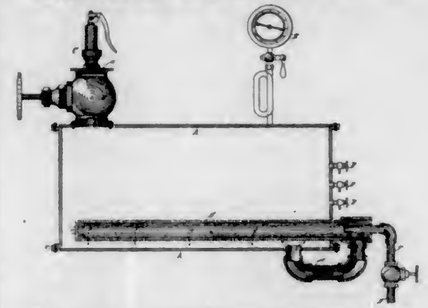
Claim.—A detachable handle for adjustment to safe dial-plate knobs, consisting of two parts, one sliding upon the other, and having claw-shaped flanges curving outwardly and then inwardly, and provided with serrations or corrugations upon their concaved surfaces, to firmly grasp the knob between them, together with a screw-bolt and set-nut, to rigidly fasten the flanges against the knob, substantially as set forth.



295,583. FASTENER FOR GLOVES, GAITERS, &c. CARL AUGUST PFENNING, Barmen, Germany. Filed Aug. 6, 1883. (No model.)

Claim.—1. A button for gloves, gaiters, boots, or bags, consisting of a solid body, *a*, having a radial bore, *c*, into which is fitted a movable pin and a coiled spring, the pin being provided with a knob pressed outward by the said spring, substantially as described, and for the purpose set forth.

2. The combination of a solid button, *a*, fixed to one of the two parts to be united, and having a radial bore, with a movable pin, *i*, fitted into the said bore, and a coiled spring, *f*, secured in the said bore, so as to press the pin outward, and an eyelet fixed to the other of the two parts to be united, substantially as described.



295,584. BUSTLE. JAMES B. PHILLIPS, New York, N. Y. Filed Jan. 10, 1884. (No model.)

Claim.—1. As a new article of manufacture, a spring or stiffener for wearing-apparel, consisting of straw braids, one upon the other, the braids being bound together and enveloped in a covering of unwoven fibrous material, substantially as set forth.

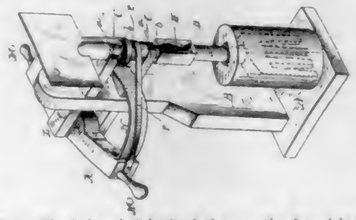
2. In combination with a bustle, a spring consisting of straw braids, one upon the other, the braids being united by stitches D and enveloped in a covering of cotton-batting, substantially as shown and described, for the purpose set forth.

295,585. APPARATUS FOR TESTING SAFETY-VALVES. GEO. W. RICHARDSON, Boston, Mass., assignor to the Consolidated Safety Valve Company, Hartford, Conn. Filed Feb. 21, 1883. (No model.)

Claim.—1. In an apparatus for testing safety-valves, the heater-pipe located in the lower part of the shell, perforated on its under side, and arranged to receive steam from a remote boiler, substantially as and for the purposes set forth.

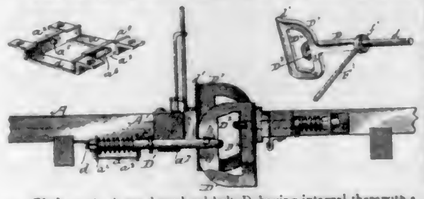
2. In an apparatus for testing safety-valves, the combination, with the shell and heater-pipe, of a supplementary pipe or run-around and a nozzle upon the steam-pipe, located and arranged substantially as shown, so as to produce a circulation of water, for the purposes and objects explained.

295,586. HAND-PROTECTING ATTACHMENT FOR UMBRELLAS AND CANES. EUGENIA ROSS, New York, N. Y. Filed June 9, 1883. (No model.)



Claim.—1. The combination, with an umbrella-stick or cane, of a hand-protecting attachment composed of a bag or pooch secured to the

handle portion of the stick or cane, and adapted to receive and cover the hand that holds the stick, as set forth.

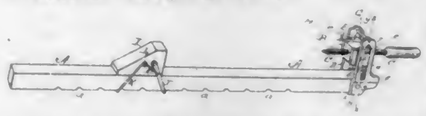


2. The combination, with an umbrella-stick or cane, of a bag or pouch secured near the end of the stick by a clamping device, substantially as described, which confines one end of the pouch to the stick, the end of the pouch not so secured having a gathering device whereby it may be drawn about the wrist and serve as a protection for the hand, as set forth.

295,587. CHURN-MOTOR. HYMENUS C. SADLER, Booneville, Ark. Filed Nov. 10, 1883. (No model.)

Claim.—The dasher-shaft having its lower section formed in two separable pieces, the upper section being provided with a dovetailed recess to receive a correspondingly-shaped projection on the lower section, and a pivoted spring-pressed flap or plate bearing against the projection and covering the joint, so as to hold the same in place, as and for the purpose set forth.

295,588. CAR-COUPLING. JOHN SHANAMAN, Annville, assignor of one-half to Jonas L. Knoll, Lebanon, Pa. Filed Feb. 9, 1884. (No model.)



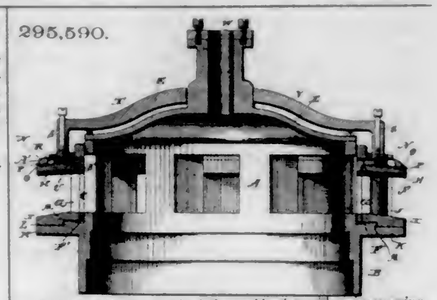
Claim.—1. A car draw-head bolt, D, having integral therewith a plate, D′, provided with a vertical slot, D^2, and a hook, D^3, projecting through said slot, substantially as and for the purpose described.

2. The combination of a draw-head bolt, its vertically-slotted draw-plate, and hook projecting through the side of said draw-plate, with the eyebolt F and spring thereon, substantially as and for the purpose described.

3. The combination of a draw-head bolt, its vertically-slotted draw-plate, and hook projecting through the side of said draw-plate, with the lever G and rod g^2, substantially as and for the purpose set forth.

4. The combination of a draw-head bolt, its vertically-slotted draw-plate, and hook projecting through the side of said draw-plate, with the lever G, rod g^2, having notch g^3, and latch-plate d^2, substantially as and for the purpose described.

295,589. CABINET-MAKER'S CLAMP. WILLIAM E. SHELDON, Jr., Medford, Mass. Filed Aug. 2, 1883. (No model.)



Claim.—In a cabinet-maker's clamp, the combination of the head-block, provided with the slide *d*, and suitable spring, H, and the frame E, provided with the slot *e*, substantially as and for the purpose set forth.

295,590. TURBINE WATER-WHEEL. ISAAC SHERCK, Fremont, Ohio, assignor of six-eighths to W. F. Jobbins, New York, and Geo. E. Raymond, Brooklyn, N. Y. Filed Feb. 6, 1883. (No model.)

Claim.—1. In a turbine water-wheel, the combination, with the inner casing having a series of apertures whose rear walls are beveled and whose forward walls are curved, of a rigid chute-ring surrounding it, having apertures provided with deflecting-wings, and a gate interposed between the casing and the chute, consisting of a band or ring of metal arranged to be rotated, and provided with apertures corresponding in number and position with those of the casing and chute, substantially as set forth.

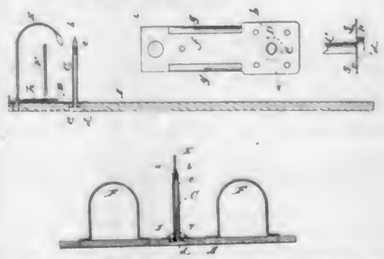
295,590.

2. In a turbine water-wheel, the combination, with an inner casing, of a chute-ring surrounding the casing, a ring-gate interposed between the casing and chute, and a ring-guard located above the gate.

3. In a turbine water-wheel, the combination, with an inner casing, of a chute-ring surrounding the casing, a ring-gate interposed between the casing and chute, and a ring-guard located above the gate, and arranged to prevent the displacement of the chute-ring.

4. In a turbine water-wheel, the combination, with an inner casing, of a chute-ring surrounding the casing, a ring-gate interposed between the casing and chute, and a ring-guard located above the gate, and provided with slots to permit the gate to be attached to the mechanism which actuates it, substantially as and for the purpose set forth.

5. In a turbine water-wheel, the combination, with an inner casing, of a chute-ring surrounding the casing, of a ring-gate interposed between the casing and chute, and a guard-ring located above the gate, and arranged to inclose a space above the upper ring of the chute.



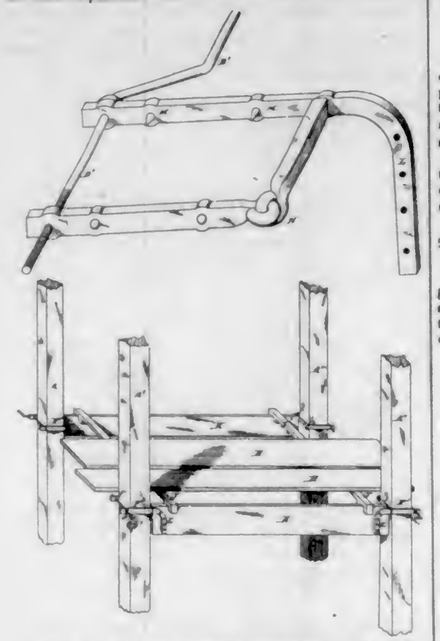
6. In a turbine water-wheel, the combination, with an inner casing, of a chute-ring surrounding the casing, a ring-gate interposed between the casing and chute, and provided with a flange having bearing upon the upper ring of the chute.

7. In a turbine water-wheel, the combination, with an inner casing, of a chute-ring surrounding the casing, a ring-gate interposed between the casing and chute, and provided with a flange having bearing upon the upper ring of the chute, and a ring-guard located above the gate, and adapted to inclose and protect the flange of the gate.

8. In a turbine water-wheel, the combination, with the inner casing having a series of apertures whose rear walls are beveled and whose forward walls are curved, of a chute-ring surrounding it, and having apertures provided with deflecting-wings, and rigidly secured to the bed of the wheel, and a gate interposed between said casing and chute, consisting of a band or ring of metal provided with apertures corresponding in number and position with those in the casing and chute, and devices, substantially as shown, for rotating the gate, as and for the purpose set forth.

9. In a turbine water-wheel, the combination, with an inner casing, of a chute-ring inclosing the casing and a ring-gate interposed between said casing and chute-ring, the said casing-ring and gate being provided with registering-apertures, the apertures of the casing, the forward side walls of which are curved, being set in advance of the apertures of the chute-ring, substantially as and for the purpose set forth.

295,591. PAPER-FILE. CALVIN W. SHERWOOD, Chicago, Ill. Filed Oct. 26, 1883. (No model.)



Claim.—1. A receiving-wire for a paper-file, provided with a notch at its upper end, the walls of which notch are adapted to cut a piece out from a paper when being placed on the wire, in combination with a sliding holding-wire adapted to enter said notch by its sliding movement, substantially as described.

2. In a paper-file, a sliding plate, A, and a wire, E, secured thereto, in combination with a base, A, receiving-wire C, notched at its upper end, and stops F on opposite sides of said wire and back thereof, substantially as described.

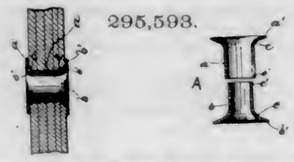
295,592. SCAFFOLDING. THOMAS N. SUBERS, Philadelphia, Pa., assignor of one-third to George E. Buckley, same place. Filed Dec. 21, 1883. (No model.)

Brief.—Hinged inwardly-pointed clamps are secured to uprights by screw-rods and to ledger-boards by bolts. Detachable cross-clamps provided with downwardly-projecting lugs ride upon said ledger-boards and receive a platform.

Claim.—1. In a building-scaffold, in combination with the uprights A A′ A″ A‴, the hinged inwardly-pointed clamps F′ F′ F′ F′, adapted to clasp around the said uprights, and provided with tightening screw-rods D′ D′ D′ D′, whereby they are firmly secured thereto, substantially as described.

2. In a building-scaffold, in combination with the uprights A A′ A″ A‴, the hinged clamps F′ F′ F′ F′, provided with tightening screw-rods D′ D′ D′ D′ and ledger-boards K K, to which said clamps are attached, substantially as and for the purposes described.

3. In a building-scaffold, in combination with the uprights A A′ A″ A‴, the hinged clamps F′ F′ F′ F′, provided with tightening screw-rods D′ D′ D′ D′, ledger-boards K K, attached to said clamps, and detachable bridging-clamps J J, resting upon said ledger-boards, and adapted to receive the working-platform H H, substantially as described.



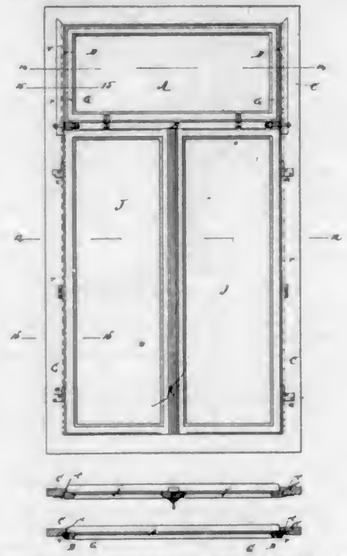
4. In a building-scaffold, in combination with the uprights A A′ A″ A‴, the hinged inwardly-pointed clamps F′ F′ F′ F′, provided with tightening screw-rods D′ D′ D′ D′, and suitable connections, K K, between said clamps to support superincumbent cross-pieces, substantially as described.

5. In a building-scaffold, in combination with the uprights A A′ A″ A‴, the hinged clamps F′ F′ F′ F′, provided with the tightening screw-rods D′ D′ D′ D′, connections K K from clamp to clamp, and bridging or cross pieces J J, provided with downwardly-projecting lugs or lips to clasp the connections between the clamps F′ F′ F′ F′, substantially as specified.

6. In a building-scaffold, in combination with the uprights thereof, a hinged clasping-clamp provided with a tightening screw-rod at one end, and terminating at its other end in a hook or bend, and a suitable tightening-screw, whereby the clamp is adapted to be attached to various parts of the building and hold the scaffolding-uprights, substantially as described.

7. In a building-scaffold, in combination with the uprights A A′, the inwardly-pointed clamp F′, composed of two clasping-bands, which are suitably joined at one end by a metallic connection and at the other end by a tightening screw-threaded rod, D′, substantially as described.

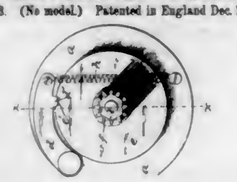
295,593. METHOD OF ATTACHING BUTTONS, &c. JAS. F. THAYER, Providence, R. I. Filed Dec. 15, 1883. (No model.)



Claim.—1. That improvement in the art of securing layers of fabric or other material together which consists in perforating the same, then passing eyelets through such perforation from opposite sides, one within the other, and finally pressing together the eyelets endwise, whereby they are interlocked and the thickness of material held firmly together, all substantially as shown and set forth.

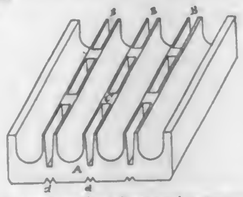
2. The combination, with layers of fabric or other material, of the flanged eyelets *a b*, one within the other, their flanged ends resting upon opposite sides of the fabric or material, and interlocked, substantially as shown and set forth.

295,594. SAFETY-WINDOW. FRIEDRICH OSKAR THIEM, Leipsic, Germany. Filed Jan. 15, 1883. (No model.)



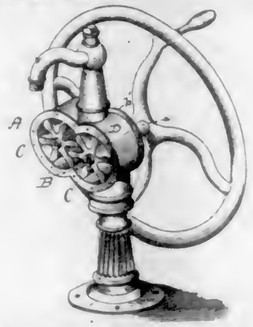
Brief.—The side edges of an upper sliding sash fit in S-shaped grooves in side strips on the main frame, said grooves connecting with similar grooves below in the window-frame. French windows fold into the latter grooves. A division-bar is located between the French windows and the upper sliding sash.

Claim.—1. In a window-frame, C, a single S-shaped groove, *r*, in each side, in combination with the sliding frame D for the upper section of the window, and the hinged or French windows J J, forming the lower section of the window, folding or closing into said S-shaped groove *r*, and the division-bar B, substantially in the manner described.



2. In combination with a window-frame, C, and sliding upper frame, D, the side strips, *v v*, in the upper part of the main window-frame, said strips, *v v* containing an S-shaped groove, *r*, forming a continuation of the S-shaped groove in the lower part of the window-frame, substantially as and for the purpose set forth.

295,595. CLUTCH-GUARD. DAVID TILTON, Hartford, Conn. Filed Aug. 27, 1883. (No model.) Patented in England Dec. 16, 1878.



Claim.—In a guard-clutch, the combination of the rotary disk *a*, the toothed pawl *d*, pivoted on the side thereof, the peripherally-mortised disk *e*, bearing the appertenant pinion *f*, and the extension spiral spring *h*, all substantially as described, and for the purpose set forth.

295,596. STEREOTYPE-PLATE. FREDERICK K. TRACY, Chicago, Ill., assignor of one-half to Charles E. Strong, same place. Filed Apr. 2, 1883. (No model.)

Claim.—A stereotype-plate of columned matter cast type high, and with column-rules and anterior longitudinal grooves under and extending upward toward the rules, and provided with necks or bridges across and intercepting such grooves, for the purpose of diminishing the labor of subdividing such plates and preventing any bulging of the form.

295,597. ROTARY PUMP. FRANK S. TROUTMAN, Seneca Falls, N. Y. Filed Mar. 21, 1883. (No model.)

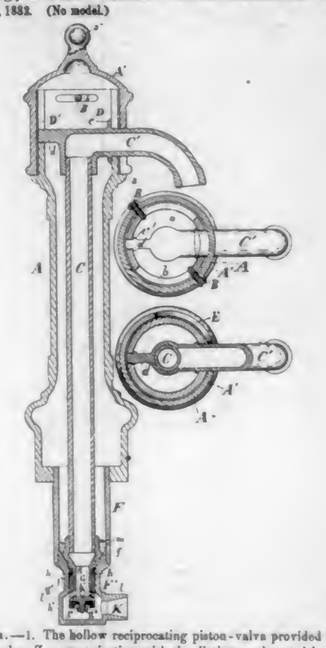
Claim.—In a double-piston rotary pump, the combination, with the casing, as described, of the pistons B, having blades C, the contact-surfaces of which are curved and their opposite surfaces flat, said pistons being so relatively arranged that at the time progressive contact is maintained between two approaching blades a retrogressive contact subsists between the two immediately receding blades of opposite pistons, and no two blades at any time lap each other their full length, the effect being to form a water-tight chamber which is never diminished in capacity, essentially as and for the purpose set forth.

295,598. ENVELOPE. EMANUEL J. TRUM, Brooklyn, N. Y. Filed Aug. 31, 1882. (Model.)

Claim.—1. The combination of the front A and back A', provided, respectively, with flaps *b h* and *c*, with an intermediate lip, B, said lip having its end edges secured to the back A' and its bottom edge attached to the front A, whereby the lip B forms one side of the mouth of the envelope, and the flap *b h* is detached from the said lip, substantially as and for the purpose described.

2. The combination of the lip B, flap *c*, flap *b h*, provided with the slit *l*, and the swivel *i*, substantially as described.

295,599. BELT-STUD. ORRIN S. TURNER, New Vineyard, Me. Filed May 31, 1883. (No model.)



Claim.—1. As an article of manufacture, the stud B, composed of a shank, *a*, and of end cross-heads provided with elongations *d*, projecting therefrom toward the opposite head, and bent downward, substantially as described.

2. As an article of manufacture, a stud, B, composed of a shank, *a*, and of end cross-heads, *b*, provided with elongations *d*, projecting therefrom toward the opposite head, and bent and pointed at their outer ends, substantially as described.

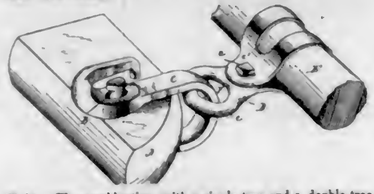
3. As an article of manufacture, a stud, B, composed of a shank, *a*, and of cross-heads *b*, provided with elongations *d*, projecting therefrom toward the opposite head, and having tapering and pointed ends, substantially as described.

295,600. HYDRANT. BENJAMIN C. VANDUZEN, Cincinnati, Ohio. Filed July 18, 1882. (No model.)

Claim.—1. The hollow reciprocating piston-valve provided with central chamber, Z, communicating with the discharge-pipe, and having an imperforate bottom and packing-rings *h h'*, and provided with orifices *l*, located in the side of the said valve between said packing-rings, and being the only inlet-conduits to said central chamber, Z, in combination with the valve-box having constricted portion *f*, provided below with the inlet-conduit, so that when the valve is moved vertically in one direction communication is made between the inlet-conduit and orifices *l*, and when the valve is moved in the opposite direction communication between said inlet-conduit and said orifices *l* is cut off, substantially as and for the purposes specified.

2. The combination of the valve-chamber having a constricted portion, *f*, and an enlarged portion above provided with waste-orifice, and an enlarged portion below provided with supply-conduit, and the vertically-reciprocating piston-valve having an imperforate bottom and packing-rings *h h'*, and orifices located between the said packing-rings, so that when the valve is at the upper part of its movement the upper packing shall be at a distance above the constricted portion, and the lower packing engaging the latter, and when the valve is at the lower portion of its movement the lower ring shall be at a distance below the constricted portion, and the upper ring shall engage the latter, substantially as and for the purposes specified.

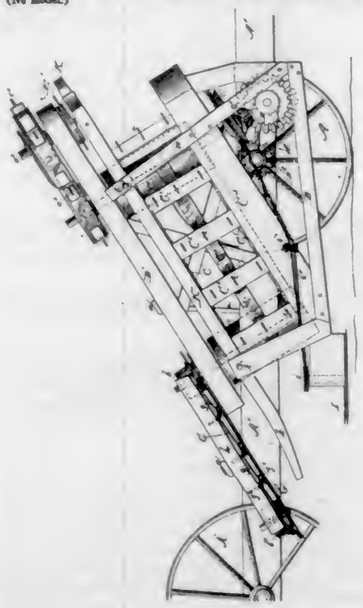
3. The combination of the valve-chamber having a constricted portion, *f*, and an enlarged portion above provided with waste-orifice, and an enlarged portion below provided with supply-conduit, with the vertically-reciprocating piston-valve having an imperforate bottom and packing-rings *h h'*, and orifices located between the said packing-rings, so that when the valve is at the upper part of its movement the upper packing shall be at a distance above the constricted portion, and the lower packing engaging the latter, and when the valve is at the lower portion of its movement the lower ring shall be at a distance below the constricted portion, and the upper ring shall engage the latter, and the ring *s*, for engaging upon the descent of the valve the flared portion *f* of the upper enlarged portion of the valve-chamber, substantially as and for the purposes specified.



4. In a hydrant, the rotatable cap A', connected to the top of the standard and incapable of vertical movement, and provided with an inclined slot, E, receiving the non-rotatable spout connected to the vertical discharge-pipe, capable of vertical movement by means of the rotation of the cap, and the inclined slot E, substantially as and for the purposes specified.

5. The body A, provided with surrounding collar *a* and vertical slots D D' and horizontal slots *b*, in combination with the cap A', provided with inclined slot E and pins B, and the spout C', substantially as and for the purposes specified.

6. The body A, provided with slots D D', in combination with the spout C', provided with lug *d*, and guiding-flanges *e e'*, fitting against the interior of the body, and means, substantially as described, for raising and lowering the spout and its connections, substantially as and for the purposes specified.

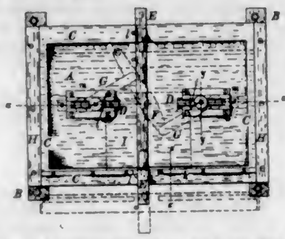


7. The combination of the cap rotatable upon (but incapable of vertical movement on) the standard, and having inclined slot E, with the reciprocating discharge-pipe provided with a projection engaging said slot, substantially as and for the purposes specified.

295,601. WHIFFLETREE-COUPLING. OLIVER VANORMAN, Racine, Wis., assignor of one-half to W. H. Johnson, same place. Filed Dec. 17, 1883. (No model.)

Claim.—The combination, with a single-tree and a double-tree, of a coupling-iron constructed of a single piece of metal and provided at one of its ends with a loop, said coupling-iron being also formed with perforations to receive a bolt or equivalent fastening, and a bail connected to the loop of said coupling-iron and secured to the double-tree by a bolt, the upper end of said bail being bent upwardly and then rearwardly to form a hook, substantially as set forth.

295,602. CORN-HARVESTER. JOHN WAGNER and HENRY DRYER, Portage, Wis., said Dryer assignor to said Wagner. Filed Feb. 17, 1883. (No model.)



Claim.—1. In a corn-harvester, a carrier-belt composed of links, each of which is formed with an eye at each end, and having one end turned upward and the other outward, substantially as and for the purpose set forth.

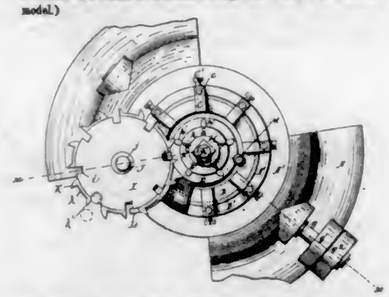
2. In a corn-harvester, the combination of the chain spur-belt G, constructed as herein described, with the bar G', pulleys *b b'*, and cap H, having flanges A, whereby the chain is held always in proper position with its carrying-spurs projecting horizontally, substantially as shown and described.

3. In a corn-harvester, the combination, with the wagon A and frame B, provided with an inclined way or platform, C', of the carrier C', running over vertical rollers, the guide-belt G, delivery-belt E, spring-actuated guide-bar K, having its forward end flared outward and its rear end bent around toward the wagon, the revolving cutters I I, belt *i*, pulleys *i d'*, gear-wheels *c²* D, sprocket-wheels D' D², and chain-belt *d*, all constructed and arranged to operate substantially as and for the purpose set forth.

295,603. GLASS-CUTTING APPARATUS. WILLIAM H. WALKER, Rochester, N. Y., assignor to Walker, Reid & Inglis, same place. Filed July 25, 1883. (No model.)

Claim.—1. The combination, with the bed A, provided with a suitable support for one edge of the glass plate, of the centering-jaws D D and the rule E, substantially as and for the purposes set forth.

2. The combination, with the bed A, of the movable frame C, provided with a ledge or rest to support one edge of the glass plate, the centering-jaws D D, and the rule E, substantially as and for the purposes set forth.



3. The herein-described cutting apparatus for glass plates, having suitable supports, whereby the plates are sustained and centered under a suitable cutting-rule, out of contact with the bed or frame of the apparatus, substantially as described.

4. The combination, with the bed A, provided with a suitable support for one edge of the glass plate, of the centering-jaws D D, adjustable supplementary jaws *s s*, having lugs *t t*, and the cutting-rule E, substantially as and for the purposes set forth.

295,604. ROOFING COMPOSITION. WELCOME WHITE, Everett, Mass., assignor of one-half to William L. Maltby, Montreal, Canada. Filed Jan. 29, 1883. (No specimens.)

Claim.—A roofing cement or composition composed of mica, asbestus, soapstone, and coal-tar, or other liquid bituminous substance, united in about the proportions herein set forth and described, for the purposes specified.

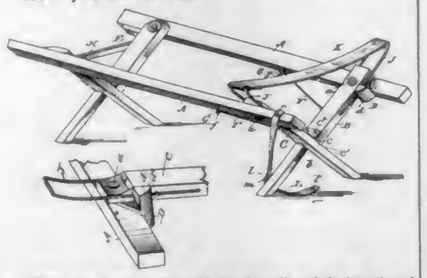
295,605. MACHINE FOR ROLLING THREADS ON METAL. JOHN S. WILSON and JAMES H. HASKINS, Chicago, Ill. Filed May 29, 1882. (No model.)

Claim.—1. In a machine for rolling threads upon metal, an annular non-revolving threaded die, in combination with a cylindrical revolving die, reversely threaded, and of less pitch than the non-revolving die, as set forth.

2. In a machine for rolling threads upon metal, an annular non-re-

volving threaded die, in combination with a cylindrical revolving die, reversely threaded, and of less pitch than the non-revolving die, the circumference of each die being a multiple of the blank circumference adapted to the space between the die-surfaces.

3. The circular threaded die D, in combination with the curved threaded die B, provided with a tongue, *b*, the block B', provided with the groove *b'*, and the set-screws *c'*, substantially as and for the purpose set forth.



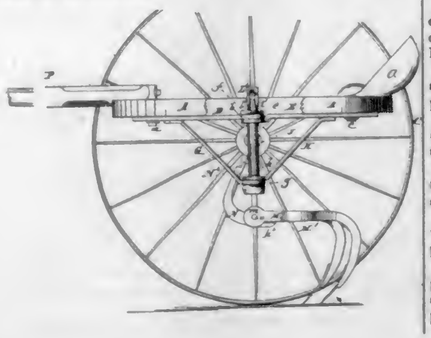
4. In a machine for rolling threads upon metal, a circular revolving die, in combination with a curved non-revolving die arranged outside the former, a feed-wheel in which the blanks are held, and a timer arranged to revolve with the circular die and to act on the feed-wheel to deliver the blanks to the opening of the space between the two dies at the proper moment, substantially as described.

5. The revolving die D, in combination with the non-revolving die B, the timer H, mounted on the shaft of the revolving die, and provided with arms *h'*, and the feed-wheel I, provided with projections K, and mounted on loose shaft, so as to be turned by the timer, substantially as described.

6. The feed-wheel I, provided with a circumferential groove, *i'*, in combination with the shoe *k*, carrying the projections K, and provided with pins entering the groove *i'*, substantially as described.

7. The shoe *k*, carrying projections K, and provided with the slot k^2, in combination with the feed-wheel I, provided with the circumferential groove *i'* and the fastening-screw k^4, substantially as and for the purposes set forth.

295,606. FOLDING COT. WILLIAM H. WOOLDRIDGE, Louisville, Ky. Filed May 26, 1883. (No model.)



Claim.—1. In combination with the side rails and the legs pivoted thereto by the pin or bolt *a*, a T-shaped casting pivoted by said bolt, said casting having its head somewhat triangular in shape, and provided with the upper and side bearing-surfaces, d'' d^3, for the purpose set forth.

2. In a folding cot, the combination of the side rails with the legs pivoted thereto, as described, wire frames J, secured to the sides of the legs, and the pillow or head-support K, attached to the top of the wire frames, whereby said frames may fold with the legs between the side rails, while the head-support folds between the legs, as set forth.

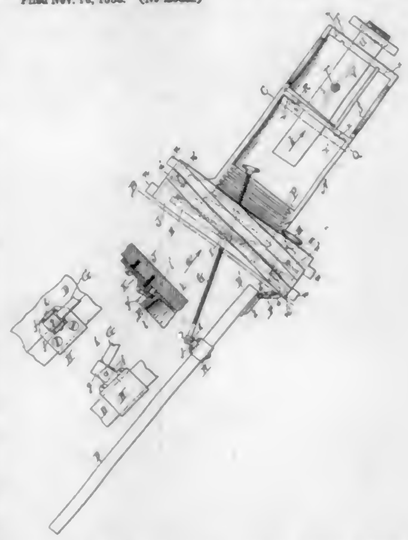
295,607. CULTIVATOR. JOHN WOOLRIDGE, Libertyville, Ill. Filed Dec. 12, 1883. (No model.)

Brief.—The hangers for the drag-bars are swiveled in a cross-bar arranged for lateral oscillation. The longitudinal bars of the frame are in two sections, allowing the hangers and drag-bars to be moved from side by the foot. The hangers are tubular in which the drag-bar rods are raised and lowered by cam-levers, while a curved foot-lever extends under and lifts the shovels.

Claim.—1. The bars D E, pivotally connected at their inner ends to permit of side movement, for changing the travel of the plow-beams, substantially as and for the purpose specified.

2. The bars D and bars E, having slots *d* in their rear ends, in combination with a post or standard carrying the plow-beams and forming a pivot for the inner end of the bars D E, substantially as and for the purposes specified.

3. The bars D and E, in combination with the braces G and H, cross-bar F, and posts or standards J, substantially as and for the purposes specified.



4. The bars D and E, in combination with the cross-bar F, posts or standards J, and braces G, H, and I, for forming a frame-work and support which permits of free side movement, substantially as and for the purpose specified.

5. The bars D and E, cross-bar F, posts J, and suitable bracing, in combination with the sliding shanks K and the plow-beams, for adjusting the running depth of the plows and allowing of side movement, substantially as and for the purpose specified.

6. The posts J, forming a pivot for side movement, in combination with sliding shanks K, for attaching the plow-beams and locating both movements at a common point, substantially as specified.

7. The bars D and E, cross-bar F, post J, and suitable bracing, in combination with the sliding shanks K, plow-beams, and foot-treadle, substantially as and for the purposes specified.

295,608. SOLAR CAMERA. CHARLES F. ADAMS, Worcester, Mass. Filed Nov. 16, 1883. (No model.)

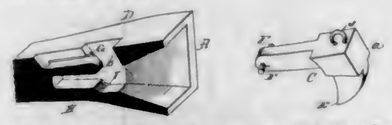
Claim.—1. In a solar camera, the combination, with the reflecting-mirror D and the adjusting-gear of the camera, of an adjustable hinge for attaching said mirror to said adjusting-gear, substantially as shown and described.

2. The bent hook-piece H, having projections *f* on its top part, in combination with and attached to one side of the reflecting-mirror D, in connection with cube-piece *g* and screw G, to raise or lower said mirror D, substantially as shown and described.

3. In a solar camera, the combination, with an adjusting-gear and a screw for tipping the mirror D, of the cube-piece *g*, attached to hook-piece H on the reflecting-mirror, substantially as shown and described.

4. In a solar camera, the combination, with an adjusting-gear, of an elongated nut, I, pivoted thereto, and the adjusting mirror-screw G, substantially as shown, and for the purposes stated.

5. The combination, with the frame part J, having a slot for the mirror-tipping screw G, of the adjusting-gear E, having a flange, *k*, substantially as shown, and for the purposes stated.



6. The combination, with the frame part J, of camera-box N, provided with shadow grooves and ridges P, and having a diaphragm or plate, Q, therein, substantially as shown and described.

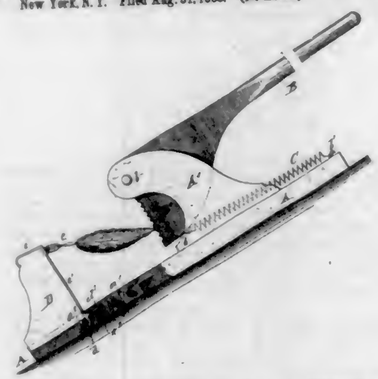
7. The combination, with the camera-box N, of a wedge-shaped piece, R, used to make the lines of the picture perpendicular on the screen, and adjustable shelf S, substantially as shown, and for the purposes stated.

8. The combination, with the reflecting-mirror D, adjusting-gear E, tipping mirror-screw G, and frame part J, of the box part N and parts attached thereto, hinged or pivoted to said frame part J, and reflecting-mirror W, all to be used for a vertical camera, substantially as shown and described.

9. The combination, with the frame part J and the reflecting-mirror D, hinged to the adjusting-gear E and tipping mirror-screw G, of the camera-box N and parts attached thereto, all so constructed and arranged that the instrument may be used either as a right-hand or a left-hand camera, substantially as shown and described.

295,609. CAR-COUPLING. FRANCIS K. ADAMS, Nashotah, Wis. Filed Sept. 18, 1882. (No model.)

Claim.—In a car-coupling, the draw-bar A, provided with horizontal recess H, angular recess I, vertical slot D, and recesses G G, in combination with the latch C, provided with lugs F F, adapted to operate in said recesses G G, said latch C being adapted to be thrown upward by contact with said angular recess I as it is moved rearward by the approaching link preparatory to the link entering beneath it, said horizontal recess H being adapted to hold said link in position to enter an approaching draw-bar or coupling, substantially as and for the purpose specified.



295,610. WOOD PAVEMENT. ROBERT ALBRECHT, Tilsit, Prussia, Germany. Filed Feb. 1, 1884. (No model.) Patented in England Dec. 3, 1883, No. 5,621.

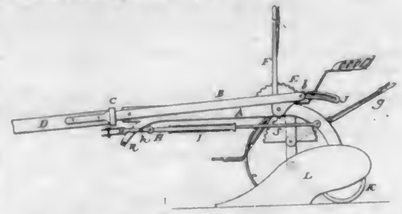
Claim.—1. A pavement composed of a foundation or bed of unburned bricks and of wooden blocks laid upon said foundation and connected by interlocking metal strips inserted in side grooves of the blocks, substantially as described.

2. A pavement composed of a foundation or bed composed of unburned bricks and an outer or curb portion of burned bricks, and of wooden blocks grooved in their sides, laid upon said foundation, and connected by interlocking metallic strips.

295,611. MACHINE FOR OPENING OYSTERS. LOUIS A. AMOUROUX, New York, N. Y. Filed Aug. 31, 1883. (No model.)

Claim.—1. An oyster-opener consisting of a supporting-frame, a fulcrumed lever having a serrated jaw, an adjustable standard having a fixed and twisting knife, and means whereby the standard is rigidly locked to the base of the frame, substantially as set forth.

2. The combination of a base, A, having fixed upright standards A', and a recess with transverse rods a^2, a fulcrumed lever, B B', an adjustable standard, D, having a fixed and twisted cutting-knife, *c*, and a bottom hook, *d*, and heel, whereby the standard D may be rigidly locked to the base at varying distances from the jaw, substantially as set forth.

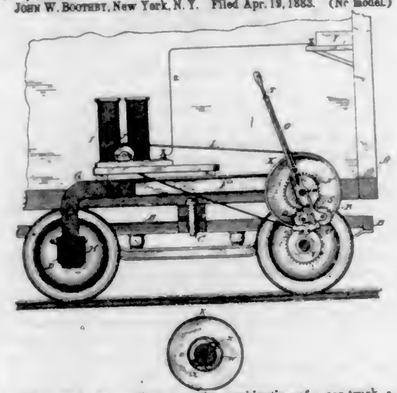


295,612. SHOE-BUTTON NEEDLE. ELLENE A. BAILEY, St. Charles, Mo. Filed Dec. 6, 1883. (No model.)

Claim.—As a new article of manufacture, a needle constructed in two parts, the main one being provided with a screw-threaded socket, and the other being rigidly secured to the thread and provided with a screw-threaded end to engage therewith, whereby the main body of the needle is adapted for use with a number of threads, as set forth.

295,613. SULKY-PLOW. SAMUEL W. BARR, Mansfield, Ohio. Filed Aug. 11, 1883. (No model.)

Brief.—Wheel-landside upon the plow-beam. A bar extends rearward from the tongue, hinged to it, and the parts are vertically rigid. A cam-lever lifts or adjusts the plow. A spring-pawl holds the tongue in line, which, when released, may swing around in turning. A spring-clevis working upon a cam projection of the plow-beam varies the height of the front end according to the power of the draft.



Claim.—1. The combination, in a sulky-plow, with the pivoted bar B, of the tongue D, the hinge-plate *c*, the hinged bars M N, staple O, and spring T, substantially as shown and described.

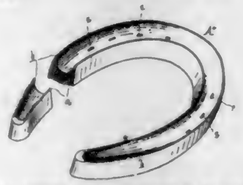
2. The plow-beam A, pivoted to the bar B, and the curved projection R, in combination with the spring draft-rod H, roller A, and draft-clevis, substantially as set forth.

3. The combination, with the pivoted bar B, having pin *b*, of the lever F, having the curved slotted arm J, the rack E, plow-beam A, and wheel K, substantially as shown and described.

295,614. DRIVING-GEAR FOR DYNAMO-ELECTRIC MACHINES. JOHN W. BOOTHBY, New York, N. Y. Filed Apr. 19, 1883. (No model.)

Claim.—1. In a railway-car, the combination of a car-truck, a tripod-frame resting upon two axles of said truck, and not connected to the car-body, a dynamo-electric machine resting upon said frame, and a system of gearing supported by said frame, and transmitting motion from one of said axles to the dynamo, substantially as described.

2. The combination of the axles D and E, tripod-frame F F' G, gear V, pivoted lever O, gears Q and R, gear N, shaft M, pulley K, belt L, and dynamo I, substantially as described.



3. The combination of the axles D and E, tripod-frame F F' G, gear V, pivoted lever O, gears Q and R, gear N, shaft M, pulley K, disk W, spring-pawls X, belt L, and dynamo I, substantially as described.

295,615. PROCESS OF TREATING FIBROUS RUBBER WASTE FOR THE RECOVERY OF THE RUBBER OR CAOUTCHOUC THEREFROM. AUGUSTUS G. BOURN, Bristol, R. I. Filed Feb. 25, 1884. (No specimens.)

Brief.—Improvement on the invention in Letters Patent No. 292,891, dated February 5, 1884, to same inventor.

Claim.—The process of treating rubber waste containing cotton fiber by subjecting said waste to the action of nitric acid or muriatic acid, or compounds of both of said acids, in solutions of sufficient strength to convert the fiber into soluble matter and enable its removal from the waste with the solution, substantially as described.

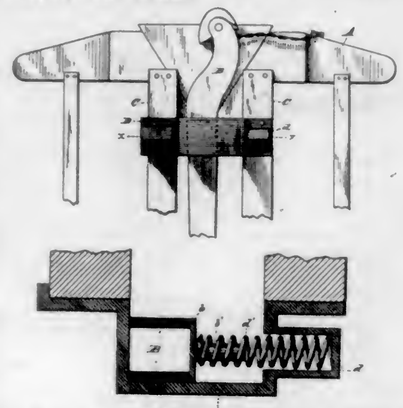
295,616. HORSESHOE. MAX CASPARI, Detroit, Mich. Filed Dec. 12, 1883. (No model.)

Claim.—In a horseshoe, the combination of the two ridges *a b*, formed upon the sole of the shoe, and following the inner and outer contour thereof, with the intervening sunk portion, which is formed with sloping sides and rounding bottom, substantially as and for the purposes described.

295,617. PULVERIZING-MACHINE. LEWIS S. CHICHESTER, Jersey City, N. J., assignor to C. M. Edward Schroeder, same place. Filed Dec. 29, 1882. Renewed Dec. 27, 1883. (No model.)

Claim.—1. The combination of an inclosing-casing, means for supplying the materials, means for discharging them when pulverized, a revolving disk having curved funnel-shaped ejectors applied thereto, composed of inner and outer shells of corresponding shapes, with air-spaces between them, and means whereby compressed air is conducted to said spaces between the outer and inner shells of the ejectors, substantially as described.

2. A pulverizing-machine having a horizontal rotary shaft provided with a longitudinal air-channel, an air-receiver connected to the end of said shaft, a disk having an annular space in its hub, radial air-conducting tubes projecting from said annular spaces, ejectors composed of inner and outer shells, having air-spaces between them connected with said air-tubes, whereby currents of compressed air are made to impinge currents of dust and air at the discharge-orifices of the ejectors, and a rim or casing surrounding said disk, substantially as described.



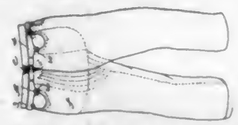
3. A pulverizing-machine having a rotary disk, an inclosing-casing provided with projections on its inner circumference, means for admitting and means for discharging the material, an ejector composed of an outer and an inner shell, which form an air-channel between them, a compressed-air receiver, and means for conducting air from said receiver to and through the air-channel of the ejector, whereby the compressed air is made to impinge a current of mingled air and dust which passes through the inner channel of the ejector and against the projections, substantially as described.

4. A pulverizing-machine, including the casing, having a horizontal rotary shaft provided with a longitudinal air-channel, an air-receiver at one end of the shaft, a disk having an annular space in its hub, radial air-conducting tubes projecting from said annular space, ejectors composed of outer and inner shells, forming an air-channel between them, and flanges *b*, provided with bolt-holes, substantially as described.

5. In a pulverizing-machine, an ejector composed of an inner and an outer shell, with an air-channel between them, said ejector having a funnel-shaped mouth and a discharge-nozzle at an angle thereto, the outer shell being provided near the mouth on the side opposite the nozzle with a tube adapted to connect with an air-pipe, substantially as described.

6. In a pulverizing-machine, an ejector having a funnel-shaped mouth and a discharge-nozzle at an angle thereto, composed of an inner and an outer shell, with an air-space between them, the outer shell being constructed with a flange whereby the device may be attached to the disk, substantially as described.

295,618. CAR-COUPLING. NEWELL P. COWELL, Cleveland, Ohio. Filed July 3, 1883. (No model.)



Claim.—1. In an automatic car-coupler, the part D, adapted to support the draw-head, and provided with a boss formed integral therewith, and containing a cylindrical chamber that is adapted to furnish a seat for a coiled spring that actuates the draw-head laterally, substantially as and for the purpose set forth.

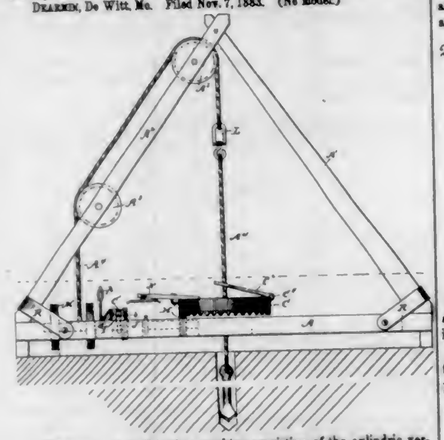
2. In an automatic car-coupler, the part D, substantially as described, and provided with a hollow boss formed integral therewith, and adapted to support the spring *d''* in proper relative position to the draw-head, substantially as described, and for the purpose specified.

3. In an automatic car-coupler, the combination, with the part D, provided with the boss *d* and the spring *d''*, of the draw-head B, the plate *b*, and the pin *b'*, or projection, substantially as shown and described.

295,619. OVERALLS. WILLIAM A. DAWSON, Stony Point, Cal. Filed Dec. 13, 1883. (No model.)

Claim.—1. The inside flap, C, of the front opening of pants and overalls, formed from the lining thereof, substantially as described.

2. An auxiliary waistband for pants, made in four pieces, and arranged to be connected together by buckles in front, over the hips on each side, and at the back, substantially as and for the purpose described.

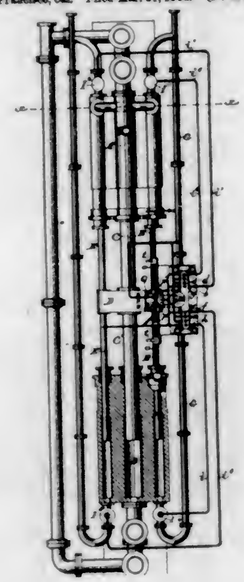


3. In combination with overalls or pants having a main waistband, the auxiliary waistband-pieces 1 2 3 4, having widened portions *w*, such widened portions forming an integral part of said waistband, substantially as and for the purpose set forth.

295,620. HORSESHOE. GEORGE A. DEAN, Dorchester, Mass. Filed Aug. 9, 1883. (No model.)

Claim.—The improved horseshoe and pad herein described, consisting of the shoe A, having a recessed front portion, and slots located near the heel of the shoe, in combination with the shoe B, having upwardly-projecting toe-piece *c* and perforated blocks *b*, and pad C, with recess *f* at the toe, and slots *a a*, the parts being adapted to be united to each other, substantially as shown, and for the purpose set forth.

295,621. WELL BORING AND DRILLING MACHINE. FRANK DEARMIN, De Witt, Me. Filed Nov. 7, 1883. (No model.)

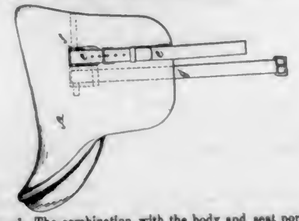


Claim.—1. A well-boring machine consisting of the cylindric vertical journal D, projecting through cog-wheel C, having notch *e* and arm N, auger-holder C', shafts G and K, cam-wheel *b*, engaging with clutch-wheel C', dog J, lever I, spring *d'*, reel M, rope A^4, auger C'', and the pulley-frame, substantially as shown and described.

2. The combination of the shafts G and K, operating in guides *j*, lever I, spring *d'*, cam-wheel *b*, clutch-wheel C', and dog J, for alternately clutching and disengaging, substantially as shown, and for the purpose described.

3. The combination of the shafts G and K, having guides *j*, lever I, spring *d'*, cam-wheel *b*, clutch-wheel C', dog J, reel M, rope A^4, guided by pulleys A^5 and secured to auger C'', and the driving mechanism, substantially as shown, and for the purpose described.

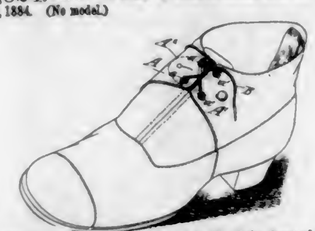
295,622. VALVE-GEAR FOR HYDRAULIC PUMPS. GEORGE W. DIXIE, San Francisco, Cal. Filed Mar. 21, 1882. (No model.)



Claim.—1. In a hydraulic pumping apparatus, the main valves I, I', I^3, and I^4, in combination with auxiliary valves *a b c d e f g h*, substantially as and for the purpose herein described.

2. The time-cylinder M, with its valves, piston, and piston-rod, in combination with the rack N, pinion O, shaft K, and cams J, all constructed to operate as and for the purpose set forth.

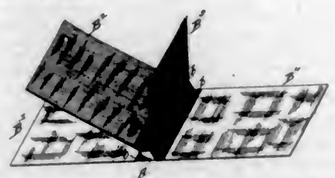
3. The valves R, having their upper and lower ends made of different diameters, in combination with the chamber S, having openings above and below to admit the pressure of a column of water, substantially as and for the purpose set forth.



295,623. RIDING-SADDLE. WILLIAM FRAHER, West Alexander, Pa. Filed Aug. 27, 1883. (No model.)

Claim.—1. The combination, with the body and seat portion A of a saddle formed of rubber and having recesses in its sides, of the pins *f*, inserted in said recesses, substantially as herein shown and described.

2. The saddle or portion A, constructed with an under central longitudinal groove, *h*, and four bearing-points, *s*, essentially as and for the purposes herein described.

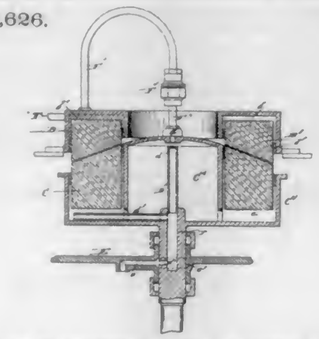


295,624. SHOE. WALTER S. FREEMAN, Bloomfield, N. J. Filed Jan. 12, 1884. (No model.)

Claim.—1. A shoe provided in each side of the front of the quarter with lace-holes and having attached to one side thereof a strap adapted to be turned in under the side of the quarter and be secured to said other side of the quarter by a fastening device, substantially as herein described.

2. The combination, with the sides A A', provided with lace-holes *a a'*, of the pocket *b* and the strap A^5, attached to the side A and adapted to be turned in within said pocket, substantially as herein described.

295,625. BLOTTER. AUGUST H. FREDERICK, St. Louis, Mo. Filed Jan. 24, 1884. (No model.)

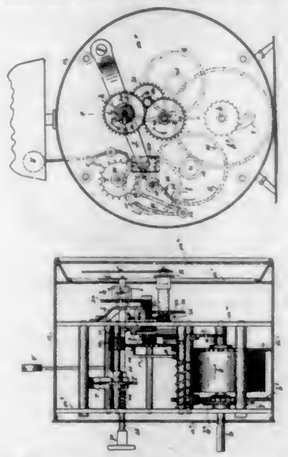


Claim.—An improved blotter, consisting of a suitable base or head having a series of blotting-leaves flexibly hinged thereto, with intermediate spaces adapted to receive a block of writing-paper and to be interchangeably used, all substantially as described.

295,626. COOLING APPARATUS FOR PAINT-MILLS. L. EUGENE FULLER and JOSEPH H. MACAULEY, Chicago, Ill. Filed Oct. 8, 1883. (No model.)

Claim.—1. In a paint-mill, the running-stone C, casing C', having a circulating-space around the stone, and the hollow spindle D, in combination with the plate E, through which the spindle passes, formed with the cored passage *e* and chamber *d'*, substantially as shown and described.

2. In a paint-mill, the running-stone C and its case C', formed with a circulating-space around the stone, and with the receptacle C', in com-



295,626.

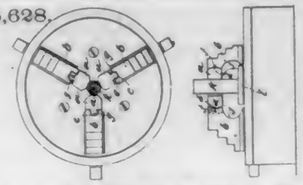
bination with the hollow spindle D, pipes d', and extension D', formed with perforations d, substantially as and for the purpose set forth.

3. In a paint-mill, the stationary stone B', its case B, having a circulating-space, b, and the partition b^2, the supply-pipe F, connected on one side of said partition, and the pipe F' upon the other, the coupling F^2, and section F^3, in combination with the coupling G, chamber G', case C', stone C, and hollow spindle D, all constructed and arranged to operate substantially as and for the purpose set forth.

295,627. ALARM-CLOCK. JACOB GANSS, Brooklyn, assignor to himself and John Blackwood, New York, N. Y. Filed July 6, 1883. (No model.)

Claim.—1. The combination, with the time-gearing and the wheels s t, their pins 28 and 14, and the pivoted arms 25 and 12, of the arbor b, barrel b', loose on said arbor, the spring b^4, with its ends connected to the arbor and barrel, teeth upon the barrel b' for driving the time-gearing, the ratchet-wheel b^3, secured to the arbor, and the loose wheel b^5 and pawl, substantially as and for the purposes set forth.

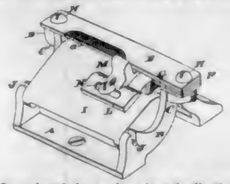
2. The combination, with the time and alarm mechanism, of the wheel 34, notched cylinder A, notched ring i, spindle 35 and hand, pin 5 on said spindle, the gearing 43, 31, 32, and 33, and spring-lever J, substantially as and for the purposes set forth.



3. In an alarm mechanism, the combination of the mainspring, wheels s t, their pins 28 and 14, pinions 10, 17, and 29, escapement-wheel T and escapement, pivoted arms 12, 16, 21, and 25, spring-lever J, acting directly upon the arms 16 and 21, and automatic mechanism operating once in every twenty-four hours to allow the lever J to release the alarm mechanism, substantially as set forth.

4. The combination, with the time and alarm mechanism, of a revolving and sliding toothed wheel, 34, a notched cylinder secured to the same, a notched ring, i, within the cylinder A, a spindle upon which the wheel, cylinder, and ring turn, and a pin and hand upon said spindle, substantially as and for the purposes set forth.

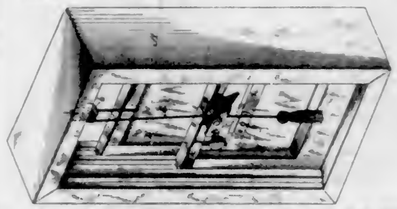
295,628. LATHE-CHUCK. JAS. S. GILMORE, Philadelphia, Pa. Filed Nov. 5, 1883. (No model.)



Claim.—The jaw-face a, connected to the jaw b by a tongue-and-

295,628.

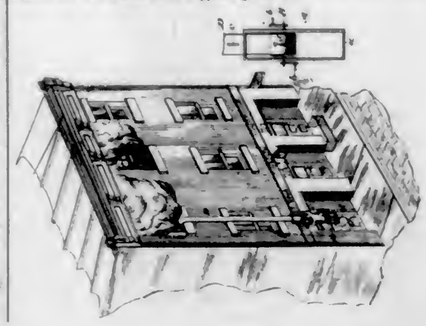
groove device having a lateral tongue and groove, g h, and a fastening-stud, f, the said lateral tongue being notched for the fastening-stud, substantially as described.



295,629. SPLITTING-GAGE. HENRY S. GUTHRIE, Olney, Ill., assignor of one-half to F. T. Phillips, same place. Filed Sept. 24, 1883. (No model.)

Claim.—1. In a chamfering-tool, a pivoted adjusting-plate, I, provided with guide M, in combination with knife G, block F, and a bar, E, the parts being constructed and supported substantially as and for the purposes described.

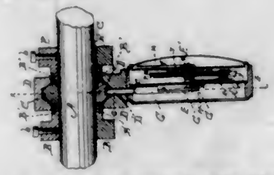
2. In combination with pivoted adjusting-plate I, provided with screw K and adjustable guide M, the knives E and G and a supporting-frame, substantially as and for the purposes set forth.



295,630. SASH-BALANCE. MARLON B. GLADMAN, Hopkins, Mo. Filed Dec. 26, 1883. (No model.)

Claim.—In a sash holder and fastener, a cord secured to the upper sash and passing over a pulley connected to the window-frame and extending down between a friction-roller and cam upon the lower sash, in combination with a spring-bolt to fasten the sashes closed, said bolt working in the same case with the cam, and having a flange extending a portion of its length, to serve both as a guide and stop, and extending through a plate with a slot projecting radially from the opening through which the bolt passes, substantially as and for the purpose set forth.

295,631. FIRE-ESCAPE. LAURA J. GOTT, La Grange, Ohio. Filed Jan. 31, 1884. (No model.)

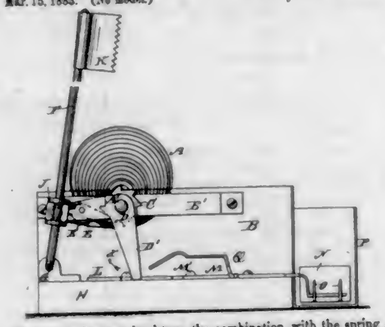


Brief.—A slotted flat spring coiled around a sprocket-drum which is provided with cranks and a supporting-frame.

Claim.—1. In a fire-escape, a frame or cage suspended by a coiled spring secured to an axle provided with a crank, by means of which persons may lower themselves from a building, and so arranged that the device will be raised to the starting-point by the recoil of the spring, substantially as set forth.

2. In a fire-escape, the combination, with the frame A, the shaft B, and attached sprocket-drum and cranks, of the spring D, provided with slots adapted to engage the said sprockets, substantially as set forth.

295,632. CYCLOMETER. GEO. H. GOULD, Somerville, Mass. Filed July 31, 1883. (No model.)



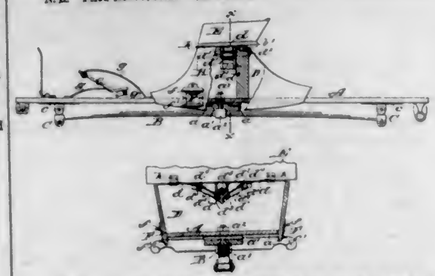
Claim.—1. In a cyclometer, the combination of the following parts, viz: the clamp B, rigidly secured to the axle, and provided with the cam C c, the pendent holder D, provided with the passage D', the rod G, the case E, and suitable mechanism, substantially as shown, by which the said rod is adapted to communicate motion to a differential gear, all substantially as and for the purpose set forth.

2. In a cyclometer, the combination of the clamp B, provided with the cam C c, the pendent holder D, provided with the passage D', and the case E, provided with the rod G, lever H, and spring I, said lever arranged to actuate a differential gear, substantially as and for the purpose described.

295,633. REMOVING OLEINE FROM LINSEED-OIL. THOMAS HENRY GRAY, Brooklyn, N. Y., assignor of one-tenth to John Leavens, same place. Filed Sept. 17, 1881. (No specimens.) Patented in England July 9, 1880, No. 2,831.

Claim.—A process of removing oleine from linseed-oil, which consists in maintaining the oil at a temperature of 110° Fahrenheit and in a state of agitation for about ten hours a day for nine to fourteen days, then mixing therewith, while hot and in a state of agitation, a saline solution, and finally drawing off the saline and oleine precipitate, and washing the purified oil with pure water until a further precipitate is obtained, as described.

295,634. ANIMAL-TRAP. CHARLES HALL, Changewater, N. J., assignor to himself, Jacob Hill, Jr., and Victor Castner, same place. Filed Mar. 15, 1883. (No model.)

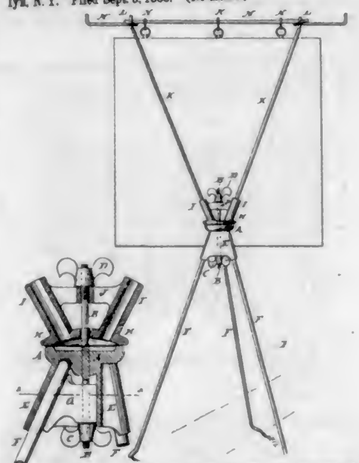


Claim.—1. In an animal-trap, the combination, with the spring A, of the shaft A', the elbow-lever D, the U-shaped piece J, the rod F, the knife K, the cross L, the lever M, provided with a bent arm, M', and devices for holding the bait on the free end of the lever M, substantially as herein shown and described, and for the purpose set forth.

2. In an animal-trap, the combination, with the spring A, of the shaft A', the elbow-lever D, the U-shaped piece J, the rod F, the knife K, the cross L, the lever M, provided with a bent arm, M', devices for holding the bait on the free end of the lever M, and of the bent lever Q, adapted to set on the lever M, substantially as herein shown and described, and for the purpose set forth.

3. In an animal-trap, the combination, with the spring A, of the shaft A', the ratchet-wheel C, the pawl E, the elbow-lever D, the pivoted U-shaped piece J, the swinging rod F, the knife K, the cross L, the lever M, provided with an arm, M', and the bent lever Q, substantially as herein shown and described, and for the purpose set forth.

295,635. SPRING-BOARD WAGON. JOHN C. F. HARRIS, Littleton, N. H. Filed Nov. 1, 1883. (No model.)



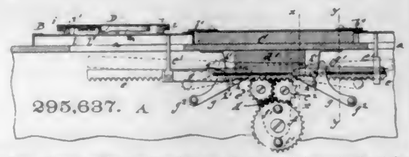
Claim.—1. The foot-rest G, connected to the spring-board A by springs g, and having rubber cushions g', substantially as described.

2. The seat E, hinged to the support H at A, and supported at the rear by springs d, and rubber cushions b' above the seat-supports, substantially as described.

3. The combination, with the hinged seat E, of springs d, supported in the frame, consisting of side bars, d', and cross-bars, as described, and attached to seat-support D by bolt d^2, substantially as specified.

295,636. REVOLVING MAP-STAND. HENRY EDWIN HAYES, Brooklyn, N. Y. Filed Sept. 8, 1883. (No model.)

Claim.—1. A revolving chart and map stand constructed substantially as herein shown and described, and consisting of the base-block A, having screw-rod B, and nuts C D, and triangular socket E, the revolving top block, H, having sockets I, the triangular wedge-block G, and the supporting and suspension rods F K M, as set forth.



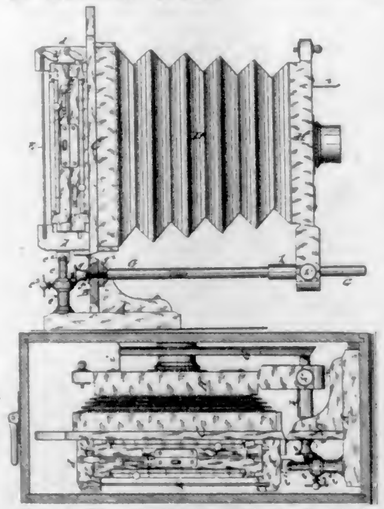
2. In a revolving map and chart stand, the combination, with the base-block A, having screw-rod B and triangular socket E, and the supporting-rods F, of the triangular wedge-block G and the nut C, substantially as herein shown and described, whereby the said block and rods can be firmly connected, as set forth.

3. In a revolving map and chart stand, the combination, with the base-block A, having screw-rod B, of the revolving block H, having sockets I, to receive the upper supporting-rods, K, and the nut D, substantially as herein shown and described, whereby the suspended map or chart can be readily turned to face in any direction, as set forth.

4. In a revolving map and chart stand, the combination, with the upper supporting-rods, K, having bent upper ends, of the suspension-rod M, having eyes L and bent ends, and provided with slide-hooks N, substantially as herein shown and described, whereby maps and charts of different sizes can be readily suspended, as set forth.

295,637. SAFETY RAILWAY-CAR. EDUARD HENN, Jersey City, N. J. Filed Nov. 10, 1883. (No model.)

Claim.—1. The combination of a car-roof having transverse escape-openings, longitudinally-sliding roof sections guided on ways of the roof, mechanism arranged in the interior of the car for moving the sliding roof-sections in opposite directions, and mechanism, substantially as de-



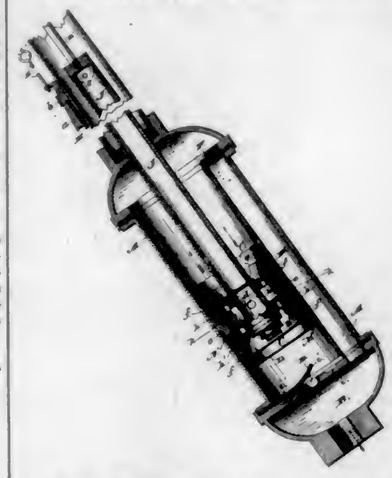
scribed, whereby either roof-section may be moved independently of the other, substantially as set forth.

2. The combination of a car-roof having transverse escape-openings, sliding roof-sections guided in ways of the roof, parallel rack-bars connected to said roof-sections, pinions turning on a fixed hanger-plate and engaging said rack-bars, a gear-wheel meshing with one of said pinions and having handles, levers pivoted to said hanger-plate and engaging grooves of said rack-bars, and check-springs which engage said levers and retain them, together with the rack-bars, in raised or lowered position, substantially as set forth.

3. In a safety attachment to railway-cars, the combination of a car-roof having transverse escape-openings, longitudinally-sliding roof-sections guided on ways of the roof, auxiliary transversely-sliding roof-sections guided on ways of the main sections, and means whereby the auxiliary roof-sections are locked to or released from the main sections, substantially as described.

4. As an improvement in safety attachments to railway-cars, the combination of a car-roof having transverse escape-openings, sliding roof-sections guided on ways of the roof, auxiliary transversely-sliding roof-section guided on ways of the main sections, a spring-actuated slide-latch for locking the auxiliary section, and a fulcrumed and weighted lever engaging said latch to open it automatically by gravity when the car is tilted, substantially as set forth.

295,638. PHOTOGRAPHIC CAMERA. AUGUST HERZOG, Guttenberg, N. J. Filed Nov. 2, 1883. (No model.)



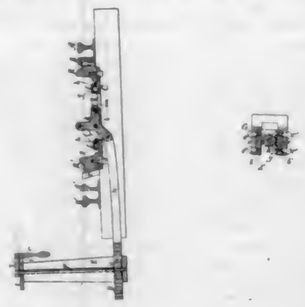
Claim.—1. The combination of a supporting base-frame having forward-extending guide-rods, a rear frame hinged to the base-frame, means for adjusting the rear frame to the proper inclination on the base-frame, an extensible camera, a lens-carrying frame, and means whereby the lens-carrying frame can be adjusted on the guide-rods, substantially as set forth.

2. In a photographic camera, the combination of a supporting base-frame, a rear frame having means for supporting the ground glass and plate-holder, said rear frame being hinged to the base-frame, a camera in front of the rear frame, a plunger pivoted to the rear frame, a fixed cylindrical socket of the base-frame for guiding the plunger, and a clamping-screw for fastening the plunger to the socket, substantially as specified.

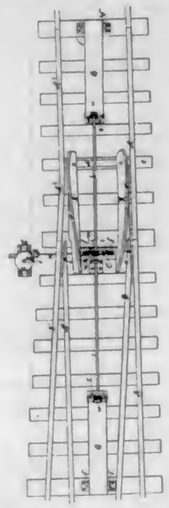
3. In a photographic camera, the combination of a supporting base-frame, a rear frame having means for supporting the ground glass and plate-holder, horizontal guide-rods made of two hinged sections, the shorter of which is applied to the base-frame, an extensible camera having lens-carrying frame, and means whereby the lens-carrying frame is secured to the guide-rods, substantially as and for the purpose set forth.

4. In a photographic camera, the combination of a supporting base-frame, a rear frame having means for supporting the plate-holder and ground glass, horizontal guide-sections made of two hinged sections, the shorter of which is applied to the base-frame, an extensible camera having a movable lens-carrying frame, means for guiding the latter on the guide-rods, and means for retaining the longer rod-section in upright position on the lens-carrying frame, substantially as set forth.

295,639. HOLLOW-PISTON PUMP. JACOB F. HESS, FREDERICK H. SNYDER, LENERD HESS, JACOB F. SNYDER, and CHARLES F. SNYDER, Massillon, Ohio. Filed Mar. 13, 1883. (No model.)



Claim.—1. The combination, with the pump-barrel having a valved opening below the piston and a valved opening above the piston, of a hollow piston-rod having openings near its lower end, and the piston consisting of a ring, *e*, having upper and lower annular flanges, the upper and lower perforated plates *f*, the flexible packing-rings held between the said flanges and plates, and the valve N between the plates, all of the said parts being combined, and adapted to operate as described.

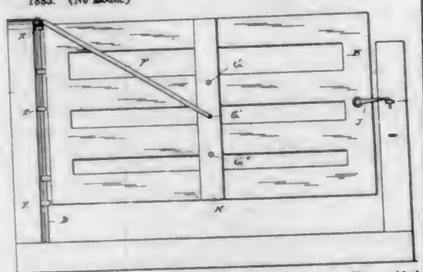


2. The combination, with a pump-cylinder and hollow piston-rod, the latter secured at its upper end to the rod K, of the piston consisting of the ring *e*, having annular flanges, the upper and lower perforated plates *f*, the flexible packing-ring, and the valve located on the piston between the perforated plates, and adapted to move above and below the opening *d*, for the purpose set forth.

295,640. MECHANISM FOR GUIDING CARS FROM ONE TRACK TO ANOTHER. JOHN ADAM HEYL, Boston, Mass. Filed Aug. 16, 1883. (No model.)

Brief.—In connection with fixed rails of main and siding, vibrating guide-rails shifted by a three-armed lever, toggle-jointed, and having a switch-stand connection, and carried by an oscillating shaft geared at each end with a removable vertical rack fixed in the jaws of a hinged lever, the two racks being on the same side of the shaft, and the two hinged levers being arranged between the rails and actuated from the locomotive, the jaws of each lever having two recesses—one on each side of the shaft—either of which may receive the rack and the other a filling-piece.

295,640.



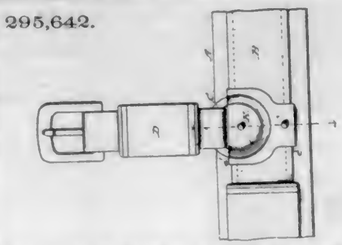
Claim.—1. The combination of a single depressor and its rack and the pinion thereof, and its shaft, with the main and turn-out tracks, the two switching-guides, the tri-armed lever, the toggles, the connection-piece provided with a rack and pinion or other suitable device, and mechanism for moving it, all being adapted to operate substantially as set forth.

2. The combination of the two depressors and their racks and the pinions thereof, and their shaft, with the main and turn-out tracks, the two switching-guides, the tri-armed lever, the toggles, the connection-piece provided with a rack and pinion or other suitable devices, and mechanism for moving it, all being adapted to operate substantially as set forth.

3. The combination of the notched head *l* and the arm, consisting of parts *q* and *r*, with the switching-guides R and R′, and with the standard E, and the upright or driving shaft *p*, its pinion *o*, the rack D, link *n*, and the toggles and tri-armed lever applied to the connection-piece of the two guides, all being adapted to operate substantially as set forth.

4. The depressor furcated, and having its prongs provided with the separable rack, and filling-piece adapted and secured thereto, substantially as represented.

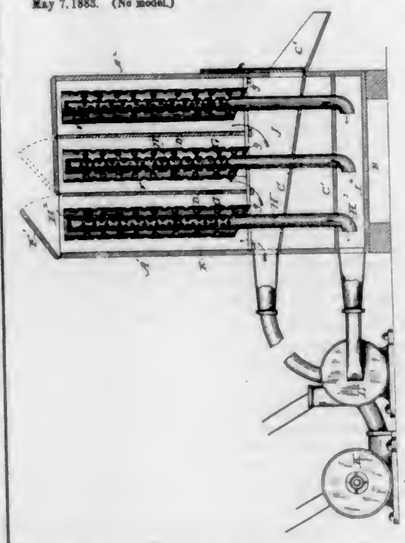
295,641. GATE. NORMAN B. HUFFMAN, Grant, Ind. Filed Sept. 12, 1883. (No model.)



Claim.—The gate-frame having central vertical piece, H, provided with a series of perforations, G G′ G″, in combination with vertical rod D, secured to the gate-post A, and provided with swinging angled piece F, having flange F″, for engaging with the perforations G G′ G″ in the piece H, and thereby securing the vertical adjustment of the gate, substantially as specified.

295,642. HARNESS. GEORGE H. INGALLS, Warner, N. H., assignor of one-half to GUSTAVUS W. Ingalls, Worcester, Mass. Filed Jan. 23, 1884. (No model.)

Claim.—1. A face-plate provided with a curved groove for holding a neck-strap ring, in combination with said ring, a breast-strap, and means for securing said ring to the outside of said strap by clamping said face-plate against the same, substantially as set forth.



2. A breast-strap body or breast-plate body, and a supplemental layer secured to the front thereof, in combination with a face-plate provided with flanges or extensions for overlapping the upper and lower edges of said supplemental layer, a neck-strap ring secured between said face-plate and said layer, and means for clamping or fastening said face-plate against said layer, to hold said ring in place, substantially as set forth.

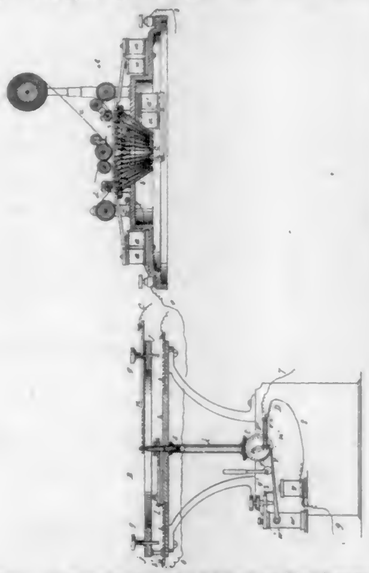
295,642.

3. In combination with breast-strap body A, supplemental layer B, and neck-strap ring C, the face-plate E, provided with extension F, tongues *f*, and flange *e*², said extension being bent through said ring and behind said layer, and said tongues clinched on said flange, substantially as set forth.

295,643. GRAIN-DRIER. RALPH S. JENNINGS, Boston, Mass. Filed May 7, 1883. (No model.)

Claim.—1. In a grain-drier, the combination of a perforated tube for holding the grain, surrounded by a sheet of netting or reticulated fabric, substantially as and for the purposes set forth.

2. The combination of the outer bin or casing having the drying-compartment subdivided into smaller compartments, the perforated grain-holders, situated, respectively, within the smaller compartments, the tubes within the grain-holders, and the air-chamber communicating with all of said interior tubes, substantially as set forth.



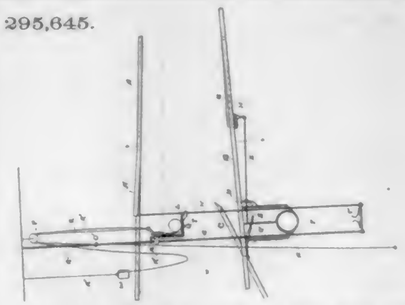
3. The combination of the outer bin or casing having the drying-chamber subdivided into smaller compartments, the perforated grain-holders, situated, respectively, within said compartments, the chamber below the drying-chamber adapted to receive the grain after treatment, and a separate exhaust-chamber communicating with the interior of the grain-holders in the drying-compartments, substantially as set forth.

4. The herein-described method for drying grain or other material in a mass or masses of small particles, it consisting in arranging said mass in a body having similar diameters at all points, allowing air to pass into said mass from one side on the lines of said diameters, and exhausting said air from the other side on the lines of said diameters by a positively-acting suction-fan, substantially as set forth.

5. The combination of the main bin or casing, the series of independently-arranged interior grain-holders, means for supplying air thereto,

means for exhausting the air therefrom, a bin or reservoir which supplies all of said holders, means for continuously introducing the material into the said holders, and means for continuously withdrawing it therefrom, substantially as set forth.

295,644. PRINTING-TELEGRAPH. ALBERT F. JOHNSON, Brooklyn, N.Y. Filed Apr. 5, 1883. (No model.)



Claim.—1. In combination with a telegraph receiving-instrument in which each printing-type is actuated independently of the others, the key-boards B' B, the latter located at the receiving-station and the former at the sending-station, and connected with each other by a line-wire, C, the said key-boards being constructed substantially as described, and having needles *l*, that rotate synchronously with each other, and each provided with a series of keys, *g*, and corresponding circuit-closing plates, *i*, (one for each letter or character,) radially arranged, and traversed by a revolving needle, *l*, driven by clock-work mechanism, which closes an electric circuit whenever it makes contact with one of said plates, said key-board B having its plates *i* connected, respectively, with the several printing-magnets which print the letters represented by said plates *i*, the whole being arranged, substantially as described, with ground and battery wires forming properly-arranged electric circuits, whereby an electric impulse is transmitted along said line-wire C at each contact of any of the keys *g* with their corresponding plates, *i*, at the sending-station to the corresponding plate, *i*, at the receiving-station, and from the latter to the corresponding magnet on the printing-instrument to print the letter, as described.

2. In combination with the key-boards B and B', constructed substantially as described, the equalizing mechanisms connected therewith, one of said mechanisms being located at the sending-station and the other at the receiving-station, and each consisting of the following parts, namely: a revolving disk, *u*, provided with an insulated plate, u^2, and a ratchet-tooth, *u'*, the magnet *y*, the pivoted armature-lever *v*, forming a detent, the contact-arms *w' w²*, and the spindle *k*, carrying the needle *l*, said mechanisms being provided with ground and battery connections, substantially as described, and being operated in connection with said key-boards through the medium of electric impulses sent over the line-wire C, as and for the purpose set forth.

3. The key-board B, herein described, composed of the following parts, namely: a series of keys, *g*, each representing a particular letter, and a corresponding series of insulated contact-plates, *i*, adapted to be connected each with a printing-magnet, an insulated annular plate, *j*, carrying a ground-wire, and insulated plate *n*, carrying a line-wire, and a revolving needle, *l*, mounted upon a spindle, *k*, driven by clock-work and arranged to make metallic contact with the plates *i*, the whole being constructed substantially as described, to operate as and for the purpose set forth.

295,645. CASH-CARRIER FOR STORES. CHARLES M. JOHNSON, Peoria, Ill., assignor to William S. Lamson, Lowell, Mass. Filed Jan. 14 1884. (No model.)

295,645.

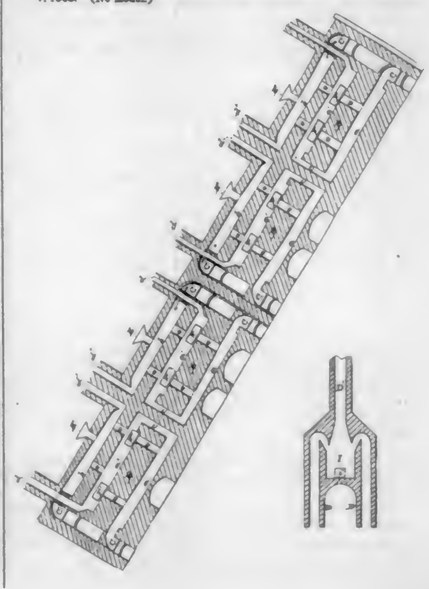
Claim.—1. In a cash-carrier, a track having several balls or other carriers of different weights thereon, in combination with traps in said track, and means whereby the weights of said balls shall each open its own trap alone.

2. In a cash-carrier, a track having a trap, and a slight elevation a short distance in front of said trap, in combination with means, substantially as described, whereby the depression of said elevation shall unlock said trap, for the purpose set forth.

3. The track B, having trap C and tongue G, in combination with the latch D, spring S, and means whereby the depression of said tongue shall release said latch, substantially as and for the purpose specified.

4. The track B, trap C, and tongue G, in combination with the angle-iron H, rod E, latch D, and spring S, substantially as set forth.

5. The track B, trap C, and laterally-curved cage F, in combination with the elevator L, having low side M, and means for raising the same.



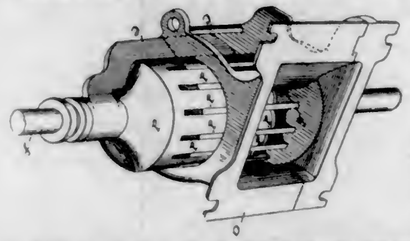
6. The track B, trap C, and laterally-curved cage F, in combination with the elevator L, having low side M, rods O N, switch-track A', and track A, substantially as described.

7. The track B, trap C, and cage F, in combination with the elevator L, having low side M, cords R and R', pulley P, and weight W, having supporting-cord R''.

8. In combination with the elevator L, rods O N, and cord R, the terminally-enlarged lag T and springs T', for the purpose set forth.

9. In combination with the track B, having trap C, curved cage F, and track A, having switch-track A', an elevator adapted to receive a ball from said cage and deliver it at said switch-track, substantially as and for the purpose described.

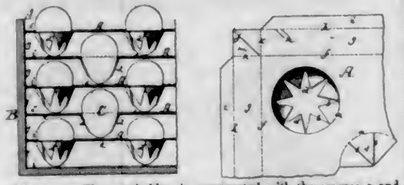
295,646. REVERBERATORY ORE-FURNACE. GEORGE W. JONES, Silver Creek, assignor to Adams & Carter, San Francisco, Cal. Filed Sept. 7, 1883. (No model.)



Claim.—1. In a desulphurizing, chloridizing, and chlorinating furnace, the connected hearths *a a'*, having the escape-flue *d*, and the fire-box C, in combination with the hearth *b*, having escape-flue *d'*, and fire-box C', and the traps *e*, connecting it with hearth *a'*, substantially as herein described.

2. In a desulphurizing, chloridizing, and chlorinating furnace, two or more furnaces built in one connected line, and having an arch, D, in which the escape-flues are contained, and top openings with feed-hoppers E, in combination with the track *f* on top of said furnaces and inclosed by the arch, substantially as and for the purpose herein described.

3. In a desulphurizing, chloridizing, and chlorinating furnace, the connected hearths *a a'*, having escape-flue *d*, and the top hearth, *b*, having the escape-flue *d'*, and the feed-hoppers E on top of the furnace, in combination with the arch D, inclosing the escape-flues, the stack D', and the track *f* on top of the furnace, substantially as and for the purpose herein described.



4. In a desulphurizing, chloridizing, and chlorinating furnace, the arch D, and the escape-flues *d d'* from the furnace, in combination with the dust-chamber I, formed above said arch, and the smoke-stack D', substantially as herein described.

295,647. FEED FOR SEED-DRILLS. WM. H. JULIAN, Springfield, Ohio, assignor to Thomas Wall, same place. Filed Jan. 2, 1884. (No model.)

Claim.—In a seeding-machine, the corrugated cylinder *b*, revolving in a feed-case, *a*, in combination with a sliding cut-off, *d*, that has fingers *d'*, chamfered at their free ends, and a cut-off, *e*, all substantially as and for the purpose specified.

295,648. EGG-HOLDER. WILLIAM KEARNEY, Franklin, N.J. Filed Jan. 5, 1884. (No model.)

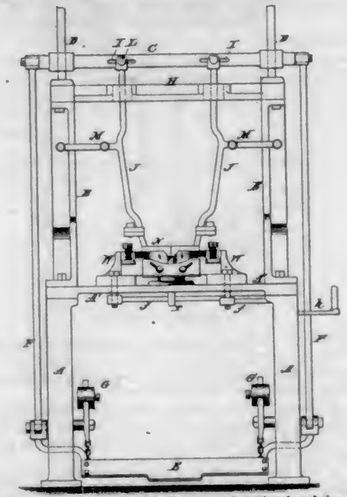
Claim.—1. The egg-holder A, constructed with the creases *a*, and with the incisions *b*, that are embraced by said creases, and adapted to form the wings *d*, substantially as described.

2. The egg-holder A, having apertures for the reception of the eggs, and provided with creases *f*, by which it is adapted to have the edges *g* turned down, as specified.

3. The egg-holder A, having creases *f* and *h*, adapted to form the vertical walls *g*, and lower flanges, *i*, substantially as described.

4. The egg-holder A, having vertical walls *g*, and provided with corner-lapels *m* and incisions or slits *n*, substantially as and for the purpose herein shown and described.

295,649. SAW-TOOTH. ROBT. W. KELLEN, Albion, Cal. Filed June 5, 1883. (No model.)



Claim.—1. The combination, with the saw-plate having spur *m*, of the saw-tooth *a*, the shank *e*, with shoulder *m'*, and the oval rivet adapted to be inserted and turned, as described, to lock the parts in place by a cam action, as set forth.

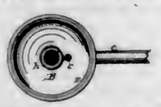
2. The combination, with the cam-plate having spur *m*, of the tooth *a*, made wider at its lower end, and having its shank-face constructed with an ogee curve, the shank having shoulder *m'* and a corresponding ogee curve next to the tooth, and the oval rivet inserted between the bearings *m* and *m'*, and turned to lock the parts by a cam action, as set forth.

295,650. HAT-SHAPING MACHINE. JOHN ROBINSON KELSEY, Bristol, England. Filed Nov. 20, 1882. (No model.)

Brief.—Improvement on the invention in Letters Patent No. 260,298, to the same inventor, dated June 27, 1882.

Claim.—1. In a machine for shaping and setting hat-brims, the two suspended presses, in combination with means for adjusting the distance between the ends to which the divided curling-ring is attached when depressed and acting upon the hat, substantially as described.

2. In a machine for shaping and setting hat-brims, the combination of the forked rod J and slotted cross-head C, bolt I, and sleeve or nut K, substantially as described.



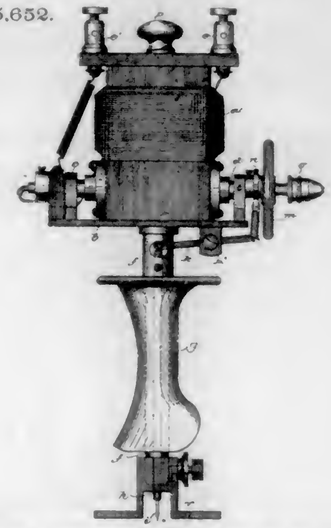
3. In a machine for shaping and setting hat-brims, the combination of the dish or mold O, reverse-threaded screw U, nut T, spring V, and table A', substantially as described.

4. In a machine for shaping and setting hats, the curling-boxes Z, adjustably attachable to the brackets W, and arranged so as to have an up-and-down motion, substantially as and for the purpose described.

5. In a machine for shaping and setting hats, the combination of the curling-boxes Z with the screw-bolts *b* and springs *c*, substantially as described.

6. In a machine for shaping and setting hat-brims, the combination, with curling-boxes, of the brackets W, pins X, levers *f f*, and lever *g*, all arranged and operated substantially as described.

295,651. SAFETY ATTACHMENT FOR VAPOR-BURNERS. ROLAND S. KELSEY, Syracuse, N.Y. Filed Aug. 24, 1883. (No model.)



Claim.—1. The combination, with the burner and its heating-cup *a*, of a subjacent supplemental cup, a screen interposed between the two cups, and a discharge-pipe tapping the supplemental cup, substantially as and for the purpose set forth.

2. In combination with the burner and its cup *a*, the base B, provided with the cup *b*, the conduit *c*, tapping the cup *b*, and the screen *s*, interposed between the cup *a* and conduit *c*, substantially as set forth, and for the purpose specified.

295,652. ELECTRIC IMPLEMENT. ARTHUR H. KINDER, Boston, Mass., assignor to Amasa S. Barnes, same place. Filed Oct. 25, 1883. (No model.)

Claim.—1. The field-magnet and its rotary armature and shaft and supporting-platform therefor, combined with the guide-tube connected

295,652.

with the said platform, the vibrating rod for carrying a tool guided in the said tube, and the rocking lever fulcrumed on the said platform, and having one arm connected with the said rod, and its other arm connected with the armature-shaft, substantially as described.

2. The electromotor having a rotary shaft, and the guide-tube containing a vibrating rod actuated by the said rotary shaft, combined with the supporting-foot, recessed to show the operation of the tool carried by the said vibrating rod, substantially as described.

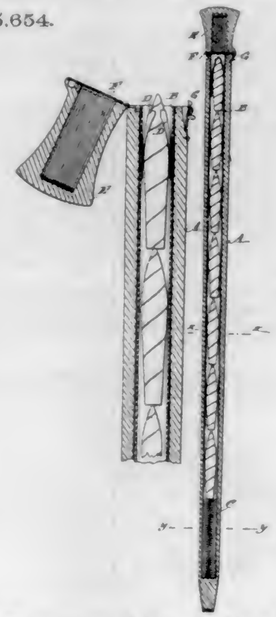
3. The electromotor having a rotary shaft and supporting-platform therefor, combined with the guide-tube fixed upon the said platform, having at its exterior a handle, and the vibrating rod operating in the said tube, and the lever pivoted upon the said platform, and having one arm connected with the said rod, and its other arm connected with the rotary shaft, substantially as described.

295,653. COLORING AND BRONZING LEATHER. LORENZ KLOPFER, Munich, Germany. Filed Sept. 4, 1883. (No specimens.)

Claim.—1. The process of treating leather preparatory to coating with metal and embossing it, consisting of first wrapping the leather in a cloth moistened with a solution of water and milk, drying it, then washing it with a mixture of white of egg, glycerine, and water, and then covering the leather first with a varnish and then with a flexible collodion compound, and finally applying a thin coating of size or other similar mixture, and applying the metal coating before the mixture has become dry, substantially as set forth.

2. In the process of treating leather preparatory to coating with metal and embossing it, the method of rendering the leather pliable and soft, consisting in wrapping the leather in a cloth moistened with boiled water and milk, then drying it, and then washing the leather with a mixture of white of egg, glycerine, and distilled water, substantially as set forth.

3. In the process of treating leather preparatory to coating with metal and embossing it, the method of forming a good adhesive surface for the reception of the metal, consisting in thoroughly drying the leather, previously rendered pliable, applying a solution of shellac, and coating the leather with a mixture of crude collodion, castor-oil, alcohol, and sulphuric ether, applying a thin coating of size or similar mixture, on which the desired color or leaf is laid, substantially as set forth.

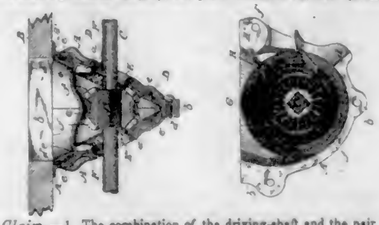


295,654. COMBINED CANE AND CIGAR-CASE. DAVID LEE, Jr., Mount Willing, Ala. Filed Nov. 16, 1883. (No model.)

Claim.—1. The combination, with a hollow cane adapted to receive cigars, of a spiral spring secured in the bottom of the hollow or recess in the cane, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with a hollow cane, of a removable tube fitting in the same, and of a spiral spring, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the cane A, of the tube B, the spiral spring C at the bottom and the springs D at the top of the tube, substantially as herein shown and described, and for the purpose set forth.



295,654.

4. The combination, with the cane A, of the tube B and the pivoted cap E, forming a match-receptacle, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the cane A, of the tube B, the hinged cap E, and the plate F, pivoted to the bottom of the said cap, substantially as herein shown and described, and for the purpose set forth.

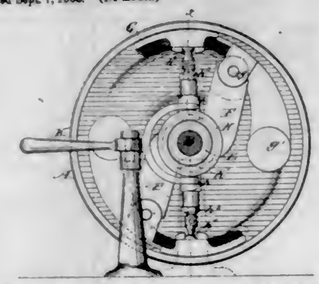
295,655. APPARATUS FOR DISTRIBUTING GRAIN AND FERTILIZERS. ANDREW J. MARTIN, Mechanicsburg, Ohio, assignor to the Mechanicsburg Machine Company, same place. Filed Nov. 28, 1883. (Model.)

Claim.—1. The combination of the driving-shaft and the pair of feed-wheels arranged obliquely thereto, and converging from top to bottom, substantially as and for the purpose hereinbefore set forth.

2. The combination, substantially as hereinbefore set forth, of the feed-cup or casing, the oblique feed-wheels therein, and the driving-shaft actuating the feed-wheels.

3. The combination, substantially as hereinbefore set forth, of the feed-cup, of approximately inverted-cone shape, and the oblique feed-wheels having their bearings in the sides of the feed-cups.

4. A feed-wheel constructed with the central bearing, and the surrounding bevel-gear, substantially as and for the purpose hereinbefore set forth.



5. The combination of the feed-cup, the driving-shaft, the pinions on the driving-shaft, and the oblique feed-wheels supported in the feed-cup, and having the bevel-gears engaged by the driving-shaft pinions, substantially as and for the purpose hereinbefore set forth.

6. The combination, substantially as hereinbefore set forth, of the feed-cup, of approximately inverted-cone shape, the oblique feed-wheels having their bearings in the feed-cup sides, and the interior casing interposed between the feed-wheels.

7. A sectional feed-cup, of approximately inverted-cone shape, provided with side bearings for oblique feed-wheels, substantially as and for the purpose hereinbefore set forth.

8. The combination, substantially as hereinbefore set forth, of the feed-cup, the oblique feed-wheels supported thereby, the driving-shaft actuating the feed-wheels, and the vertical central feed-disk rotating with the driving-shaft.

295,656. FRICTION-PULLEY. VOLNEY W. MASON, Providence, R. I. Filed Sept. 7, 1883. (No model.)

Claim.—1. A friction-pulley made, substantially as herein shown and described, with one or more counterbalanced shoes, as set forth.

2. In a friction-pulley, the combination, with the shoe, of a counterbalance, substantially as herein shown and described.

3. In a friction-pulley, the shoe constructed with an attached counter-balance, and adapted to operate substantially as herein shown and described.

4. In a friction-pulley, the combination, with one or more counterbalanced shoes, of a mechanism for throwing said shoes in and out of contact with the pulley, substantially as shown and described.

5. In a friction-pulley, the arm F, attached at one end to the driving-shaft, and carrying at the other end a counterbalanced shoe, substantially as shown and described.

6. The method herein described of counteracting the centrifugal pressure of friction-pulley shoes against their pulleys, which consists in opposing the tendency to such pressure by an equal centrifugal pressure brought to bear upon the shoe in the contrary direction, substantially as set forth.

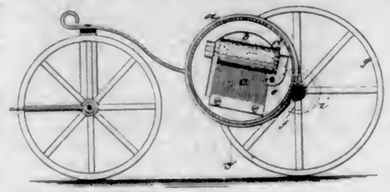
295,657. MANUFACTURE OF WOOD-GRAIN PAPER, CLOTH, &c. GEO. F. McINDOE and JAS. W. McINDOE, Everett, Mass. Filed May 23, 1883. (Specimens.)

Claim.—1. The process herein described of manufacturing wood-grain paper, cloth, or other like material, consisting in preparing the surface of natural wood, the grain or lines characteristic of which are to be transferred, by making the same level, plane, and smooth, but otherwise unfinished, then taking an impression of the grain and lines of the wood by means of wax, as described, then in preparing an electrotype from the wax impression, and then in printing by means of the electrotype upon paper, cloth, leather, or other suitable material colored or tinted to the color or tint of the body of the natural wood a fac-simile of the lines or grain of the wood, all substantially as and for the purposes described.

2. As an improved article of manufacture, a wood-grain fabric consisting of paper, cloth, or other like material colored to imitate the color or tint of the natural wood, and having printed thereon a representation of the lines or grain of the natural wood, obtained by taking an impression of the grain and lines of the wood by means of wax, then preparing an electrotype therefrom, and then printing upon the colored paper or cloth the lines or grain thus transferred to the electrotype, all substantially as and for the purposes described.

295,658. MANUFACTURE OF WOOD-GRAIN PAPER, CLOTH, &c. GEO. F. McINDOE and JAS. W. McINDOE, Everett, Mass. Filed Nov. 8, 1883. (Specimens.)

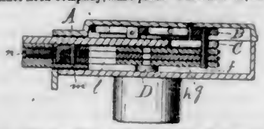
Claim.—1. The art or process of making wood-grain paper, cloth, &c., consisting, first, in obtaining from wood itself an electrotype or engraved fac-simile of the grain or natural lines thereof, in the manner described; second, in preparing a stain electrotype or engraved plate that shall represent the stain or color lines of the wood between the lines or grain; third, in taking paper, cloth, or other suitable material of a color which shall approximate the natural color of the wood; fourth, in printing in suitable color thereon the stain, by an electrotype-plate prepared as described, or representation of the wood between the grain-lines; and, fifth, in subsequently printing in proper color the grain or lines of the natural wood thereon by means of the electrotype or key plate, prepared as specified, all substantially as and for the purposes described.



2. As a new article of manufacture, a wood-grain paper, cloth, &c., consisting, essentially, of paper, cloth, leather, or other suitable material colored to approximate the color of the natural wood, and having printed thereon the stain or middle colors of the wood and the grain or lines thereof, which represent a fac-simile of the grain and lines of the natural wood, and transferred therefrom by the process herein described, substantially as specified.

3. The art of transferring from the natural wood the stains or middle colors and the lines or grain thereof by means of an electrotype key-plate and electrotype stain-plate, prepared as specified, to a flat field of paper, cloth, or other similar material, all substantially as and for the purposes described.

4. A paper, cloth, or other similar material colored to represent the natural color of wood and printed with the stain or middle colors, substantially as specified, and with the grain or natural lines of the wood, as indicated, and varnished or finished to represent a finished wood-surface, substantially as and for the purposes described.

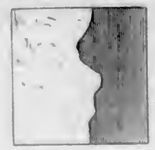


5. In the process of transferring the natural grain of the wood in the art of manufacturing wood-grain paper, &c., the preparation of the wood in the manner described, covering the same with printer's ink, and then taking an impression therefrom on white paper, and then taking a photograph from such impression, all substantially as and for the purposes described.

295,659. MUSICAL WAGON. HIRAM J. D. MINER, Dunkirk, N. Y. Filed Oct. 23, 1883. (No model.)

Claim.—The combination, with the axle *f* of a wagon, provided with the gear-wheel *i*, of the pin-drum *b* of a musical instrument, provided with the gear-wheel *d*, the worm *e*, and the pinion A on the end of the worm, and meshing with the gear-wheel *i*, substantially as herein shown and described.

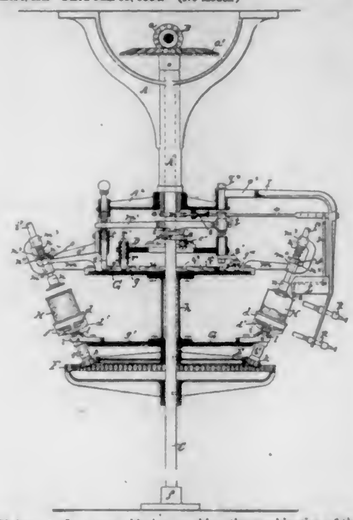
295,660. LOCK. FRANK W. MIX, New Britain, Conn., assignor to the Corbin Cabinet Lock Company, same place. Filed Dec. 31, 1883. (Model.)



Claim.—1. The combination of a lock-bolt, the tumblers belonging thereto, the master-key bolt and its tumbler, and the pivotal post for the tumblers of the lock-bolt proper, mounted on said master-key bolt, substantially as described, and for the purpose specified.

2. The combination of a master-key bolt, means for holding it stationary, a main bolt, and tumblers thereof mounted upon and moving with the master-key bolt, substantially as described, and for the purpose specified.

3. The combination of the lock-bolt, the adjustable fence composed of a series of superposed plates, a bearing for said plates, and a clamping mechanism extending to and accessible from the front end of the bolt, substantially as described, and for the purpose specified.



4. The combination of the lock-bolt, its fence composed of superposed plates, with flanged or shouldered ends overlapping each other, and mechanism for fastening said fence by pressure upon said flanged ends, substantially as described, and for the purpose specified.

295,661. METHOD OF MAKING LITHOGRAPHIC PRINTING-PLATES. PETER CORFITS MÖLLER, Leipsic, Saxony, Germany. Filed May 26, 1883. (No model.) Patented in Germany Feb. 10, 1883, No. 23,302; in France Mar. 19, 1883, No. 154,575; in Hungary Apr. 10, 1883, No. 22,459; in Belgium Apr. 14, 1883, No. 61,090; in Austria May 20, 1883, No. 14,129, and in Italy June 30, 1883, XVII, No. 15,586, CXXI, 77.

Claim.—The method herein described of preparing lithographic printing-plates, which consists in moistening the surface of a metal foundation-plate with a saturated solution of bicarbonate of lime, then heating said plate so as to evaporate the solution, and repeating these steps until a coating or deposit of bicarbonate of lime of sufficient thickness is formed on the plate, which is then used in the same manner as a lithographic stone, substantially as set forth.

295,662. CAN-SOLDERING MACHINE. DAVID M. MONROE, Baltimore, Md. Filed Jan. 15, 1884. (No model.)

Claim.—1. In a can-soldering machine, the combination of the rotating vertical shaft C, the rotary table G, rotating thereon freely, mechanism to impart to the table G an intermittent movement, and the hanger A, supporting the said intermittent mechanism, whereby an under supporting table or frame is dispensed with.

2. The combination of the rotary vertical shaft C, the table G, supported thereon and rotating intermittently around the rotating shaft C, and mechanism centrally supported that will move, stop, and hold the table G, whereby free access may be had to all parts of the machine.

3. The combination of the central shaft, C, can-holder *d*, wheel E, the intermitting mechanism, and the rotary table G, placed between the intermitting mechanism and the wheel E, whereby the table G is rotated from above, and the can-holders rotated from below, the table.

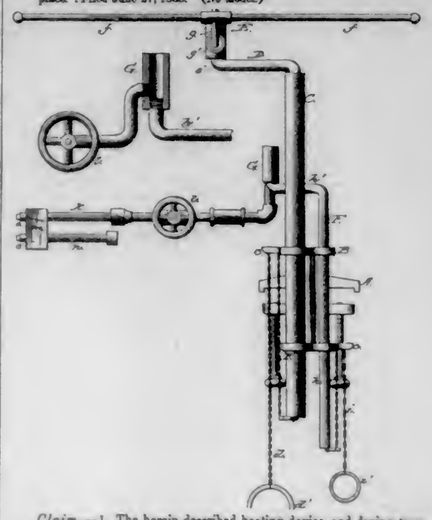
4. The combination of the vertical shaft C, the crank *c*, the pendulum D, the pin or pawl *r'*, and rotary table G, provided with ratchet-teeth *u*, for the purpose as herein specified.

5. The combination of the rotary table G, swiveled can-holder *d*, external gear-wheel, F, internal gear-wheel, E, and pinion *k*, for the purpose shown and described.

6. The combination of the vertical shaft C, rotary table G, hanger A, brake-shoe q^2, and stop-pin *t'*, whereby the brake steadies the forward movement of the table G when the pin *t* is disengaged therefrom.

7. The combination of the rotary central shaft, C, can-holder *d*, wheel E, the intermittent mechanism, the rotary table G, placed between the intermittent mechanism and the wheel E, and a molten-solder-applying device, whereby both ends of the can may be soldered at the same time, for the purpose and as herein specified.

8. The combination of the rotary table G, the swiveled or pivoted can-holder *d*, pinion *k*, and means that will hold the pinion *k* in contact with either of the master gear-wheels E or F, for the purpose as set forth.

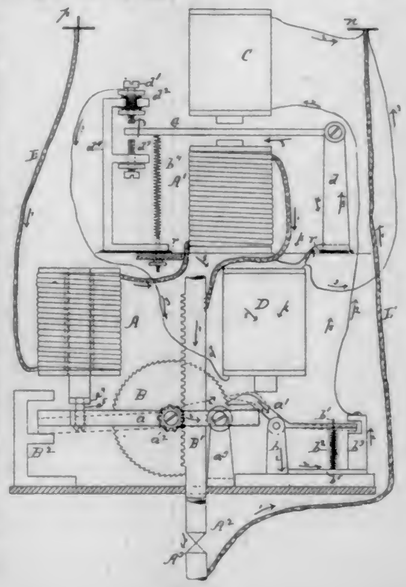


9. The combination of the rotary table G and a rotary can-holder provided with a rotating cylindrical ring, *d*, which protects the upper part of the can placed therein from the heat, for the purpose as specified.

10. The combination of a rotating cylindrical ring, *d*, and arms d^2, which will allow a portion of the can-body to project below the ring *d*, for the purpose as herein described.

11. The combination, in a rotary can-holder, of the cylindrical rings *d*, arms d^2, and the protecting-plate d^3, for the purpose as set forth.

12. The combination of the rotary table G, rotary can-holder *d*, the pinion *k*, internal gear-wheel, F, the cap-holding pin *x*, provided with the port o^3, and the molten-solder-applying device, for the purpose as herein specified.

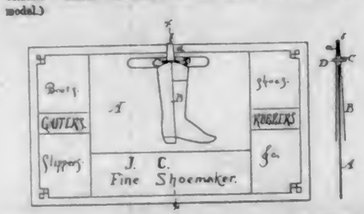


295,663. COMBINED HEATING APPARATUS AND DRYING-RACK. JACOB R. MOORE, Clayton, Mich., assignor of one-half to Henry Bovee, same place. Filed June 27, 1883. (No model.)

Claim.—1. The herein-described heating device and drying-tray combined, consisting of the supporting-frame A, provided with the plates B, having chain-holding devices *c* and circular openings *b b'*, adapted to receive the tube C, crank-rods D and F, which are adjustably secured therein by the chains *d* and *i*, and carrying the drying-frame E, and the frame of the oil or gasoline burners, all substantially as and for the purpose specified.

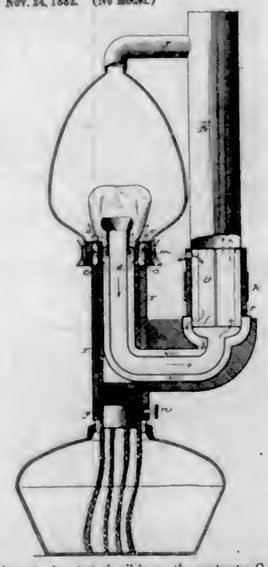
2. The supporting-frame A, provided with the upright A', adapted to receive the plates B, having the chain-holding devices *c* and circular openings *b b'*, in combination with the tube C, crank-rods D and F, chains *d* and *i*, and the drying-frame E, and heating device, all substantially as and for the purpose specified.

295,664. ELECTRIC LAMP. WENZEL MORAVA, Chicago, Ill. Filed May 22, 1883. (No model.)



Claim.—1. In an electric-arc lamp, the combination, with a carbon-separating electro-magnet in the main circuit, a regulating electro-magnet in a closed shunt around the arc, and a feed-magnet the vitalization of which is controlled by the regulating-magnet, of a second electro-magnet in the main circuit arranged to act in opposition to the regulating-magnet, substantially as described.

2. The combination, with the toothed upper-carbon holder, the pivoted yoke, the pinion mounted on a shaft supported by the yoke, the ratchet-wheel fixed on said shaft, and the pawl arranged to engage said ratchet-wheel, of the electro-magnet in the main circuit arranged to lift the yoke, and an electro-magnet in a shunt arranged to attract the pawl, substantially as described, and for the purpose set forth.



3. The combination, with the yoke, toothed carbon-holder, pinion, and ratchet-wheel on a common shaft, and the pawl, of the electro-magnet in the main circuit arranged to lift the yoke, the electro-magnet arranged to attract the pawl, and a regulating electro-magnet in a closed shunt, arranged to control the vitalization of the magnet which attracts the pawl, substantially as described.

295,665. METHOD OF ATTACHING ADVERTISING ARTICLES TO CARDS. SHELBY P. MOUNT, Cleveland, Ohio. Filed June 27, 1883. (No model.)

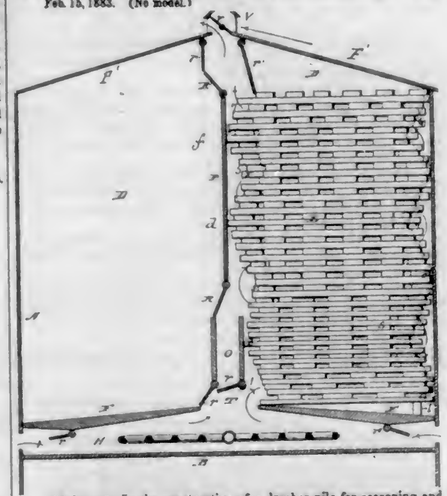
Claim.—The method of attaching a miniature advertising article, consisting of two portions connected by a narrow piece, *b*, to a card, A, having a slot, C, near its edge, forming a strip, *a*, consisting, first, in folding the card at its central portion; second, in sliding a ring onto the folded strip; third, in passing a part of the divided article between the folded portions of the strip, so that the connecting-piece will rest upon the upper edge of the strip, and, fourth, in moving the ring back off from the folded strip and releasing it, so that when the card is straightened out the ring will rest in the slot over the folded connecting-piece *b*, and one portion of the advertising article will be suspended in front and the other on the back of the card, as set forth.

295,666. HOT-AIR OIL-LAMP. CHARLES H. MURRAY, Leadville, Colo. Filed Nov. 24, 1882. (No model.)

Claim.—1. In a hot-air oil-lamp, the preheater O, with its divisions, chambers, and its inward draft-apertures constructed exterior to the lamp-shaft, in combination with the connecting-pipes *d* and *b*, communicating with the lamp-flame, all substantially as set forth and illustrated.

2. In a hot-air oil-lamp, the lateral openings through the top of the cylinder that bears the wick, placed below the toothed rings and between the wick-channels on the cylinder, and communicating between the interior of said cylinder and the annular hot-air space *c*, as set forth, and for the purpose specified.

3. In a hot-air oil-lamp, the annular hot-air space *c*, constructed below and exterior to the ignition-points of the wicks, supplied with air from the cylinder interior to it by the communicating apertures, as shown and specified.

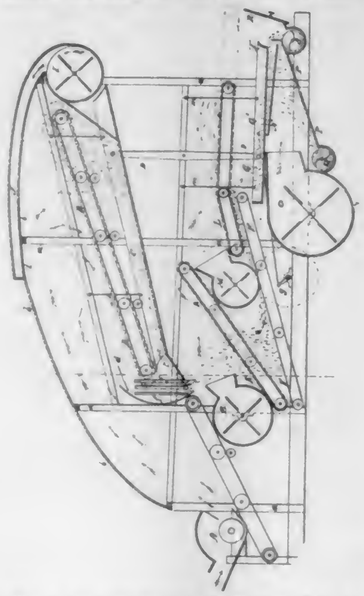


4. In a hot-air oil-lamp, the two toothed concentric rings *x x*, in combination with the termination of the annular hot-air-supply spaces, both placed in the same horizontal plane and having downward-sloping teeth which extend toward and encircle the wicks below their point of ignition, substantially as shown, and for the purpose specified.

5. In a hot-air oil-lamp, the throttle-ring *g*, made either to contract or open by the thumb-screw *n*, placed inside the shaft of the lamp, and encircling and bearing upon the wick, substantially as illustrated, and for the purpose set forth.

6. The combination of a central tube, *d*, inclosed by a much larger tube, *b*, with a free annular space between the two, constructed to begin at the top of the lamp-shaft interior to the frame, descending the shaft and terminating externally to it, in combination with the preheater O, in such manner that the tube *d* communicates through the channels *f f f f* with the chimney E, and the encircling tube *b* communicates through the channels *a a a a* with the internal openings in the preheater O, all substantially as shown, and for the purpose described.

7. In a hot-air oil-lamp, the combination of the external preheater, O, the connecting-pipe *d*, the inclosing connecting-pipe *b*, the communicating hot-air chamber *c*, the deflected toothed concentric rings *r r*, and the convolvulus-shaped flame mouth-piece *k*, arranged and operating in relation to one another as herein described with reference to the accompanying drawings.



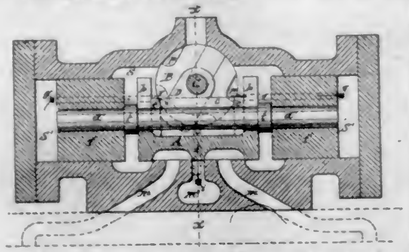
295,667. LUMBER-KILN. EPHRAIM MYERS, Suspension, Ala. Filed Feb. 15, 1883. (No model.)

Claim.—1. In the construction of a lumber pile for seasoning and drying the boards, the herein-described process of piling it upon cross-strips the ends of which engage with angular pattern guides or formers, the inclined edges of the formers coming in contact with the lumber, and their sides with the cross-strips, which are located near each end of the pile, the vertical edges of the formers abutting against the walls of the kiln, thereby forming cavities or flues between the lumber pile and the walls of the kiln, and preventing the outer air from entering the pile inside of the cross-strips and formers, for the purpose of circulating hot air through the pile, substantially as specified.

2. The combination, with the chambers D D, having the inclined floors F F and rooms F' F', and the vertical central partition, P, having the swinging valve R at its lower end and the swinging valve R' at its upper end, of the swinging valves *r' r'*, hinged to the base of the ventilator V, the flue *o* below the partition P and above the floors F F, provided at its lower end with the swinging valves adapted to engage the inner edges of the inclined floors F F, and the heating-chamber below, having cold-air inlets provided with valves *r r*, substantially as specified.

295,668. GRAIN-SEPARATOR FOR THRASHING-MACHINES. PONTALBA L. NASH, Hollister, Cal. Filed Dec. 7, 1883. (No model.)

Claim.—1. In a thrashing-machine, the thrashing-cylinder, in combination with a directing-shield, *d*, the arched top *b*, the blast-fan, and duct J, substantially as herein described.



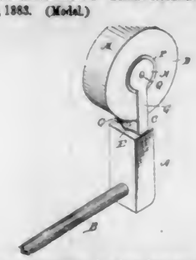
2. In a thrashing-machine, the combination, with the thrashing-cylinder, of the arched top, forming a space through which the grain and straw may be projected from the cylinder, the superposed air-duct, the blast-fan, the inclined angular grain-table, and the return-carrier B, substantially as herein described.

3. The inclined angular grain-table, the suspending-links and end-shaking mechanism, and the return straw-carrier traveling above the table, in combination with the curved shield *d*, inclined directing-strips, and the fan E, substantially as herein described.

4. The inclined angular shaking-table, the return straw-carrier, directing-shield and strips, and the fan E, in combination with the straw-carrier K and grain-belt F, substantially as herein described.

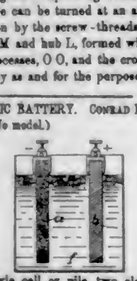
5. The combination of the inclined angular shaking-table, the return straw-carrier, directing-shield, carriers K and L, fans E and M, grain-belt F, and the screens, substantially as herein described.

295,669. STEAM-ACTUATED VALVE. DAVID F. NEWBY, Syracuse, N. Y. Filed Nov. 23, 1883. (No model.)



Claim.—1. In combination with a slide-valve of a steam-engine, a steam-chest having its interior formed with end-extension pistons on the ends of the valve, a rock-shaft having cams adapted to move the valve part way its stroke, a supplemental valve connected with the rock-shaft and provided with steam and exhaust passages, and auxiliary steam and exhaust channels extended from the supplemental valve, respectively, to the ends of the steam-chest extensions and to the exhaust-port of the steam-cylinder, said parts being constructed and arranged in such relation to each other that the main valve will move part way its stroke synchronous with the first movement of the supplemental valve and complete the stroke by the pressure of steam admitted to the steam-chest extensions by the supplemental valve, substantially as specified.

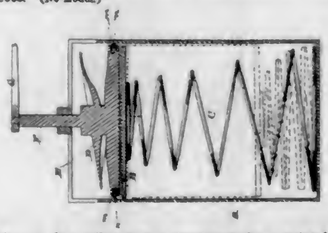
2. In combination with a slide-valve of a steam-cylinder, a steam-chest provided in the center of one of the sides with an annular opening, the exhaust-port of the cylinder, a rock-shaft extended through the center of said cavity, a disk mounted on the rock-shaft and fitted to the aforesaid cavity, and having in its periphery recesses adapted to communicate with the aforesaid ducts, and cams attached to the rock-shaft and adapted to carry the valve part way its stroke, substantially as described and shown.



3. In combination with the main valve provided with pistons at opposite ends, the rock-shaft provided with cams D D, the supplemental valve provided with passages *r* and *p p*, and single ducts extended from the supplemental valve, respectively, to opposite ends of the steam-chest and to the exhaust-port, substantially as described and shown.

295,670. PIANO-HAMMER. EDWIN RUTHVIN OBER, Waterbury, Vt. Filed May 19, 1883. (Model.)

Claim.—As an improvement in piano-hammers, the combination of the head-block A, the forked piece C, comprising the side plates, G G, having end disks formed with conical inner surfaces, I, provided with a central perforation, and the top connecting-plate, from which projects a screw-threaded shank, F, entering a corresponding recess in the end of the block A, so that the forked piece can be turned at an angle to the block, and will be retained in position by the screw-threads, the hammer-disk D, comprising the periphery M and hub L, formed with the central perforation, N, and conical end recesses, O O, and the cross-pin Q, all arranged and operating substantially as and for the purpose set forth.



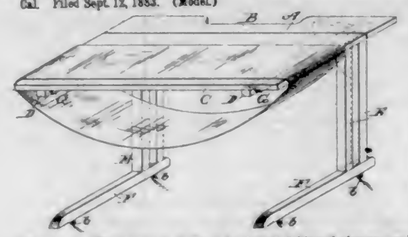
295,671. GALVANIC BATTERY. CONRAD PABST, Stettin, Germany. Filed July 5, 1883. (No model.)

Claim.—1. In a single cell or pile, two electrodes—carbon and metal—immersed in the aqueous solution of the compound consisting of chlorine, with such metals whereof there are existing two combinations with chlorine, both soluble in water, the compound corresponding to the protoxide and the oxide of the metal.

2. In a single cell or pile, two electrodes—carbon and iron—immersed in a solution of perchloride of iron, substantially as shown and described.

295,672. BALING-PRESS. JOHN D. PAGE, Sanders, Cal. Filed Sept. 25, 1883. (No model.)

Claim.—1. In a baling-press, a chamber having a spring-follower within it, in combination with a screw feeder and compressor opposing said follower, and means for rotating it, substantially as herein described.

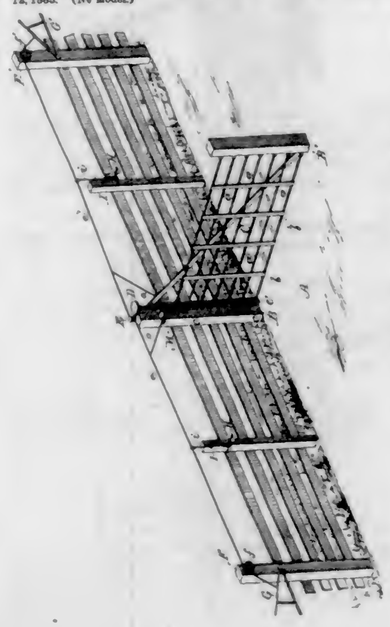


2. In a baling-press, the cylindrical chamber A, closed at one end, in combination with the feeder and compressor D, mounted in its other end, said feeder consisting of one section of screw with a double or multiplex thread, each of semi-circumference on opposite sides of the stem, whereby apertures *d* are formed, substantially as herein described.

3. In a baling-press, the cylindrical chamber A, the follower B, and spring C within it, in combination with the screw feeder and compressor D, mounted in said chamber, and means for rotating it, substantially as herein described.

4. In a baling-press, the chamber A, having a flange, *n*, at its top, in combination with the double-threaded screw feeder and compressor D, the threads of which have grooves *m* in their edges, in which the flange *n* fits, substantially as herein described.

5. In a baling-press, the cylindrical chamber A and the spring-follower B, in combination with the hinged cover M and the screw feeder or compressor D, mounted therein, and means for rotating it, substantially as herein described.

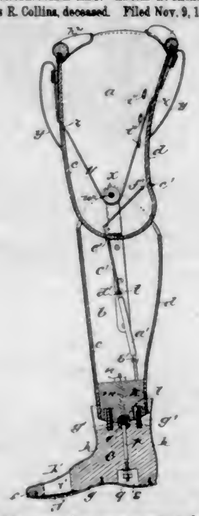


295,673. FOLDING TABLE. WILLIAM WINTER QUIGLEY, Santa Ana, Cal. Filed Sept. 12, 1883. (Model.)

Claim.—1. The board A, having the board C hinged thereto, and provided also with the fixed brackets H on its under side, in combination with the standards E, hinged to the brackets H, and provided with the top rails, G, and feet F, parallel to each other and extending to or near the outer edge of the board C, when said board is in its raised position, substantially as set forth.

2. In a skirt-board, the combination, with the board A, of the board C, hinged to the same and provided with recessed blocks or sockets D, the top rails, G, and of the standards E, hinged to brackets H, fixed to the board A, and having the feet F extending forward as far as the outer edge of said board A, substantially as herein shown and described.

295,674. GATE. EDWIN DAVIS RATHBUN, Williams, Cal. Filed June 12, 1883. (No model.)



Claim.—1. The swinging gate C, having pins or plates *h* in its edge, and the means for swinging it, consisting of the pulleys D E, ropes *e e'*, and levers G G', in combination with the gravitating latches H H on posts I, engaging with projecting pin *h*, the wires or cords *i i*, connecting said latches with ropes *e e'*, and the catches *m m*, secured to post B', and constructed as shown, substantially as and for the purpose herein specified.

2. The gate-post B, the swinging gate C, loosely hinged thereto, and having pins or plates *h* in its edge, the catches *m*, with which said pins engage, consisting of spring-stripe having their ends bent back and inclined upwardly, and the means for raising said pins out of the catches and swinging the gate, consisting of the pulleys D E, the ropes *e e'*, and levers G G', all arranged substantially as herein described.

3. The gate-post B, the gate C, having frame-post *c'*, loosely hung by hinges *c* to the gate-post, and having pins *h*, the catches *m*, with which they engage, and the means for operating the gate, consisting of the pulleys D E, ropes *e e'*, and levers G G', in combination with the means for preventing the gate from being released, except by said levers G G', consisting of the guard-plate M, supported on pins *n* between the gate-post and frame-post, and connected with ropes *e e'* by cords *o*, substantially as herein described.

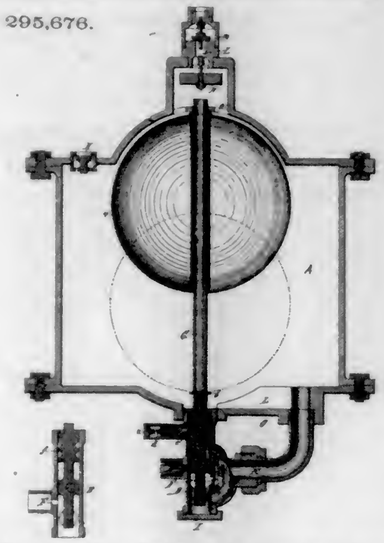
295,675. ARTIFICIAL LEG. EDGAR D. RICHMOND, Hart, Mich., Executor of Kins R. Collins, deceased. Filed Nov. 9, 1883. (Model.)

Claim.—1. The suspension-strap *y*, connected to the leg by passing through the sides of the thigh-socket at *z* and under the pulley *x*, mounted on the pivot-pin *w* of the knee-joint, substantially as described.

2. The extensor-spring *a'*, connected to the ankle behind the ankle-joint, and having a connection, *c'*, extended through the thigh-socket in front of the vertical line of the knee-joint, and also extended through the side of the thigh-socket, to be tied for maintaining the tension of said spring, substantially as described.

295,676. AIR-PUMP. GEORGE ROSS, Troy, N. Y. Filed Aug. 27, 1883. (No model.)

Claim.—1. In an air-compressing apparatus, the detent or latch, combined with the float and valve, and arranged for holding the float until its weight or buoyancy is sufficient to overcome the resistance of the detent or latch, and to shift the valve, substantially as shown and described.



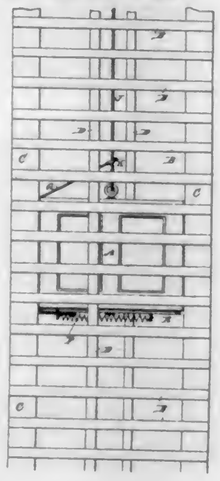
2. In an air-compressing apparatus, the water-valve balanced in its casing, said valve having its stem extended directly into the tank, and operated by a float, substantially in the manner and for the purposes set forth.

3. In combination with the valve-casing located outside of the tank, and having the valve and latch or detent therein as specified, the removable cap applied upon the bottom of the casing, the whole being arranged so as to permit withdrawal of the valve and washing of the casing, substantially as shown and described.

4. In an air-compressing apparatus, the valve-case having the inlet and outlet channels and ports therein, one above the other, the balanced valve, the latch or detent and the screw-cap, combined and arranged substantially as shown and described.

5. In combination with the tank containing the float, the boss for at-

295,676.

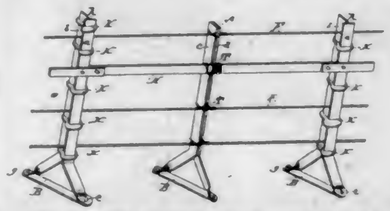


tachment of the water-conduit leading to the valve-casing, said boss being provided with a channel leading from the lowermost point of the tank to facilitate cleaning, substantially as shown and described.

295,677. BLACKING-BOX. ADDISON V. SANFORD, Elmira, assignor to Frederick Dietz, New York, and S. W. Corvin, Middletown, N. Y. Filed Nov. 9, 1883. (No model.)

Claim.—The box A, cover D, handle B, having bends *b* therein, and cover-holder C, having ends *b'* and bearing thumb-piece E, the whole combined and arranged to operate substantially as shown and described.

295,678. SAFETY-STOP FOR ELEVATORS. ELLISON SAUNDERS, Austin, Tex. Filed Sept. 10, 1883. (No model.)



Claim.—1. The combination, with an elevator-car, of a pivoted locking-lever on its bottom, and of bars or analogous devices on the sides of the elevator-shaft, substantially as herein shown and described.

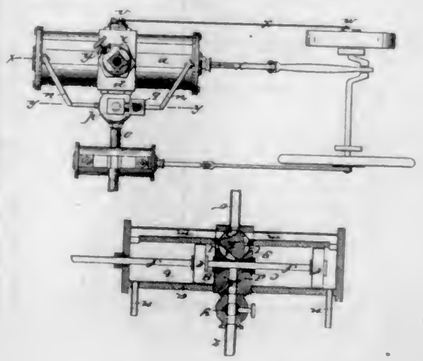
2. The combination, with an elevator-car, of a lever pivoted to its bottom, a spring acting on the lever and tending to throw it in a transverse position, and a rope or cable secured to the opposite end of the lever, and provided at its upper end with an eye or ring, through which the elevating-cable passes, substantially as herein shown and described.

3. The combination, with an elevator-car, of a lever pivoted to the bottom of the same, a spring secured to one end of the lever and to the car, a rope secured to the opposite end of the lever, and provided at its upper end with a ring through which the elevating-cable passes, and of horizontal bars or analogous devices secured to the sides of the shaft, substantially as herein shown and described.

4. The combination, with an elevator-car and a lever pivoted to the bottom of the same and acted on by a spring, of bars B B, secured to the posts C, and of the struts D, substantially as herein shown and described.

295,679. FENCE. FRANK SCHMITT, Cornell, Ill. Filed Apr. 9, 1883. (No model.)

Claim.—In a fence, the combination of the board H, wires F, keyed bars *a* and *b*, transverse bar B, and keys K, substantially as shown and described.



295,680. DEVICE FOR POINTING PENCILS. HENRY G. SCHRAMM, Camden, assignor to William Koufel and Herman Ebner, both of Hoboken, N. J. Filed Jan. 25, 1884. (No model.)

Claim.—1. The combination, in a device for pointing pencils, of the box A, roller or rollers B, and fixed band D, or their equivalents, substantially as set forth.

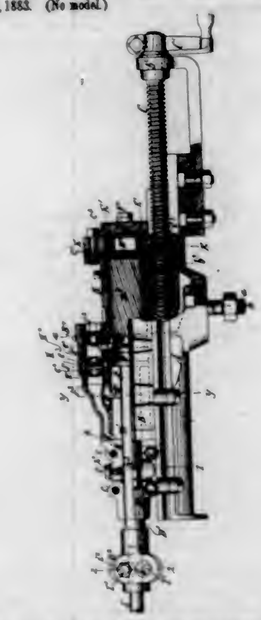
2. The combination, in a device for pointing pencils, of the box A, rollers B, or their equivalents, band D, and bridge E, substantially as set forth.

295,681. STEAM-ENGINE. GEORGE F. SIEBEL, Carrollton, Ky. Filed Dec. 17, 1883. (No model.)

Claim.—1. The combination, with the steam-cylinder *a*, having chambers *b c* and passages *m*, and the pistons *s* on the same rod, *f*, of the partition *d*, separating said chambers, and provided with the passage *k* and ports *l*, and the valve *h*, provided with the passages *i j*, substantially as herein shown and described.

2. The combination, in a steam-engine in which the live steam acts on one side of the piston only, of a valve and passage adapted to exhaust the steam from the driving side of the piston to the other side for balancing the pressure of the exhaust-steam thereon, substantially as described.

3. The combination, in a steam-engine in which the live steam acts on one side of the piston only, of a valve and passage adapted to exhaust the steam from the driving side of the piston to the other side for balancing the exhaust-steam thereon, and means for condensing the exhaust-steam in the balancing-chamber, substantially as described.



4. The combination, in a steam-engine in which the live steam acts on one side of the piston only, of a valve and passage adapted to exhaust the steam from the driving side of the piston to the other side for balancing the pressure of the exhaust-steam thereon, means for condensing the exhaust-steam in the balancing-chamber, and a valve adapted for exhausting the water from said balancing-chamber when the forward movement of the piston begins, or thereabout, substantially as described.

5. The combination, in a steam-engine in which the live steam acts on one side of the piston only, of a valve and passage adapted to exhaust the steam from the driving side of the piston to the other side for balancing the pressure of the exhaust-steam thereon, means for condensing the exhaust-steam in the balancing-chamber, a valve adapted for exhausting the water from said balancing-chamber when the forward movement of the piston begins, and a pump for receiving and delivering the water therefrom, substantially as described.

6. The combination, in a steam-engine, of the divided cylinder *a b c*, piston *s* in each chamber, distributing-valve *h* in the partition between said chambers, passages *m*, exhausting the steam into the chambers *b c* behind the pistons, distributing-valve *p h*, supply-pipe *q*, and condensing-pipes *n*, substantially as described.

7. The combination, with the cylinder *a*, having chambers *b c*, divided by partition *d*, of the water-valve case *p*, arranged at one side of the said cylinder, and the steam-distributing valve *h*, extending into said water-case and provided with way *t*, substantially as herein shown and described.

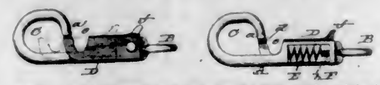
295,682. ROCK-DRILL. HENRY C. SERGEANT, Denver, Colo. Filed Dec. 4, 1883. (No model.)

Claim.—1. In a rock-drill in which the exhaust-port is controlled by the piston, the combination of the ported cylinder and the piston with a fluid-controlling valve actuated by the inflowing fluid when the compression is made on the exhaust end of the cylinder, substantially as shown and described.

2. The combination, with the cylinder B, having supply-ports *e e'* and an exhaust-port, *g'*, between said supply-ports, of the piston D, having a movement across and considerably beyond the said exhaust-port at each stroke, and the automatic valve H, movable between the valve-seats *e² e²*, for controlling the admission of a motive agent to said supply-ports *e e'*, substantially as described.

3. The combination, with the cylinder B, having supply-ports *e e'* and an exhaust-port, *g'*, between said supply-ports, of the piston D, having a movement across and considerably beyond the said exhaust-port at each stroke, and the automatic valve H, movable between the valve-seats *e² e²*, and provided with the disks *f⁴*, upon which the motive agent acts to move the valve, substantially as herein described.

4. The combination of the cylinder B, the head B', the follower F, and bolts F', connecting said head and follower, the head B², having its diameter slightly larger than the cylinder, and formed with an annular rabbet, so as to enter the cylinder, the piece E, rigidly secured to the cylinder, and forming a cylindric guide, wherein the said head B² and follower F may move, and the cushion E', arranged in said guide E between the head and follower, substantially as herein described.

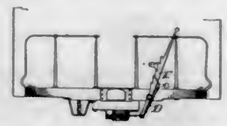


5. The combination, with the cylinder of a rock-drill, of a piston having a head or extension which is spirally grooved externally, and a spring-actuated nut-section engaging with the spiral grooves of the piston head or extension, and capable of being forced back by the action of the motive agent upon its face or inner end to free it entirely from the spiral grooves of said piston head or extension, substantially as and for the purpose herein described.

6. The combination, with the cylinder of a rock-drill, of a piston head or extension having a spirally-grooved exterior, a spring-actuated nut-section engaging with the spiral grooves of said head or extension, and capable of being forced back by the pressure of the motive agent upon its face to free it entirely from said spiral grooves, and a stop for limiting the inward movement of said nut-section, substantially as and for the purpose herein described.

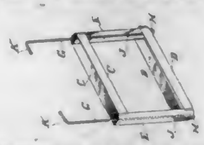
7. The combination of the cylinder B, having the transverse socket or slideway B³, provided with the shoulder *d³*, the spirally-grooved piston-extension D², the movable nut-section G, engaging with the grooves of said piston-extension, and provided with the shoulder *d²*, the spring *d'*, and the plug *d*, closing the outer end of said socket or slideway B³, substantially as herein described.

8. The combination, with the piston-rod D', of the longitudinally-divided cylinder-head B', having the annular packing-groove *h* and the tangential aperture *h'*, substantially as herein described.



295,683. SNAP-HOOK. JOHN H. SHAW, New Haven, Conn., assignor to Sargent & Co., same place. Filed Jan. 28, 1884. (No model.)

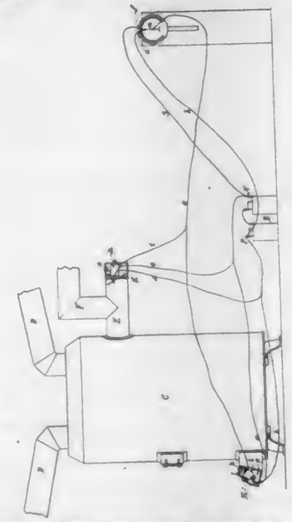
Claim.—1. The herein-described snap-hook, consisting of the body A, terminating at one end in a device for attachment and at the other in the hook C, its nose *a* turned downward toward the body of the hook, combined with a longitudinally-sliding spring-bolt, D, constructed at its forward end to pass beneath the nose of the hook, and with a transverse recess, *e*, in rear of its forward end, and so as to leave a space or recess in rear of the forward end of the bolt for the introduction of the engaging device, and the spring F, substantially as described.



2. The combination of the body A, terminating at one end in a device for attaching the hook, and at the other end in the hook C, its nose turned downward toward the body of the hook, the body constructed with a recess, E, in rear of the hook, the longitudinally-sliding bolt D, inverted-U shape in transverse section, the legs of the U extending down over the sides of the body to cover said recess, its forward end *d* constructed to pass beneath the hook, and with the transverse recess *e* in rear of its forward end, the spring F, arranged in the recess in the body, and so as to bear rearward against the bolt, substantially as described.

295,684. CAR-COUPLING. LEANDER E. SLOAN, Milwaukee, Wis. Filed Feb. 21, 1883. (No model.)

Claim.—A draw-bar adapted to yield laterally against springs, and having a pivoted hooked head and locking-pawl, in combination with lever E, having notches *e'*, and chain having loop *e*, as and for the purpose set forth.



295,685. BROOM-BAND. JAMES SMITH, Boston, Mass. Filed Sept. 11, 1883. (No model.) Patented in Canada Oct. 26, 1883, No. 17,999.

Claim.—1. The improved broom-band herein described, the same consisting of the elastic strap C, non-elastic strap D, flexible straps E, and holders G, constructed, combined, and arranged to operate substantially as set forth.

2. In a broom-band substantially such as described, the wire holder G, having the inwardly-projecting hook K at its upper end, and the loop H and inwardly-projecting stud J at its lower end, substantially as shown.

295,686. ELECTRIC HOT-AIR-FURNACE REGULATOR. FRANK MILLER SPARROW, Mattapoisett, Mass., assignor, by mesne assignments, to himself and William E. Sparrow, same place. Filed June 13, 1883. (No model.)

Claim.—1. In combination with a furnace and a thermostat or thermometer, substantially as described, and with the valves G and K of the fire-place and discharge-flue of such furnace, the magnetic armatures, the two electro-magnets, the two switches, the current-wires, and battery, and abutments, as adapted and arranged substantially and to operate as set forth.

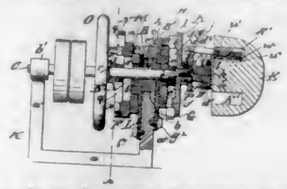
2. The combination of an electro-magnet, H, a magnetized armature, *i*, therefor, a switch, *l*, and its abutments *m* and *n*, a thermostat or dial thermometer, A, as described, a battery, B, and circuit-wires *a*, *b*, *g*, *k*, and *e*, arranged and adapted substantially as represented, whereby an electric current may be caused to pass in one and next in the opposite direction through the magnet, and such current be produced only when the armature is in movement relatively to the magnet.

295,687. CHIMNEY-COWL. EMIL R. STAHL, Corning, N. Y. Filed Sept. 3, 1883. (No model.)

Claim.—A chimney-cowl composed of a cylindrical flue, A, two downwardly-projecting hollow arms, B B, and a deflecting-shield placed directly above the flue and composed of two inclined plates, each extending into the hollow arms B B and terminating at or near the level of the top of flue A.

295,688. ART OF PRINTING AND MOUNTING PHOTOGRAPHIC PICTURES. JUAN DE M. TERREFORTE, New York, N. Y., assignor to himself and ANTONIO M. MOLINA, same place. Filed June 27, 1883. (No specimens.)

Claim.—The method herein described of taking and mounting photographic pictures, which consists in preparing upon glass or other suitable surface a film of dry collodion, then spreading upon the collodion film a sensitive coating of gelatinous or albuminous emulsion containing nitrate of silver, then drying the same, then printing and developing the picture in the ordinary manner upon said sensitized coating, then attaching paper to the picture by applying paper that is faced or coated with plain moist gelatine or albumen to the picture upon the glass, then allowing the paper to dry under pressure in contact with the picture, and then stripping the paper, and with it the picture, from the glass, all substantially as herein described.



295,689. CASTER. EDDY T. THOMAS, New York, N. Y. Filed Apr. 23, 1883. (No model.)

Claim.—1. The combination, with the leg of an article, of an eccentric bearing-roller or cam, whereby the said article may be properly supported on an uneven floor, substantially as described.

2. The combination, with the main caster or roller rotating concentrically on an axis, of an auxiliary eccentric bearing-roller or cam, substantially as and for the purpose described.

295,690. HAT-POUNCING MACHINE AND LATHE. WILLET THOMPSON and JOSEPH A. GEORGE, Brooklyn, N. Y., assignors to the Brooklyn Needle Works, same place. Filed Jan. 22, 1884. (No model.)

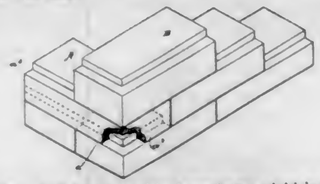
Claim.—1. The plate K, arranged to receive irregular rotary movement from the eccentric B′, in combination with the counterbalancing-plate F, arranged to receive opposite irregular movement from the eccentric B^2, the eccentrics B′ B^2 being adapted to be turned for shifting the still-point, substantially as and for the purposes described.

2. The collar B, formed with the opposite eccentrics B′ B^2, and adapted to be turned in the openings *b* of the upright a^2 of the frame, substantially as and for the purpose described.

3. The collar B, formed with the eccentrics B′ B^2, in combination with means, substantially as described, for imparting irregular motion to the face-plate K and counterbalancing-plate F, as and for the purposes set forth.

4. The collar B, formed with the eccentrics B′ B^2, the plate G, formed with eccentric *g*, placed on eccentric B′, yoke H, placed on eccentric *g*, slotted plate I, secured to shaft C, and face-plate K, connected to yoke H and formed with blocks that move in the slots made in the plate I, in combination with the plate I, formed with eccentric *i*, placed on eccentric B^2, yoke M, counterbalancing-plate F, attached to yoke M, and slotted cross-piece N, in the slots of which the blocks *p* of the plate F move, the cross-piece being arranged to revolve with the shaft C, substantially as and for the purposes described.

5. The face-plate K, formed with the collar *j*, in combination with the cam P, placed thereon, and the chuck D, provided with the pivoted arms d^2 d^3, the arms being provided at their ends with pivoted plates, substantially as and for the purposes described.



6. The chuck D, composed of head *d*′, pivoted arms d^2 d^3, provided at their ends with pivoted plates, the plate u^2 being formed with the fin u^3, in combination with the plate K, having collar *j*, and cam P, adapted to be revolved upon the said collar for operating the arms d^2 d^3, substantially as and for the purposes set forth.

295,691. WATER-CLOSET VALVE. HENRY A. TOBEY, Dayton, Ohio, assignor to the Hartford Sanitary Plumbing Company, Hartford, Conn. Filed July 30, 1883. (No model.)

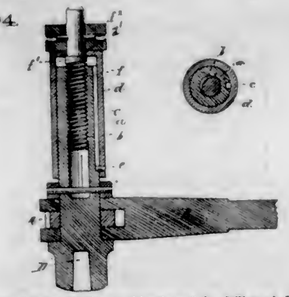
Claim.—The herein-described valve, consisting of the chamber B, having an inlet, C, concentric therewith and below the outer passage, the outlet-passage from one side of the chamber, with a tubular extension therefrom into said chamber and concentric therewith, and so as to form a concentric space between the walls of said chamber and said tubular extension, with the valve G arranged to seat upon the open end of said concentric extension, and of an area substantially equal to the internal area of the chamber, but so as to leave a slight passage from that part of the chamber below to the part of the chamber above the valve, and an opening from that part of the chamber above the valve, with mechanism, substantially such as described, to open said passage above the valve for the escape of water therefrom, substantially as described.

295,692. BRICK. ALBERT TROCHSLER, Boston, Mass. Filed Jan. 7, 1884. (No model.)

Claim.—As an improved article of manufacture, a brick having projections at its under side along its longitudinal edge and across one end, and having rabbets at its upper side along one longitudinal edge and across one end, substantially as shown and described, whereby a strong and neat-appearing corner may be formed, substantially as set forth.

295,693. BEE-HIVE. JOSHUA VANLANDT, Seward, Kendall County, Ill. Filed May 11, 1883. (Model.)

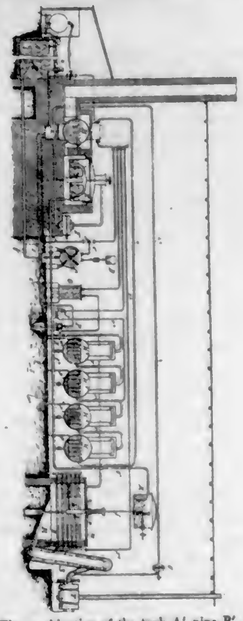
Claim.—In a bee-hive, the combination, with the body A, of the open-bottomed feed-box F, resting on the edges thereof, and the feed-trough J, arranged therein on comb-frame B, leaving an open space between the feed-box and trough, as described.



295,694. RATCHET-DRILL. JOHN H. VINTON, Boston, Mass., assignor to the Ashcroft Manufacturing Company, same place. Filed Oct. 13, 1883. (No model.)

Claim.—1. In a ratchet-drill, the combination of the post or nut *a*, having the groove or recess *c* and threaded hole *b*, with the sleeve or cap *d*, having the pin *e*, and the feeding-screw *f*, loosely secured to the sleeve, and adapted to be revolved therein, all substantially as and for the purposes described.

2. The combination of the post or nut *a*, having the screw-threaded hole *b*, with the sleeve or cap *d* and a feeding-screw, *f*, loosely attached to the sleeve or cap, and adapted to screw into the threaded hole *a*, all substantially as and for the purposes described.



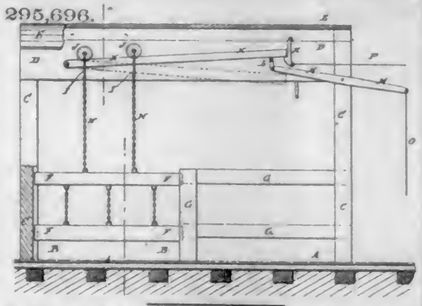
3. In a ratchet-drill, the combination of the post or nut *a*, having the screw-threaded hole *b*, the sleeve or cap *d*, and feeding-screw *f*, adapted to screw into the nut *a*, and the thumb-disk f^3, all substantially as and for the purposes described.

295,694.

4. In a ratchet-drill, the combination of the drill-stock D, ratchet-wheel A; handle B, spring-pawl C, and the feeding device described, comprising the nut *a*, the cap or sleeve *d*, feeding-screw *f*, loosely attached to the sleeve or cap *d*, and the thumb-disk f^3, all substantially as and for the purposes described.

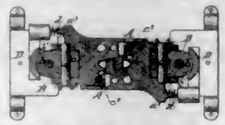
295,695. APPARATUS FOR MAKING FERTILIZERS. ADALBERT BARON VON PODEWILS, Munich, Bavaria, Germany. Filed May 10, 1883. (No model.)

Claim.—1. The combination of the tank A′, pipe B′, communicating with a flue, revolving bell C′, and hollow arms B′ B^2, substantially as set forth.



2. The combination, with the tank and its pipe B′, of the bell C′, carrying hollow arms, and appliances for raising and lowering the bell, substantially as set forth.

3. The drying-tank provided with one or more shallow steam-casings, with traveling scrapers, and with a traveling feed-pipe, substantially as set forth.



295,696. RAILWAY-GATE. LAWRENCE COOPER WALSH, Webster, Mass. Filed Oct. 22, 1883. (No model.)

Claim.—The combination, with the gate F, the pulleys, connections between said gate and pulleys, and the track K, pivoted at its outer end, and provided near its free end with a link, L, of the pivoted lever M, connected to the track by said link, and the vertical pivoted latch N, for engaging the free end of the track, cords or wires O P, secured to the free end of the lever and lower end of the latch, respectively, and a suitable frame-work for supporting the above devices, substantially as set forth.

295,696.

295,697. CAR-COUPLING. WILLIAM H. WARD, Monongahela City, Pa. Filed Feb. 14, 1883. Renewed Oct. 3, 1883. (No model.)

Claim.—1. A twin-hook coupling having the shank part A pivoted, the fixed projection *c'* extending from said shank part into the throat of the hook *c*, and having its hook end recessed to adapt it to receive the said fixed projection to be locked within the intermatching hooks, substantially as described, for the purpose specified.

2. A twin coupling having the shank of each hook part pivoted by a double flexing joint, substantially as described, for the purpose specified.

3. The combination of a suitable coupling-hook draw-head with a coupling-hook pivoted thereto by joint-pins arranged at right angles to each other, substantially as described, for the purpose specified.

4. A twin-hook coupling having the shank of each hook part pivoted to the draw-head by a horizontal butt-joint pin, *a*, and a vertical butt-joint pin, *b*, in combination with a joint-coupling, B, connecting the hook with the draw-head, substantially as described, for the purpose specified.

5. The combination, in a twin coupling, of the hooks, with their pivot-pins *a b*, the joint-coupling B, and the separate joint-head *s*, connecting said joint-coupling with the draw-head, substantially as described.

6. The combination, with the hook A, of the joint-coupling B, the joint-head *s*, the butt-joint pins *a b*, the yoke-rods *t t*, and the cushioned draw-head *p*, substantially as described, for the purpose specified.

7. The combination, with the hook having its shank part A pivoted by a double flexing joint, substantially as described, of means, substantially such as described, whereby it is adjusted and sustained both in lateral and vertical positions for automatic coupling.

8. The combination, with the hook, pivoted substantially as described, of the cranked rod *h i*, the ratchets *k*, the pawls *l*, and the chain *j*, connecting said hook and the crank *i* of said rod, substantially as described, for the purpose specified.

9. The combination, with the hook, pivoted substantially as described, of the cranked rod *f f'*, the ratchets f^2, and the pawls f^3, and the pivoted rod *a*, connecting the said cranked rod with the hook, and provided with the spring a^3, for sustaining said hook upon the pivoted rod, substantially as described, for the purpose specified.

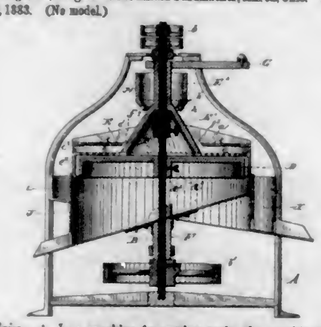
10. The combination, with the coupling-hook, pivoted substantially as described, of the cranked rods *h i f f'*, their ratchets and pawls, and means, substantially such as described, whereby said hook is connected with the cranked rod *i* and with the cranked rods *f f'*, and sustained in horizontal position for coupling.

11. The combination, with the coupling-hook, pivoted substantially as described, of the cranked rods *h i f f'*, their ratchets and pawls, the chain *j*, the pivoted rod *a*, provided with the hook-sustaining spring a^3, and means, substantially such as described, whereby the said cranked rods are connected for operating and adjusting the coupling-hook from the top of the car.

12. The combination, in a car-coupling, of the slotted plate n^2, secured to the top of the car, the rods *m m'*, provided each with a catch, *n'*, the cranked rods *h i f f'*, their ratchets and pawls, the chain *j*, the pivoted rod *a*, provided with the hook-sustaining spring a^3, and a hook having its shank pivoted by a double joint, all constructed and arranged for coupling and for uncoupling cars from the ground and from the top of the car, substantially as described, for the purpose specified.

13. The combination of the hook A, having the interior recess, c^4, the fixed projection *c'*, extending into the throat of the hook, and a pin-hole, c^5, passing through said interior recess, with the removable locking-pin c^6, substantially as described, for the purpose specified.

295,698. PULLEY. JULIUS E. WATEROUS and JAMES N. PEEL, Brantford, Ontario, Canada. Filed Feb. 5, 1884. (No model.)

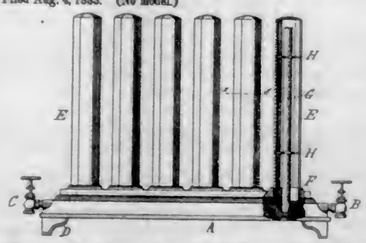


Claim.—1. The combination, with the hub A, of arms B, rigidly secured thereto, adjustable heads D, applied to the outer ends of the arms, and a rim, C, secured to the heads D, substantially as set forth.

2. The combination, with the hub A, of arms B, rigidly secured thereto, heads D, arranged at the outer ends of the arms, sleeves E, whereby the heads D are adjustably secured to the arms, and a rim, C, secured to the heads D, substantially as set forth.

3. The combination, with the hub A and rim C, of arms B, rigidly secured to the hub, and having their outer ends provided with external screw-threads, heads D, secured to the inner side of the rim, and sleeves E, constructed with internal screw-threads, and having flanges *f* at their outer ends bearing against the sleeves, substantially as set forth.

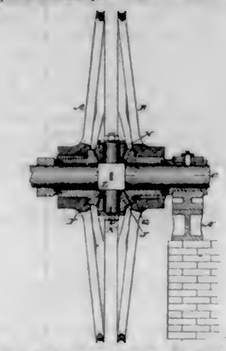
4. The combination, with the hub A, arms B, and rim C, of heads D, connecting the rim to the arms, and constructed with cavities adapted to receive counterbalancing material, substantially as set forth.



295,699. MACHINE FOR CUTTING GRAIN. ANDREW WEMPLE, Chicago, Ill., assignor to Ferdinand Schumacher, Akron, Ohio. Filed May 22, 1883. (No model.)

Claim.—1. In a machine for cutting grain, the combination, with the spider E and the covers *e'*, of the detachable feed-plates adapted to be cleaned, repaired, or removed from the machine while in operation, substantially as set forth.

2. In a machine for cutting grain, the revolving cutting-disk, segmental detachable feed-plates, and covers therefor, adapted to have one portion of the cover and feed-plates cleaned, removed, and repaired without affecting the successful operation of the machine, substantially as shown and described.

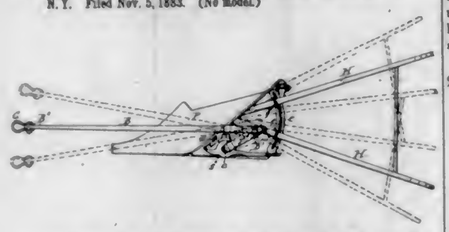


295,700. STEAM-RADIATOR. ELISHA T. WEYMOUTH, Brooklyn, N. Y. Filed Aug. 4, 1883. (No model.)

Claim.—1. In a steam-radiator of the character herein specified, the vertical octagonal radiating-pipes secured to a base-chamber, and having circulating-tubes, open at both extremities, centrally supported by the two arms, substantially as shown and described.

2. In a radiator of the character herein specified, base-chamber A, having an inlet, B, and outlet C, octagonal radiating-pipes E, and circulating-tubes G, centrally supported in pipes B by means of the two arms H, the said tubes being open at both extremities, as set forth, and the whole combined and arranged to operate substantially as shown and described.

295,701. DEVICE FOR TRANSMITTING POWER. ANDREW D. WHITTON, Philadelphia, Pa., assignor of two-thirds to George Rice and Hans P. Hougen, both of same place. Filed Dec. 3, 1883. (No model.)



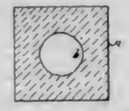
Claim.—1. The shaft C, in combination with the loose pulleys A B, the gear-wheels F G, connected with said pulleys, and gear-wheels H J, rotating with said shaft C, and gearing with the wheels F G, substantially as and for the purpose set forth.

2. A shaft, in combination with pulleys loosely fitted thereon and carrying gear-wheels, and a shaft secured to the first-named shaft at a right angle thereto and supporting loosely-fitted gear-wheels, which gear with the first-named gear-wheels, substantially as and for the purpose set forth.

3. The bevel-wheels F G H J, the driving-pulleys A B, the independent pulleys D E, and the cable, combined and operating substantially as and for the purpose set forth.

295,702. PLOW. HARRY WIARD and WILLIAM R. BULLOCK, Syracuse, N. Y. Filed Nov. 5, 1883. (No model.)

Claim.—1. In combination with a plow and handles pivoted at their forward end on said plow, as shown, a handle-supporting plate extended across the rear portion of the plow, and having its central or intermediate portion depressed or deflected downward to carry the handles at a uniform elevation in relation to each other in their lateral adjustment, substantially as specified and shown.

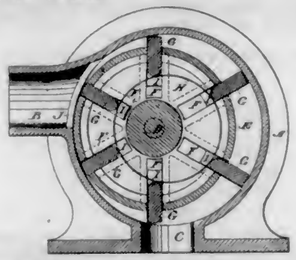


2. A plow-beam formed of a metal bar terminating at the rear end with a vertical cylindrical shank, in combination with a plow provided with a vertical cylindrical socket or step for the reception of said beam-shank, and an adjustable clamping device connected with said socket, to confine the beam at different elevations and in different angles in relation to the line of draft, substantially as described and shown.

3. In combination with the plow-beam provided with a vertical cylindrical supporting-arm and a vertical groove in said arm, the plow provided with a vertical cylindrical socket and with openings in the side of said socket, an eyebolt adapted to pass through said openings and to carry its eye in range with the socket, and provided with a feather to engage with the groove of the beam-supporting arm, and a clamping-nut on the end of the eyebolt protruding through the side of the socket, substantially as described and shown.

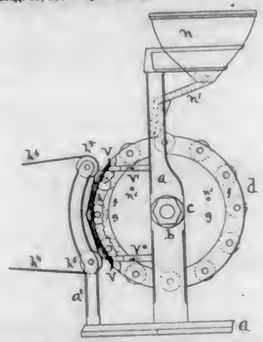
4. A plow-beam formed of a round bar of wrought metal bent into the shape of a vertical shank, c, at its rear end, thence rearwardly, laterally, and upwardly, and thence forwardly and downwardly, and having its forward extremity adapted for the attachment of the whiffletree for the attachment of the clevis, substantially as described and shown.

5. In combination with the plow-beam provided with a vertical cylindrical supporting arm or shank, and with a vertical groove in said shank, the plow provided with the vertical socket *s*, openings *t* and *t'* in said socket, and serrations *u* on the exterior, the eyebolt *a*, provided with the feather *b*, the serrated washer *w*, and nut *n*, all constructed and combined substantially in the manner specified and shown.



295,703. SMOOTHING THE INNER SURFACE OF WOODEN TUBING. MERRILL F. WILCOX, Bay City, Mich. Filed Sept. 10, 1883. (No model.)

Claim.—1. A method of smoothing the inner surface of wooden tubes, which consists in forcing through said tubes a rapidly rotating smooth steel plug slightly larger than the bore of the tube, as described.



2. A method of filling cavities or open places on the inside of wooden tubes and glazing the inner surface thereof, which consists in centrifugally distributing rosin or like substance on the inner surface in advance of and from a rotary smoother, as described.

295,704. ROTARY PUMP. JOHN M. WILES, Butte City, Cal. Filed Sept. 1, 1883. (No model.)

Claim.—In a rotary pump, a cylindrical outer case and a cylindrical inner drum rotating upon axis at one side of that of the case, and having the radially-sliding buckets, in combination with an interior elastic ring fitting loosely within the drum, and pressing against the inner ends of the buckets, substantially as herein described.

295,705. BUTTON-MACHINE. GEORGE R. WILLIAMS, Ithaca, N. Y. Filed Aug. 23, 1883. (No model.)

Claim.—1. In a machine for smoothing the edges of buttons, the receptacle which holds a supply of buttons, in combination with tubes or channels, substantially as shown, which automatically separate and convey the buttons to their appropriate places in the machine.

2. An inclined channel down which the buttons roll singly in a series, provided with apertures in the base of it—one nearer one side than the other—whereby the buttons faced one way fall into the one aperture, and the buttons faced the other way pass on by the bridge left in the channel-base for their edges to roll on and fall into the other aperture.

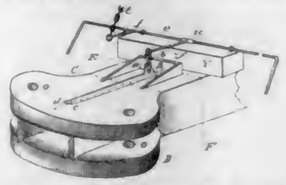
3. A curved delivery-channel connected with one or the other aperture in the main channel through which buttons descend singly in a series, whereby buttons wrongly faced in the main channel are reversed.

4. In a button-smoothing machine, the guide-plate held in suitable relation to the lathe-holding disk or disks, and provided with U-shaped recesses or pockets, in combination with the lathes, lathe-chucks, and the clamping-spindles.

5. A lathe-wheel with a series of lathes near its circumference, in combination with a stationary concave tool held in proximity to and ad-

justable to the buttons in the lathe-chucks, whereby as the wheel revolves the edges of the buttons are rotated in contact with the tool.

6. The combination of a revolving button-finishing wheel having lathes and clamping-spindles with cams which open by means of projections on the spindles or their springs, a space between the spindles and lathes to receive the buttons before the finishing-tool is reached, and which also open said spindles from the lathes to discharge the buttons after the finishing-tool is passed.



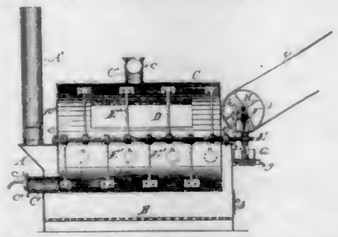
7. The combination of the main or feeding-channel having separating-exits in its base with the conveying-spouts which connect said main with the chucks of the lathes.

8. The spindle-supporting rims *f f'*, in combination with the spindle-supporting disks *g g'*, whereby a frame with rotation on the axle *c* is made.

9. The lathe-plates A A', constituting the lathe-frame, in combination with the lathes, said plates or disks being on an axle, *c*, and rotating thereon.

10. The band A', provided with pulleys in a supporting standard or part, in combination with the button-lathes, which band rotates the lathes while the buttons are passing the finishing-tool.

295,706. CAR-COUPLING. HAMLINE B. WILLIAMS, Glenwood, Iowa. Filed Feb. 7, 1883. (No model.)



Claim.—1. The bell-mouthed draw-head, Fig. 1, with triple pin-holes *o* and beveled slot *k*, adapted to receive the lever-catch or automatic block, with beveled horseshoe-shaped groove in the lower plate, *w*, with water-hole *y*, with shoulders or projections *l* in the chamber or cavity, with the upper plate thicker than the lower, with longitudinal opening *m*, with brace Z, all constructed substantially as described.

2. The combination of the automatic pin, block, or lever-catch, Fig. 4, with the triple-slotted draw-head, Fig. 1, all constructed substantially as described.

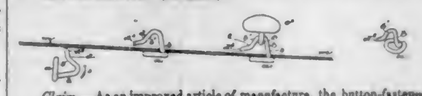
3. The combination of the automatic pin, block, or lever-catch, Fig. 4, with the triple-slotted draw-head, Fig. 1, and uncoupling mechanism, all constructed substantially as described.

295,707. MACHINE FOR MIXING ASPHALT. GEORGE WINDING, Milwaukee, Wis. Filed Jan. 2, 1884. (No model.)

Claim.—1. In a machine for mixing asphalt, &c., the combination, with a stationary cylinder and furnace, of a horizontal stirrer-shaft having stirring-blades attached thereto, a worm-shaft, an exterior water-trough, and a worm-wheel adapted to revolve in said trough, substantially as set forth.

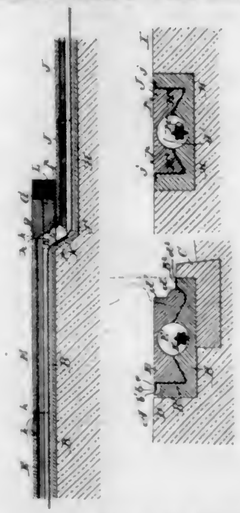
2. In a machine for mixing asphalt, &c., the combination of the stationary cylinder C, having ventilating-pipe C^2, with damper c^2 and outlet-pipe C', horizontal shaft E, with stirrers E', attached thereto, and furnace A, below the cylinder, having fire-bed and series of cooling-ports controlled by gates *a a*, substantially as set forth.

295,708. BOTTLE-STOPPER. AUGUST H. WIRZ, Philadelphia, Pa. Filed Oct. 15, 1883. (No model.)



Claim.—1. A bottle-stopper provided with a valve having a flange, a valve-seat, and a cylindrical neck encompassing the valve, said neck being provided with an inwardly-projecting annular crease above the flange on the valve, and having sufficient space between the crease and the valve-seat to allow the movement of the valve, as set forth.

2. A bottle-stopper having a valve with a flange and screw-thread near its upper end, a valve-seat and cylindrical neck, formed of a single piece, the neck being provided on its inside, near the top, with screw-threads for engaging with those on the valve and a crease above the flange on the valve-seat, as and for the purpose set forth.



3. In a bottle-stopper, the neck B, extending up so as to cover the screw-threads on the valve-stem, and having the circular depression or crease *b*, in combination with the valve C, having central outlet, *d*, passage *d''*, and cuts *d' d'*, substantially as shown.

295,709. BUTTON-FASTENER. WILLIAM H. WOOD, Rochester, N. Y. Filed Nov. 13, 1883. (No model.)

Claim.—As an improved article of manufacture, the button-fastener herein shown and described, it consisting of a single piece of wire bent or coiled to form the base *a*, and loop-like inclined shank portions *b b'*, the part *b'* being further bent to form a foot, d^3, all being constructed and adapted to operate as set forth.

295,710. SIDEWALK-CURB AND SURFACE-CASE FOR ELECTRIC WIRES. RICHARD WYLIE, Napa, Cal. Filed Dec. 14, 1883. (No model.)

Claim.—1. In a case for electric wires, the combination, with a grooved block or casting, of a cover provided with a roller-joint for swinging the cover upward, substantially as herein shown and described.

2. In a case for electric wires, the combination, with a grooved block or casting, of a cover fitting on the said block or casting, and provided with a roller-joint, *d*, and with a shoulder, *d''*, substantially as herein shown and described.

3. In a case for electric wires, the combination, with a block or casting having a longitudinal groove in the upper surface of its bottom, which upper surface is inclined downward from the edges of the groove, of a cover fitting on the casting or block, and provided with a longitudinal groove in its under side, substantially as herein shown and described.

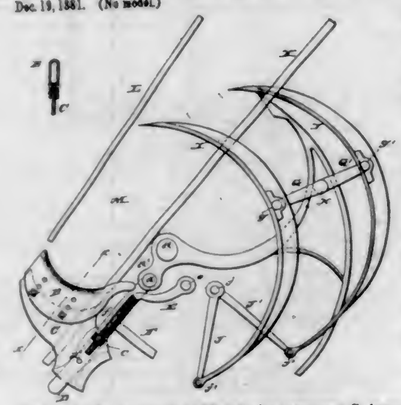
4. In a case for electric wires, the combination, with the block or casting B, having a flange, D, provided in its upper edge with a rabbet, *b*, of the cover E, provided with a flange, *e*, fitting in the rabbet *b*, substantially as herein shown and described.

5. In a case for electric wires, the combination, with grooved castings held along the curb of the sidewalk and grooved castings located in the street at the crossings, of a corner-block located at the corner of the sidewalk, and establishing communication between the blocks or castings of the curb and the blocks or castings of the street-crossings, substantially as herein shown and described.

6. In a case for electric wires, the combination, with the grooved castings or blocks B H and their covers E J, of corner-blocks establishing communication between the castings B and H, substantially as herein shown and described.

7. In a case for electric wires, the combination, with the grooved castings or blocks B H and their covers E J, of the fixed corner-block G and the removable corner-block L, placed between the fixed corner-block G and the cover of the first casting or block H, substantially as herein shown and described.

8. In a case for electric wires, the combination, with the grooved castings or blocks B H and their covers E J, of the fixed corner-block G and the removable corner-block L, placed between the fixed corner-block G and the cover of the first casting or block H, which corner-block L is provided with a ridge, M, substantially as herein shown and described.



9. In a case for electric wires, the combination, with the grooved castings or blocks B H and their covers E J, of the fixed corner-block G, provided with a rabbet, *m'*, and the removable corner-block L, placed between the fixed corner-block G and the cover of the first casting or block H, which corner-block L is provided with a ridge, M, having a rabbet, *m*, substantially as herein shown and described.

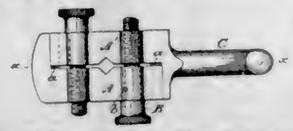
10. In a case for electric wires, the combination, with the grooved castings or blocks B H and their covers E J, of the fixed corner-block G and the removable corner-block L, provided in its under surface with grooves for receiving ridges *p* on the cover J of the first casting or block H, substantially as herein shown and described.

11. In a case for electric wires, the combination, with a grooved block, B, and a grooved block, H, of the cover E, having a recess or notch, *s*, the fixed corner-block G, and the removable corner-block L, having a projection, *r*, adapted to pass into the notch *s* in the adjoining cover E, substantially as herein shown and described.

12. In a case for electric wires, the combination, with a casting or block, B, and the cover E, of a casting or block, H, and its cover J, the fixed corner-block G, and the removable corner-block L, whereby a continuous groove is formed, substantially as herein shown and described.

295,711. GRAIN-BINDER. JAS. H. ANDERSON, Newton, Kans. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination of the tripping compressor C, formed as described, with the section B, U-shaped in cross-section, and adjustably applied to said compressor, substantially as described.



2. The adjustable compressor having the section B, U-shaped in cross-section, the main part of the compressor C entering the part B, the whole combined with the tripping-lever E, the needle A, bar D, passed through and supporting the compressor, and having pivotal connection to the same, substantially as described.

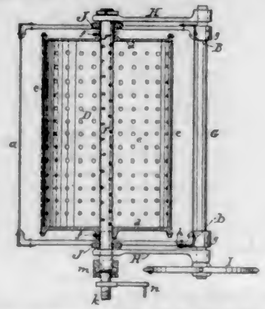
295,712. HORSE-ARMOR. JAS. H. ANDERSON, Newton, Kans. Filed Aug. 16, 1883. (No model.)

Claim.—In an armor for animals, the combination of the neck-piece D, formed wider at one end than the other, the breast-piece H, cut to fit the neck or throat of the horse, and the leg-pieces E E, all constructed of wire fabric, and each part being provided with suitable fastenings, straps, and means substantially as described for securing the said parts to the animal, all substantially as and for the purposes set forth.

295,713. LATHE-DOG. FRANK ARMSTRONG, Bridgeport, Conn. Filed June 21, 1883. (No model.)

Claim.—A lathe-dog composed of the two jaws A A', provided with the screws B B' and pin *b*, and formed with V-shaped guides or bearings *a* at either end, whereby the jaws are guided in their movements and the binding-screws are relieved from strain, substantially as hereinbefore set forth.

295,714. BUCKLE. FRANK ARMSTRONG, Bridgeport, Conn. Filed Aug. 18, 1883. (No model.)



Claim.—1. A combined buckle frame and clamp consisting of the side and end bars, one or both of the latter having angular serrated flanges or projections to form clamping-jaws, the whole formed of a single piece of sheet metal doubled upon itself and provided with a slide, substantially as set forth.

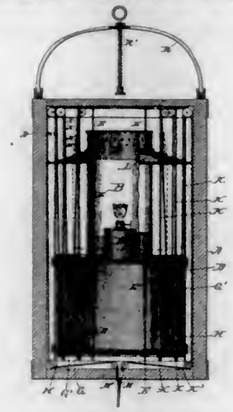
2. A combined buckle frame and clamp consisting of the side and end bars, one or both of the latter having angular serrated flanges to form clamping-jaws, the whole formed of a single piece of metal doubled upon itself and provided with an operating-slide, D, in combination with the cross-bar C, substantially as and for the purpose set forth.

3. A combined buckle frame and clamp consisting of the side and end bars, one or both of the latter having angular serrated flanges or projections to form clamping-jaws, the whole formed of a single piece of metal doubled upon itself, in combination with the slide D and a connecting-hook, E, substantially as and for the purpose set forth.

295,715. FRUIT AND VEGETABLE WASHER. JOHN BAKER, Muscatine, Iowa. Filed Oct. 29, 1883. (No model.)

Claim.—1. The combination, with the tank A, of the cylinder D, mounted on a shaft arranged in circular guides, and connected with the shaft G by means of the arms H, substantially as and for the purposes described.

2. The combination, with a tank, A, cylinder D, and circular slotted guides J, of the shaft G, connecting-arms H, and operating lever or wheel I, substantially as and for the purposes set forth.



3. The combination, with the tank A, of the cylinder D, having perforated ends *d*, and sides *c*, and mounted upon the tubular perforated shaft F, the slotted curved guides J, the shaft G, connecting-arms H, and operating-levers I, substantially as and for the purposes set forth.

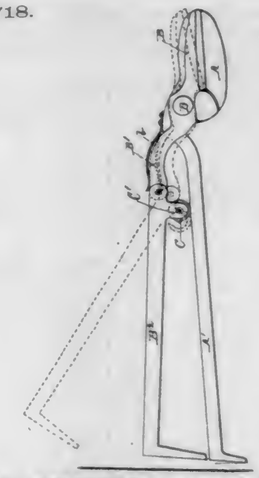
295,716. FRUIT, VEGETABLE, AND MEAT CAN. JOHN BAKER, Muscatine, Iowa. Filed Oct. 31, 1883. (No model.)

Claim.—The can A, constructed to be hermetically sealed, and provided with the central tube, C, closed at its inner end and open at its outer end, which is fastened to one end of the can, substantially as and for the purposes described.

295,717. MARINE-SIGNAL LIGHT. RICHARD J. BAKER and JOHN P. ROBERTS, Providence, R. I. Filed Jan. 16, 1884. (No model.)

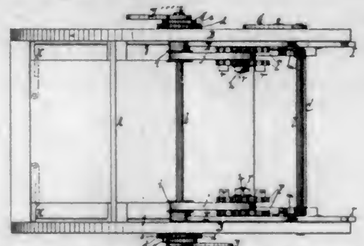
Claim.—1. In a marine night-signaling apparatus, the combination, with a white light or lantern, of three movable concentric cylindrical shades or screens—one opaque and two of colored glass—fitted below the support for the light, and adapted to be moved upward, each independently of the other, to cover and uncover the light, substantially in the manner and for the purpose herein set forth.

2. In a marine night-signaling apparatus, the combination, with each other and with a suitable frame adapted to their support, of three separate lights, each of which is provided with three movable shades or screens—two transparent and colored and one opaque—arranged to be moved, the one independently of the other, to cover and uncover the light, by means of appliances adapted thereto, substantially in the manner and for the purpose herein set forth.



3. The combination, in a marine night-signaling apparatus, with a suitable supporting-frame, a light or lantern carried therein, and a series of movable shades adapted to cover or uncover the light, of a series of operating-cords led from each separate slide over suitable friction-pulleys in the frame, and in consecutive and systematic order through a lower bar, whereby an operator below the frame is enabled to readily and quickly actuate each slide independently of the other, as required in making signals, substantially in the manner and for the purpose herein set forth.

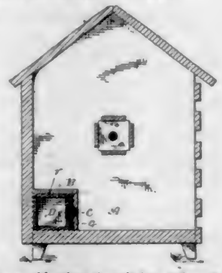
295,718. SCISSORS AND SHEARS. WILLIAM J. BAYNER, Southington, Conn. Filed Jan. 8, 1884. (No model.)



Claim.—1. In tinners' shears or analogous implements, the lever or operating portion B^2 of the handle, pivoted to the part B', which is rigidly connected with the blade or jaw, said lever or portion B^2 being provided with a bracket or arm and roller carried thereby, adapted to ride upon the opposite handle, substantially as set forth.

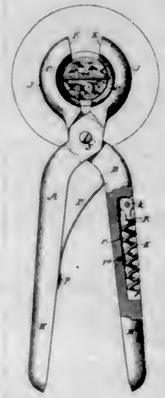
2. In a pair of shears or analogous implement, the combination, with the blade A and handle A' and blade B and part handle B', of the spring *b*, secured to one part, as A', and bearing upon the other, as B', and an operating-handle, B^2, pivoted to B', and having a roller, C, to bear upon the opposite side, A', as set forth.

295,718.



295,719. SLED-PROPELLER. CHARLES BERNHARD, New York, N. Y. Filed Jan. 7, 1884. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, with a sled, of the propeller-wheels F, mounted on independent arms E, means for depressing the propeller-wheels upon the ground, the shaft *b*, connected to the propeller-wheels by belts or chains, the cog-wheels *c*, mounted on the shaft *b*, the cog-wheels *d*, gearing into the cog-wheels *c*, and the levers D, and pawls *f*, for imparting a rotary motion to the cog-wheels *d*.



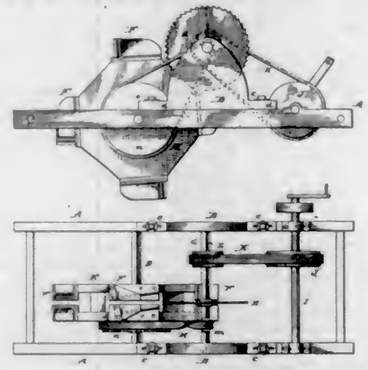
2. The combination, substantially as hereinbefore described, with a sled, of the propeller-wheels F, mounted on independent arms E, the rock-shaft *i*, lever G, and elastic fingers *m*, for depressing the propeller-wheels, and means for imparting to the said propeller-wheels a rotary motion.

295,720. RAT-TRAP FOR BUILDINGS. THOMAS M. BEVERAGE, Monterey, Va. Filed Dec. 14, 1883. (No model.)

Claim.—The combination of a suitable stationary box having openings in one of its sides with the removable trap, which is to be placed inside of this stationary box, and which is provided with a removable top and a suitable number of perforations through its side, and the perforated endwise-moving slide, substantially as shown and described.

295,721. CUTTER FOR WIRES AND CORDS OF BOTTLES. JOHN BEVINS and AMEDY PROFIT, New York, N. Y. Filed Jan. 22, 1884. (No model.)

Claim.—1. A cutter for the wires and cords of bottles, having the jaws on the opposite side of the hinge or pivot from the handles, said jaws being formed into circular sections with the cutting-edges on the inner sides of said jaws.



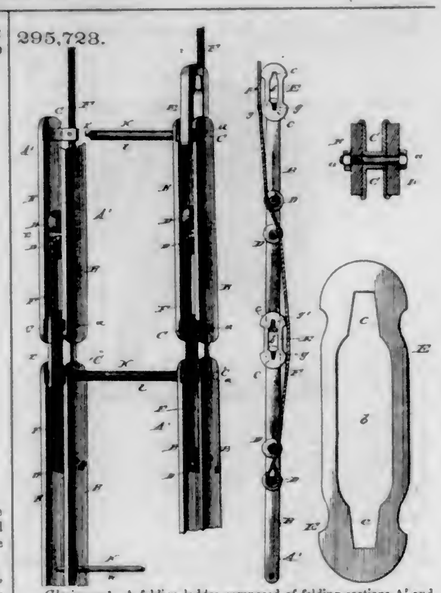
2. The combination of the handles H and H', the circular jaws J, having the cutting-edges C, the spring P, and the corkscrew K, substantially as described.

3. A cutter for the wires and cords that fasten corks to bottles, having the jaws on the opposite side of the hinge from the handles, said jaws being formed in the shape of sections of circles, and having cutting-edges removable from the said jaws.

4. The combination of the handles H and H', the pivot S, the circular jaws J, the removable cutting portion J', the pins p' and p^3, and the screws *s*, substantially as described.

5. The combination of the handles H and H', the pivot S, the circular jaws J, the removable cutting portion J', the spring P, and the corkscrew K, substantially as and for the purpose set forth.

295,722. SHINGLE-SAWING MACHINE. SAMUEL L. BITTING, Big Creek, Miss. Filed Jan. 10, 1884. (No model.)



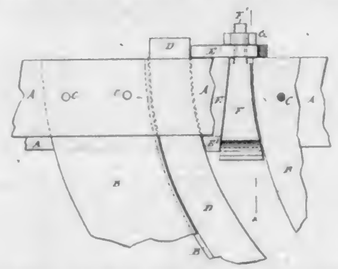
Claim.—1. The wheel E upon shaft D, having a series of divided boxes, F F, mounted upon its periphery and at a slight angle to its line of motion, in combination with a circular saw, H, duly mounted and adjustable, substantially as and for the purpose set forth.

295,723. FIRE-ESCAPE. VIRGIL W. BLANCHARD, New York, N. Y. Filed Jan. 2, 1883. (No model.)

Brief.—The sections of the ladder-sides are coupled together by links having V-shaped recesses, into which V-shaped tenons on the said sections rest, locking the same, and forming a rigid ladder.

295,723.

Claim.—1. A folding ladder composed of folding sections A' and coupling-links E, constructed as described, in combination with self-locking and unlocking devices, constructed and adapted to operate substantially in the manner and for the purposes described.

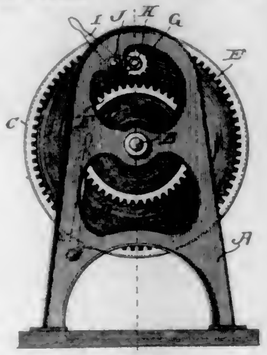


2. The combination of folding sections A', locking coupling-links E, ropes F, and pulleys D, all constructed and adapted to operate substantially in the manner and for the purposes described.

3. The combination of the folding ladder-sections A', the slotted coupling-links having V-shaped recesses *c c*, and V-shaped tenons *g g'* at the ends of the sections, all constructed and adapted to operate substantially in the manner and for the purposes described.

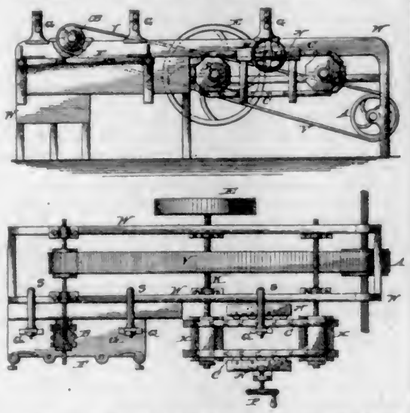
4. The combination of folding ladder-sections A', formed of pairs of plates B B, the V-shaped tenons *g g'*, the clasping-braces C, their tie-bolts, the pulleys D D, and the rungs K, all constructed and adapted to operate substantially in the manner and for the purposes described.

5. The combination of folding ladder-sections, locking coupling-links therefor, ropes and pulleys P, and a windlass, J, all constructed and adapted to operate substantially in the manner and for the purposes described.



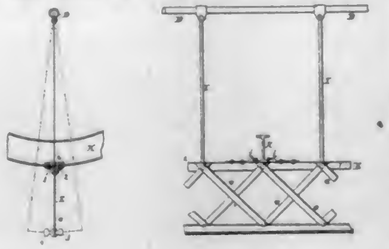
295,724. INSERTED-TOOTH FASTENING FOR ICE-PLOWS. JOHN GEORGE BODENSTEIN, Staatsburg, N. Y. Filed Jan. 9, 1884. (Model.)

Claim.—1. An inserted-tooth fastening for ice-plows constructed substantially as herein shown and described, and consisting of the stop-plate E, having a perforated L-head, E', at its upper end and a shoulder, E^2, at its lower end, and the wedge-key F, having screw F' and nut G, as set forth.



2. The combination, with the plow-beam A, the plow-plate sections B, and the inserted tooth D, of the stop-plate E, having a perforated L-head, E', at its upper end and a shoulder, E^2, at its lower end, and the wedge-key F, having screw F' and nut G, substantially as herein shown and described, whereby the inserted tooth will be securely held and can be readily adjusted and replaced, as set forth.

295,725. HOISTING-GEAR. JOHN L. BOOTH, Hamilton, Ohio. Filed Jan. 10, 1884. (No model.)

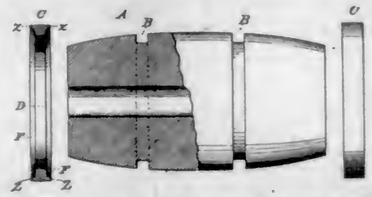


Claim.—In a hoisting-gear, the combination of a reel-shaft, an internally-toothed gear, an externally-toothed gear of the same pitch, disposed concentric to said externally-toothed gear, a toothed pinion having a pitch corresponding with said gears, a lever supporting said pinion and fitted to oscillate upon a pivot having its axis coincident with the axis of said gears, and a motor-shaft adapted to impart motion to said pinion, substantially as and for the purpose set forth.

295,726. MACHINE FOR DRESSING MOLDINGS. JOHN CLARK BRANDON, Detroit, Mich. Filed Dec. 15, 1883. (No model.)

Claim.—In a machine for dressing and forming moldings, the main frame W, the slotted standards G, the laterally arranged and adjustable endless-chain feeding device, the lateral vertically-adjustable table F, the rotary cutters or knives B, arranged above the said adjustable table, and mechanism for operating the machine, substantially as shown and described.

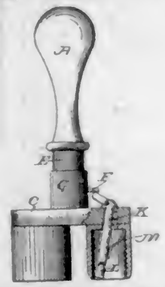
295,727. HOISTING AND CONVEYING MACHINE. ALEXANDER E. BROWN, Cleveland, Ohio. Filed Dec. 7, 1883. (No model.)



Claim.—1. In a hoisting and conveying apparatus or contrivance, the combination, with necessary piers or supports, of a cable and a rigid tramway or bridge-like roadway free to swing with the cable, all substantially as set forth.

2. In combination with a rigid roadway and a sustaining-cable and suitable piers, means for assisting in the support of the bridge directly from the pier and at the same time permitting it to swing or move laterally with reference to the pier, substantially as and for the purposes set forth.

3. A bridge tramway composed of a single narrow frame provided with laterally-projecting rails for the accommodation of the truck or carriage wheels, substantially as set forth.



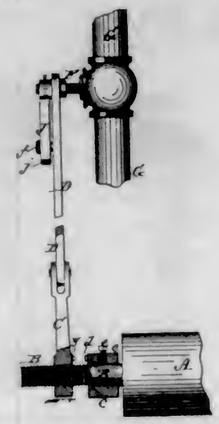
4. In combination with a bridge or rigid tramway composed of a narrow truss provided with laterally-projecting rails or tracks at or near its lower edge, a carriage or truck the wheels and wheel-frame of which are adapted to straddle the bridge, substantially as set forth.

295,728. WHEEL-HUB. ARTEMAS M. BROWN, Ottawa, Ohio. Filed Dec. 15, 1883. (No model.)

Claim.—The combination, with the wooden wheel-hub having turned into its periphery annular grooves of rectangular form in cross-section, of the metallic seamless bands C, having the interior rectangular annular rib or fillet D, and the broad outer portion, E, the said rib having a beveled flange, F, on both sides thereof, extending from its base to the point *i*, and terminating in a short and sharp bevel, Z, which joins the outer surface of the band in a sharp edge, whereby the bands can be easily forced into the grooves in the hub even with the seam, the fibers of the wood made to conform to the said short bevels Z, and the edges of the band and the fibers of the wood will fit together without breaking the fibers of the latter, substantially as and for the purposes specified.

295,729. CANCELING-STAMP. ENOCH B. BROWN, Mystic, Conn. Filed Apr. 5, 1883. (No model.)

Claim.—1. A stamp-canceler consisting of an L-shaped lever or arm pivoted to the bed-plate of the canceler, and having attached at its lower extremity a pivoted serrating piece or scratcher, in combination with mechanism, substantially as described, for operating said arm.

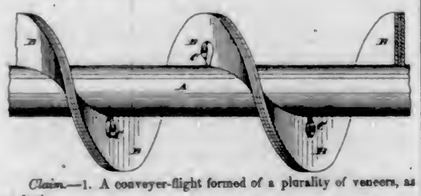


2. The handle A, constructed as described, in combination with the ferrule E having lug F, coil-spring D, bed-plate C, with sleeve G and spindle B and having slot H therein, and L-shaped arm K, pivoted to the bed-plate and having at its lower extremity the pivoted scratcher L, substantially as set forth and described.

295,730. HOISTING-MACHINE. FAYETTE BROWN, Cleveland, Ohio. Filed Nov. 12, 1883. (No model.)

Claim.—1. In combination with the drum-shaft of a hoist engine or machine and the valve or other device through which the supply of steam or other motive medium is applied to said machine, means for closing the valve (or for cutting off the supply of motive power) automatically whenever the cable-drum shall have revolved to a predetermined extent, and actuated directly from the shaft of said drum, all substantially as set forth.

2. In combination with the drum-shaft and valve-stem, a mechanism for working the valve from the drum-shaft, as specified, and adapted

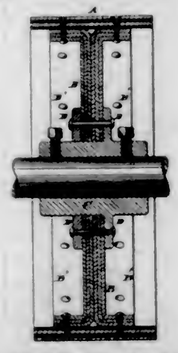


295,730.

to continue the movements of its parts after having cut off the motive power, whereby the moving parts of the machinery are permitted to continue their motions to the extent induced by momentum without any injury to or derangement thereof.

3. In combination with the drum-shaft, supply-valve, and intermediate devices for transmitting motion from the said shaft to said valve, (to open and close the latter,) means for adjusting or regulating the action of the shaft B on the intermediate mechanism so as to accomplish the working of the valve at any predetermined time desired.

295,731. SCREW-CONVEYER. FRANK C. CALDWELL, Chicago, Ill. Filed Sept. 4, 1883. (No model.)

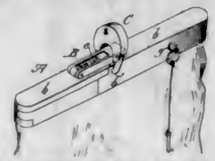


Claim.—1. A conveyer-flight formed of a plurality of veneers, as set forth.

2. A conveyer-flight formed of a plurality of veneers secured together and to the shaft, substantially as set forth.

3. In a conveyer, the combination of the shaft and the continuous flight, the latter being formed of a plurality of veneers, which are secured together and to the shaft, substantially as shown and described.

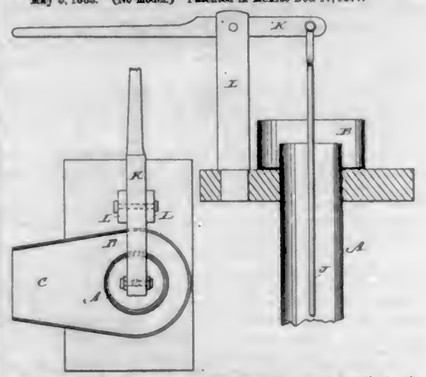
295,732. PULLEY. FRANK C. CALDWELL, Chicago, Ill. Filed Sept. 4, 1883. (No model.)



Claim.—1. As a new article of manufacture, a pulley the rim and disk or body of which consist of a plurality of veneers, substantially as set forth.

2. A pulley the rim and disk of which consist of a plurality of veneers, the periphery of the disk being turned outward, forming a flange, to which the rim is secured, substantially as set forth.

3. In a pulley, the combination of rim A, made of a plurality of veneers, disk or body B, made of a plurality of veneers, hub C, and plates D, all made, constructed, and arranged substantially as specified.

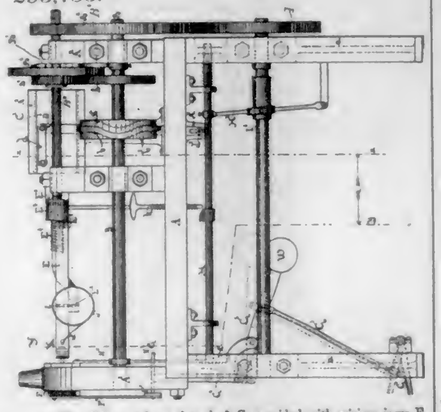


295,733. MAIL-BAG. SOLON OWEN CAMPBELL, Van Wert, Iowa, assignor of two-thirds to Adam J. Johnson and John Gemmill, both of same place. Filed Jan. 25, 1884. (No model.)

Claim.—1. In a combined mail-bag fastening and tag-holder, the combination of the frame A, composed of hinged sections, two of which are perforated for the passage of a padlock, a tag-holder, B, pivoted to the top of one of said sections, and a padlock, C, passed through the closed frame, so as to secure the same and confine one end of the tag-holder, substantially as described.

2. In a combined mail-bag fastening and tag-holder, the combination of the side pieces, *a a*, having flanges *b b*, apertures *b' b'*, and blocks *c c*, the end pieces, *a' a'*, the tag-holder B, hinged to one of the side pieces, and having lip *f*, and the padlock C, substantially as described.

295,734. PUMP. LUIS G. CARRAGA Y SAENZ, Puebla, Mexico. Filed May 5, 1883. (No model.) Patented in Mexico Dec. 17, 1877.



Claim.—In a pump, the combination, with a pump-barrel, A, of a sucker and rod, the apertured disk D, the circular valve F, made of rubber or leather and held on the disk D, and the bolts E, passing through the thickness of the barrel into the edge of the disk D, substantially as herein shown and described, and for the purpose set forth.

295,735. MACHINE FOR WIRING CORKS IN BOTTLES. ORAMILLE C. CARPENTER, Brooklyn, N. Y., assignor to Nathaniel B. Abbott, same place. Filed Dec. 17, 1883. (No model.)

Brief.—To put the machine in readiness for operation, twist together the ends of the four wires which are carried by the rotating shaft and the operating-jaws. Then by operating a treadle a table carrying a bottle begins to rise. A cam on the table operates a clutch and sets the machine in motion. The wire-carrying shaft advances, and the twisted ends of the wires are grasped by the nippers. The bottle on the table is lifted until its neck projects into a holder having a spring-follower, when two of the wires extend over the cork, and one extends around each side of the neck of the bottle. The twister-shaft rotates and recedes, twisting the four wires together close to the bottle-neck. Shears cut the twisted wires. On releasing the treadle the table descends, and a spring operates to release the clutch and stop the machine.

Claim.—1. In a bottle-cork-wiring machine, the combination of a pair of movable jaws with a rotating and sliding shaft to which the jaws are attached, mechanism, as described, for opening and closing the jaws, and a cam rotated by a train of gearing for moving the jaws longitudinally, whereby the sliding and rotating movements of the said jaws, together with their opening and closing movements, complete the wiring of a cork, automatically, at one operation.

295,735.

2. The sliding and rotating shaft C, provided with wiring-jaws E, in combination with the sliding collar E^3, stop E^2, and spring E^4, and the detent e^3, with means for operating the detent, whereby the movements of the jaws are controlled by the sliding shaft and the detent, as described.

3. A vertically-moving finger or wire-depresser pivoted to the transverse bar or frame of the movable jaws of a bottle-wiring machine, in combination with a sliding bar for actuating the finger, operated by the longitudinal movement of the said jaws, and a lever-connection, as described, so as to throw the wire down to the flange of the neck of the bottle at each stroke of the machine before the twisting of the wire commences.

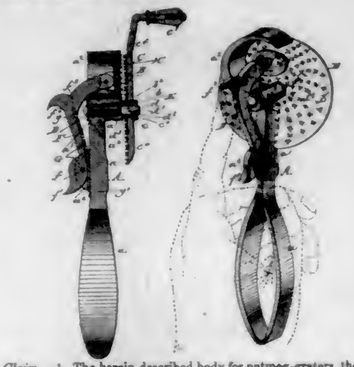
4. The vertically-moving finger M, the sliding operating-bar M′ for moving the said finger M, and the detent or pawl m' and operating-pin m^3, in combination with the pivoted lever M^3, constructed and operated as described.

5. The cam B^2, pivoted lever D, sliding shaft C, with its attached movable jaws E, opening-spring E^4, and closing stop collar and abutment E^2 E^3, combined and arranged so that each at revolution of the cam B^2 the sliding shaft, with its attached movable jaws, shall make one forward and backward movement, with the necessary opening and closing of the said jaws, at each revolution of the cam.

6. The combination of the driving-shaft B and sliding shaft C, and its attached gears, connected together by the gearing-train B^2 B^3 B^4 C^2, whereby the sliding shaft and its attached jaws are rotated a sufficient number of times to thoroughly twist and tighten the wire on the bottle during a fractional portion of the revolution of the driving-shaft, and the forward and backward movement of the sliding shaft is effected during the remainder of the rotation of the driving-shaft.

7. The vertically-sliding table G, having cam-faced attachment 2, the sliding rod H, arranged, as described, so as to be shifted by the engagement of said attachment 2 therewith, and devices, substantially as described, connecting the sliding rod H with the jaw-operating mechanism, whereby the jaws are thrown into operation by the reciprocation of table G, all the recited elements in combination, as and for the purposes set forth.

8. The spring-clamp L, attached to bottle-mouth holder A′ K, so as to clasp the neck of bottle just below the flange thereof, and hold the bottle by the top end of its neck during the wiring operation.



9. The automatic wire-holders F' F^3, for centering the wires over the cork, the said holders hinged to the bottom of the spring-follower of the bottle-mouth holder, and provided with springs for automatically closing the said wire-holders on the wires, and with bevel-edged lips to allow the wires to escape from the said holders when the wires are drawn down tightly on the corks of the bottles.

10. In combination with the reciprocating table, the sliding and rotating jaws and their operative mechanism, substantially as described, arranged at one side of said table, and the nippers F at the other side of said table, said nippers provided with operative mechanism, substantially as described, by which they are operated to grasp the wires projecting from said jaws and hold them during the backward movement of the jaws, substantially as set forth.

11. The automatic nippers F, their operating-cam F^2, connecting-rod F^3, and the bottle-holding table, combined substantially as described and set forth.

12. The combination of jaws E, nippers F, and shears N, with means, substantially as described, for operating the same, arranged as set forth.

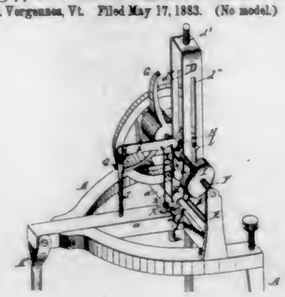
295,736. NUTMEG-GRATER. LOUIS J. CHURCH, Washington, D. C. Filed Dec. 29, 1883. (No model.)

Claim.—1. The herein-described body for nutmeg-graters, the same consisting of a handle portion, a central stem, and a curved or segmental top guard-finger, all the parts being integral, substantially as set forth.

2. The combination in a nutmeg-grater, with the stem of the body provided with the lateral extension and with the curved or segmental guard-finger extending from this extension, of the bearing-bolt journaled in said extension, and the rotary disk secured to the outer end of the said bolt, substantially as set forth.

3. The combination, with the grating-disk, of an operating handle or arm connected centrally therewith, and comprising a series of bracing-arms extending radially to the periphery of the disk, substantially as set forth.

4. The combination, in a nutmeg-grater, with the feeding-lever, of a head pivoted to the lever and acting directly against the nutmeg, substantially as and for the purpose set forth.



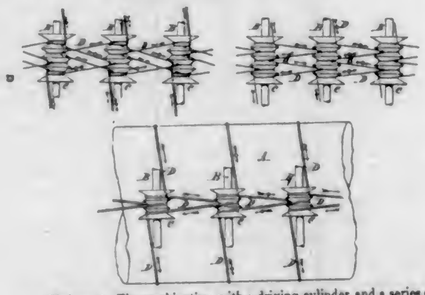
5. The combination, in a nutmeg-grater, of the body comprising the stem and the integral segmental guard-finger, the rotary grating-disk journaled at the juncture of the stem and guard-finger, and the approximately right-angular feed-lever fulcrumed to the stem, and having its head working in the guard-finger, substantially as set forth.

6. The combination of the body of the grater, comprising the handle portion, the integral stem having the lateral wings, and the integral segmental finger extending from the stem, the rotary grating-disk journaled at the vertex of the angle formed by the stem and segmental finger, the approximately right-angular feed-lever fulcrumed between the said wings, and having a pivoted head moving in the finger, and the flat actuating-spring connected with the lever, and having its free end extending between the said wings, substantially as set forth.

7. A nutmeg-grater embodying the stem, having the lateral wings, the feed-lever fulcrumed between these wings, and having the recess, and the flat spring having one end set in the recess and its other end extending down between the lever and stem, and protected from damage or displacement by the said wings, substantially as set forth.

8. A nutmeg-grater embodying a body comprising the stem and the integral segmental guard-finger, the rotary grating-disk journaled at the vertex of the angle formed by the stem and said finger, the approximately right-angular feed-lever fulcrumed to the stem and having the pivoted head working in the finger, and provided with the foot or extension below its fulcrum, by which it can be operated to draw its head from the grating-disk, and the spring engaging the lever to normally force its head toward the grating-disk, substantially as set forth.

295,737. ROCK-DRILL. FREDERICK W. COE and CHARLES A. HOFFMANN, Vergennes, Vt. Filed May 17, 1883. (No model.)

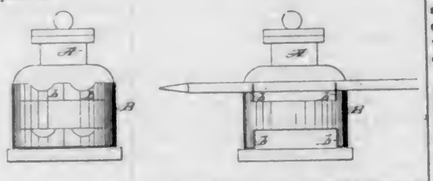


Claim.—1. The combination, in a rock-drilling machine, of the frame D, carrying the hammer, and pivoted as described, a shaft, F, suitably journaled and having keyed thereon cams G, H, and I, a pivoted latch, i, adapted to be intermittently lifted by the cam H, a jam-wrench, K, connected with the latch i, to be lifted therewith and bite the drill-rod, and a lever, N, arranged and operating, as specified, to rotate the jam-wrench, substantially as set forth.

2. The combination, in a rock-drill, of the frame D, carrying the hammer, and pivoted as described, a shaft, F, actuating means for reciprocating the drill-rod and hammer, the waved wheel I, lever N, having spring attached thereto, so as to keep the upper end of said lever in contact with the waved wheel, and a connecting-rod, n, attached to the lever N and to devices for rotating the drill-rod, substantially as set forth.

295,738. SPINNING AND TWISTING MACHINE. CHARLES A. COGGESHALL, Providence, R. I. Filed Apr. 27, 1883. (No model.)

Brief.—Each spindle is provided with a whirl having two or more grooves. A series of driving-bands extend from the cylinder to the whirl, there being two or more bands for each spindle, and each band arranged to drive two or more spindles, said band passing around the whole or nearly the whole periphery of the whirl, so that the spindles will all be driven at a uniform speed.

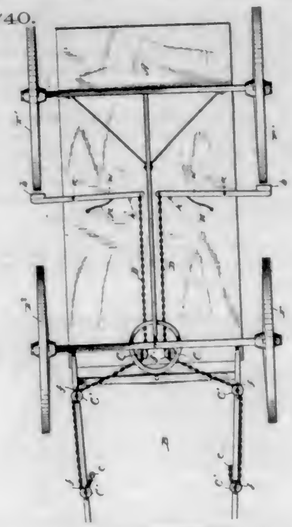


Claim.—1. The combination, with a driving-cylinder and a series of spindles carrying grooved whirls, of a series of driving-bands extending from the cylinder to the spindles, the said bands being arranged substantially as described, whereby each band shall drive two or more spindles, and the latter being each driven by two or more bands, substantially as and for the purpose set forth.

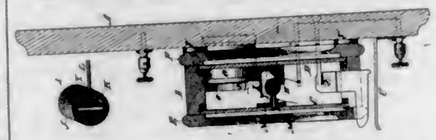
2. The combination, with a driving-cylinder and a series of spindles carrying grooved whirls, of a series of bands extending from the cylinder to the spindles, said bands being laced from one spindle to another, and surrounding or partially surrounding said spindles, each band being arranged to drive two or more spindles, and each spindle being driven by two or more bands, substantially as and for the purposes described.

295,739. INK STAND OR RECEIVER. JOHN B. DAVIDS, New Rochelle, N. Y. Filed Jan. 7, 1884. (No model.)

Brief.—The ink stand or receiver is surrounded with a belt or band having sections adapted to be turned outward to form a holding-rack for pens, &c.



Claim.—As an article of manufacture, a bottle or receiver provided with a belt or band having divisions or sections capable of being distended or turned out into position to form racks or supports for pen-holders, pencils, and other similar instruments, substantially as shown and described.



295,740. VEHICLE-BRAKE. JOHN T. DILLEHAY, Beech Grove, Ky. Filed Feb. 4, 1884. (No model.)

Claim.—The vehicle-brake herein described, consisting of the body A, having the spring-pivoted brake-levers E and pulleys C, the shafts B, having the pulleys C′ arranged at suitable intervals thereon, the chains D D, secured to the levers at their inner ends, and passing around the pulleys C and C′, and provided with hooks c at their outer ends, and the stop-pins A, as shown and described.

295,740.

295,741. TELEPHONE-TRANSMITTER. DANL. DRAWBAUGH, Eberly's Mill, Pa., assignor to the People's Telephone Company, of New York. Filed Nov. 12, 1883. (No model.)

Claim.—1. An electrode for telephone-transmitters, composed of an envelope of carbon or other conductor containing a mass or body of finely-divided conducting material, substantially as described.

2. An electrode for telephone-transmitters, consisting of an envelope of carbon or other similar conducting material containing a mass of finely-divided conducting material, and an electrode penetrating the envelope and insulated therefrom, and embedded in the finely-divided material, substantially as described.

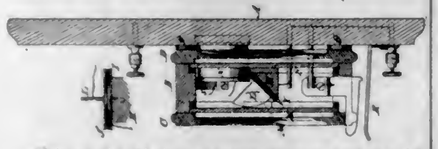
3. An electrode for telephone-transmitters, composed of a tubular shell of carbon or other similar conducting material, closed at both ends, and containing a mass of finely-divided conducting material, substantially as described.

4. An electrode for telephone-transmitters, composed of a tubular shell of carbon or similar conducting material, closed at both ends, and containing a mass of finely-divided conducting material, in combination with an electrode passing through said shell and insulated therefrom, and embedded in the finely-divided conductor, substantially as described.

5. In a telephone, a diaphragm or sound-receiving surface, an electrode having an inclined upper surface, a second electrode consisting of a shell of conducting material containing finely-divided conducting material, and a third electrode embedded in said finely-divided material and insulated from the shell, and having its end loosely connected to the diaphragm, substantially as described.

6. In a telephone, a diaphragm, an electrode of cylindrical form loosely connected to said diaphragm, and a fixed electrode having an inclined upper surface, the loose electrode resting upon said surface by gravity, substantially as described.

7. The combination of the diaphragm C, socket-tube M, rod-electrode I, cylindrical electrode J K, inclined fixed electrode H, and a support for said last-mentioned electrode, substantially as described.



8. In a telephone, a diaphragm, a support, and three electrodes, one electrode having an inclined upper surface and rigidly attached to the support, the second electrode resting upon the inclined electrode by gravity, and containing conducting material in a finely-divided state, and the third electrode having one end embedded in said finely-divided material and the other end loosely connected to the diaphragm, substantially as described.

9. In a telephone, two diaphragms and three electrodes, one elec-

trode having an inclined upper surface and rigidly attached to one of the diaphragms, the second electrode resting upon the inclined electrode by gravity, and containing conducting material in a finely-divided state, and the third electrode having one end embedded in said finely-divided material and the other end loosely connected to the other diaphragm, substantially as described.

10. In a telephone, in combination with the vibratory diaphragm and a rear support carrying a block of conducting material, the compound electrode consisting of a metallic conductor embedded in a finely-divided conductor, which latter is inclosed in an envelope of carbon or similar conducting material, said compound electrode being supported at one end upon the fixed electrode and at the other in loose metallic contact with the diaphragm, substantially as described.

295,742. TELEPHONE-TRANSMITTER. DANL. DRAWBAUGH, Eberly's Mill, Pa., assignor to the People's Telephone Company, of New York. Filed Nov. 12, 1883. (No model.)

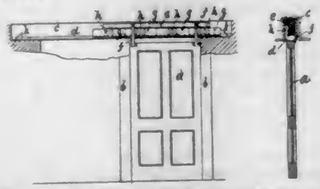
Claim.—1. In a telephone-transmitter, electrodes consisting of flat plates having their surfaces in contact, the said surfaces being covered with a hard, thin coating of finely-divided conducting material combined with an agglutinating substance, substantially as described.

2. An electrode or resistance-varying conductor for telephone-transmitters, consisting of a thin stratum of finely-divided conducting material, combined with an agglutinating substance, substantially as described.

3. A telephone electrode or resistance-varying conductor for telephone-transmitters, consisting of a plate covered with a hard, thin coating of finely-divided conducting material, combined with an agglutinating substance, substantially as described.

4. In a telephone-transmitter, electrodes consisting of metallic plates or surfaces provided with a hard, thin coating of finely-divided conducting material, combined with an agglutinating substance, the said coated surfaces being in contact, substantially as described.

5. In a telephone-transmitter, electrodes consisting of metallic plates having their surfaces partially covered with a hard, thin coating of finely-divided conducting material, combined with an agglutinating substance, the coated portions of said plates being in contact, substantially as described.

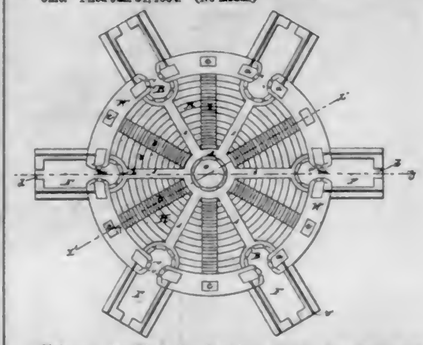


6. In a telephone-transmitter, and rigidly attached to a support, an inclined plate or surface coated with a mixture of finely-divided material and agglutinating substance, in combination with a movable plate similarly coated and pressing by gravity upon said inclined surface, and a diaphragm acting upon said movable plate, substantially as described.

7. In a telephone-transmitter, the combination of the diaphragm E, guides M, plate J, coated with a mixture of finely-divided conducting material and agglutinating substance, and having a projection, L, similarly coated plate, I, and an inclined support for said plate I, substantially as described.

8. In a telephone, the combination, with the diaphragm and the fixed support carrying the inclined electrode, of the loose plate having a surface of conducting material resting upon the fixed electrode, and a projection in contact with the diaphragm, substantially as described.

295,743. HANGING DOORS. CHARLES W. EVERSON, Charlestown, Mass. Filed Feb. 7, 1884. (No model.)



Brief.—The door-rail traverses grooved rollers which are spaced by detached bars, each recessed to embrace the axis of its roller, the rollers traveling upon a track having a central web extending up between their two treads.

Claim.—1. The combination, with a door, *a*, of the hangers *f f*, the sliding bar *e*, the grooved rollers *h*, the separate or sectional bars *g g*, recessed on their under sides, and the track *d*, provided with a central guide, all as and for the purpose specified.

2. The door *a*, having a recess in the top or upper edge, in combination with the bar *i* and rectangular hanger *f*, and the bar *e*, as and for the purpose set forth.

295,744. BRICK AND TILE KILN. WILLIAM A. EUDALY, Cincinnati, Ohio. Filed Jan. 31, 1884. (No model.)

Claim.—1. In a kiln for burning bricks, tiles, &c., a heat-distributing chamber or chambers, O, located within the kiln, closed at the bottom, and provided with a series of apertures, as and for the purpose set forth.

2. A kiln for burning bricks, tiles, &c., provided with one or more heat-distributing chambers, O, located within the kiln and closed at the bottom, and with a furnace or series of furnaces having fire-bags, substantially such as described, whereby a large portion of the heat is carried upward and then downward and distributed to the bricks in the center of the kiln, as set forth.

3. A brick-kiln the floor of which is divided into compartments by walls of solid masonry, said compartments being provided with a perforated floor, under which is a net-work of flues connecting each compartment separately with a chimney situated in or at the sides of the kiln-wall, in combination with the fire-bags B and distributing-chambers O, closed at the bottom, whereby a more equal distribution of heat to the articles to be burned is attained.

4. A brick-kiln the floor and lower part of which are divided into compartments by the walls *s s*, extending above the floor, said compartments being each provided with a flue and chimney adapted to be closed, whereby the heat is made to rise from the floor-level before being distributed to other parts of the kiln.

5. A brick-kiln the walls of which are provided with air-chambers *a*, communicating with the eye or throat of the furnace by ports or flues *c*, and with the external air by means of the flues *v'*, as set forth.

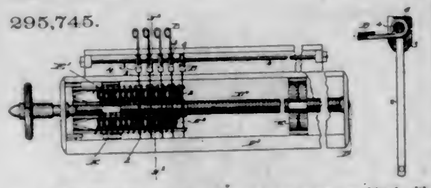
6. In a brick-kiln, the combination of the furnace F and fire-bags B with the distributing-chamber O, as and for the purposes set forth.

7. In a brick-kiln, the combination of the furnaces F, fire-bags B, distributing-chamber O, with the compartments H and chimneys *c*, as and for the purposes set forth.

8. In a brick-kiln, the combination of the walls or benches *s*, extending above the floor-level, forming compartments H, with the flues *t t'*, chimney *c*, and dampers *n*, as set forth.

9. The combination of the air-chambers *a*, located within the walls of the kiln, provided with the ducts *v*, with the throat *w*, constructed substantially as described, and the fire-bags B, as set forth.

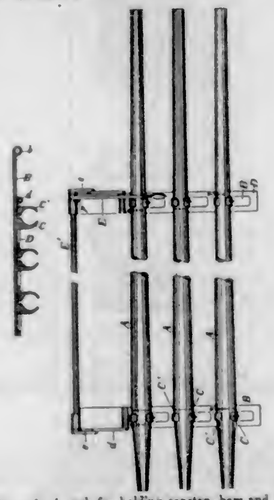
295,745. WARPING-MACHINE. GEO. S. FOLLANSBEE, Boston, Mass. Filed July 11, 1883. (No model.)



Brief.—The drop-wires are pivoted in slotted heads positively connected to dents, which are caused to be moved toward or from each other by expanding springs, which are operated by a suitable screw. A bar mounted upon pivoted arms is provided for elevating the drop-wires when necessary.

Claim.—1. The expanding springs and means to operate them, combined with a series of dents, a series of heads, 3, positively connected with the said dents, and drop-wires pivoted to turn in the heads fixed to the said dents, the said dents being adapted to be moved toward or from each other according as the expanding springs are contracted or expanded, substantially as described.

2. The comb-box, the right-and-left-hand-threaded screw, the nuts adapted to be actuated thereby, and two pairs of expanding springs at opposite sides of the said screw, combined with a series of dents held by the said springs, a series of heads positively connected with the said dents, and with drop-wires pivoted to turn with relation to the said heads, substantially as described.



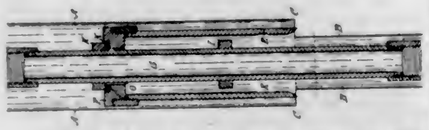
3. The dents 2 and the slotted head 3, rigidly attached to it, combined with a drop-wire pivoted in the said head, substantially as shown and described.

295,745.

4. The comb-box and series of pivoted drop-wires, combined with the bar 14 and its pivoted arms 15, to operate substantially as described.

295,746. RACK FOR HOLDING CAPSTAN-BARS AND LIKE OBJECTS. WILTON FOSTER and LEMUEL D. HANFORD, Erie, Pa. Filed Nov. 9, 1883. (No model.)

Claim.—1. A rack for holding capstan-bars and like objects on shipboard, consisting of uprights having brackets arranged substantially as shown, and clamps which operate toward said brackets, substantially as shown, and for the purposes set forth.



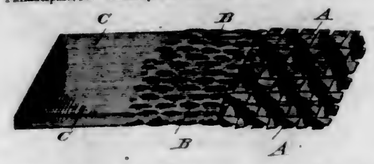
2. A rack for holding capstan-bars and like objects on shipboard, consisting of brackets arranged substantially as shown, clamps which operate toward and from said brackets, and, finally, means, substantially as shown, for moving said clamps, for the purposes mentioned.

3. A rack for holding capstan-bars and like objects on shipboard, consisting of brackets arranged substantially as shown, clamps which operate toward and from said brackets, and, finally, means, substantially as shown, for moving all said clamps simultaneously, for the purposes mentioned.

4. In a rack for holding capstan-bars and like objects on shipboard, the combination, substantially as shown, of the uprights B, brackets C, movable plates D, and clamps C', connected with said movable plates.

5. In a rack for holding capstan-bars or like objects on shipboard, the combination, substantially as shown, of the uprights B, having brackets C thereon, the movable plates D, having clamps C' thereon, and, finally, the lever E, shaft E', crank-arms *e*, and links *d*, for moving said plates and clamps simultaneously.

295,747. GAS AND WATER PACKER FOR OIL-WELLS. EUGENE B. FREW, Titusville, Pa. Filed Aug. 18, 1883. (No model.)

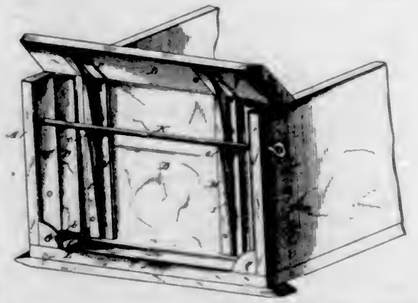


Claim.—1. The casing E, seated upon the shoulder C, and having at its top end the plug F, forming a water-tight joint between the casing E and the tubing D, as a device for shutting off the water from the bottom of an Artesian well, substantially as described.

2. In oil or Artesian wells, a combined gas and water packer, consisting of a joint of casing, and a pipe larger than the tubing of the well, the lower end of said casing being seated on a shoulder in the rock walls of the well, and the upper end being fitted with a plug or reducer to entirely fill the annular space between the top of the casing and the tubing, substantially as described.

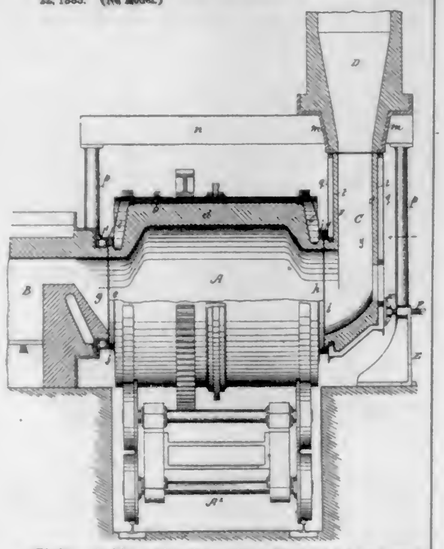
3. A gas and water packer for oil and Artesian wells, consisting of the joint of casing E, seated at the lower end on the seat C in the rock wall of the well, and having at its upper end the plug F, said plug fitting loosely around the joint G of the tubing D, in combination with the joint G of the tubing D, said joint having the collars H and I above and below the plug F, the collar H engaging with a recess in the plug F, the joint between being packed and made water-tight by the packing-ring K, and the whole weight of the tubing resting on the plug F, the whole constructed substantially as described, and for the purposes herein set forth.

295,748. ASBESTUS JOINT-PACKING. WILLIAM ARMSTRONG FRIES, Philadelphia, Pa. Filed Apr. 30, 1883. (Model.)



Claim.—As an article of manufacture, a gasket-packing consisting of flat woven, braided, or looped fabric made from hard-spun asbestus yarn, saturated or coated with a flexible agglutinating and flexible water-proof composition or compound, substantially as and for the purpose set forth.

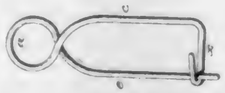
295,749. ASBESTUS STEAM-PACKING. WILLIAM ARMSTRONG FRIES, Brooklyn, N. Y. Filed Jan. 31, 1883. (Model.)



Claim.—As an improved article of manufacture, a steam-rod packing made entirely from fine hard-spun asbestus yarns inclosed in a braided covering of similar yarns, as set forth and described.

295,750. END-GATE FOR WAGONS. HENRY W. GIER and FREDERICK T. FINCKE, Sigel, Ill. Filed Jan. 11, 1884. (No model.)

Claim.—In combination with an end-gate for wagons, provided with cleats having shouldered recessed ribs and a fastening-rod, plates made with flanges to form grooves for the reception of the gate, and a bottom plate and strengthening-web, substantially as and for the purpose specified.



295,751. ROTARY PUDDLING-FURNACE. JESSE HALL, Jr., Phœnixville, Pa., assignor to the Phœnix Iron Company, same place. Filed June 22, 1883. (No model.)

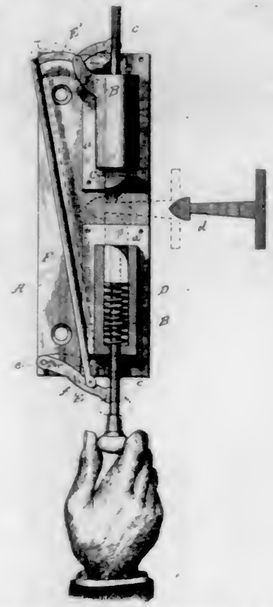
Claim.—1. The combination of the puddler and a fixed vertical chimney, open at the bottom, with the pivoted or suspended flue structure C, having an opening at the top communicating with the said chimney, and a lateral opening communicating with the outlet of the puddler, all substantially as set forth.

2. The combination of the fixed chimney, open at the bottom, the rotary puddler, and the flue structure pivoted or loosely suspended beneath the chimney at *y*, so that there shall be a preponderance of the structure tending to keep it away from the puddler, with devices for forcing the lower portion of the structure against the outlet end of the puddler, all substantially as specified.

295,752. TAG OR LABEL HOLDER. ALEXANDER HANVEY, Steubenville, Ohio, assignor of one-half to William Scott, same place. Filed Feb. 11, 1884. (No model.)

Claim.—An improved spring tag or label holder, consisting of a single piece of wire bent to form the eye *a*, and two parallel prongs, *c c*, one of which is bent at its end to form the hook *x*, and the other extending beyond the hook and adapted to rest therein, all substantially as set forth.

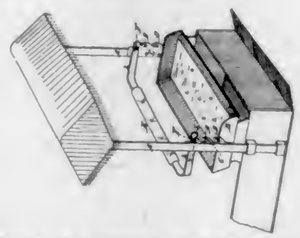
295,753. GATE-LATCH. JOHN B. HASENOHR, Terre Haute, Ind. Filed Jan. 14, 1884. (No model.)



Claim.—1. The shells provided with the inwardly-closing bolts, and the springs located in said shells, for actuating the bolts toward each other, in combination with the levers E E' and rod F, connecting the outer ends of said bolts, substantially as described.

2. The upper and lower shells having the springs and bolts located and working therein, as described, the upper shell having lugs B', in combination with lever E, rod F, and the lever E', fulcrumed at said lugs, all connected substantially as and in the manner described.

3. The upper and lower shells having the springs and the bolts located therein, and formed with the slotted shanks, as described, said upper shell having the lugs B', in combination with the levers E E', having one of their ends rounded and extending through the slots in the bolt-shanks, and the rod F, connecting said levers, substantially as shown and set forth.



4. The plate A, having screw-holes, and the plates *a* secured thereto, the shells B, attached to said plates *a*, and formed substantially as shown, the springs and the bolts working in said shells, the lower one of which is provided with the knob, in combination with the levers E E', pivoted and connected with the bolt-shanks, as described, the rod connecting

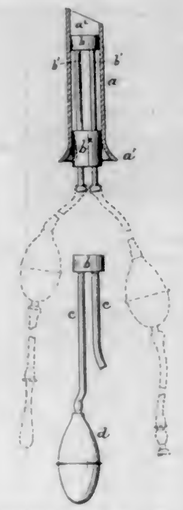
295,753.

said levers, and the spear-shaped latch, all substantially as and for the purpose set forth.

295,754. VEHICLE-SEAT. GEORGE B. HASKELL, Salem, Mass. Filed Aug. 23, 1883. (No model.)

Claim.—1. The combination, with the seat B, of the standards A A at the ends of the seat, the back E, having the rigid arms 2 2, and means for detachably securing the said arms to the standards, whereby the back is supported independently of the seat, as set forth.

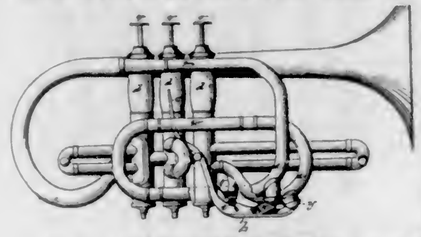
2. The combination, with the seat B, of the end standards, A A, having the plates C, containing vertical series of slots, and the back E, and means for detachably engaging the arms of the back with any of said slots, whereby the back is made vertically adjustable, as set forth.



3. The combination, with the seat B, of the end standards, A A, having the slotted plates C, and the back E, having the bolts F and their clamping-nuts, whereby the back is adapted to be detachably secured at different heights to said plates, as set forth.

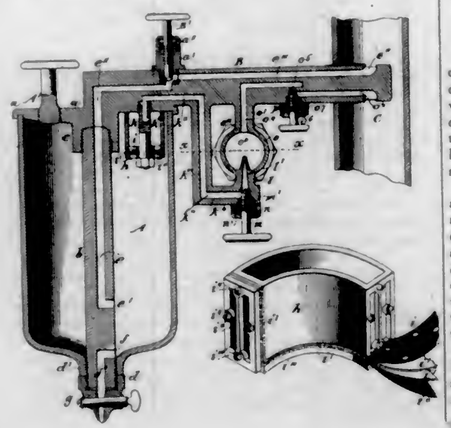
295,755. VAGINAL SYRINGE. JAMES A. HAWLEY, Canandaigua, N. Y. Filed Nov. 15, 1881. (Model.)

Claim.—1. The improved vaginal syringe hereinbefore described, wherein an ordinary speculum or vaginal tube is fitted with a plug inclosing two pipes of suitable lengths, in combination with compressible and expansible induction and eduction bulbs, whereby water may be injected and forcibly withdrawn as rapidly as injected, substantially as set forth.



2. The combination, with a speculum or vaginal tube, of the plug *b*, fitted to the inner end of the speculum, the inflexible pipes *b' b'*, having their inner ends inclosed by and flush with the inner face of plug *b*, and having their opposite ends projected out of the opposite end of the speculum, a supporting-plug, *b²*, fitted to the outer end of the speculum and around the pipes *b' b'*, and induction and eduction bulbs, whereby water

295,755.



may be injected and forcibly withdrawn as rapidly as injected, substantially as described.

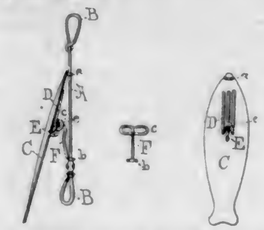
295,756. WATER-KEY FOR BRASS MUSICAL INSTRUMENTS. JOHN HEALD, Springfield, Mass. Filed Oct. 19, 1883. (No model.)

Claim.—In a brass musical instrument, the water-key *b*, having its shank extending upward from its pivot-point and terminating at or near the sides of the piston-tubes *d*, substantially as set forth.

295,757. LUBRICATOR. NATHAN H. HEFT, Valley, N. J. Filed Sept. 11, 1883. (No model.)

Claim.—1. The within-described method of lubricating, consisting in admitting steam under boiler-pressure to a body of oil and forcing the oil through an obstructing body or filtering medium placed in the exit-port by the difference in steam-pressure existing at the two sides of said obstructing body, as set forth.

2. The within-described method of lubrication, consisting in forcing oil to the point of application by subjecting different parts of the apparatus and its connections to unequal steam-pressures.

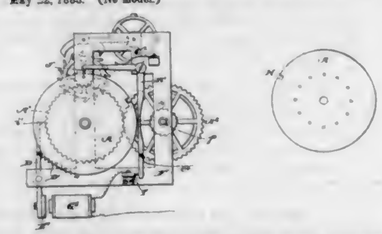


3. The combination of an oil-cup having a port leading thereto from the steam-pipe, a box, and a filtering medium, said box having a port leading therefrom to said steam-pipe, substantially as set forth.

4. The combination of an oil-cup having a port leading to its lower end from the steam-pipe, a box and filtering medium at the upper part of the cup, having a port leading therefrom, a transparent vessel in said port, and having a port leading to the steam-pipe, and suitable valves, substantially as set forth.

5. The lubricator-cup combined with the box A, having open sides, and a suitable filtering material, substantially as set forth.

6. The lubricator-cup combined with the box A, having open sides, and a filtering medium, and gauze, substantially as set forth.



295,758. SPOON-BAIT. CHARLES B. HIBBARD, Grand Rapids, Mich. Filed June 28, 1883. (Model.)

Claim.—1. The combination of the wire A, the spoon C, the spring D, secured to the spoon, and the independent lever F, connected to the spring at one end, as described, and at the other to the wire A.

2. The combination, with the wire A and sliding lever F, of the sliding revolving spoon C, having the doubled spring-rod D and stop E, substantially as described.

295,759. ELECTRIC FIRE-ALARM. JOHN HILL, Columbus, Ga. Filed May 22, 1883. (No model.)

Claim.—1. The combination, with wires composing a single circuit, of one or more branch wires connected therewith, a series of automatic circuit-closers located at different points in the main or in the branch wires, a station-clock located in each branch, and an indicator-clock located at the point where the alarm is sounded, both set in motion by the making of the circuit, and arranged to have equal movement, the index-hand of the latter being arrested by the breaking of the circuit in the station-clock, substantially as described.

2. A station-clock for automatic electric fire-alarms, consisting of a train of clock-gearing comprising a one-minute gear, the whole being actuated by a spring and governed by the ordinary escapement, a disk divided into equal parts and having a notch in its periphery opposite one of said parts, a spring-actuated lever resting upon the periphery of said disk and making the circuit while in that position, but breaking it upon engaging with the notch in the disk, a detent-lever, which engages with and arrests the one-minute gear, and an electro-magnet, by which, when the circuit is made at any point upon the line, the armature of said detent is attracted and the gearing released, substantially as described.

3. The combination, with the gear A' and disk A, having a notch, H, of the spring-actuated lever B', having electrical contact at T, the spring-actuated detent D, having an armature, E', and the magnet G^2, substantially as described.

4. A fire-indicator clock consisting of an index mounted upon the

spindle of the one-minute hand, a train of clock-gearing driven by a spring, a spring-actuated detent-lever engaging with said gearing, an electro-magnet energized by the closing of the circuit and attracting an armature on said lever, thereby releasing the gearing, and electrical connections with a station-clock having similar and simultaneous movement, and provided with means for breaking the circuit after a predetermined portion of a revolution has been made, whereby the magnet in the indicator-clock releases the spring-detent which arrests the gearing at the instant of breaking the circuit and simultaneously with the stopping of the station-clock, substantially as described.

5. The combination, with the wires N P, of the branches 1 2 3, &c., in each of which are arranged a series of automatic circuit-closers, a device at the terminals of each branch, whereby the circuit may be broken or made at pleasure and a suitable alarm placed in circuit at any desired point, substantially as described.

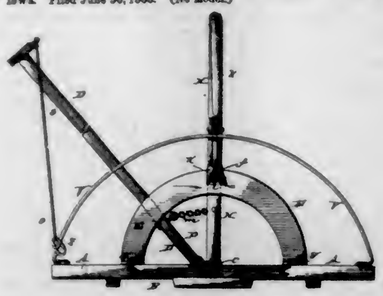
6. The combination of the disk A, having a notch, H, in its periphery, and the spring-actuated lever B', having its end resting upon the disk and completing the circuit, with an electro-magnet, G², while in said position, said circuit being broken and the disk arrested by the engagement of the lever with the notch H, substantially as described.

7. The combination, with the station-clock having disk A, provided with notch H, and the spring-actuated lever B', of the fire-indicator clock having an index mounted upon the spindle of the one-minute gear, a spring-actuated detent-lever engaging with said gear, and an electro-magnet, which, when energized, attracts the armature upon said lever and releases the gear, substantially as described.

8. The combination, with the wires N P, having a series of automatic circuit-closers interposed at various points, of a relay in the primary circuit, a vibratory bell actuated by the relay-battery, the armature-lever of the relay being provided with a detent-pawl and mounted upon a notched arm, whereby it is held in engagement with the magnet, and the secondary circuit remains completed after the primary circuit is broken, substantially as described.

295,760. AUTOMATIC FIRE-ALARM. JOHN HILL, Columbus, Ga. Filed Sept. 10, 1883. (No model.)

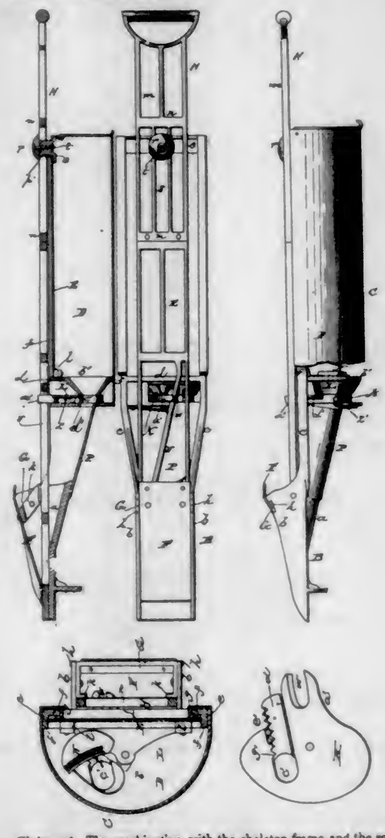
Claim.—1. In an automatic fire-alarm, the combination of two conductors, one of which is composed of an elastic metal, with a metallic disk, means for supporting the disk in a stationary position at one side of the elastic conductor, and a fusible joint connecting the latter with the stationary disk, to hold the said elastic conductor out of contact with the other conductor, substantially as described.



2. An automatic circuit-closer contained in a closely-sealed case, and consisting of electric connections which enter said case and are normally in contact, but which are held out of contact by a fusible plug which enters and seals an aperture in the top, from which it is exposed, substantially as described.

3. An automatic circuit-closing device, consisting of the conductors K and L, having suitable contact-points, said points being contained within a casing, *a a'*, and being held out of contact by means of a fusible plug, X, exposed upon the outside of said casing *a*, substantially as described.

4. The combination, in an automatic fire-alarm, of a case having a recess, a sensitive disk having a convex center and a flat surrounding margin, and arranged in the recess, the conductors, and a fusible joint, substantially as described.



5. The combination, in an automatic fire-alarm, of a disk having a perforation, a conductor, L, having a contact-point, an elastic conductor having a contact-point on one side and a projection on the opposite side, and a fusible plug passing through the perforation in the disk for connecting the said projection with the disk, substantially as described.

295,761. LAND-MARKER. ARTHUR W. HITCHCOCK, Parkersburg, Iowa. Filed June 30, 1883. (No model.)

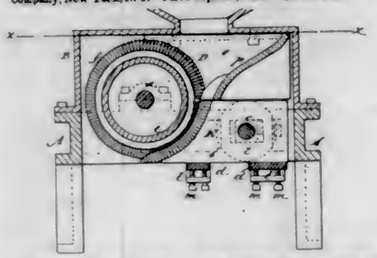
Claim.—The combination, with the gage-bar D, connected by a link-joint, *c*, to the bar B, to be moved freely in any direction, and connected to the arched runner-bar V by a rope, *s*, of the operating-lever H, having the spring-catch *k*, and a flexible connection with the gage-bar D and a sliding connection with the arch E, whereby the movement of the gage D, when in contact with the ground, is independent of the lever H, substantially as specified.

295,762. HAND SEED-PLANTER. ALBERT HOAG, Pearl, Vt. Filed Nov. 14, 1883. (No model.)

Claim.—1. The combination, with the skeleton frame and the seed-chamber thereon, of the open-top shoe at the lower end of the frame, and separated from the base of the seed-chamber by an interval, so that its contents can be inspected, substantially as specified.

2. The combination, with the shoe and spring-plate, of the transverse bar to which the spring-plate is riveted, having arms extending toward the back of the shoe to serve as guides for the plunger.

3. The feed-block located in the valve, and having a flat shank made with a serrated edge, in combination with a tooth of the valve-body and a holding device, whereby the feed-block can be adjusted to increase or lessen the size of the seed-chamber in the valve, substantially as specified.

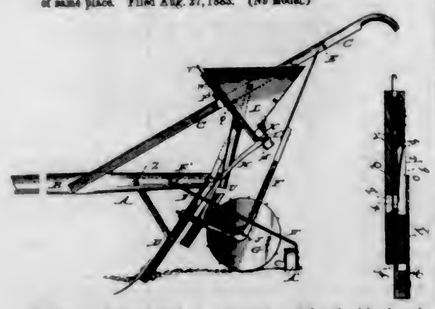


295,763. CAR-COUPLING. EDWARD HUBER and HENRY M. BARNHART, Marion, Ohio. Filed Nov. 27, 1883. (No model.)

Claim.—The combination of a draw-head having the usual vertical perforation for the pin, provided at the rear side of its upper portion with a recess, and having a longitudinal recess forming a narrower slot at its upper side, the forward end of the said slot entering the lower end of the recess in the pin-receiving perforation, a spring-actuated block having a forwardly-projecting lip and an upwardly-projecting lip upon its upper side, and a common coupling-link and pin, as and for the purpose shown and set forth

295,763.

295,764. GRINDING-MILL. HENRY HUNGERFORD, Norwalk, Conn., assignor, by mesne assignments, to the United States Cotton Seed Cleaning Company, New York, N. Y. Filed Sept. 15, 1881. (No model.)

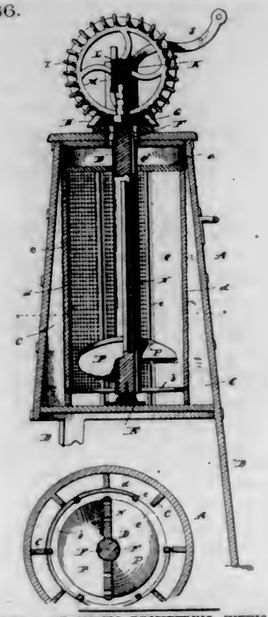


Claim.—1. The combination of the revolving grinder composed of the cylinder *e* and rings *f*, provided with grinding-faces arranged upon the cylinder and held in place by the end disks, *g*, as described, with the grinder E, composed of a series of plates bolted together with grinding-faces corresponding to those of the revolving grinder, and adjustable thereto, both horizontally and vertically, substantially as described.

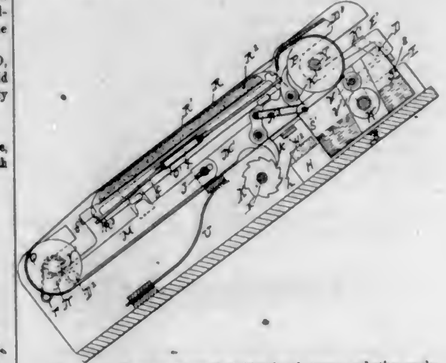
2. In a grinding-mill, the revolving grinder D, in combination with the grinder E, composed of plates *b*, tied together by rod *c*, and provided with grinding-faces corresponding to the revolving grinder D, said grinding-faces being adjustable vertically by means of set-screws *m* in the hangers *l*, substantially as described.

3. In a grinding-mill, the combination of a revolving grinder, D, and the grinder E, composed of plates and tie-rod *c*, as described, the said rod *c* having its bearings in adjustable blocks in the frame, substantially as described.

295,765. SEED-PLANTER. WILLIAM LANE HUTSON, St. Lawrence, N. C., assignor of one-half to THOMAS A. BROOKS and NOAH R. HARRIS, both of same place. Filed Aug. 27, 1883. (No model.)



Claim.—The combination, with the plow, of the wheel having pins J, the bent lever H, having bifurcations bent outward from each other and arranged in engagement with said pins, the hopper L, the dropping-slide K, having tongues L' and M, formed as described, and the case Q and plate V, substantially as shown and described.



295,766. CHURN. ADOLPHUS JACKSON, Frederick, Md. Filed Oct. 10, 1883. (No model.)

Claim.—The combination, with the churn-vessel having vertical wings on the inside and a detachable foraminous cylinder located therein, of the vertical shaft provided with perforated dasher-blades, and a propeller-screw near the bottom, with suitable mechanism whereby said shaft may be rotated, substantially as and for the purposes specified.

295,766.

295,767. AUTOMATIC REGISTERING INKING APPARATUS. JOSHUA W. JONES and ALBERT COOPER, Harrisburg, Pa. Filed Aug. 13, 1883. (No model.)

Claim.—1. In an apparatus for inking hand-stamps and other analogous forms, an endless ink-distributing belt, in combination with bed having reciprocatory vertical movements arranged between stretches of said belt, and actuated by mechanism, substantially as described, by blows of an independent hand-stamp while inking it, to present successive portions of said belt freshly inked automatically from an ink-fountain, substantially as set forth.

2. In an apparatus for inking hand-stamps and other analogous forms, the combination of an endless ink-distributing belt, suspended upon rolls whose distance apart is regulated by elastic tension, a bed supported between stretches of said belt, upheld and guided to permit it to have vertical reciprocatory movements in sustaining the blows from a hand-stamp, and mechanism, substantially as described, connecting said bed and rolls, for propelling said belt automatically, driven by said imparted blows in inking said stamp, substantially as set forth.

3. In an apparatus for inking hand-stamps and other analogous forms, an endless ink-distributing belt, in combination with mechanism, substantially as described, for moving it automatically by the impulses of a hand-stamp in inking the same on said belt, with the mechanism set forth registering the number of said impulses, and with mechanism, substantially as described, connecting the belt-moving mechanism with the

registering mechanism, substantially as herein set forth.

4. The endless ink-distributing belt E and the reciprocating bed L, in combination with the drive-roll P, the yielding stretcher-roll Q, the bands N, and sleeves *p*, applied to the journals Y' of the latter roll, for holding the same, thereby to give compensative tension to said belt or belt-surface, and permit portions of it and the bed L, inclosed between stretchers of it, to move vertically without overstraining said belt, substantially as and for the purposes set forth.

5. The reciprocatory pivoted levers M', having the pawls *k'*, pivoted thereto and united by the slip-joints J' D' to the co-operating levers M, pivoted likewise to the sides A, in combination with the supporting-springs U, under said levers, the equipped bed L R' R², the belt R, the rolls Q P, the ratchets Z on the latter, and stops *h h'*, all arranged and co-operating to convert the reciprocatory vertical movements of said bed derived from impulses of a hand-stamp into rotary motion, for propelling said belt or belt-surface automatically, substantially as set forth.

6. The reciprocatory pivoted levers M M', connected in operation by the joints J' D', and connected by pawls *k k'* thereon with the ratchets Z on the drive-roll P, and with the staggered ratchets K, in combination with the reciprocatory equipped bed L R' R², the belt R, the yielding roll Q, the limiting-stops *h h'* on sides A, and shaft K', with indices, all arranged and operating to propel both said endless belt and registering device automatically and alternately, as set forth.

7. The combination of the bed L, with guides F thereon, and pad R' R², the reciprocatory supports M M', the pawls *k'*, the stops *h h'*, the springs U, the inking-belt R, the rolls Q P, the ratchet Z on the latter, all arranged in and on casing A B, and certainly coacting to propel said belt only the instant after the hand-stamp giving it impetus to move is withdrawn therefrom, substantially as set forth.

8. The combination of the bed L, having slots X in flanges thereon below and ledges *f²* on its ends, the tympan-holders *f f' f²*, having their limbs *f''* united by bands O', the blanket R², and tympan R', secured on said bed, in the manner herein set forth, for the purpose specified.

9. The combination of the endless ink-distributing belt or belt-surface R, the ink fountain or vessel S S', the duck-roller W, the distributing-roller V, and the adjustable band N', all co-operating to automatically maintain the supply of ink on said belt and to regulate the quantity distributing thereon, substantially as set forth.

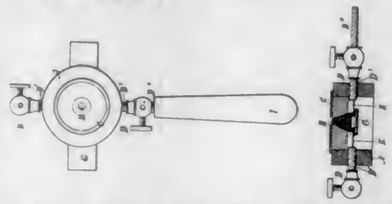
10. The combination of the endless ink-distributing belt R, with the rolls P Q, with the ink-fountain S S', its rollers W V, and regulating elastic connector N', with the bed L, equipped with blanket R², tympan R', tympan-holders *f f' f²*, and bands O', and supported on the levers M M' and springs U, and with ratchets Z and pawls *k'* on the said levers, which latter are duly limited in their movements, all co-operating to propel said belt and keep ink perfectly distributed thereon automatically, as and for the purpose set forth.

11. The combination of the endless ink-distributing belt R, mounted compensatingly for stretching or contracting on rolls P Q, of variable distance apart, the ink-fountain S S', with rollers W V therein, connected by band N' of adjustable tension, to regulate the supply of ink on said belt, the equipped bed L R' R² *f f' f²*, the supports M M' U & *h'*, ratchets K Z, pawls *k k'*, shaft K', and registering-indices, all mounted and co-operating as and for the purposes set forth.

295,768. COUNTING-REGISTER. JOSHUA W. JONES and ALBERT COOPER, Harrisburg, Pa. Filed Nov. 1, 1883. (No model.)

Claim.—1. The combination, with the ratchet-wheel, driving-pawl, and units-wheel, of the back plate provided with a series of equally-inclined studs, each having a circular rib concentric therewith, with the plane of its edge at right angles to the axis of the stud, and a series of registering-wheels mounted on said studs and kept upon said ribs, substantially as and for the purposes set forth.

2. The combination, with the ratchet-wheel, driving-pawl, and units-wheel, of the back plate provided with a series of equally-inclined studs, each having a circular rib concentric therewith, with the plane of its edge at right angles to the axis of the stud, and a series of overlapping Geneva-stop registering-wheels mounted on said studs, each having its driven teeth on its under side, said teeth being kept upon the circular rib and constituting a bearing for the wheel, whereby the wheels are prevented from twisting out of line and out of gear with each other when the keeper is closed against them, substantially as and for the purposes set forth.

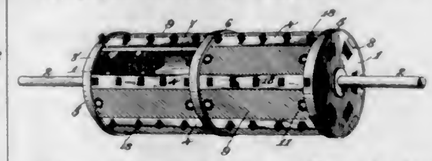


295,769. BUTTON. PHILIP KALISH, Chicago, Ill. Filed June 8, 1883. (No model.)

Claim.—1. The combination, with the shank *a* of a button, provided with parallel notches *b b*, of the fastener formed of the members *d d'*, connected by a neck, *l*, and whereof the center of the part *d* is provided with a hole, *g*, and the part *d'* with the holes *e* and slot *f*, adapted for use as set forth.

2. In combination with the shank *a*, provided with parallel notches *b b* and cone *c*, the fastener formed of the parts *d d'*, connected by a neck, *l*, and whereof the center of the part *d* is provided with a hole, *g*, and near its circumference with a hole, *e*, connected with a slot, *f*, extending to or beyond the center of the part *d'*, adapted for use as set forth.

295,770. MICROSCOPE. WILLIAM K. KIDDER, New York, N. Y. Filed Feb. 9, 1884. (No model.)



Claim.—1. The combination, substantially as hereinbefore described, with the body or frame and the lens of a microscope, of the binding-posts arranged on the body, and constructed with electrodes which project inward to a point opposite the lens, substantially as and for the purpose described.

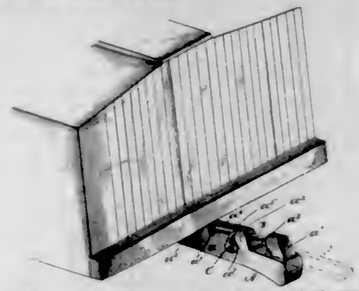
2. The combination, as hereinbefore described, with the body and the lens of a microscope, of the binding-posts arranged on the body, and constructed with inwardly-projecting electrodes, and the handle connected to one of the posts, substantially as and for the purpose described.

3. The combination, substantially as hereinbefore described, with the body or frame A, of the binding-posts arranged on the body, and constructed with electrodes which project inward to a point opposite the lens, substantially as and for the purpose described.

295,771. CYLINDER FOR CLOVER-HULLERS. HORATIO N. LAND and HOWARD CAMPBELL, Richmond, Ind., assignors to GEAR, SCOTT & COMPANY, same place. Filed Jan. 7, 1884. (No model.)

Claim.—1. The combination, in a clover-hulling cylinder, of the cylinder-heads having lugs on their inner sides, the longitudinal lags, the detachable rubber-teeth thereon, the rubbing-plates extending longitudinally between the lags and detachably connected to the lugs, substantially as described.

2. The combination, in a clover-hulling cylinder, of the cylinder-heads having lugs on their inner sides, the longitudinal lags, the rubber-teeth having shanks projecting through the lags, the nuts holding the rubber-teeth, and the rubbing-plates extending longitudinally between the lags and detachably connected to the lugs, substantially as described.



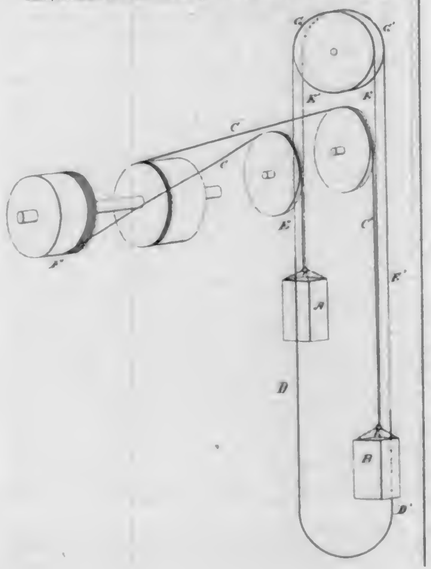
3. The combination of the cylinder-heads, having lugs on their inner sides, the lags, the rubber-teeth detachably secured in the lags, the rubber-plates extending longitudinally between the lags, and the screws connecting the plates to the lugs, substantially as described.

295,772. ORNAMENTAL CHAIN-LINK. SIGMUND L. LEDERER, New York, N. Y. Filed Oct. 19, 1883. (Model.)

Claim.—The combination, with the wire links *a a* and the links *a' a'*, of the coiled-wire spring *b*, constructed to allow the link to be extended, as described.

295,773. CAR-COUPLING. SAMUEL D. LEE, Mechanicsville, Iowa. Filed Jan. 18, 1884. (No model.)

Claim.—1. The combination, with a draw-head having top projections and provided with guide-perforations and with laterally-extending grooves, of a longitudinal coupling-pin adapted to slide longitudinally in the guide-perforations, and to turn therein, so as to engage the lateral grooves, substantially as and for the purpose set forth.

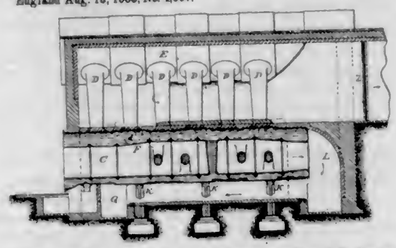


2. The combination, with a draw-head having two top projections provided with perforations on an inclined plane, of a longitudinal coupling-pin sliding in these perforations and retained thereby, substantially as set forth.

3. The combination, with a draw-head having top projections, and a guideway terminating in lateral grooves, of a longitudinally-sliding coupling-pin engaging the projections, and provided with a lateral handle engaging said grooves, substantially as and for the purpose set forth.

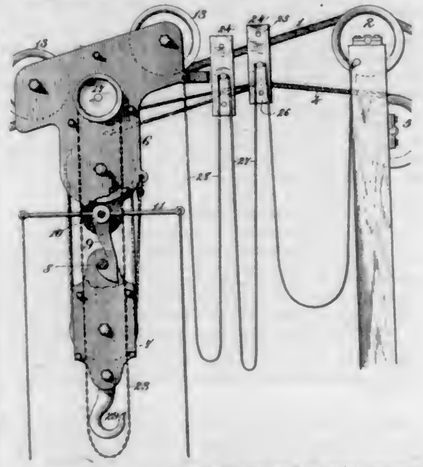
4. A car-coupling embodying the draw-head, provided with the front projection or head, the projection in rear of this, the groove having the lateral end grooves and the intermediate guideway, and the longitudinal coupling-pin sliding in the projections and provided with the lateral handle, substantially as set forth.

5. The combination, with the draw-head having the front head or projection, the projection in rear thereof, the rear wall, the guideway extending between the middle projection and the rear wall, and terminating in lateral grooves at each end, the cylindrical perforations extending on the same plane through the projections and into the rear wall, and the groove at one side of the guideway, of the cylindrical coupling-pin adapted to slide longitudinally in the said perforations, and to turn therein, and provided with a lateral handle engaging one of the said lateral grooves, substantially as set forth.



295,774. WINDING APPARATUS FOR MINES. ARTHUR LINDENBERG, Dortmund, Prussia, Germany. Filed Jan. 28, 1884. (No model.)

Claim.—1. In a winding apparatus for mines, the combination, with the counterbalance rope or chain D D', of the suspension rope or ropes E E', passing over sheaves G G', and attached to the rope or chain D D' while being brought in relation to a movable portion of the apparatus adapted to draw upon the suspension-rope attached to the part of the rope or chain D D' which is to be raised, substantially as and for the purpose described.



2. The combination, with the counterbalance rope or chain D D', of the suspension-ropes E and E', passing over the sheaves G and G', and attached with one of their ends to the rope or chain D D', and with their other ends respectively to the top of the cages B and A, substantially as hereinbefore specified.

295,775. STEAM-GENERATOR. FOUNTAIN LIVET, London, County of Middlesex, England. Filed Oct. 13, 1883. (No model.) Patented in England Aug. 18, 1883, No. 4,007.

Claim.—The combination of boiler-tubes A, B, and E, the latter supported by the first two, with flues N, R, T, and U, and expansion-chambers L and R, the said flues and chambers being of successively increased sectional area, substantially as described.

295,776. HOISTING AND CONVEYING APPARATUS. MILO W. LOCKE, Baltimore, Md., assignor of one-half to R. SNOWDEN ANDREWS, same place. Filed Jan. 17, 1884. (No model.)

Claim.—1. The combination, in a hoisting and conveying apparatus, of a cable, a carriage to travel thereon, gripping devices on said carriage for stopping and holding the carriage while both loading and unloading, a tackle-block, and a fall-rope connecting the carriage and the tackle-block, and serving to raise and lower the latter, and also acting as a draft medium for moving the carriage on the cable, substantially as described.

2. The combination, in a hoisting and conveying apparatus, of a cable, a carriage to travel thereon, gripping devices on said carriage for stopping and holding the carriage while both loading and unloading, a tackle-block, means whereby the tackle-block may be connected with and supported by the carriage, and a fall-rope connecting the tackle-block and carriage, and serving to raise and lower the tackle-block, and also acting as a draft medium for moving the carriage on the cable, substantially as described.

3. The combination, in a hoisting and conveying apparatus, of a cable, a carriage to travel thereon, gripping devices on said carriage for

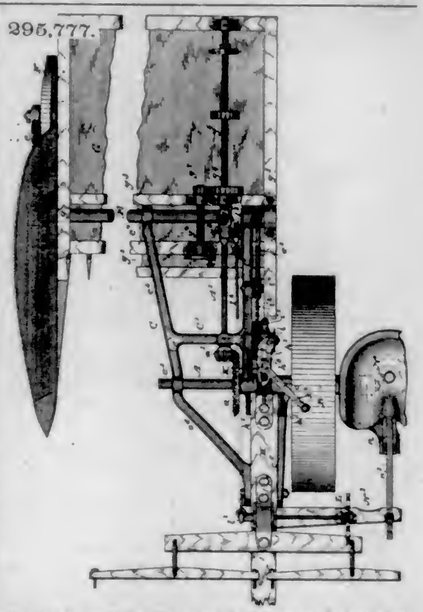
grasping the cable and stopping and holding the carriage while both loading and unloading, a tackle-block, means for detachably connecting the tackle-block with and supporting it on the carriage, and a fall-rope acting to move the carriage on the cable, and also to raise and lower the tackle-block, substantially as described.

4. The combination of a cable, a carriage to travel thereon having a swinging hook, a tackle-block having a bolt or rod to engage and disengage the hook, gripping devices on said carriage for stopping and holding the carriage while both loading and unloading, and a fall-rope for raising and lowering the tackle-block, and also serving as a draft medium for moving the carriage on the cable, substantially as described.

5. The combination of a cable, a carriage to travel thereon, a pulley-block detachably connected with the carriage, a fall-rope for moving the carriage on the cable and raising and lowering the pulley-block, and fall-rope carriers moving on the cable, substantially as described.

6. The combination of a cable, a carriage to travel thereon, a tackle-block, means for connecting the tackle-block with and supporting it on the carriage, and a fall-rope connecting the carriage and tackle-block to raise and lower the latter, and having a branch connected with the carriage, and of such length that when the tackle-block is raised sufficiently to engage it with the carriage the draft-strain is thrown upon the branch to move the carriage on the cable, substantially as described.

7. The combination of the traveling carriage, the rock-shaft, the hook thereon, the pulley-block having means to engage the hook, and the fall-rope connecting the carriage and pulley-block, for moving the carriage on its support and raising and lowering the pulley-block, substantially as described.



8. The combination of a cable, a carriage to travel thereon, a rock-shaft mounted in the carriage and carrying a hook, arms extending from said shaft to rock it, a tackle-block having a bolt or rod to engage and disengage the hook, and a fall-rope passing around pulleys both in the carriage and tackle-block, and acting both to raise and lower the tackle-block, and to move the carriage on the cable, substantially as described.

9. The combination of the cable, the carriage thereon, the cable-grip, the swinging hook on the carriage, the tackle-block having means to engage the hook, and the fall-rope for moving the carriage on the cable and raising and lowering the pulley-block, and having a branch connected with the carriage, and of such length that when the tackle-block is raised and engages the hook the draft is thrown upon the branch to move the carriage on the cable, substantially as described.

10. The combination of the cable, the carriage thereon, the tackle-block, means for detachably connecting the tackle-block with and supporting it on the carriage, the fall-rope connecting the carriage and tackle-block, to raise and lower the latter, and also move the carriage on the cable, the gripping-jaws pivoted directly on said carriage, the toggle-levers connecting the ends of the jaws, a screw-collar secured to the connected ends of the toggle-levers, the screw-shaft passing into the screw-collar, the grip-wheel on the screw-shaft, and means for operating the wheel, substantially as described.

11. The combination, with the cable or track way, the carriage thereon, hoisting mechanism connected with the carriage, the fall-rope, and the endless rope or cable, substantially as described.

295,777. HARVESTER. SYLVANUS D. LOCKE, Hoosick Falls, N. Y. Filed Apr. 3, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the main axle, the driving or carrying wheel thereon, the main or wheel frame mounted on the axle, a rock-shaft turning in bearings afforded by the rear end of said frame, a platform mounted upon said rock-shaft as a journal or axle, an arm extending rearward from said rock-shaft at its outer end and supporting the grain-wheel, a second arm extending forward from said rock-shaft at or toward its inner end, and a connection between said second or lever arm and adjusting mechanism upon the wheel-frame, whereby the rock-shaft may be oscillated to raise and lower the platform.

2. The combination, substantially as hereinbefore set forth, of the main axle, the drive-wheel mounted thereon, the main or wheel frame mounted on the axle, the rock-shaft journaled in the rear end of the main frame and supporting the platform, a grain wheel or caster carried by a rearwardly-extending arm at the outer end of said rock-shaft, a forwardly-extending lever-arm at or toward the inner end of said shaft, a draft-tongue hinged to the front of the main frame and extending rearwardly from the pivotal point, a bracket-casting or other means of attachment on the heel of said draft-tongue, and connections between said bracket, said lever-arm, and a common controlling instrumentality, whereby the rock-shaft may be oscillated in its bearings and the draft-tongue simultaneously flexed upon its pivot in such relation as to raise the platform, preserving its parallelism.

3. The combination, substantially as hereinbefore set forth, of the main axle, the drive-wheel mounted thereon, the main frame mounted on the axle, a rock-shaft journaled in the rear end of the main frame and supporting the platform, a grain wheel or caster carried by a rearwardly-extending arm at the outer end of said rock-shaft, a forwardly-extending lever-arm at or toward the inner end of said shaft, a draft-tongue hinged to the front of the main frame and extending rearwardly from the pivotal point, a bracket-casting or other means of attachment on the heel of said draft-tongue, chains extending from said bracket and from said lever-arm to properly-proportioned pulleys or winding-drums upon the main frame, and mechanism for rotating said pulleys to wind up or let out said chains, and thereby raise or lower the harvester-platform.

4. The combination, substantially as hereinbefore set forth, of the main axle, the drive or carrying wheel mounted thereon, a main frame sleeved upon the axle inside the carrying-wheel, a platform hinged to the main frame at its rear end, a draft-tongue hinged to said frame at its front end in advance of its connection with the axle, means for simultaneously changing the angle between draft-tongue and main frame and platform and main frame, to raise and lower said platform, a seat and its support sleeved to the axle outside of the drive-wheel, and a brace-rod extending from said seat to an adjustable connection with the tongue or a foot-rest offset therefrom.

5. The combination, substantially as hereinbefore set forth, of the main axle, the drive or carrying wheel mounted thereon, the main frame mounted on the axle, a rock-shaft borne in bearings at the rear end of the main frame, a grain-wheel mounted upon a rearwardly-extending arm from the outer end of said rock-shaft, a forwardly-extending lever-arm at or toward the inner end of said rock-shaft, a draft-tongue pivoted to said main frame in advance of the axle and extending rearwardly between guide-ears, which permit it to play in a vertical plane, and connections between the heel end of said draft-tongue, the free end of the lever-arm, and a common controlling instrumentality, by which the draft-tongue can be vibrated upon its pivot and the rock-shaft simultaneously oscillated in its bearings, to change the angle between the draft-tongue and frame and the platform and frame, and raise and lower said platform.

6. The combination, substantially as hereinbefore set forth, of the main axle, the drive or carrying-wheel mounted thereon, the main frame mounted on the axle, a rock-shaft mounted in bearings at the rear end of the frame, and having at its outer end a rearwardly-extending arm to support the grain-wheel, and at its inner end or length a forwardly-extending lever-arm, a platform supported upon said rock-shaft as a journal or axle, a tongue hinged to the main frame in advance of the main axle, and extending rearwardly from said pivot to vertical guides or keepers, between which its heel end plays and is steadied, a bracket-casting secured to said heel end, a worm-shaft extending down from about the height of the seat and turning in bearings upon the main frame, a crank at the upper end of said shaft to be operated by the driver, a worm-pinion meshing with the worm at the lower end of said shaft, and turning on a stub-axle projecting from the main frame, and properly-proportioned winding-drums fixed to said pinion to turn therewith, one receiving a chain from the bracket-arm at the rear of the tongue, and the other a chain from the lever-arm extending forwardly from the rock-shaft.

7. The combination, substantially as hereinbefore set forth, of the main axle, the drive-wheel turning loosely thereon, a clutch between said drive-wheel and axle, a main frame sleeved to the axle, a beveled gear-wheel pinned to the axle within said main frame, a platform hinged to the rear end of the main frame and carrying a transverse driving-shaft, a shaft geared with the beveled wheel by means of a beveled pinion, and extending rearwardly through the main frame to a universal-joint connection with the platform-shaft, and means for raising and lowering said platform.

8. The combination, substantially as hereinbefore set forth, of the main axle, the drive-wheel turning loosely thereon, the clutch between the wheel and axle, the main frame sleeved to the axle on the inner side of the drive-wheel, the rock-shaft mounted in bearings at the rear end of the main frame, and carrying in a crank-arm at its outer end the grain-wheel, and oscillated by means of a lever-arm at its inner end, and controlling mechanism on the main frame, the platform journaled on said rock-shaft and carrying the transverse driving-shaft, the outer crank-shaft parallel to and gearing with said driving-shaft, the beveled gear pinned or keyed to the main axle, the prime pinion with which it meshes, and the telescoping shaft extending rearwardly from said prime pinion through the main frame to a universal-joint connection with the platform driving-shaft, above or near the axis of said platform.

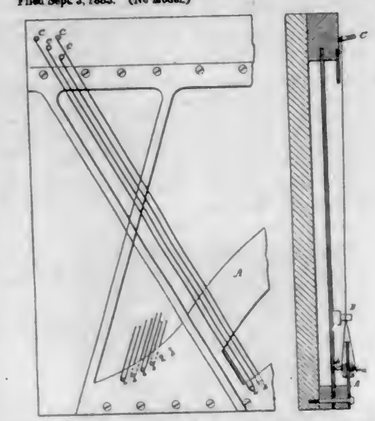
9. The combination, substantially as hereinbefore set forth, of the main axle, the drive-wheel mounted thereon, the main frame mounted on the axle, the rock-shaft having its bearings in the rear end of said main frame, and supporting, by means of a crank-arm at its outer end, the grain-wheel, the forwardly-extending lever-arm from said rock-shaft, a chain-connection between said lever-arm and a winding-drum on the main frame, a worm-pinion fast to said drum, and a worm-shaft controlled by the driver and meshing with said pinion, whereby the rock-shaft can be oscillated in its bearings to raise or lower the platform.

10. The combination, substantially as hereinbefore set forth, of the main axle, the drive-wheel mounted thereon, the main frame mounted on the axle, the platform hinged to the rear end of said main frame, the draft-tongue hinged to forwardly-extending arms on said frame, and steadied in rear of the pivotal point by vertical keepers, a chain-connection between the heel end of the draft-tongue and a winding-drum upon the frame, a worm-wheel fast to said winding-drum, and a worm-shaft meshing with said wheel, whereby it may be revolved by the driver, to cause the drum to take up or let out the chain and alter the angle of the draft-tongue to the frame.

11. The combination, substantially as hereinbefore set forth, of the main axle, the drive-wheel or carrying-wheel turning on said axle, the main frame sleeved upon the axle inside of the drive-wheel and abutting against its hub to support it against lateral displacement on that side, a tube or sleeve pinned to the axle on the outer side and abutting against the hub of the wheel on that side, to prevent its lateral displacement in such direction, and a sliding clutch-half feathered to said sleeve, and engaging with a clutch-face formed on the opposing hub, to clutch the wheel to the axle.

12. The combination, substantially as hereinbefore set forth, of the main axle, the drive or carrying wheel turning thereon, the main frame sleeved upon the axle on the inner side of said wheel and abutting against its hub on that side, a tube or sleeve pinned to the axle on the outer side of the wheel, and also abutting against the hub on that side, whereby the axle is secured against lateral displacement, a seat-support mounted upon the axle outside of said tube, and a seat carried thereon, a sliding clutch-half feathered to the sleeve inside of the seat-support and engaging with a clutch-face formed in the opposing wheel-hub, a standard projecting from the seat-support, and a clutch-lever pivoted to said standard, to operate the sliding clutch-half.

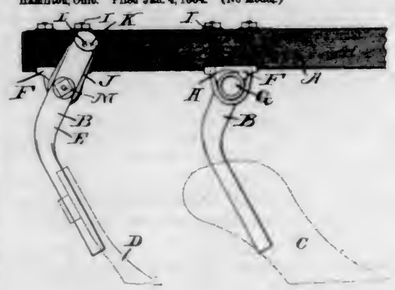
13. The combination, substantially as hereinbefore set forth, of the main axle, the drive or carrying wheel turning thereon, the main frame sleeved upon the axle on the inner side of said wheel and abutting against its hub on that side, a sleeve pinned to the axle on the outer side of the wheel, and also abutting against the hub on that side, whereby the axle is steadied against lateral displacement, a seat-support mounted upon the axle outside of said sleeve, and a seat carried thereon, a sliding clutch-half feathered to the sleeve inside of the seat-support and engaging with a clutch-face formed in the opposing wheel-hub, a standard projecting from the seat-support and formed with an inclined face, and the clutch-lever pivoted to said standard by a spring-seated bolt, and having on its shank a projection to travel over said incline and snap behind the edge of the standard, to lock the clutch-half out of engagement.



14. The combination, substantially as hereinbefore set forth, of the main axle, the drive or carrying wheel mounted thereon, the main frame mounted on the axle, the cranked rock-shaft mounted in bearings at the rear end of said frame and supporting the grain-wheel, the lever-arm from said rock-shaft, the platform mounted upon the rock-shaft as a bearing, the standard on the platform, the draft-tongue pivoted to the frame in advance of the axle and extending rearwardly from the pivotal point, connections between the lever-arm, draft-tongue, and a common controlling device, whereby said lever and draft-tongue may be simultaneously moved to change their angles with the frame and raise the platform, a lever pivoted to the draft-tongue, a segment-rack for said lever, and a link connecting the lever with the standard upon the platform, whereby said platform may be tipped and secured in the tipping adjustment.

15. The combination, substantially as hereinbefore set forth, of the main axle, the drive or carrying wheel mounted thereon, the main frame mounted on the axle, the rock-shaft mounted in bearings at the rear end of the frame and supporting the grain-wheel by a cranked arm at its outer end, a lever-arm from said rock-shaft, connected with mechanism whereby it may be vibrated to oscillate the rock-shaft, a platform mounted upon said rock-shaft as a journal or axle, and adjusted vertically as it oscillates, and means whereby said platform may be tipped and secured in any tipping adjustment independently of its vertical adjustment.

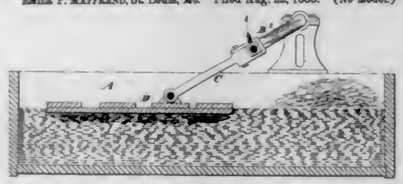
16. The cast main frame formed, substantially as described, in a single integral piece, with sleeves or bearings for the main axle, rearwardly-extending arms for the platform-connection, forwardly-extending arms for the draft-tongue connection, and vertical guides for the heel end of said tongue.



17. The main frame formed, substantially as hereinbefore described, in a single integral piece, comprising sleeves or bearings for the main axle, an arm extending rearwardly at practically right angles to said bearings, a second arm extending rearwardly at an oblique angle to said bearings to serve as a brace, a cross-arm between the two, a forwardly-extending arm at right angles to the bearings, and another forwardly-extending arm at an oblique angle, to receive the pivot-bolt of the tongue, embrace the tongue between them, and serve as bounds, vertical guides for the rear end of the tongue, and a web and ears for the attachment of the adjusting devices.

295,778. STRINGING DEVICE FOR PIANO-FORTES. JOHN E. LOMAS, New Haven, Conn., assignor of one-half to E. Shoninger, same place. Filed Sept. 3, 1883. (No model.)

Claim.—The combination of the sound-board, the frame A, arranged in a plane parallel with the sound-board, the said frame provided with pins *a* upon its outer side and pins *b* upon its under side, and so as to stand between the frame and the sound-board, the said pins *b* being intermediate between the pins *a* upon the opposite side, the agraffe B, arranged upon the sound-board, on the same side of the board as the plate, the strings attached to the pins *a* and *b*, those from the pins *a* on the one side of the frame inclining downward toward the sound-board to the agraffe, and those from the pins *b* on the opposite side inclining upward from the sound-board to the agraffe, substantially as described.

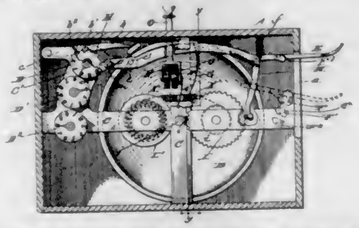


295,779. CULTIVATOR. JOHN M. LONG and CHARLES E. MCBETH, Hamilton, Ohio. Filed Jan. 4, 1884. (No model.)

Claim.—1. The combination of a tooth-shank provided with a stud of parallel form projecting at right angles from the side thereof, a beam provided with a receiving feature suited to receive said stud and permit its endwise adjustment without permitting rotation, and a clamp for drawing said stud firmly into engagement with said receiving feature, substantially as and for the purpose set forth.

2. The combination of shank B, the cylindrical ribbed sliding stud secured thereto, the saddle F, fitting said ribbed stud, the beam A, and the stirrup I, engaging the stud, the saddle, and the beam, substantially as and for the purpose set forth.

295,780. APPARATUS FOR DIPPING TOBACCO IN LICORICE. EMILE F. MAYTRAND, St. Louis, Mo. Filed Aug. 22, 1883. (No model.)



Claim.—1. The combination, with a suitable tank, of a float and means to elevate and depress the rear and of the float at the receiving end of the tank to dip the material, as set forth.

2. The combination, with a tank, of a float, a shaft having a crank supported over the receiving end of the tank, and a pitman connected to the crank and float, the whole arranged substantially as shown, whereby the float assumes an inclined position at the receiving end of the tank, and a horizontal position as it advances with the dipped material, as set forth.

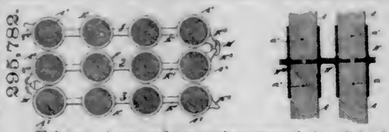
3. The combination, with a tank, of a float, a crank-shaft, suitable boxes on the tank to support the crank-shaft at the receiving end thereof, and a pitman connected to the crank-shaft and float, the operating means being arranged to elevate the rear end of the float at the receiving end of the tank to form a pocket for and then dip the material, as set forth.

295,781. FARE-REGISTER. HOLMES MARSHALL, Cleveland, Ohio. Filed Oct. 31, 1883. (No model.)

Claim.—1. A register constructed substantially as described, having an inclosing-case, gong, frame C, decimal-dials, and lever E, provided with two or more graduated perforating-pins, all in combination, whereby fares paid in cash, tickets, &c., are separately registered, as and for the purpose set forth.

2. A register constructed substantially as described, having the case A, gong B, frame C, decimal-dials D D′ D², and lever E, provided with means for clearly recording each fare taken, in combination with a printing device, substantially as described, whereby each trip or half-trip may be registered.

3. In a fare-register, the case A, gong B, frame C, decimal-dials D D′ D², and lever E, provided with stud E′, having graduated needles, with the rolls I I′, paper K′, and means for causing said paper to pass from one to the other of said rolls, substantially as described.

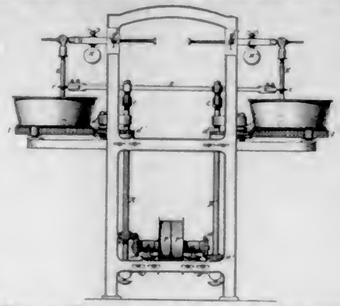


4. In a fare-register, the rod O, having bifurcated lower end, O′, and downward-projecting arm S, provided at its lower end with pawl *s*, printing-wheels N N′, pivoted between the lower bifurcated arms, O′, of the rod O, in combination with the stud R, having pawl *r*, spring *q*, paper K′, stud K, and rolls I I′, substantially as described.

5. In a register substantially such as described, the combination of the lever E, having stop F³, with the stops F F′ F², attached to the frame C, whereby the downward movement of the lever E is gaged, substantially as described.

295,782. MAT. RAFAEL MARTINEZ, New York, N. Y., assignor to Emil Gutmann and Henry Goodman, both of same place. Filed Dec. 11, 1883. (No model.)

Brief.—Consists of parallel rods of wood united in rigid sections, with flexible connections between said sections, the inner ends of the rods being received in castings.



295,782.

Claim.—1. A mat or floor-covering composed of parallel rods A of wood, united in rigid sections 1 2 3, in combination with flexible connections between the several sections, all combined and arranged for joint operation substantially as herein specified.

2. In a mat, substantially as described, the parallel rods of wood, as A, made in sections, combined with the castings W, which receive the abutting ends of said sections, substantially as set forth.

295,783. MACHINE FOR SIFTING COLORS. JEAN CHARLES MATTER, Mülhausen, Germany. Filed Oct. 22, 1883. (No model.) Patented in England Sept. 25, 1883, No. 4,570, and in France Oct. 8, 1883, No. 145,527.

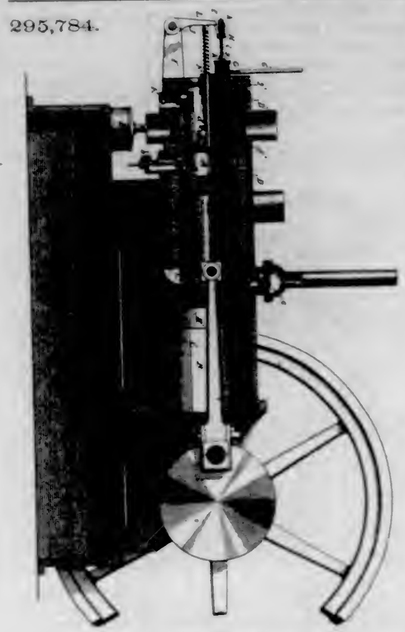
Claim.—1. The combination of a sieve arranged for rotation in a horizontal plane, a spindle, E, carrying a brush within the sieve, the said spindle being suitably swiveled, and mechanism, substantially such as described, for communicating rotation to the sieve in one direction and rotation to the brush in the opposite direction, substantially as described.

2. The combination of two sieves arranged for rotation in a horizontal plane, mechanism, substantially such as described, for imparting such rotation to said sieves, the two cranks C C′, the rod D, connecting said cranks and extending over the sieves, and carrying at its extreme ends the rings *c c′*, the brush-spindles E E′, carrying brushes at their lower ends, extending up through said rings *c c′*, and suspended at their upper ends by swivel-joints, substantially as described.

295,784. GAS-ENGINE. HIRAM S. MAXIM, Paris, France. Filed June 13, 1883. (No model.) Patented in France Jan. 16, 1883, No. 153,138, and in England Feb. 23, 1883, No. 999.

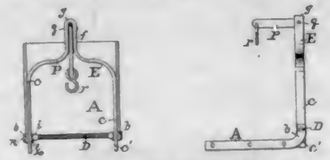
Claim.—1. The combination, in an engine of the kind described, of an explosion-chamber, a gas-generating chamber communicating therewith by means of a suitably-operated valve, an automatically-closed valve arranged to introduce oil into said gas-generating chamber, a spring-actuated mechanism for opening said valve, and means for setting said mechanism intermittently in operation, the action of which depends upon the movement of the engine, all as set forth.

2. The combination, with an explosion-chamber and an air-valve opening into the same, of a gas-generating chamber arranged to communicate therewith by means of a suitable valve, an oil-valve and air-inlet valve opening into said gas-generating chamber, and means for operating said valves in proper relation to each other, substantially as described.



3. The combination of a vacuum or exhaust cylinder and piston, a working cylinder and piston, an automatic air-valve opening into the working-cylinder, a gas-generating chamber, a valve for controlling the admission of gas from the gas-generating chamber to the working-cylinder, and an automatic air-valve opening into the generating-chamber, all as described.

4. The combination, with the working-cylinder of an engine of the kind described, of a gas-generating chamber, a valve for admitting oil into said chamber, mechanism for opening said valve, and a governor operated by the engine for rendering said mechanism inoperative when the speed of the engine becomes too high, all as set forth.

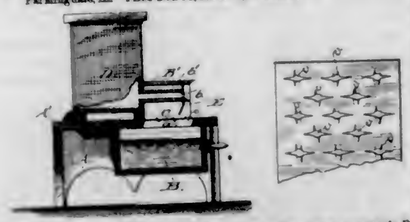


5. The combination, with the working-cylinder A and valve *b*, of the chamber *d*, valves E *a*, oil-valve G, and mechanism, substantially as described for operating the same.

6. The combination, with the working-cylinder A and valves *b a*, of the chamber *d*, air and oil valves opening into the same, and the hot-air space surrounding said chamber, all as set forth.

295,784.

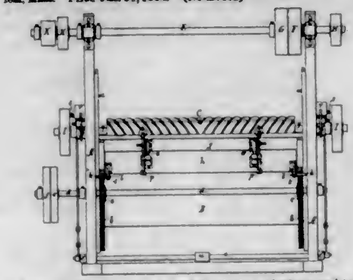
295,785. FOLDING SCALE-PAN. WILLIAM MAGUIRE, Baltimore, Md. Filed Oct. 21, 1881. Renewed Dec. 20, 1883. (No model.)



Claim.—1. In a scale-pan, the combination of a pan, a hanger consisting of two legs, the upper ends of which curve toward each other and join, and the lower ends of which are spread apart, each leg being jointed to one side of the pan, and a stop device, substantially as described, to retain the pan in proper position with respect to the hanger, as set forth.

2. In a scale-pan, the combination of a hanger to support the pan having two legs, which join at the uppermost part, and an arm pivoted between the legs by which the scale is suspended, as set forth.

3. An improved scale-pan, consisting of a pan, A, a hanger, E, hinged to one side only of the pan, a stop device to retain the pan in proper position for use, and an arm pivoted at the upper end of the hanger, as shown and described.

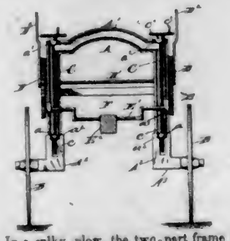


295,786. MOTH-TRAP FOR BEE-HIVES. JOHN T. MCELFRESH, Farmingdale, Ill. Filed Dec. 31, 1883. (No model.)

Claim.—1. In an attachment for bee-hives, the water-receptacle B, having located above the same the perforated plate with transverse slots having central circular portions, and upwardly and downwardly turned edges located under the bee-entrance of a hive, substantially as shown, and for the purpose set forth.

2. In combination with a bee-hive having a raised bee passage or entrance, *b*, surrounded by an outer wall, B′, and a plate, E, bent at its lower end, the base A′, provided with an opening, and perforated plate C, located above a water-tank, substantially as shown.

295,787. MACHINE FOR PUTTING OUT OR STRETCHING SKINS. BENJAMIN MCKEEN, Peabody, assignor of one-fourth to Daniel Murray, Salem, Mass. Filed Jan. 31, 1884. (No model.)



Claim.—1. The combination of the bed or platform and its guide-ways inclined to the horizon and provided with mechanism for reciprocating the said bed rectilinearly on its ways, with the screw-threaded cylinder and its weighted supporting-levers for raising it, and the mechanism for depressing it, all being adapted and to operate substantially as set forth.

2. The combination of the bed B, having the opening *g*, with the door or clamp *h* and mechanism for operating it, as and for the purpose described, during the movements of the bed, substantially as set forth, such mechanism consisting of the weighted lever *m*, link *p*, arm *i*, and bracket *k*, provided with the roller *l*, all being adapted to operate essentially as represented.

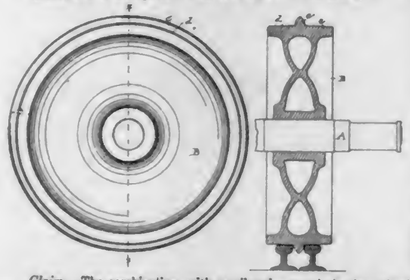
3. The combination of the inclined bed, movable, and provided with a water intercepting and deflecting lip arranged with it, as described, with the screw-threaded cylinder arranged and provided with mechanism for operating it relatively to such bed, substantially as represented.

295,788. SULKY-PLOW. WILLIAM MCNARY, Bryan, Ohio. Filed July 6, 1883. (No model.)

Claim.—1. In a sulky-plow, the two-part frame A, consisting of the upper arched or U-shaped portion, A′, and lower parts, A², the latter slotted or recessed to receive the ends of the former, in combination with the rods C, secured in bosses at their upper ends, and having their lower ends threaded to engage with threaded nuts or projections on the parts A², and means for operating said rods, as and for the purpose set forth.

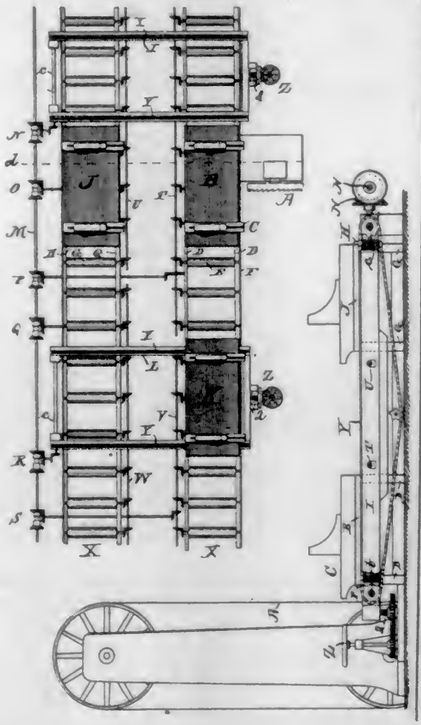
2. In a sulky-plow, the combination of a two-part frame, A, constructed substantially as described, and provided with adjusting-rods C, with spur-wheels D, mounted upon the shaft D′, and having hand-levers D², pinions E, mounted upon the crank-shaft E′, having its bearings in the adjustable part of the frame, and plow-beam E², substantially as described.

295,789. ARMATURE-COIL FOR DYNAMO-ELECTRIC MACHINES. JAMES J. MCTIGHE, Pittsburg, Pa. Filed Oct. 16, 1883. (No model.)



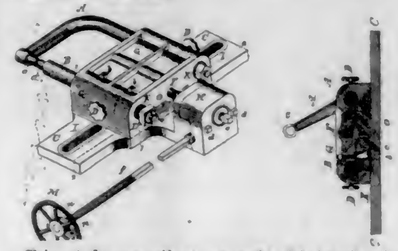
Claim.—1. A prepared armature-coil having a wedge shape in cross-section, and having its layers of wire interlocked by tying, and the whole adapted to be placed on an armature after being completed, substantially as described.

2. A prepared armature-coil, completely covered externally by an insulating band or tape wound spirally thereon, substantially as described.



3. A prepared armature-coil having a wedge shape in cross-section, its layers of wire interlocked by tying, and covered externally with an insulating band or tape wound spirally thereon, substantially as described.

295,790. CAR-WHEEL. JOSIAH W. MELVIN and WILLIAM H. CLUTE, Houston, Tex., assignors of two-thirds to Abraham H. Swanson and James McGee, both of same place. Filed Nov. 28, 1883. (No model.)

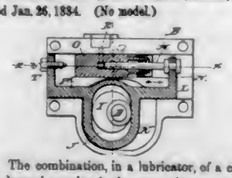


Claim.—The combination, with a railroad-car axle having wheel-bearings of equal diameters throughout their whole lengths, of wheels the peripheries of which are provided with central flanges, dividing each into two treads, said wheels adapted to be pressed on the aforesaid bearings with either side innermost, substantially as described, and for the purpose set forth.

295,791. SAW-MILL. DAVID FERGUSON MILNE, Rochester, N. Y., and JAMES THOMPSON MILNE, Clay City, Ky. Filed Dec. 22, 1883. (No model.)

Claim.—In a saw-mill, the combination of a saw, a carriage-way provided with carriage-moving mechanism, and located so as to form a carriage-pathway past the saw, a second similarly-provided carriage-way disposed parallel thereto, one or more log-carriages fitted to move on said carriage-ways, and two or more transfers located one before and one after the saw, and adapted to shift said carriage or carriages from one carriage-way to the other, substantially as and for the purposes specified.

295,792. SAW-GUIDE. THOMAS J. NEACY, Milwaukee, Wis. Filed Mar. 17, 1883. (No model.)



Claim.—1. In a saw-guide, the combination of the laterally-adjustable block G, right-angled arm A, pivoted in block G, straight arm B, provided with threaded adjusting-sleeve E, bed-plate C, provided with transverse dovetailed way O, gib *c*, wedges *b b*, worm P, and screw F, provided with pinion N, substantially as and for the purposes set forth.

2. In a saw-guide, the combination of the block G, adapted to move transversely upon the dovetailed way O, raised on the bed-plate C, bed-plate C, arms A and B, screw F, provided with the pinion N, worm-wheel P, and rod *f*, provided with hand-wheel M, substantially as and for the purposes set forth.

3. The combination, in a saw-guide, of the arm A, provided with the lug A, arm B, provided with the threaded sleeve E, block G, adapted to move transversely upon the dovetailed way O, raised on the top of bed-plate C, and provided with the shoulder *g*, set-screws D D, bed-plate C, with the gear-case H, inclosing the worm-wheel P and the pinion N, and the screw F, substantially as and for the purposes set forth.

4. In a saw-guide, the combination of the block G, provided with the right-angled arm A and the adjustable arm B, and capable of lateral movement upon the bed-plate C, and screw F, having a fixed bearing in an extension from the rear edge of bed-plate C, substantially as and for the purposes set forth.

295,798. LUBRICATOR. LARS CHRISTIAN NIELSEN, Copenhagen, Denmark. Filed Jan. 26, 1884. (No model.)

Claim.—1. The combination, in a lubricator, of a casing having an inlet and outlet channel opening in the same plane, a pump having a lateral aperture from its bore and reciprocating in a plane so as to bring the aperture to register with the inlet and outlet channel, a piston reciprocating in the pump, and means for reciprocating the piston and pump operated by the machinery to be lubricated, as and for the purpose shown and set forth.

2. The combination, in a lubricator, of a casing having an inlet and an outlet channel opening in the same plane in one side of the casing, a pump sliding inside the casing, having a lateral aperture opening from the inner end of its bore and sliding in a plane so as to bring the aperture to register with the inlet and outlet channel, a reciprocating frame having a piston fitting into the pump secured from one arm, and having a set-screw at its other arm adapted to strike the end of the pump, and means for reciprocating the frame, as and for the purpose shown and set forth.

3. The combination, in a lubricator, of a reservoir for the lubricant, a casing having an inlet and an outlet channel for the lubricant opening in the same plane in one side of the casing, a pump having a lateral aperture opening from the inner end of its bore and sliding in ways in the casing in a plane so as to bring the aperture to register with the inlet and outlet channel, a frame sliding in the same plane as the pump inside the casing, having two upwardly-projecting arms straddling the ends of the pump and having a downwardly-projecting slotted lug, a piston fitting in the bore of the pump and secured to one arm of the bifurcated frame, a set-screw passing inward through the other arm of the bifurcated frame, and a shaft revolved by the machinery to be lubricated, and having an

eccentric disk revolving in the slotted lug of the sliding bifurcated frame, as and for the purpose shown and set forth.

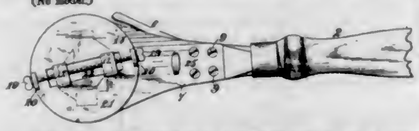
295,794. FAUCET-SCREW. MICHAEL O'CONNOR, New Brunswick, N. J. Filed Jan. 19, 1884. (No model.)

Claim.—1. The attaching-plate A, including in one piece the elevated chamber *b*, formed directly at the inner end of the screw-socket, and the valve-seat A, and having the nozzle and the threaded valve-stem and the valve arranged to play in the socket and bear upon the seat of the attaching-plate, as and for the purpose described.

2. The attaching-plate A, adapted to be secured to a can, and including in one piece of sheet metal the screw-socket, and directly at its inner end the elevated chamber *b* and the valve-seat A, and having the nozzle B, said socket containing the screw-stem, having a thumb-piece at its outer end, and a valved inner end arranged to close over the chamber *b* and bear against the seat on the attaching-plate, substantially as shown and described.

295,795. DOOR-LATCH. WILLARD F. OLIVER, Lynn, assignor of one-half to Mellen Bray, Newton, Mass. Filed Jan. 11, 1884. (No model.)

Claim.—1. A door-latch provided with a spring-actuated bolt, the forked arms of which are provided with suitable ears, in which are mounted adjusting-screws which co-operate with the arms upon a collar secured to the shank, upon which the knobs are mounted, substantially as and for the purposes described.



2. In a door-latch, the combination of the two-part casing A B, provided with the lug *f*, the collar C, the shank D, the forked bolt E, provided with the slot F, the spring G, the ears or projections *b b*, and the adjusting-screws *c c*, mounted in suitable ears upon the bolt E, all adapted to operate substantially as and for the purposes described.

295,796. PULLEY. OLAF R. OLSEN, Indianapolis, Ind. Filed Dec. 6, 1883. (No model.)

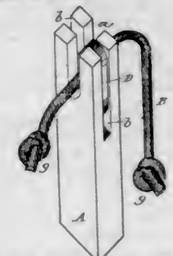
Claim.—The split pulley formed of a continuous rim, having one opening adapted to be drawn and secured together by suitable fastenings, in combination with a bisected hub and bisected corrugated metal web, with means for uniting the parts, substantially as described.

295,797. RATCHET-WRENCH. ADELBERT E. OSBORN, Waco, Tex., assignor to the Model Machine Company, same place. Filed Dec. 31, 1883. (No model.)

Claim.—1. The combination of the rotating head having an irregular-shaped opening, forming a series of sets of seats or recesses, with the movable jaws having shanks, and means for moving the jaws about in the said opening and adjusting them to any set of the seats or recesses, substantially as described.

2. The combination of the rotating head having an irregular-shaped opening, forming a series of sets of seats or recesses, with the movable jaws having shanks, the rotating plate at one side of the head, provided with a slot, and an adjusting-screw carried by the plate and engaging the shank of the jaws, substantially as described.

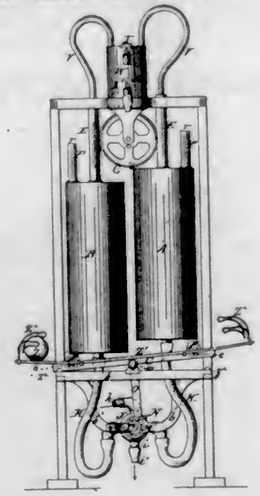
3. The combination of the rotating head held to rotate between the plates of the handle, and provided with an irregular-shaped opening, forming a series of sets of seats or recesses, with the jaws having shouldered heads, the rotating plate at one side of the head, provided with the rectilinear slot, and the screw-rod carried by the rotating plate and engaging the shouldered heads of the shanks, substantially as described.



295,798. SPECULUM. GEORGE W. PAGETT, Oxford, Ind. Filed Jan. 11, 1884. (No model.)

Claim.—1. The combination of an outer speculum-tube, having a longitudinal slot in its side, with an inner tube fitting and turning in the outer tube, and having a longitudinal slot in its side, increasing in width toward one end, as and for the purpose shown and set forth.

2. The combination of an outer speculum-tube, having a rounded closed inner end, a longitudinal slot in its side, and a suitable handle at its outer flanged end, with an inner tube fitting and turning in the outer tube, and having a longitudinal slot consisting of sections decreasing in length, each of the same width as the slot in the outer tube, as described, the outer flanged end of the inner tube and the handle upon the outer tube having marks corresponding to each other, as and for the purpose shown and set forth.



295,799. TAG OR LABEL. WILLIAM P. PATTON, Harrisburg, Pa. Filed Feb. 21, 1884. (No model.)

Claim.—1. In an address tag or label, a binding-hook pivoted forward of the longitudinal center of the bight of the hook, substantially as specified.

2. The tag or billet A, having the recess *a* cut through its end to receive an attaching-cord, and having the kerf *b* cut through its end at right angles to and of a greater depth than recess *a*, in combination with a hook, D, pivoted within the kerf *b*, so as to be entirely within the outer edges of the kerf when the hook seizes the attaching-cord, substantially as and for the purpose set forth.

295,800. HYDRAULIC AIR-COMPRESSOR. CHAS. PFANNL, Washington, D. C. Filed Dec. 27, 1883. (No model.)

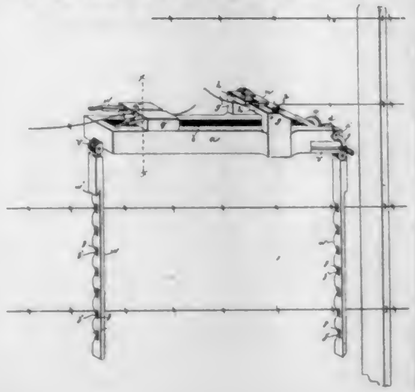
Claim.—1. The combination, in a hydraulic air-compressor, of the two water-receiving and air-pumping vessels, each supported independently upon a rising and falling bearing, a suitable rocking support for sa vessels, means for maintaining and guiding said vessels in their movements in vertical parallel relation to each other, means for connecting said chambers with a water-controlling device, and means for supplying the air to and discharging it from said vessels, substantially as described.

2. The combination, in a hydraulic air-compressor, of two non-rocking water-receiving and air-pumping vessels, each supported independently upon a vertically-moving bearing, with a rocking balance-frame supporting and moving with said separate bearings, a weight adapted to travel upon said balance-frame, a suitable guide-bearing for the upper ends of said vessels, a cock and suitable means for connecting it with the said vessels, the said balance-frame, and the water-supply, substantially as described, for the purpose specified.

3. In a hydraulic air-compressor, the combination of the non-rocking vessels A B, the rocking balance-frame C, weight Z, a cock, I, the tubes H, and the arm O, with the air-storage reservoir W, having one or more hose-receiving supply-cocks, X, and the flexible tubes V, connecting it with the said vessels, substantially as described, for the purpose specified.

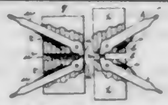
4. In a hydraulic air-compressor, the combination, with the vessels A B, of the cylindrical cock I, its case J, having a projecting joint-forming bearing-sleeve, K, a spring, I^2, adapted to secure said cock within its case, and suitable means for operating said cock by the movements of said vessels, substantially as described.

5. In an air-compressor, the two non-rocking water-receiving and air-pumping vessels, each having a knife-edge bearing, *c*, and a top guide, E, in combination with the rocking balance-frame C, having knife-edge bearings *a a*, the weight Z, adapted to travel upon said frame, a suitable support for said guides, and means, substantially such as described, for controlling the supply and discharge of water into and from said vessels, and to control the supply and discharge of air into and from said vessels, substantially as described.



6. The combination, in a hydraulic air-compressor, of the two non-rocking vessels A and B with the cylindrical cock I, the case J, having the joint-forming bearing-sleeve K, the spring I^2, pinion M, carried by said cock, arm O, having the cogged sector N, rocking balance-frame C, the traveling weight Z, suitable connections for supplying and discharging water to and from said vessels, and suitable means for supplying and discharging air to and from said vessels, as set forth.

7. In a hydraulic air-compressor, the non-rocking vessels A and B, each having a knife-edge bearing, combined with a suitable rocking support having knife-edge bearings, and suitable means for operating said vessels by water-pressure and for pumping and supplying air from said vessels, substantially as described.

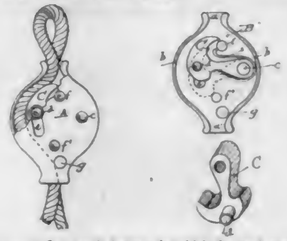


8. In a hydraulic air-compressor, the non-rocking vessels A and B, each supported independently upon a rising and falling bearing, combined with a suitable rocking support, upon and by which the said cylinders are adapted to be operated in vertical parallel relation to each other, substantially as and for the purpose stated.

9. In a hydraulic air-compressor, the combination of the vessels A and B with the chambers P, having the inlet air-valves *l*, and the chambers E, having the outlet-valves *l'*, with the tube *m*, extending from the bottom of each of said air-inlet chambers to near the bottom of each of said vessels, and means for controlling the supply and discharge of water into and from said vessels, whereby the air is caused to pass into and through the water before being discharged, substantially as set forth.

295,801. WIRE-FENCE STRETCHER AND SPLICER. JONATHAN K. PIERCE, Deming's Bridge, Tex. Filed Sept. 29, 1883. (No model.)

295,801.



Claim.—1. The combination, with the open box *a*, stationary right-angular pieces *g g*, secured thereto, spring-pressed clamping-levers *k k* having serrated ends *m*, and notched lever *n*, of the reciprocating block *g*, having slot w^2, and provided with a projection, *r*, having a threaded orifice, *s*, spring-pressed levers *n*, having serrated ends, screw *b*, and beveled pinions *c d*, substantially as shown and described.

2. The combination, with the open box *a*, provided with the arms *v*, of the arms *w*, pivoted to the latter, and provided with the slots *z*, each having an opening, *z'*, substantially as shown and described.

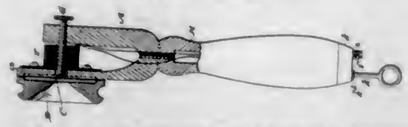
3. The combination, with the box *a*, of the folding arms *w*, one of which is beveled at its end, and the other arm provided with the beveled piece *w'*, substantially as shown and described.

295,802. ROPE OR LINE CLASP. ALBERT L. PITNEY, Washington, D.C. Filed Dec. 31, 1883. (No model.)

Claim.—1. In a cord-fastener in which the cord passes out of a direct line through the case, the combination of a case provided with a narrow throat at each end and slots on each side, with a cam lever or levers pivoted at one side of the center of the case, and provided with a stud or studs for releasing the same, substantially as set forth.

2. In a cord-fastener, the combination of a case provided with a narrow throat at each end and a pivoted cam lever or levers, with a pin located eccentric to the longitudinal center of the case, to form a guide for the cord, and also to assist in binding the two parts of the case, substantially as set forth.

3. In a cord-fastener, the combination of a case provided with a pivoted cam lever or levers with a stop-pin and a guide-pin that act as a stop to the cam lever or levers and as a guide to the cord, and also to assist in binding the two parts of the case, substantially as set forth.

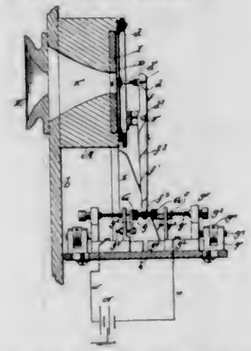


295,803. ROPE OR LINE CLASP. ALBERT L. PITNEY, Washington, D.C. Filed Feb. 18, 1884. (No model.)

Claim.—1. In a cord-fastener, the combination of a case having perforations in one of its edges, with serrated roller or rollers provided with teeth or projections that enter the said perforations, whereby the rollers are prevented from slipping, all substantially as shown and described.

2. In a cord-fastener, the combination of a case having slots, and slides for covering the same upon each side, and means, substantially as described, for preventing the roller or rollers from slipping, with serrated roller or rollers, having lugs projecting from their sides, whereby the said rollers are withdrawn and the cord released, substantially as described.

295,804. TELEPHONIC RECEIVER. CHARLES A. RANDALL, New York, N.Y. Filed May 3, 1883. (No model.)



Claim.—1. In a telephonic receiver, the combination of a permanent magnet having one of its poles formed into a disk integral therewith, and provided with a rim or raised edge forming a support for the vibratory diaphragm, an elastic or vibratory diaphragm secured thereto and arranged to be acted on inductively, and a helix arranged to vary and control the inductive action of the permanent magnet upon the elastic or vibratory diaphragm, substantially as described.

2. In a telephonic receiver, the combination, with the permanent magnet A, having one of its poles flattened or laterally extended and centrally perforated, of the diaphragm secured to the outer margin of said flattened pole, the core projecting from the diaphragm through the opening in the flattened pole and close to the other pole, and the helix loosely surrounding said core, substantially as described.

3. The combination, in a telephonic receiver, of a permanent magnet having one of its poles formed into a disk integral therewith, and having a raised rim or edge for supporting the vibratory diaphragm, an elastic or vibratory diaphragm supported thereon, a soft-iron core or extension attached to or in contact with the other pole of the permanent magnet, and a helix surrounding and adapted to influence such soft-iron core or extension, the thus formed operative poles of the magnet being in magnetically operative proximity to each other, and the helix being arranged to vary and control their magnetic action on each other and the vibratory or elastic diaphragm, substantially as described.

4. The combination, with the helix and the handle, of the spring-actuated rod *k*, provided with the insulating-plate *l*, the finger-spring bearing against said rod and connected with the helix, and the binding-posts connected, respectively, with the helix and the said rod, substantially as described.

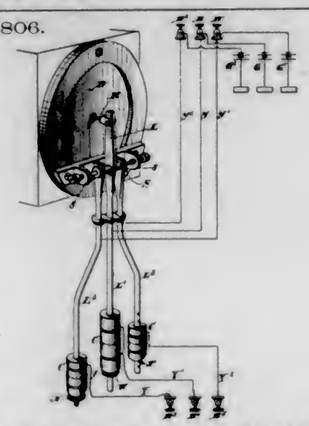
295,805. TELEPHONIC TRANSMITTER. CHARLES A. RANDALL, New York, N.Y. Filed May 3, 1883. (No model.)

Claim.—1. In a lever transmitting-telephone, the combination, with the amplifying-lever, of a motive diaphragm formed of a carbon or slate disk, substantially as described.

2. In a telephonic transmitter, the combination, with the motive diaphragm, of a mouth-piece and an air-chamber interposed between the diaphragm and mouth-piece, said air-chamber being conical in form, its greater diameter being next to and larger than the inner opening of the mouth-piece, substantially as described.

3. The combination, with the diaphragm, of the amplifying-lever loosely connected therewith, to have a slight play independently of the diaphragm, substantially as described.

4. The combination, with the amplifying-lever and its carbon or contact terminal and the battery terminals or contacts, of means, substantially such as described, for adjusting the positions of said battery-terminals relatively to each other and the lever-terminal, and separate means, substantially such as described, for adjusting their normal contact or pressure, substantially as set forth.



5. The combination, with a spring-seated battery-terminal, as shown and described, of a pin or equivalent means attached to the carbon and to its support, so as to prevent the carbon from turning in its seat or support, substantially as set forth.

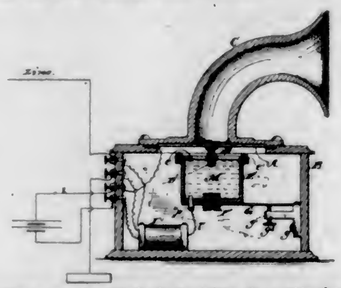
6. The combination of the air-chamber, the metallic disk attached thereto, the diaphragm, the lever supported from the air-chamber, block and disk, a non-conducting base-plate carrying the battery-terminals, and an arm or support rising from and carrying or supporting the air-chamber block and disk, and forming a common support for the operative devices attached to or controlled by the motive diaphragm, substantially as described.

295,806. TELEPHONIC TRANSMITTER. CHARLES A. RANDALL, New York, N.Y. Filed May 3, 1883. (No model.)

Claim.—1. In a telephonic transmitter, the combination of an amplifying vibratory lever forming one electrode, and the opposite electrode mounted loosely thereon and supported thereby, so that the contact of the two electrodes may be varied, substantially as described.

295,806.

2. In a telephonic transmitter, the combination of a diaphragm or vibrator, an amplifying-lever operated thereby and forming an electrode, and an opposite or second electrode loosely mounted upon the long arm of the lever, the two electrodes being arranged and adapted to vary contact upon movement or vibration of the lever, substantially as described.



3. The combination of a lever forming one electrode, a second electrode loosely mounted thereon and carried thereby, and means, substantially as described, for adjusting or regulating the position of the second electrode upon the first, as set forth.

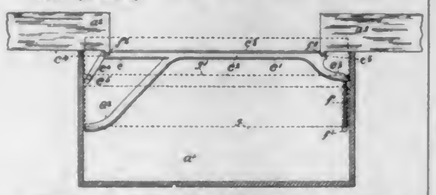
4. The combination, with the diaphragm and short lever-arm connected therewith, of a plurality of long lever-arms provided with electric contact-surfaces and connections, substantially as described, of the contact-blocks or electrodes mounted loosely upon said long arms and provided with electric connections, essentially as set forth.

5. The combination, with the diaphragm, connected short arm, and the shaft, of the three metallic long arms insulated from each other, and the contact-blocks mounted loosely upon said long arms, substantially as described.

6. The combination of a single diaphragm, a series of amplifying-levers controlled thereby, each lever forming one electrode loosely carrying and supporting a second electrode, a series of batteries—one for each lever and connected thereto—and connections to the line or lines from the second electrodes, substantially as described.

295,807. TELEPHONIC TRANSMITTER. CHARLES A. RANDALL, New York, N.Y. Filed Feb. 6, 1883. (No model.)

Claim.—1. In a telephonic transmitter, the combination, with a variable contact-electrode, of a body of mercury confined and under pressure and in contact with said electrode, substantially as described.

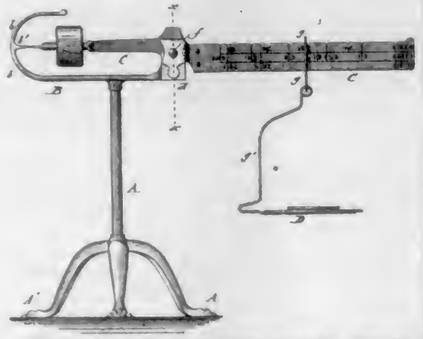


2. In a telephonic transmitter, the combination, with the electrodes, of a confined body of mercury in contact with one of said electrodes, and devices for producing and regulating the pressure of said mercury upon said electrode and its supporting elastic plate, substantially as described.

3. In a telephonic transmitter, the combination of one electrode supported and controlled by a diaphragm, a confined body of liquid whose confining-surface contains and controls a second electrode, which body of liquid is adapted to vary and control the position of the second electrode, and means for varying the pressure of said body of liquid, so as to vary and control the position of the second electrode, substantially as described.

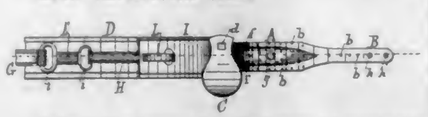
4. In a telephonic transmitter of the class referred to, the combination, with one of the variable contact-electrodes, of an elastic plate con-

taining and supporting such electrode and a vessel adapted to contain a body of liquid, the elastic plate forming the cover thereto, the liquid therein serving the purpose of adjusting the pressure upon such plate and its tension, substantially as described.



295,808. TRUNK. FRANK H. RANSOM, Buffalo, N. Y. Filed Aug. 9, 1883. (No model.)

Claim.—1. A trunk or box provided with the bars c^3, having the flange c^5, for supporting the tray a^3, as specified, when drawn out, in combination with the inclined portions c^2 c', the parts c^4 having projections or pins c^5, for supporting the tray when down in position within the trunk.

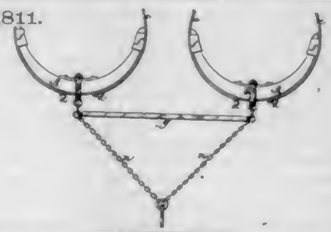


2. The combination of the tray a^3, having pins or projections f^3, with the angular flanges c^5, for supporting it when drawn out, and the angular flange c' and pin f^3, for supporting it in its movements back and forth or downward in place, substantially as described.

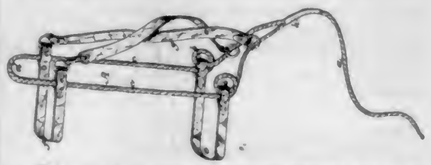
295,809. COIN AND LETTER SCALE. CHARLES REETMANN, New York, N. Y., assignor to H. Richtmann & Co., same place. Filed Oct. 11, 1883. (No model.)

Claim.—A scale for coins and letters, comprising a supporting-standard, a horizontal supporting-arm attached to said standard, provided with a hook-shaped guard having an inward projection or index at the center of the hook, a scale-beam pivoted in said bearings, one end of which is provided with a weight and adapted to oscillate within the hook-shaped guard, being in alignment with the index thereof when balanced, the outer end of said beam being graduated, a slide-link on said scale-beam, and a scale-pan suspended from said link, substantially as described.

295,810. HARNESS-SADDLE TREE. LEVI A. RIDGWALT, Wilmington, Del. Filed Oct. 29, 1883. (Model.)



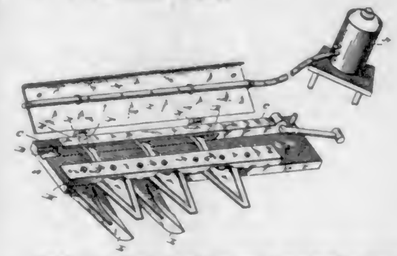
Claim.—As an improved article of manufacture, a harness-saddle tree composed of wings and skirt-stiffening projections, all formed of a single piece, said wings being hollowed out, as shown, on the upper side, for the purpose set forth, and formed with longitudinally-extending ribs, as shown, on the under side, substantially as set forth.



295,811. WHIFFLETREE. HENRY ROEBBEN, Paterson, N. Y. Filed June 2, 1883. (No model.)

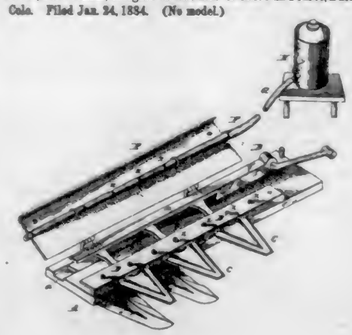
Claim.—The wooden semicircular whiffletree A, furnished with the swing-clevis *b* and the trace-hooks *d*, near the center of the periphery of the same, to act in combination with the embracing-tugs *c*, each provided with the box-loop *f*, substantially as and for the purposes herein specified.

295,811.



295,812. COMBINED BRIDLE AND HALTER. HENRY ROEBBEN, Parma, assignor to Andrew V. Smith, Rochester, N. Y. Filed Oct. 12, 1883. (No model.)

Claim.—An interchangeable or a combined halter and bridle, A, in which the bit-loops *b*, the cheek-cords *c*, and the headstall *d* are all formed of one and the same piece of rope, in combination with the riveted leather frontlet *f*, nose-strap *e*, and cruciform throat-latch *g*, substantially as and for the purposes specified.



295,813. CUTTING APPARATUS FOR HARVESTERS. ELIAS D. ROTH, Fort Collins, assignor of one-half to Jacob A. Pearce, Buena Vista, Colo. Filed Apr. 14, 1883. (Model.)

Claim.—1. In a cutter-bar for a harvester, the slotted reciprocating bar with pins F, in combination with the pivoted cutters having the rear slotted ends passed into the slot of the reciprocating bar and engaging with their respective pins, whereby the slots of the cutters are protected and upward displacement obviated, as described.

2. In a cutter-bar for a harvester, the combination, with the pivoted cutters, of the tension-bar G, provided with the flange H, having recesses formed therein for the passage and operation of the pivoted cutters, substantially as and for the purposes set forth.

295,814. LUBRICATING DEVICE FOR CUTTER-BARS. ELIAS D. ROTH, Fort Collins, assignor of one-half to Jacob A. Pearce, Buena Vista, Colo. Filed Jan. 24, 1884. (No model.)

Claim.—1. The perforated pipe F, in combination with the cutting apparatus of a reaper or mower, said pipe being connected to a suitable oil-reservoir, substantially as and for the purpose set forth.

2. The hinged cap K, carrying a perforated pipe, F, in combination with the cutting apparatus of a reaper or mower, the same being connected to an oil-reservoir by a flexible connection, substantially as and for the purpose set forth.

295,815. PROCESS OF EXTRACTING METALS FROM ORES AND METALLURGICAL PRODUCTS. EDWARD HUBBARD RUSSELL, Park City, Utah. Filed Mar. 3, 1884. (No specimens.)

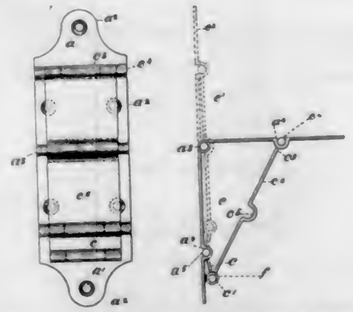
Claim.—1. The process of removing precious metals from ores and metallurgical products, which consists in first dissolving out therefrom with water the salts soluble therein, then subjecting the mass to the dissolving action of a hyposulphite solution, and finally to the dissolving action of a hyposulphite solution to which has been added a soluble salt or compound of copper, substantially as described.

2. The process of removing precious metals from ores and metallurgical products, which consists in subjecting the ore or product to the dissolving action of a hyposulphite solution, and then to the dissolving action of a hyposulphite solution to which has been added a soluble compound or salt of copper, substantially as described.

3. The process of separating precious metals from ores and metallurgical products, which consists in leaching the ore or product with a hyposulphite solution, and then leaching it with a hyposulphite solution to which has been added sulphate of copper, substantially as described.

4. The process of separating precious metals from ores and metallurgical products, which consists in subjecting the ore or product to the dissolving action of a hyposulphite solution, and then to the dissolving action of a solution containing the double salt of cupreous hyposulphite and sodium hyposulphite, substantially as described.

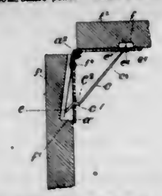
295,816. PROCESS OF EXTRACTING PRECIOUS METALS FROM ORES. EDWARD HUBBARD RUSSELL, Park City, Utah. Filed Oct. 25, 1883. (No specimens.)



Claim.—1. The process of removing precious metals from ores and metallurgical products, which consists in subjecting the ore or product to the dissolving action of a solution containing a hyposulphite to which has been added a soluble compound or salt of copper, substantially as described.

2. The process of removing precious metals from ores and metallurgical products, which consists in subjecting the ore or product to the dissolving action of a solution containing a hyposulphite to which has been added sulphate of copper, substantially as described.

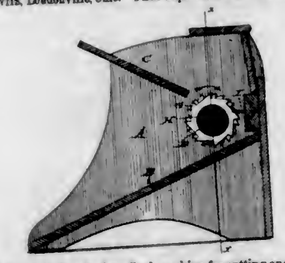
3. The process of removing precious metals from ores and metallurgical products, which consists in leaching the ore or product with a hyposulphite solution to which has been added a soluble compound or salt of copper in the proportions substantially as described.



4. The process of removing precious metals from ores and metallurgical products, which consists in subjecting the ore or product to the dissolving action of a solution containing the double salt of cupreous hyposulphite and sodium hyposulphite, substantially as described.

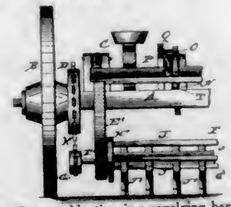
295,817. DUPLEX BRACE-HINGE. AMOS W. SANGSTER, Buffalo, N. Y., assignor to Frank H. Ransom, same place. Filed Aug. 11, 1883. (No model.)

Claim.—A duplex brace-hinge for trunks, consisting of the jointed hinge-plates *a a'*, having the bent or grooved portion a^4, in combination with the hinged plate *e* and brace-plate e^3, provided with a bent or grooved portion, e^4, one end of which plate is jointed to the hinge-plate by a joint, e^5, and the other end to the plate *e* by a joint, e', substantially as and for the purposes described.



295,818. BRACE-HINGE. AMOS W. SANGSTER, Buffalo, N. Y., assignor to Frank H. Ransom, same place. Filed Dec. 10, 1883. (No model.)

Claim.—1. A trunk-hinge consisting of the jointed hinge-plates *a a'*, provided with the openings c^3 e', in combination with a brace, *c*, having the parts c^2, the bent portion c', and a spring, *e*, for the purposes described.

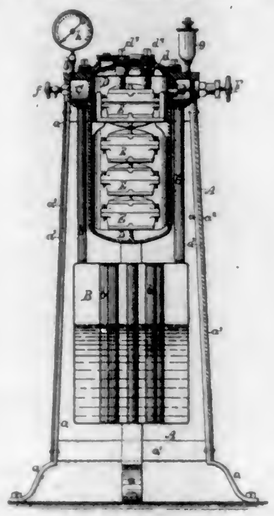


2. The hinge *a a'*, having the opening a^3, in combination with the brace-plate *c*, provided with a narrow portion, c^3, substantially as and for the purposes specified.

295,819. MACHINE FOR CUTTING CORN IN THE COB. SAMUEL F. SAVITS, Londonville, Ohio. Filed Sept. 19, 1883. (No model.)

Claim.—The herein-described machine for cutting and crushing corn in the cob, comprising the frame A, inclined feed-table C, inclined floor B, shaft D, having fly-wheel E and pulley F, circular saws or cutters G, the teeth of one saw being arranged opposite to the notches of the two saws next to it, spacing-disks H, and fixed teeth I, between which the saws G project, the whole constructed and arranged to operate substantially in the manner and for the purpose shown and described.

295,820. HARROW OR SOIL-PULVERIZER. JACOB SCHINDLER, Koeltztown, assignor of one-half to Herman Luckenhoff, Westphalia, Mo. Filed July 23, 1883. (No model.)



Claim.—1. The combination, in a revolving harrow, of the axle mounted upon the wheels and having vertical perforations of bearings near its ends, two uprights adapted to slide in the vertical bearings, two inclined frames hinged at their upper ends upon the uprights, and provided with revolving cutters at their lower ends, an upright secured upon the middle of the axle, and having a rack secured upon one side, a lever pivoted in the upper end of the upright, having its shorter arm hinged to the upper cross-bar of one of the frames, having a pawl engaging the rack upon the upright, and provided with a cogged segment upon its under side at its fulcrum, and a short arm pivoted in the upright below the lever, having its outer end engaging under the upper cross-bar of the other hinged frame, and having a cogged segment upon its inner end engaging the segment upon the lever, as and for the purpose shown and set forth.

2. The combination, in a revolving harrow, of the drive-wheels provided with sprocket-pulleys, two inclined frames hinged at their upper ends upon uprights upon the axle of the harrow and forming bearings at their lower ends, shafts turning in the bearings of the lower ends of the frames, disks secured upon the shafts and forming bearings in their inner faces, transverse bars pivoted at their ends in the bearings in the disks, and having curved cutters sharpened at the edges facing in the direction of the revolution of the disks, sprocket-pulleys secured upon the ends of

the shafts, the pulleys upon the forward shaft being smaller than the pulleys upon the drive-wheels, but larger than the pulleys upon the rear shaft, and sprocket-chains passing over the wheel-pulleys and over the pulleys upon the shafts, as and for the purpose shown and set forth.

3. The combination, in a revolving harrow, of the axle having vertical perforations or bearings near its ends, the drive-wheels turning upon the ends of the axle and having sprocket-pulleys secured to their hubs, uprights with their lower ends adapted to slide in the vertical bearings in the axle, inclined frames hinged at their upper ends to the upper ends of the uprights and forming bearings at their lower ends, shafts turning in the said bearings and having sprocket-pulleys at their ends, and disks inside the bearings provided with pivoted cutter-carrying bars, sprocket-chains passing over the wheel-pulleys and over the pulleys upon the shafts, an upright secured upon the axle and having a rack at one side, a lever pivoted in the upright and having its short arm hinged to the upper end of one of the inclined frames, having a cogged segment upon its under side around its fulcrum, and having a pawl engaging the rack upon its longer arm, and an arm pivoted under the lever in the upright having a cogged segment at its inner end meshing with the segment upon the lever, and having its outer end engaging under the upper cross-bar of the other inclined frame, as and for the purpose shown and set forth.

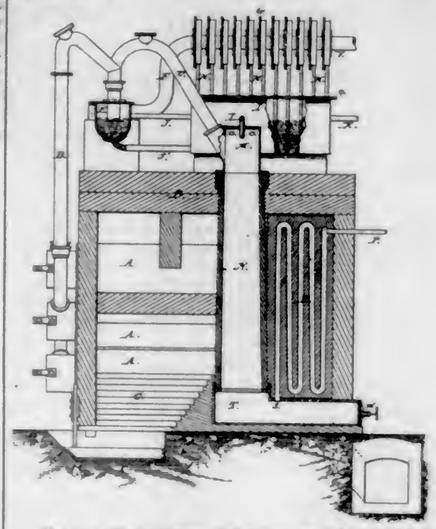
295,821. DENTAL VULCANIZER. FREDERICK W. SEABURY, Providence, R. I. Filed Oct. 19, 1883. (No model.)

Claim.—1. In a dental vulcanizer, the combination, with the oven or heater D and cover *d*, of the steam-generator B, the steam-tubes *b' b'*, the steam-valve F, and the case A, inclosing the whole, as described.

2. In a dental vulcanizer, the combination, with the case A, constructed to support the oven and steam-generator and inclose the same, of the oven D and boiler B, constructed to expose the oven to the heat of the fire externally and supply steam internally, as described.

3. The combination, in a dental vulcanizer, of the oven D, the vertical tubular boiler B, steam-tubes *b' b'*, and case A, constructed so that the heat applied will pass through the tubes of the boiler and surround the oven, as described.

4. The combination, with the case A, the oven D, constructed to receive two or more flasks successively and exert pressure on each during the process of molding, of the steam-boiler B, the tubes *b' b'*, valve F, and the case A, inclosing the whole and supporting the boiler above the burner, as described.



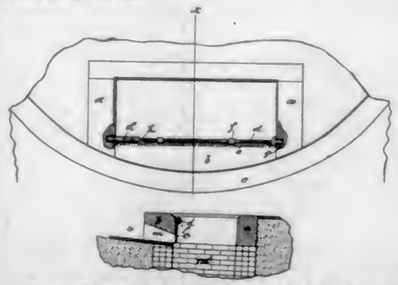
5. The combination, with the oven D, steam-boiler B, and tubes *b' b'*, of the steam-space C, partially or wholly surrounding the upper end of the oven, as described.

6. The combination, with the oven D, constructed to receive two or more flasks, of the cover *d*, provided with the glass-covered opening *d'*, the openings d^3 d^3, and the screws d^4 d^4, constructed to force the two parts of the flask together, as described.

7. The combination, with the oven D and the cover *d*, provided with the screws d^4 d^4, of a shelf constructed to support the flask during the process of molding and allow a flask to be passed below the support, as described.

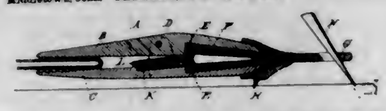
295,822. APPARATUS FOR MANUFACTURING ILLUMINATING-GAS. JAMES JOHN SHEDLOCK, Barnet, County of Hertford, England. Filed Oct. 9, 1882. (No model.) Patented in Belgium June 24, 1878, No. 45,512; in England June 25, 1878, No. 2,533; in France June 25, 1878, No. 125,278, and in Germany Mar. 28, 1879, No. 7,287.

Brief.—Coal is distilled, as usual, in heated retorts and the gas conducted to the hydraulic main. The tar condensed from such gas while passing through a condenser is passed into the top of a vertical retort containing solid carbon, while superheated steam is supplied to the bottom of such retort and decomposed into hydrogen and carbonic oxide in contact with the heated carbon, and the hydrogen combines with the rich gas and vapor from the tar to form carbureted hydrogen. These gases are passed into the main and mixed with the coal-gas. Steam is superheated by passage through a coil of refractory material located in the retort-furnace.



Claim.—1. The combination, with the retorts for effecting the first distillation of the tar, the condensing devices, and tar-receptacle, of a vertical retort having a feed-pipe at its upper end connected with the tar-receptacle, and also an outlet-pipe for gas leading to the mains or pipe carrying the gas of the first distillation, the said retort being adapted to be filled with coke and connected with a superheated-steam coil opening into the retort at its lower end, as and for the purpose described.

2. The combination of the retorts A, ascension-pipes D, hydraulic main E, condensers G, with pipes H, the subjacent tank I, retort N, and pipe U, the feed-pipe L, connecting the tar-tank and retort N, the waste-discharge chamber T, and the superheating-pipe R, substantially as shown and described.

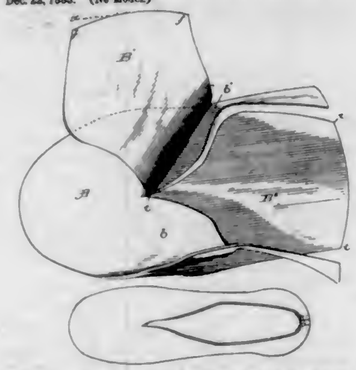


295,823. SEWER-BASIN. WILLIAM SEEVERING, Newark, N. J. Filed June 29, 1883. (No model.)

Brief.—The shutter in the mouth of the sewer-basin is mounted on an extensible pivotal bar.

Claim.—The combination, with the sewer-basin *m'*, having the mouth *m*, of the shutter *e* and extensible pivotal bar *d*, all arranged and operating substantially as and for the purposes set forth.

295,824. CARPET-STRETCHER. WILLIAM ALEXANDER SKINNER, Middletown, Conn. Filed Jan. 9, 1884. (No model.)

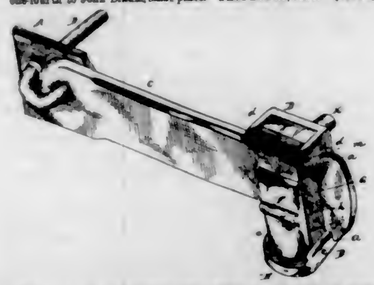


Claim.—1. A carpet-stretcher consisting of a pair of clamping jaw-levers, in combination with a wedge, substantially as specified.

2. The combination, with a wedge having an eye at its rear end and a floor-spur, of a pair of jaw-levers having guides to engage the wedge, and a spring connecting said wedge to one of the jaw-levers, substantially as specified.

295,825. MANUFACTURE OF PARACHINANISOL. ZDENKO HANNS SKRAUP, Vienna, Austria-Hungary, assignor to Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Dec. 14, 1883. (Specimens.)

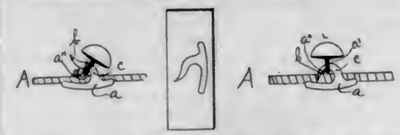
Claim.—As a new product, the parachinanisol hereinbefore described, and having the characteristics above set forth.



295,826. MANUFACTURE OF SHOES. GEORGE W. SLEEPER, Westborough, Mass., assignor of one-half to William A. Reed, same place. Filed Dec. 22, 1883. (No model.)

Claim.—1. The hereinbefore-described method of forming the upper of a shoe, consisting in first cutting a blank in substantially the form shown and described, then splitting the leather and forming the counter out of the split portions, all substantially as described.

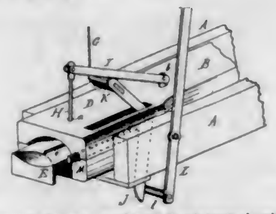
2. A shoe-upper formed of one piece split in the rear portion, the split portion being cut to form the counters, substantially as described.



295,827. HASP-LOCK. DUNCAN SMITH, Brooklyn, N. Y., assignor of one-fourth to John Blakie, same place. Filed Dec. 20, 1883. (Model.)

Claim.—1. In combination with a flange-headed hasp, an independent locking device consisting of the box D, carrying the hinged block G, which is provided with the sliding bolt F, adapted to enter one end of the box D, all being arranged to embrace the hasp, substantially as and for the purpose set forth.

2. The combination of the hasp having a flanged head with the independent box D, carrying the hinged block G and sliding bolt F, and being provided at one end with the ears *d d*, and at the other with the ears *e e*, constructed to catch and hold the flanged head of the hasp, substantially as described.

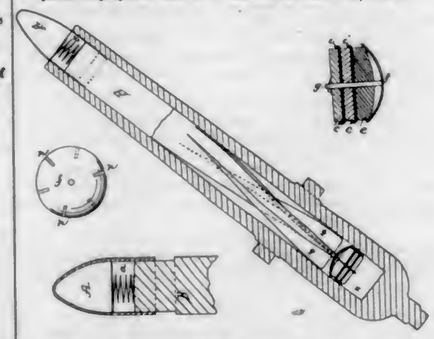


295,828. BUTTON HOOK OR FASTENING. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Jan. 14, 1884. (No model.)

Claim.—1. A button-fastener consisting of a base or head bar from which extends a hook having an upwardly-curved penetrating end, the whole being cut from sheet metal, and being in its finished condition when so cut, substantially as shown, and for the purpose specified.

2. The herein-described button-fastener A, consisting of the base-bar *a*, hook *c*, upward curved end *b*, terminating in a penetrating end, substantially as shown and described.

295,829. CAR-COUPLING. GEORGE W. SMITH, Des Arc, Ark. Filed June 21, 1883. (No model.)

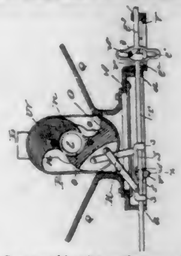


Claim.—1. In a car-coupling of the character herein specified, the combination, with coupling-pin H and arm I, of bent lever J, having projecting arm K, and lever L, bearing pin *l*, substantially as shown and described.

2. In a car-coupling of the character herein specified, the combination, with the coupling-pin H and arm I, of bent lever J, having projecting arm K, lever L, bearing pin *l*, and bar M, substantially as and for the uses and purposes set forth.

3. In an automatic car-coupling, frame A, draw-bar B, draw-head D, movable lip E, lever F, cord or chain G, coupling-pin H, pivoted to an arm, I bent lever J, having arm K, lever L, bearing pin *l*, and bar M, the whole combined and arranged to operate substantially as shown and described.

295,830. PROJECTILE FOR CARRYING HIGH EXPLOSIVES. FREDERICK H. SNYDER, Jersey City, N. J., assignor to the Dynamite Projectile Company, New York, N. Y. Filed Oct. 25, 1883. (No model.)



Claim.—1. In a projectile of the character herein described, the combination of a body, as B, a shell or magazine, A, for explosives, and an elastic spring cushion or buffer interposed between the body and the shell, substantially as and for the purposes described.

2. In an explosive projectile, the combination of a body, as B, a shell or magazine, as A, and elastic spiral wings upon the outside of the body, as and for the purposes set forth.

3. The sabot herein described, consisting of a series of disks, *c c* and *e*, connected by rod *g*, with interposed flexible disks *i i* and concavo-convex cap-plate *f*, in combination with the projectile-body B, shell or magazine A, and buffer *a*, interposed between the body and shell, as shown and described.

295,831. MACHINE FOR CUTTING GREEN CORN FROM THE COB. DARIUS B. SPEER, Blue Grass, Iowa. Filed Dec. 3, 1883. (No model.)

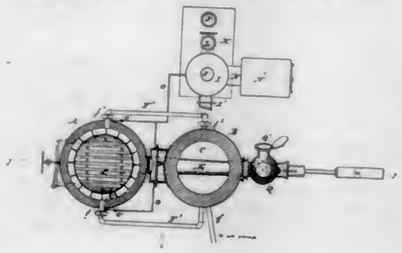
Claim.—1. In a machine for cutting corn from the cob, the combination of a hopper-feeding mechanism embodying two rolls, arranged one above the other, and provided with concave or semicircular grooves in their adjoining faces, with mechanism for rocking these rolls together, substantially as set forth.

2. In a machine for cutting corn from the cob, the combination of the herein-described hopper mechanism, comprising the two semicircular rolls, journaled one above the other, and provided with two parallel semicircular grooves in their adjoining faces, inclined feeding-boards arranged at each side of the rolls, devices connecting the rolls so that they will move positively together, and mechanism for rocking the rolls upon their bearings, substantially as set forth.

3. In a machine for cutting corn from the cob, the combination of feeding-rolls having grooves in their adjacent faces to receive the ears of corn, a reciprocating drive-rod, cross-levers connected with the drive-rod and with one of the rolls, and operative mechanism to transmit a rocking motion to the latter, substantially as set forth.

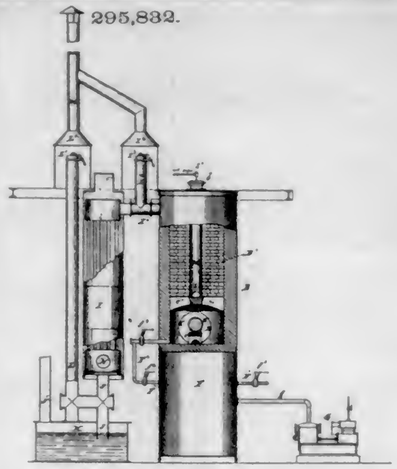
4. The combination of the feed-rolls having grooves in their adjoining faces, a drive-rod, mechanism for reciprocating the drive-rod, a lever-block connected with the drive-rod, and provided with a beveled notch, operating-levers pivoted to this block and to one of the rolls, and an automatic spring-actuated safety-pin engaging the notch, and adapted to become automatically disengaged by accidental gorge in the feed, substantially as set forth.

5. The combination of the feed-rolls having the grooves in their adjoining faces, devices connecting the rolls, a transverse reciprocating drive-rod having a vertical slot in its end, cross-levers connecting this rod and the under roll, a crank-shaft engaging the said slot, and operative mechanism, substantially as set forth.



6. The combination of the frame of the machine, the main crank-shaft, the plunger connected with said shaft, the feed-rolls journaled one above the other, said having the grooves in their adjoining faces, devices connecting these rolls together, a transverse drive-rod having a vertical slot curved or expanded at its central portion, devices connecting this rod and one of the rolls, and a crank-shaft engaging the slot and connected with the main crank-shaft, substantially as set forth.

7. The combination, with the stem of the knife containing the spring or cushion, of the approximately right-angular scraper, fulcrumed at the vertex of the angle, and acting against the cushion, substantially as set forth.



8. The combination of the cutting mechanism embodying the stem of the knife, the blade having a slotted shank, the nut, the securing-bolt passing through the stem, the shank, and the nut and the guards hinged to the said nut, substantially as set forth.

9. The combination, with the plunger-rod, of the tubular plunger-head having the annular flange at its end, the interposed spring, and devices extending from the flange to the plunger and limiting the action of said spring, substantially as set forth.

295,832. PROCESS OF AND APPARATUS FOR MANUFACTURING GAS. JOHN L. STEWART, Philadelphia, Pa. Filed Mar. 23, 1883. (No model.)

295,832.

Claim.—1. The herein-described process of generating gas, which consists in raising a body of carbonaceous fuel in a generator to incandescence by an air-blast, and at the same time, by means of the resulting hot gaseous products, heating up a charge of bituminous coal in a separate chamber or retort, then shutting off the air-blast, decomposing steam by passage through the incandescent fuel, and distilling the rich gas from the coal, and reducing it to coke by passing the hot gases resulting from the decomposed steam around the outside of the coal-distilling retorts, discharging the hot coke from the retorts into the steam-decomposing chamber, and continuing the manufacture of gas by a repetition of the said steps in successive order, whereby bituminous coal is economically distilled and rich gas therefrom is mixed with the water-gas, and hot coke is supplied to the decomposing-chamber.

2. The herein-described process of generating gas, which consists in raising a body of fuel to incandescence by an air-blast, and by means of the resulting hot gaseous products heating up a charge of bituminous coal, and a fixing-chamber containing refractory material, then, after shutting off the air-blast, decomposing steam in the bed of incandescent fuel, and by means of the resulting hot hydrogen and carbonic-oxide gases distilling the rich gases from the coal by passing such gases in contact with the coal-retorts, and simultaneously vaporizing hydrocarbon oil, then combining and fixing the water-gas, the coal-gas, and the oil-vapor in the heated fixing-chamber, discharging the coke resulting from the distilled coal into the steam-decomposing chamber, and continuing the manufacture of gas by repeating the above steps in the manner described.

3. The closed generating-chamber and the connected combustion-chamber C, freely communicating therewith, in combination with the supply-pipes for air and steam, connecting as described, the horizontal coal-distilling retort extending through the combustion-chamber and opening into the generating-chamber, and the superheater placed above the combustion-chamber, for the purpose described.

4. The closed generating-chamber, the combustion-chamber opening freely into it, and the superheating or fixing chamber placed above the combustion-chamber, in combination with the coal distilling and coking retort extending horizontally through the combustion-chamber and opening into the generating-chamber, the oil-vaporizing retort located in the fixing-chamber, and having an oil-supply pipe at the top, and the steam and air supply pipes connecting with the generating and the combustion chambers, as described.

5. The closed generator, the communicating combustion-chamber, and the superheating or fixing chamber arranged above the latter, in combination with the coal-retort extending through the combustion-chamber and opening into the generator, means for gradually and continuously supplying the retort with coal, the oil-vaporizing retort arranged in the fixing-chamber, and having an oil-supply pipe, and the connected steam and air supply pipes, for the purpose described.

6. The closed generator, the communicating combustion-chamber, and the superheating or fixing chamber arranged above the latter, in combination with the coal-retort, provided with feeding mechanism and extending through the combustion-chamber, the oil-vaporizing retort arranged in the fixing-chamber, and having an oil-supply pipe, the steam-boiler, valved chimney, connecting-flues, and a washer, and the supply-pipes for air and steam connected to the generator and combustion-chamber, for the purpose described.

7. The combination of a generator provided with air and steam pipes, a coking-retort opening into and heated by the gases from said generator, air-pump G, air-chamber F, valved pipes F' F², a superheater, and a washer, substantially as and for the purpose specified.

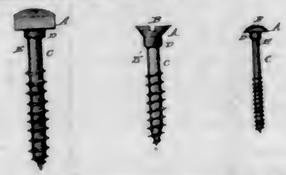
8. The combination of a generator provided with air and steam pipes, a coking-retort opening into and heated by the gases from said generator, air-pump G, air-chamber F, valved pipes F' F², air and steam superheater A', a fixing superheater, and a washer, substantially as and for the purpose specified.

9. The generator A, provided with air and steam superheating back A', having divisions A³ and holes A⁴, constructed as shown, steam-pipes O, and air-pipes F', substantially as and for the purpose specified.

10. The combination of generator A, superheater B, retort E, plunger R, and hopper Q, substantially as and for the purpose specified.

11. The combination of generator A, superheater B, retort E, plunger R, means to reciprocate said plunger, hopper Q, and means to agitate the carbon in said hopper, substantially as and for the purpose specified.

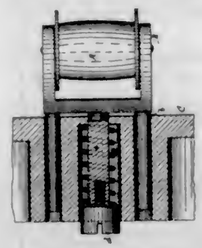
12. The combination of generator A, having steam and air pipes, superheater B, vaporizing-retort H, oil-pipe A', and retort E, substantially as and for the purpose specified.



13. The combination of generator A, having steam and air pipes, superheater B, vaporizing-retort H, oil-pipe A', retort E, and means to feed coal-dust through said retort, substantially as and for the purpose specified.

14. The combination of generator A, having steam and air pipes, superheater B, vaporizing-retort H, oil-pipe A', retort E, flues I' P, valve P, boiler I, pipe J, washer K, chimney L, and valve L', substantially as and for the purpose specified.

15. The combination of two sets of generators and superheaters, pipes I', a boiler, I, having a division, I³, washer K, smoke-chimney L, valve L', and connecting-flues, substantially as and for the purpose specified.

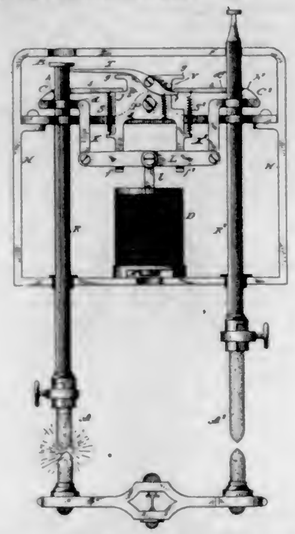


16. The herein-described method of disintegrating and fracturing the caking coal in the process of generating gas by forcing blasts of air at certain intervals or intermittently into the fuel, said blasts being of greater pressure than the regular blasts, substantially as described.

295,833. WOOD-SCREW. GEORGE A. STILES, West Gardiner, assignor of one-half to Carral Matthew Parker, Pittsburg, Mass. Filed Mar. 30, 1883. Renewed Dec. 3, 1883. (No model.)

Claim.—The improved wood-screw herein shown and described, having a reduced stem or shank, C, provided with a collar or annular enlargement, D E, at its upper end, where it connects with the head A, as a new article of manufacture.

295,834. TENSION DEVICE FOR TAPES OF PAPER-FOLDING MACHINES. JOHN H. STONEBETA, Erie, Pa. Filed June 2, 1883. (No model.)



Claim.—1. The combination of a spring-pressed bracket or frame carrying a tape-spool and provided with guide-stems, with a paper-folding-machine frame adapted to receive and hold said bracket or spool frame and a conveyer-tape passing around the spool mounted in said frame, as and for the purpose set forth.

2. In a paper-folding machine, the combination of the bracket having the stems, the spool mounted in said bracket, and a retracting-spring bearing upon a stem of the bracket, substantially as herein set forth.

295,835. MANUFACTURE OF PAPER FROM GRAIN-CUTICLES. WM. L. TETER, Philadelphia, Pa. Filed Dec. 1, 1882. (Specimens.)

Claim.—The mode herein described of utilizing the outer woody skins or cuticles of grain-berries for paper-stock, the said mode consisting in removing the said cuticles from the berries in the form of fibrous scales, and then pulping the same, as set forth.

295,836. DOUBLE-CARBON ARC-LAMP. ELIHU THOMSON, New Britain, Conn., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Apr. 2, 1883. (No model.)

Claim.—1. The combination, with two carbon-carriers in an electric-arc lamp, of a movable releasing-stop for the feeding mechanism of one carrier, and suitable means for bringing said stop into releasing position upon the descent of the other carrier to a predetermined position.

2. The combination, in a double-carbon lamp, of a releasing-clutch for one of the carbon-carriers, a movable releasing-stop for said clutch, and means for bringing said stop into releasing position upon the descent of the other carrier to a predetermined position.

3. The combination, in a double-carbon lamp, of a releasing-stop for the feed mechanism of one of the carbon-carriers, mounted on a lever, and a lug or projection on the other carbon-carrier, for tilting said lever and carrying said lever into releasing position when the latter carrier has moved to a predetermined point.

4. The combination, in a double-carbon lamp, of a feed clamp or clutch for one of the carbon-carriers, a releasing-stop for said clutch, mounted on a lever placed to hold the stop out of releasing position, and a projection on or connected with the other carbon-carrier, for tilting said lever and moving stop into releasing position.

5. The combination, in a double-carbon lamp, of a releasing-stop for the feed-controlling clamp of one carrier and means connected directly or indirectly with the other carrier for controlling the position of said stop, as and for the purpose described.

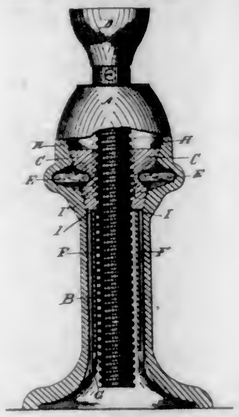
6. The combination, with two carbon-carriers, of a releasing-stop for the feed clamp or clutch of one carrier, means connected with the other carrier for setting said stop into releasing position, and a stop or catch for limiting the movement of the releasing-stop in the setting operation.

7. The combination, with two carbon-carriers, of feed clamps or clutches actuated by a common magnet system, a fixed releasing-stop for the clamp or clutch of one carrier, and a movable releasing-stop for the clamp or clutch of the other, set by a button or other suitable device connected with or controlled by the first carrier.

8. The combination, with a clutch for a carbon-carrier, of a releasing-stop, *t*, mounted on or supported by one arm of a lever, and a button-stud or its equivalent, as described, upon the other carrier, which button or stud engages with the other end of the lever when the carbon is wholly or nearly consumed.

9. The combination of a carbon-carrier, R², a feed-clutch, C², a stop, *t*, a lever, T, a carbon-carrier, R, and button B.

10. In a double-carbon lamp, the combination, with the feed-controlling mechanism engaging with one carbon or carrier, of a releasing-stop, detent, or such like releasing device adapted to cause a release of



said feed mechanism whenever, through wasting of said carbon in the arc, the feed-controlling mechanism is lowered to a predetermined extent, said releasing device being mounted in a movable support, of means for holding the same out of feed-releasing position while the other of the two carbons is in action.

11. The combination, in a double-carbon lamp, of feed-regulating devices for the two carriers, and a fixed and a movable releasing-stop for the respective feed devices of said carriers, mounted on a common adjustable support, as and for the purpose described.

12. In a double-carbon electric lamp, the adjustable support P, carrying the fixed releasing-stop J for one carrier, and the movable releasing-stop *t* for the other carrier, as and for the purpose described.

13. The combination, with the two carbon-carriers R R^1, of the clutches C C^1, releasing-stops J *t*, a movable support for stop *t*, and means connected with carrier R for setting the stop *t* in releasing position.

295,837. SCREW-JACK. ALBERT R. TIFFANY, Dayton, Ohio, assignor of five-sixths to Michael Nell, Horace L. Gillette, and John J. Leland, all of same place. Filed Jan. 26, 1884. (No model.)

Claim.—1. In a screw-jack, the combination, with a standard, of a screw-stem or lifting-bar and a divided nut the parts of which are guided to and from the lifting-bar in arcs of circles, substantially as described.

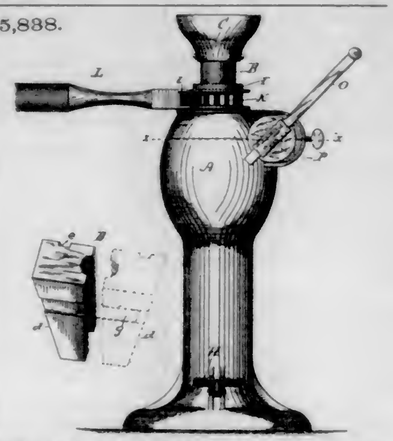
2. In a screw-jack, the combination, with a screw-stem or lifting-bar, of a divided nut the parts of which are hinged to the jack-standard, substantially as described.

3. In a screw-jack, the combination, with the standard, of a screw-stem or lifting-bar and a divided nut the parts of which are hinged to the standard, and are adapted, when in engagement with the lifting-bar, to be supported against the walls of the standard, substantially as described.

4. In a screw-jack, the combination of a screw-stem or lifting-bar with the standard having inclined inner walls, and a divided nut having inclined ends, and having each of its parts connected to the standard by a hinged connection, substantially as described.

5. In a screw-jack, the combination of a screw-stem or lifting-bar with a standard, a divided nut having each of its parts connected to the standard by a hinged connection, and means, substantially as described, for raising the nut to release the lifting-bar, substantially as described.

6. In a screw-jack, the combination of a screw-stem or lifting-bar with a standard, a divided nut having each of its parts connected to the standard by a hinged connection, and means for maintaining the parts of the nut in the same horizontal plane in all positions of adjustment, substantially as described.



7. In a screw-jack, the combination of a screw-stem or lifting-bar with a standard having inclined inner walls, a divided nut having inclined ends, and having each of its parts connected to the standard by a hinged connection, and means, substantially as described, for simultaneously raising both parts of the nut, as set forth.

295,838. SCREW-JACK. ALBERT R. TIFFANY, Dayton, Ohio, assignor of five-sixths to Michael Nell, Horace L. Gillette, and John J. Leland, all of same place. Filed Jan. 26, 1884. (No model.)

Claim.—1. In a screw-jack, the combination of a screw-shaft and a divided gravitating nut having inclined ends with a standard or case having inclined bearing-faces for the ends of the nut to work against, substantially as described.

2. In a screw-jack, the combination of a screw-shaft, a divided gravitating nut having inclined ends, and fixed and positively-acting guides for opening and closing the parts of the nut, with a standard or case having

295,888.

inclined bearing-faces for the ends of the gravitating nut to work against, substantially as described.

3. In a screw-jack, the combination, with the screw-shaft, of a divided gravitating nut, guides for positively opening and closing it, and means for keeping its parts in the same horizontal plane at all points of adjustment, substantially as described.

4. In a screw-jack, the combination of a screw-shaft with a divided gravitating nut having inclined ends, a standard or casing having inclined bearing-faces for the ends of the gravitating nut to work against, and means for raising the nut, substantially as described.

5. In a screw-jack, the combination, with the screw-shaft, of a divided nut, the parts of which gravitate toward the screw-shaft, guides for said nut, and a lever and connections for raising it, substantially as described.

6. In a screw-jack, the combination, with the screw-shaft, of the divided nut whose parts gravitate toward the screw-shaft, operating-treadle pivoted to the base of the jack, and connections for raising the nut by the operation of the treadle, substantially as described.

7. In a screw-jack, the combination, with the screw-shaft, of the elongated hub having the feather projecting into the groove in the shaft, and having also the worm-gear and the ratchet at opposite ends for the application of the worm and the pawl-arm, respectively, substantially as described.
